CIX. 10. Gramen Alpecorumides Cuffidatum minus. Baffard Footail-Grafs small sharp pointed. It grows about a Foot high, flored but with few Joints, and short narrow Leaves on them, having a Spike or Ear almost as big as the leaf, but sharper pointed, with some pieces growing out of the fides.

CX. 11. Gramen Alpecorumides Cuffidatum minimun, Smalleft Baffard footail-Grafs pointed. This is fherfer than any of thofe going before, in Stalks and Leaves, but longer in both, as is alfo the Spike or Ear, which is very small, fender, and pointed at the end.

CXI. 12. Gramen Alpecorumides alterum Radicem repente, feuer Pfaffdfchenanbn. Another Baffard Footail-Grafs with a creeping Root, called alfo Baffard Schafanb. It has a creeping Root, which spreads itelf under Ground, shooting bulk Leaves and Stalks in feveral places; the Plant somewhat resembles the greater English Footail-Grafs (at Sect. 102. N. 4, above) having this that he thicker, harder and fherfer Leaves; like unto Rafters, the Head or Spike is long and clofe, five or fix Inches long, of a Silver like finifhing color, but the Blooms are of a pale red, and the Husks redder, which when it has flood long, begins to open it elfe, expofing its Do wy flablance to the Wind.

CXII. The Places and Times. The first and twelfth grow with us only in Gardens, the other ten grow in Fields and Meadows in many parts of England, fome of them about Hackney, near London, and feveral others of them in Kent, I have found them all in Fields, Paffures, and Meadows in many parts of Norfolk, and they all keep the times of Flourifhing and Seedling with other Meafow-Grafs.

XVI. "Apnnum daftp, Gramen Hirsutum, & Hirsu- tum Nemorosum, Hairy-Grafs, and Hairy Wood- Grafs, nine Kinds.

CXIII. 1. Gramen Hirsutum latifolium Nemorum major. The greater Hairy Wood-Grafs broad Leave'd. It has a Root confifting of a tuft of many small long Fibres or Threads, and has feveral long and somewhat broad Leaves fpringing from the Root, smaller to the end, gaffh untembered, and green above, cut about the edges with whitith small long Hairs; the Scafts rise up from among them, and comes to be about two Feet high, with Leaves at the Joints, having at the top feveral small greenish, growling or little Husks, containing within them small Seed.

CXIV. 2. Gramen Hirsutum Nemorum minus poliffitum. The leff small Leaf'd Hairy Wood- Grafs. It has a Root confifting of a tuft of many small long Fibres or Threads, the Plant is leffer than the laft, folowing in its
Salmon's Herbal.

The Places and Times. All these grow in many Woods throughout England, some about Highgate, and in Hendon Wood, and other places, and Flower all of them in the Summer Months, or near the end of Summer, except the third, which Flowers a Month or two earlier than the rest.

CXXII. The Places and Times. All these grow in many Woods throughout England, some about Highgate, and in Hendon Wood, and other places, and Flower all of them in the Summer Months, or near the end of Summer, except the third, which Flowers a Month or two earlier than the rest.

CXXII. The Places and Times. All these grow in many Woods throughout England, some about Highgate, and in Hendon Wood, and other places, and Flower all of them in the Summer Months, or near the end of Summer, except the third, which Flowers a Month or two earlier than the rest.
Stalks are good against Pituious Tumors, and the Gout, being with the Lye made thereof, and that it dissolves hard Tumors and Kernels in the Kidney, discharging Swellings of the Joints. For the Filth of Lachrymales. Take the whole Plant, Rose and green Seed three parts, Roots of Wild Oats one part, boil in a sufficient quantity of Water till a third part is consumed, strain, and add an equal quantity of Honey, and boil to the thickness of a Syrup, to every Quart of which add fine Aloes in fine Powder one Ounce, mix and disperse, in which wet Tents, and put them up the Nightly. Deduce. Also the Juice of the Plant mixed with Barley Meal to a soft Paste and ingested, it good for the same purpose's mix a little of it with Damascus Roat Water to a thicknes, and apply it Plasterwise to the Eglets or Fi-brous, and it will cure it, it also fences and disquiets hard Tumors in other parts of the Body.

XVIII. *Anguina angustifolia, Gramen Echinatum, Hedge-Hog-Grats, or prickly headed Grats, four kinds.

CXXVII. 1. Gramen Echinatum vulgaris. Common Hedge-Hog, or prickly headed Grats, Gramen Palustris Echinatum Lepelis, Gramen aculeatum Decumbens. It has a fibrous or thready Root, which sends up divers Graffie Leaves, and among them several slender Stalks, leaning this way and that way, on which are far short spiked heads, very rough and sharp, made of many husks, in which lies the Seed.

CXXVIII. 2. Gramen Echinatum italicum aculeatum Harthoffi, Matthiolus his Hedge-Hog, or prickly headed Grats. It has a fibrous Root, which sends up small Grafs Leaves and Stalks, much like the Small common Grafs, but at the Joints with the Leaves come forth small prickly heads, folded in husks, and ending in three points, in which lie small pointed Seed.

CXXIX. 3. Gramen Echinatum plumum, Gramen Spica plana Echinata Bauhini, Flat Hedge-Hog, or prickly headed Grafs. It riles up not much higher than a Palm or Hant bread, and from a white Root, made of many Fibres, it sends forth a few small hairy Leaves, an inch long, as also a fine and small Stalk, with a flat spiked head, and very sharp Awns at the ends of the Husks.

CXXXV. 1. Gramen Pratense vulgaris major, The greater common Meadow-Grafs. It has a bulky

M  m  m  2

Grafs.
Salmon's Herbal. Lib. 1.

fibrous Root, from whence rise up many Grass-like Leaves, and among them several Stalks, half a yard high, having a few pointed Tufts at the top of them, somewhat resembling the Feather like heads of the Water Reed.

Loose tufted Meadow Grasses

CXXXVI. 2. Gramen Protense minus, The small Meadow Grass. This in its Roots, Leaves and Stalks, is not much unlike the former, saving that it is ever so very very something less, and its tufted Panicles are manifold, growing upon the Stalks less and less, till they come to the very top. Of this kind there are two other sorts, both smaller than this, the one with white tufted tops, and the other with reddish tuft ed tops, the first more sparred, the last more clove together.

CXXXVII. 3. Gramen multiplici Panicula Protensae; Meadow-Grafs with manifold Tufts. The Root is a thick bush of white Fibres, from whence rise up divers Stalks, a Span long, jointed, and a little bending downwards, the Leaves are small Grass-Leaves, and the Tufted Head or Panicle is manifold, and much divided, which when ripe grows hard, and is of a fair reddish color.

CXXXVIII. 4. Gramen Protense Paniculatum mollis, Soft Tufted Meadow Grasses. It has a short, bushy fibrous Root, from whence several long and somewhat broad, felt, or woolly Grass-Leaves springs, from among their Leaves rise up two or three Stalks, a Cubit high, with some Leaves upon it, and at top comes forth a soft woolly spike head, much divided, half Bloomings are reddish.

CXXXIX. 5. Gramen edulician Panicula Germannicam, Sweet Dutch Grasses with tufted heads. It has a Root which creeps in the Ground, which is white, and full of Johns, shooting out Fibres at every one of them, the Stalks are two or three feet high, with but few Johns on them, white Leaves are almost as long, and some of them exceed the height of the Stalks, being narrow, and almost at the ends, at the top of each Stalk grows a Panicle, but nothing near so much spread as the former, the which for their sweete and some like to lay among Garments, or Linen, to perfume it.

XXI. Argentum Ovius, Desfrsimum Gramen Paniculatum Montanum, Mountain Tufted Grasses, five Kinds.

CXL. 1. Gramen Montanum Panicula fuscescens delicatissima, Soft Mountain Grasses with a reddish or bright Panicle. It has a small white Root, with short Fibres, which ends up three or four joined Stalks, a Foot high, having a few small and short Leaves on them, and each likewise at the foot of the Stalks, but few in number; at the top stands a brownish or bay colored Panicle, three inches long, composed of many very small husks: this is sometimes found growing higher, and with larger Panicles.

CXLI. 2. Gramen Montanum Panicula altissimum, Tall Tufted Mountain Grasses. It has a Root which creeps in the Ground, and is covered with several Fibres, whence rise two or three very tall Reed like Stalks, two or three Feet or more high, having a broad green Leaves on them, like unto Cyperus, and at the top of the Stalks many small tufted Panicles, both Stalks and Leaves are so tough, that some Country People make them Cots or Garments thereof, to defend them against the Weather, and Husbandmen make Risps and Traces thereof, for their Horses, wherewith to draw their Ploughs.

CXLII. 3. Gramen Montanum monticolum, Mountain Herbergoes, or Ox Grasses. It has small creeping Roots; the Stalks are about a Foot and half high, fleshy, jointed, and set with short narrow Leaves. At the tops of the Stalks grow the Ears, which are long, slender and bending, composed of Donny Husks, containing a Seed like to a naked Oat.

CXLIII. 4. Gramen Montanum spicatum Chaffi, Mountain Spiked Grass: It has a Root of about a Finger thick, parted sometimes into two or three Strings, with many Fibres therein, and somewhat hairy at top, which grows forth several Heads of Leaves, each containing five or six, somewhat long, thick, and half hollow, like a Copper, very like to those of the greater Thrift, compelling one another at the bottom, a little bitter and sharp in Taste, from the middle of which springing up half smooth, fleshy and robust Stalks, above it is quite high, bearing at the tops several small Flowers, set Spike-fashion, and of a greenish color.

CXLIV. 5. Gramen Montanum spicatum angustatum, Narrow Mountain Grass with narrow Leaves. It has a Root which runs under the upper Crest of the Ground, full of small brown fibrous Fibres, running one within another: its Leaves are long and narrow, and its Stalks long and slender, at the tops of which are spiked Heads, not much unlike the former.

CXLV. The Places and Times. They all grow upon Hills and Mountains in many places of England, and in other Countries, and they flower and seed when other Grasses do. The Seed of the third is ripe in July.

XXII. *Aegypcius vulgaris, Gramen Millicere, vel Millicenum, vel Milliceto, Millet Grass, five Kinds.

XXVI. 1. Gramen Millicere vulgaris, Common Millet Grass. It has a bushy and fibrous Root; from whence rise three or four joined Stalks, with two or three somewhat large Leaves thereon: at the top of each Stalk is a bushy spreading Tuft, of many
Chap. 327. English Herbs.

many long Feather-like Sprigs, consisting of many small chaffy Husks, within which is contained small Seed, which Birds greatly eat.

CXLVII. 2. Gramen Millaceum Panicula speciosa, Gramen Setosum Panicula sparsi, Millet Grafs, with a fair Panicule, or Corn Grafs with a Feathered Panicule. It has a bushy fibrous Root, like the former, and grows up with a few long, soft, green Leaves, like to those of Millet, some below, and others upon a stiff, tall, round, smooth, green, jointed Stalk, a Yard and half high, bearing on its top a bushy, large, spreading Tuft, spread round into many slender Branches, very like in its Form, Parts and manner of Growing to the former Millet Grafs, giving that it is not only larger, but also more beautiful.

CXLVII. 3. Gramen Millaceum alterum, Another Millet Grafs. The Root is fibrous and red-diff, it has but a small weak Stalk, not much above a Foot and half high, with a few narrow Leaves, four or five Inches long, growing at the bottom, and two or three thereon at the Joints. The Feather-like Tuft at the top is spread abroad, like the former, but the chaffy Husks are much smaller and finer.

CXLIX. 4. Gramen Millaceum Panicula arundinaceum, A Reedy Grafs with Millet like Pannicles. It has a white fibrous Root, which sends forth several Reed-like Leaves, yet thinner than the last, among which rises up a Stalk or two, about a Foot and half high, with two Joints thence towards the tops, and narrower and longer Leaves growing at them, at the top Saxead forth a Feather-like Tuft, not much unlike the last, and of about three Inches long.

CL. 5. Gramen Millaceum Indicum, vel Gramen Sorghinum, Indian Millet Grafs, or Pipe Grafs. It has a fibrous Root, from whence springing up Reed-like Stalks, half a Yard high, or something more, with fair long Lily like Leaves thereon, and a spread spiked Top, consisting of many Panicles or Parts above, somewhat like unto the Indian Millet, but with larger Stalks therein than in the Millet. It is called by the Indians Eindurum, because Boys there make Pipes of its Stalks.

CL. 6. Gramen Millaceum Indicum alterum, vel Gramen forginum alterum, Another Indian Millet Grafs. It has hollow Stalks, like the last, but they are weak, bending down to the Ground, and throw out Fibres at their Joints, whereby it roots itself, and having narrow long Leaves on them, the Stalk being, as it were, to run thro' them, like a Pipe; and at the top thick like spread spiked Top as the former, whose Husks in the several parts of it are smaller.

CLII. The Places and Times. The second grows in the Borders of Corn-fields, and Grounds which have been Plowed, and flourishes chiefly in the beginning of Summer. All the other grow also in Fields, and by Hedge-sides, as well in England as in other Countries, tho' observed but by few who are curious in Herbarium, and flourish in June, July and August.

XXIII. *Avena Secale, & Cereus, Gramen Avenaceum, Oat Grafs. Twenty two Kinds.

CLIII. 1. Gramen Bromoides maximum hirsutum, The greatest hairy Oat Grafs. It has a bulky fibrous Root, and the Panneis in all hairy: the Stalks and Leaves are larger than those of Oats, being four, five, six or seven Feet high sometimes, whose Panicle at top spreadeth into many chaffy headed Ears, hanging down their Heads. It is found in Fallowes about London, as also in Essex.

CLIV. 2. Gramen Bromoides setosum Panicula laetius, Great Corn Oat Grafs. It has Oat like Stalks, Four,
four, five, or fix Feet long; the Leaves are shorter and narrower; the top is much spread, having divers ramifications, with many branch'd chiefly Leaves coming forth at a Joint, breadth below, and springing finally upwards.

Great Corn Oat-Grass.

CLV. 2. Gramen Avenaceum ineanum, Great hoary Oat Grass. It has short narrow Leaves, somewhat hairy, and a little hoary withal. The Stalk has but few Joints. The Panicle is spread, like the Leaf, but lefter, and is somewhat hoary. This is sometimes found lefter, and grow both of them in the Borders of Cornfields, both in Essex and Kent.

CLV. 4. Gramen Avenaceum Pratensis, Meadow Oaten Gras. It has many Leaves growing next the Root, which are long and narrow, and the Stalk is leffer and lower than any of the former; but the Panicles or Ears stand at top, leffer spread, and not hoary, every one upon its own Foot-balk. It differs not in any thing from the former, but that the Scaley Ears stand single, every one upon its own Thread like Foot-balk.

CLVIII. 6. Gramen Avenaceum pinnata longiscula spica, Winged Oaten Gras. It has a slender Stalk, higher or lower, according to the Place and Goodness of the Soil. The Leaves are narrower than the Leaf. The Panicle is somewhat long, but small, and not much spread, each Part being, as it were, winged or divided into several pieces, upon one Rib or Foot-balk.

CLX. 7. Gramen Avenaceum filica Paniculata Xarumpeta, Red Ver'ly like Gras. It has red fling Stalks, a Foot high. The Leaves are foft and narrow. The Panicle at the top is three or four Inches long, of a whitth green color, divided into many winged Branches, many Parts being in re on both Sides the Branch, and each Part divided, like a Tear Leaf.

CLX. 8. Gramen Avenaceum varium eretum Upright Oat Grass. It grows upright, sometimes a Span, and sometimes a Foot high. It has as many Leaves almost as any Gras. The spiked Head is three or four Inches long, and flared or divided, each final Ear being bearded. It is often found upon old Mud-walls which commonly enclose Fields.

CLXI. 9. Gramen Avenaceum supinum Argaece, Low Meadow Oat Grass. Its Leaves are as small as the Leaf, an Inch or Inch and half long. The Stalks are slender and weak, leaning downwards, with a few bearded Husks, and Spike-inflated at top.

CLXII. 10. Gramen Avenaceum supinum inobitus, Long-winged Oat Grass with flat like Flowers. It springs with many Stalks, but they seldom rise up to a Foot high; are full of Joints, and have monthly foliar Leaves upon them, of a whitth green color. The tops are repleated with four or five Our like Heads, but more winged, and with short Arrows, somewhat hard, and flowering like Rice.

CLXIII. 11. Gramen Avenaceum exile, folis multilobatis, Small self-sown Oat Grass. It is very like the Gramen exile durus, so that it may be easily mistaken for it, and differs therefrom only in the Leaves, which are never longer, and oft, as the whole Plant is, and not above half a Foot high, and spiked at its top, its parts being also winged.

CLXIV. 12. Gramen Avenaceum altero alteri immaturum, Small Oat-Grass one head for another. It is a fine small Gras, and much resembles the Gramen Britanicum Altimimum, having divers hard Hair like Leaves, with very small Stalks, a Span, or eight or nine Inches high, some of which bear their final sharp Husks at their tops only, as some others do, and others of them out of a Tuft of Leaves in the middle of the Stalk lend forth another short Stalk, with such sharp Husks on them as on the other.

CLXV. 13. Gramen Avenaceum Montanae Claviflorae, Mountain Oat-Grass with hairy husks. It has a Root consisting of several long Fibres, the Stalks are slender and jointed, a Foot and half high, with very narrow and long Leaves, and at the tops a long spiked head, bowing the head close, with woolly short husks, containing Seed like to those of Near Oats.

CLXVI. 14. Gramen Avenaceum Montanae alterum, Another Mountain Oat-Grass without hairy husks. It differs not in any thing from the former, but in the spiked head, whole husks are not hoary, as those others are.

CLXVII. 15. Gramen Avenaceum gluma rarius fitectum, Spiked Oat-Grass with a spars'd, loose, chaffy Ear. It has a fesus or stringy Root, and hairy, running under Ground, it has flender, weak, clear Stalks, a Foot high, with long Leaves on them, and at their tops, weak, bending, tupp'd heads, thin and spars'dly set with small husks, containing Oat-like Seed or Grain.

CLXVIII. 16. Gramen Avenaceum Xerampelina, Red Oat-Grass. This is somewhat like the leaf, but with much longer Stalks, clear and reddish, the husks at the top of them are more upright and longer, having the like Oat Seed in them. A little foot hereof has been found about Greatworth, in a muddy Soil.

CLXIX. 17. Gramen Avenaceum loculis rubris, Oat-Grass with red husks. It has a Root which is long and white, like unto Ogri-Grass, or Spikes-Grass, creeping in the Ground, having next to the Earth narrow short Leaves, where the Stalk is reddish, but they are longer up higher, the husks are set sparingly at the tops, all on one side for the most part, and are of a dark reddish Purple color, but white within, with small Grains within them.

CLXX. 18. Gramen
CLXX. 18. Gramen Avenaceum glums bistrii, Out-grafs with partly colored husks. It has a Root, which is thick, and is covered with a rough white Bark. The leaves are green, long and narrow, from among which rise up two or three smooth and brittle naked Stalks. A Foot high, bearing a short spike of small husks, and few seeds.

CLXXI. 19. Gramen Bromoides, five Avenaceum parte Gramen Commutante speciosa, Out-Grafs with few Seeds. It is somewhat hairy all over, the Leaves are of a flat green color, set on Stalks three, four, or five Feet high, at whose tops is a spikèd bending head, having leven or eight small long husks, with few Seeds in them: this grows near Woods files in many places.

CLXXII. 20. Gramen Avenaceum Sylvaceum, Wood Out-Grafs. It has a Root which runs creeping under the Earth, the Stalks are small in all the parts, and weak, being not above half a Yard high, with long, narrow, Jointed Leaves on them, and at their tops a few short husks, and open, like unto some of the Oat-Grafs before.

CLXXIII. 21. Gramen Avenaceum exilis, Small Wood Out-Grafs. This has a fibrous Root, and the Stalks are flender and smaller in all their parts, yet notwithstanding stand a little more upright, the husky tops are like the former.

CLXXIV. 22. Gramen Avenaceum gluma silillosa Sylvaceae, Hairy Wood Out-Grafs. It has fibrous and yellowish Roots, the Stalks hereof are three Feet high, with small narrow Leaves, four or five Inches long, the spikèd heads have somewhat long and hairy husks, differing most from one another, and is often found less by the half than the other.

CLXXV. The Places and Times. The first twelve of these grow in many Fields throughout England, some in one place, some in another, some in Meadow Land, some in Flowed Grounds, and some in Hollows: the thirteenth, fourteenth, fifteenth, sixteenth, seventeenth and eighteenth grow upon Mountains, and on Hilly Grounds, the fourteenth and fifteenth have also been found growing in Denmark, the last four grow in Woods, and by Wood files, in Mountainous Woods, and other Woodly places: they all flower in the Summer Months.

There is another of this sort, which is round with husks in England, which is smaller, else very little differing.

CLXXIX. 4. Gramen Panicum australis longum avenaceum, Panic-Grafs bearded. It has a Root consisting of many long Husks, the Stalks and Leaves are not much unlike the second sort of Panic-Grafs aforesaying, but longer and callèd, having divers brown heads at the tops, one above another, strowed with long and sharp Beards or Awes, like unto Wheat or Barley.

CLXXX. 5. Gramen Panicum minus, Panic's Gras the lesser. This is lefter than any of the other sorts going before, having few bending Stalks, eight, nine, or ten Inches long, and sharp long Leaves thereon, with small, long, chaffy Ears, like Cockfoot-Grafs, sown specially at the tops.

CLXXXI. 6. Gramen Panicum Sylvaceum Anglicum & Africum, Panic-Gras of England and Barbary. It is a kind of Wild Panic-Gras, growing in several Woods with us, whose Spike resembles Panic: the like hereof has been brought to us out of Barbary, having like Leaf and Head, and differs from ours only in itemprop.

CLXXXII. The Places and Times. These Gras grow all of them in England, and the first of them in France, usually among Rubble and in waste Grounds, as also in good and Mervellous Fields, and bear their Heads and Spikes in the Summer Months, as other Gras do.

Quaking-Gras more.

CLXXXIII. 1. Gramen Tremulum maximus, Phalaris Proserpis major, Gramen Phalarides Paniculatus, Gramen Paniculis Elegans, Tremula longa, Tremula, Panic-Gras with long Ears. It has wider and smaller Stalks than the former, and fearfully rising upright, with shorter Leaves on them; the tops of the Stalks are severally furnished with a spikèd rough head, sticking to any Garment it touches: it is small at the top, and full of small whithish Seed.

CLXXXIV. 2. Gramen Panicum Sylvaceum, Panic-Gras of Dulanepan, Wild Panic-Gras of Dulanepan. This differs from the last, in that it grows more upright, and about two Feet high, the Stalks have several Gras like on their tops, but longer and broader, with one usually under the hairy spikèd head, which sticks so fast to their Garments which touch it, that it is difficultly plucked off.
Like leaves noted below and upon the jointed Stalks, which are a Foot high and better, on the tops of the Stalks grow a number of small, flint, and long, feally like heads, greater than the following, and each of them on a few hairy Footstalks, and penul- lous, which are sometimes of a white color when they are ripe, and sometimes of a brownish green color, and are to be taken with the leaf Wind imaginable.

**Quaking-Grafs Lesser.**

---

**CLXXXIV.** Gramen Tremulum medium. Phalaris Pratensis minor Lobelli, Argentea Trogii & Gryneri in Harris. Gramen Polystachys Legendaria. The middle or shorter Maidengrass, or Quaking-Grafs. It has a slender Root like the other, and grows something like it in form, but with fewer Leaves and Stalks, and a larger Panicle or tufted head of green, thorer, and rounder Scale like pointed Ears, hanging on smaller or finer hairy Footstalks than the former, which are in such continual motion, that the moss Ready Hand cannot hold them still, or from flitting. Of this sort Bed has another, which is somewhat larger, and of a dull or brown black color.

**CLXXXV.** Gramen Tremulum parvum, Small Maidengrass, or Quaking-Grafs. Of this there are two sorts, little differing in Leaves or Stalks from the last, the heads only are a little leffer, and so is the whole Panicle also, the one of which is Party Colored, of Purplish and Green, the other is of a Snow Color and White.

**CLXXXVI.** Gramen Tremulum minus, vel minimum Parnica parva Baubini. The small or smallest Maidengrass, or Quaking Grafs. The Root is reddish, creeping here and there, from whence rise up two or three short Stalks, with few Jointed and flimby, narrow, green Leaves at them, as the many which grow below are, but out of the uppermost Joint to the Leaf, as it were out of a hole, breaks forth a small, long, single Spike of small feally heads, of a brownish color, with yellowish Bloomings, at their Scafts.

---

**CLXXXVII.** Gramen Tremulum maximum album. Baubini, Gramen eugam Lopulium glauci. Clafij, The white greatest Maidengrass, or Quaking-Grafs. It has a smaller and thorny Root, perhaps due to it being with us, it is a small Grafs, with stiffer Stalks, and a few soft green Leaves on them, at the tops thereof hard furth, soft, feally heads, greater by far than any of the aforesaying, and of such shining white color, very beautiful to behold, each of them much like to the head of an Hen, hanging upon a small Thread-like Footstalk, as the others do, and are almost as moving and flitting as they are.

**CLXXXVIII.** The Places and Times. All these sorts of Grafs grow in Corn Fields, and in Lay Grounds, which have been formerly Plowed, and some of them in dry Meadows and Pastures, the first, second, third, and fourth kinds grow not only in England, but also in Spain, Italy, West Indies, and other Countries, the third sort is found growing in Upland Corn Fields, as at Holfield, &c., on the Gracie Banks there, a fifth kind is a Native of Spain, and grows with us only in Gardens, which it persists every Year, yet seldom rises again of its own Sowing, but of the Sowing thereof in the Spring, but in Spain it Swows it self, and abides all Winter, in regard they have there no Hrolfs, the fourth four Heartstills, and is in Bloom with us in May and June.

---

**XXVI.** Calamagrostis, Calamagrostis, *Agrostis major*,bled Gramen Arundinaceum, Reed-Grafs, thirteen Kinds, of which seven are of the Land Kind, three of the Marsh Kind, and three of the Water Kinds.

**CLXXXIX.** Calamagrostis, five Gramen Arundinaceum major, Gramen Arundinaceum Spica multiplices Baubini, The greater Reed Grafs. It has a Root full of white Strings or Threads, and some jointed ones, which spread in the Ground, from whence rise up many jointed Stalks, also large, sharp, cutting Leaves on them, like to theof the Water Reed, but leffer, the tops of the Stalks are furnish'd with several hard long Spikes or Heads, some what like to the Common Reed, which they have flood long do open, and having a shockful Hance in them, are carried away with the Wind. Another Kind is leffer, and not having above one or two Spikes thereon.

**CX.** Calamagrostis altera minor, five Gramen Arundinaceum minus Norwegicum, The lesser Reed Grafs. The Root confists of many long Strings, from which rise up Stalks, not so high as the former, which, as well as the Leaves, are somewhat harder or rougher than the former, (which yet in Norway are much more hard and rough) the Spikes that at the top is larger, more spread into several Panicles, sharper also, and a little rougher in handling.

**CXI.** Calamagrostis alta Siberica Scilla Flammus, Reed Grafs of John's Wood. It has a white Root, with thick Strings, which sometimes spread under the Ground, it is in its Stalks and Leaves a little like the next Woolly Reed Grafs, but the Stalks are jointed in two or three places in the height, three or four Feet, or more, with narrower Leaves, sharper, and almost three Feet long, being a little fripped withal, the top Panicles are sometimes a Foot or more long, parted into many long Spikes, which are as soft as Silk, and of a thinning, overwarm, Murry color.

**CXII.** Calamagrostis, five Gramen Tormentosum, Woolly Reed Grafs. It has a Root which is somewhat
Chap. 327. English Herbs.

Somewhat hard and rough at top, with several long Fibres proceeding from it, the Stalks are three or four-feet high, or more, having but few joints, these Stalks are rough, and bear large spik'd heads, set up a long Panicle, which are reddish for some time, but growing to ripe, are of a flining Silver like Wheat, and as tall as Wood in handling; this Plant in its roughness, dryness, and Form of Leaves, is not much unlike that Buffard Scotch-Grafs called Plecophenomum, or Buffard Spara-thus, at Sect. 111. agreeing, but much greater.

CXCII. 6. Calamogrota Montana Enneas, Sciron prince Tragi, The greater Mountain Reed-Grafs. It has a Root of a small fulfulness, hard, and having many Fibres adjoining to it, it grows up with strong Stalks as high as a Man, without any Joints on them, or having but one at the root, having these Stalks hard, but few Long Leaves, at the tops of the Stalks are many long, slender, chaffie Spikes, growing more sparckly than the others, each of which is of a bright reddish yellow color, and fanding in the air.

CXCII. 7. Calamogrota Montana Enneas minor, The iffer Mountain Reed-Grafs. The Root is like the former, but the root of the Plant is much lower and smaller, the Spikes are all smaller and shorter, and not standing upright.

CXCVI. 8. Calamogrota Pulchris maxima, Gramen Aurantacium Pulchre maximum, Great Marsh Reed-Grafs. It has a Root which creeps far into the earth in many places, from which it throws forth great, thick, and very tall Stalks, four, five, or six Feet high, jointed up to the tops, with long and somewhat broad, hard, rough, and Knifed Leaves farther, but less jointed below, towards the tops of the Stalks with the Leaves come forth many sparckly Tusks of chaffe heads, standing on small Foothills, the whole Plant being at least a Foot long, and sometimes more.

CXCVII. 9. Calamogrota mitis, Gramen Aenica Paludis, Our great Marsh Reed-Grafs with chaffe heads. It has a jointed reddish Root, from whence spring many Ear long, tall, white Leaves, not much unlike to those of Miller-Grafs, but harder, rougher, and thinner all the length of them, having great Reed like Stalks, threes, fours, or five Feet high, jointed also and branched, and towards the tops having long and somewhat hard Panicles of Spicy chaffe heads, each of them about seven, eight, or nine Inches long, of a whithil color in some places, and reddish in others, in which chaffe or husky Heads there lies small Seed.

CXCVIII. 10. Calamogrota, Gramen Aurantinae Paludis Serietae miliores spicis, Soft headed Marsh Reed-Grafs. The Root is composed of several long Fibres, and very robust, at a head, it grows something like the last, but leffer, with narrower and shorter Leaves, and lower Stalks, hav- ing but few Joints and Leaves on them, the tufted Heads which stand at the tops are something like to the Reed like Spikes of Serieta, and turn into Downs, which is carried away with the Wind.

CXCIX. 11. Calamogrota Aquatica major, Gramen Aurantinae Aquatica major, Great Water Reed-Grafs. It has Roots which run and spread themselves in, shooting up in several places, the Stalks are great and tall, full of Joints, with large Reed like Leaves at them, striped with White and Green, like Ladies Laces, but not so evidently to be seen, up to the top almost, where stands a large and flat tufted Panicle, confiding of many Branches and parts, almost like to the Vulgar or Common Reed.

CC. 12. Calamogrota, Gramen Aurantinae Aquatica major, Great Water Reed-Grafs. The Root is almost like, but creeps not so much as the former, the Stalks are great and high, having broader and longer Leaves than the former, and something harder also, the Joints likewise are fewer, and the tufted Panicle is much more spread, and fitt in handling, and of a purplish green color, and its Bloomings are white.

CC. 13. Calamogrota, five Gramen Aurantinae Aquaticae Panicula principala, Four headed Water Reed-Grafs. It rises to three Feet or more, the Leaves are broad, and a Foot long, but flenderly set on the Stalks, a little rough on the edges, fome of which will be hollow, like Tube. To the top of the Stalk will grow 4½ feet high, the top Panicle is made of many fine, soft, fally Tusks, very beautiful to behold.

CCII. The Places and Times. The first and second grow in moifl Meadows, which are Study, and rather Barren than Fertile; the second is found growing in some nofif Fields near Hoxhury, the third is expedit in its Title, the fourth in the borders of dry Fields, and by Hedge Bites, in many Countries of this Kingdom, espeffially in Dorsetshire, the fifth grows in the like places, the forth and fefenth grow in moifl Woods which are on Mountains and Hills, the eighth grows in Marshy places, and Ditches overfowed with the Tide, I have found it growing in some parts of Carlifone; the ninth and tenth grow in low moifl Grounds by Rivers, Truth of London, the eleventh, twelfth, and thirteenth grow in Ditches, Ponds, and Lakes in furleral places of England, as also in other Countries; theift feven, as also the other eight, four in the Summer Months, and their Stalks perifh before Winter.

CC. 1. Schografs communis, or Gramen Juncum vulgaris, The common Reed-Grafs. Its Root confists of brownifh yellow Fibres or Threads, the Leaves are almost round, seven or eight Inches long, from among which growing up the Stalks, which are about eight or nine Inches high, which bear at their heads several small Panicles Spike fuffitum, one above another.

CCV. 2. Schografs Monstrenus, or Gramen Juncum famer, The common Reed-Grafs. Its Root confists of brownifh yellow Fibres or Threads, the Leaves are almost round, seven or eight Inches long, from among which growing up the Stalks, which are about eight or nine Inches high, which bear at their heads several small Panicles Spike fuffitum, one above another.

CCV. 3. Schografs, or Gramen Juncum Springorum minus, Nature Noble or Excellent Lanes? N n n Ragh-
Salmon's Herbal

Lib. I.

Rufh-Grafts. It is very like the former, but has much smaller Rufh-like Leaves, not above three or four inches long, rising out of a hard brown Hunk or Hole, set at the top of a small fibrous Root, from among which spring up several jointed Stalks, with such like Leaves on them, and a small head at the top, like unto the former, but of a brown, clear, Ceidiferous color, and smaller, as the whole Plant is, having two small Leaves thereon, as in the second foregoing.

CCV. 4. Schcenogrofis, fine Gramen Junceum Volechbampij, Volechbampiae et Rufh-Grafts. It has a very long, white, and fibrous Root, from which spring up a very great number of small, round, Rufh-like green Leaves, and among which spring up divers jointed Stalks, with some few Leaves on them, and at the top a jointed spik'd head, something like unto the Holifield Salamantium Chiit, or Spanfih Sea Plantain, confilling of many purplish Flowers.

Wood Rufh-Grafts with jointed Leaves.

CCVII. 5. Schcenogrofis Sybborn, sea Gramen Junceum Sylvestre articulato folio majore. The greater jointed Wood Rufh-Grafts. It has a Root which creeps a little, replete with many small Fibres, the Stalks are somewhat flat, and very green, the Leaves are almost round, with many several Crosses jointed on them, the tufted heads at the tops of the Stalks, which are near three Feet high, are spread in many Rufh-like Panicles, and also somewhat flat.

CCVIII. 6. Schcenogrofis, fine Gramen Junceum Sylvestre articulato folio minus, The lesser jointed Wood Rufh-Grafts. It has a Root which is hard, spreading abroad, with many Fibres adjoining to it, from whence spring up many Stalks, which take Root again in the Ground, and bear such like jointed Leaves (as in the last) at the tops of the Stalks are small, spread, Panicle Heads, very like to the former, but smaller by half in each: there is another of this kind which is yet smaller, whose Leaves are small and flender, but not jointed, the Panicle at which is smaller, and spiraled in like manner.

CCIX. 7. Schcenogrofis, fine Gramen Junceae Dactylo Actuci Paradisca, Rufh-Graft with the jointed heads. It has a Root which is yellowish, spreading it self under the Ground, with long Fibres, the Stalks are flender, something flat, and near two Feet high, the Leaves are flimmer than the common sort, being about fifteen or sixteen Inches long, the tops are also smaller, and spread with whitish Heads.

CCX. 8. Schcenogrofis, fine Gramen Junceum Pelirfere recondits Semine, Rufh-Graft with Seeds in clusters. It has a blackish thready Root, from which rise a few small Rufh-like Leaves, and from among them spring up several Stalks, a foot and half high, bearing at their tops, between small long Leaves, a small head, much like to a Bunch of Grapes, in which the Seed lies.

CCXI. 9. Schcenogrofis, fine Gramen Junceum Maritimun majus, The greater Sea Rufh-Grafts. It has a tufted fibrous Root, from which spring many hard Smooth Leaves, something like Rufhier, and from among them several felter naked Heads about a Foot high, with Rufh-like heads growing at their tops, but much smaller.

CCXII. 10. Schcenogrofis, etl Gramen Junceum Maritimum demis stipitam, Sea Rufh-Grafts thick set. It has a Rufh-like Root, and long hard Leaves, like Rufhier, growing thick and close together, the Stalks are flender, and not much longer than the Leaves, every one of them bearing at their tops a small Head, something like to those of Rufhier.

CCXIII. 11. Schcenogrofis, fine Gramen Junceum Maritimun minimum Zelandicum, The least Sea Rufh-Grafts of Zeland. It has a fibrous Root, from whence rises a small bath of Leaves, the whole Plant scarcely exceeds eight or nine Inches in height, from among this well spread bath of Leaves rises up the Stalks, with small hairy like Leaves, and a small thick head at its top.

CCXIV. 12. Schcenogrofis, fine Gramen Junceum Maritimun exili Plonphili, Small Sea Rufh-Grafts of Plymouth. It has a Root consisting of many small Fibres, coming from one Head, the Leaves are many, growing thick together, and as fine as Hairs or Threads, from among this well rise up several slender unjointed Stalks, bearing exceeding small sharp pointed heads thereon, the Stalks being continued, and appearing above them, and pointed. This Graft has been found as well as Dover as Plymouth, in their Wet Marth Grounds.

CCXV. 13. Schcenogrofis, fine Gramen Junceum Maritimun majus exile punctum folium, A taller North Rufh-Grafts with fewer Leaves. It has a small and flender Root, and fewer and shorter Stalks and Leaves than the last, more flat and delicate in feeling, and whose Heads are a little bigger, and prickly, the Stalk rising above them, as in the other.

CCXVI. 14. Schcenogrofis, fine Gramen Junceum Aquaticum magis capitato squamoso, A very small Water Rufh-Grafts. It has as few, but flimmer Leaves than the Eighth Kind aforesaid, being about two Inches long, the Stalks are about four or five Inches high, each of them bearing a small, reddish, feathery Head, with the top of the Stalk growing up above it.

CCXVII. 15. Schcenogrofis, vel Gramen Junceum Aquaticum magis squamoso Fontica, Water Rufh-Graft with a more spik'ed Panicle. It is very like the last in growing, the chiefest differences are in the Stalks, for they are greater and rife higher; and in the Leaves, for they are jointed, like to the Wood Rufh-Grafts, in the Heads, these being smaller, and more dispers'd.

CCXVIII. 16. Sch-
Chap. 327. English Herbs.

CCXVIII. 16. Schammoglossis, five Gramen fun-
corum Aquaticum Hektinii, Bassinum or Water Rush-
Grass. It has jointed Leaves, from among which
rise up Stalks, a Hand high, or more, with certain
chaffy Heads, parted into many Threads.

CCXIX. 17. Schammoglossis, feu Gramen fun-
corum Aquaticum vulgare, The common Water Rush-
Grass. It has a long, thick, spreading Root, which
fends up several jointed Stalks, and at each Joint
a narrow Rush like Leaf; at the tops of the Stalks
stand several, somewhat like unto those of Tarax.

CCXX. The Places and Times. The fifth seven
of these Grass grow upon dry Land, and in dry
places, some of them upon Hills, some on Moun-
tains, and others in Woods, the second grows on
a high Hill in Water called Bornein, continually cover-
ed with Clouds and Milts, and Watered with Show-
cers, whilst at the same time the Sun shines but in
the Valleys below it, others of them grow in the
Woods near Highgate, in Harrow Wood, and in
many other Woods of this Kingdom, as also in Met-
dows adjacent to the same, and do all of them bloom
in the Summer Monthes, viz. in June and Ju-
ly, the next six Marsh Rush-Grass grow in Salt
Marthes, and near the Sea side, and other like pla-
ces, in many parts of this Kingdom, the last four
grow in Watery places, and in or near Waters, whe-
ther standing or running, and flourish in the Sum-
mer time, as all the rest do.

XXVIII. Θαλασσόγλυσ, 'Αγιον λαδός, Αγιο-
νιον Μαρινιον, υπερ Μαρινιον, Σαλι-Grass, Eight
Kinds.

CCXLI. 1. Θαλασσόγλυσ ιδός, Οξγράφος Μα-
ρινιον Deltchamnys, Sharp pointed Sea-Grass. The
Stalks are slightly, and about two Feet long, fall of
Joints, and narrow Grass like Leaves at every one
of them, of a dark green color, and so sharp at the
points, that they are ready to prick their Legs who
pass by them unawares.

CCXXII. 2. Gramen Maritimum aquaticum &
high Sea-Grass. Its Root is a bush of long white Fibres,
which bends up several reddish, round, small Stalks,
a Foot or more high, leaing at first downwards,
encompanied with hard, short, and sharp pointed
Leaves, flancling as it were in a Tuit together, with
hard tough diens about the edges, the likned heads
are like rough hard Burs, breaking out of a Skin
which enclosed them.

CCXXIII. 3. Gramen Maritimum, vel Maritimum
exile victorum aggrega. A very small Sea Dune-Grass.
It has a Root which is small and thready,
which flows forth divers short Stalks, two Inches
long, full of small long Leaves like Hairs set close
together, and among them at the tops small Heads,
like to the Catch of the Dogef Willow.

CCXXIV. 4. Gramen Maritimum, vel Maritimum
Spicatum, Spicked Sea-Grass. It has a Root com-
poped of a bush of many long Fibres or Strings, from
whence rise up many long, hollowed, or Cotton
Leaves, encompassing one another at the bottom,
from among which rising up two or three Stalks,
bare of Leaves unto their tops, where they bore long
spicked Heads of greenish Flowers, set close to-
gether.

CCXXV. 5. Gramen Maritimum spicatum alterum,
Another spicked Sea-Grass. It has long, slender,
narrow, hard, and sharp pointed Leaves, growing
often in low places near the Sea, that sometimes
it wailes over it, the Stalks are many and low,
with small, long, and round Heads thereon.

CCXXVI. 6. Gramen Maritimum major Statice
pulchrum, Great Sea-Grass, or Sea-Thrift, called
by some Σαλιος. It has a pretty Large long Root,
with some Fibres adjoined, which extends up many
fair, long, and somewhat broad, and whitish green
Leaves, lying close together upon the Ground, from
which rise up slender Stalks, naked to their tops,
except in one place towards their middle, where
they have two small Leaves turning downwards,
contrary to all other Herbs, and at their tops
a Tuft of bluth colored Flowers, opening by de-
grees.

CCXXVII. 7. Gramen Maritimum Americanae
Siculae Statice Americanae major, Great Sea-Thrift
of America. It has a long Root, with but few Fibers
thereon, from whence springing up a vast number of
Leaves, almost like the last, but they are narrower,
of a fafter green color, and somewhat thinner, with
two Kins in each, and blunt at the ends, it has the
same Stalks, which also hath such a Tuft of Flowers,
but of a white color, and break out of a Skin, which
falls down about the Stalk.

CCXXVIII. 8. Gramen Maritimum minus, Small
Sea-Grass, Sea-Thrift, or Sea-Creation. It has many
small, hard, short, green Leaves, growing thick to-
gether, and spreading on the Ground; the Stalks
are many, of a Span high, without any Leaves on
them, but at their tops, where grow small round
Tuts of bluth colored Flowers.

CCXXIX. The Places and Times. They all of
them have been observed to grow upon our Sea
Coasts, especially on the Kentish and Suffolk Shoars;
the first grows on the Mediterranean Shoars, the
fourth on the Americas, and they all Flower and
Seed in the end of Summe.

XXVIII. 9. Αγιον ενελθα, Commun Argenteum, Sil-
ver-Grass, three Kinds.

CCXXX. 1. Gramen Argenteum capitatis globulis,
Silver-Grass round headed. It is the Grundy Laci-
dum Tribulatamontium, and is thought to be the Com-
"
Salmon’s Herbal. Lib. I.

**Gramen Pratense.** It has a small, buoyant, and fibrous Root, which sends up long Leaves, like those of Wheat, which have some small, long, white hairs upon them, and about their edges, from among these Leaves rise up several Stalks, about a foot high, with Joints and Leaves on them, at the tops of these Stalks on each Stalk grow two or three round Heads, which are flat, white, and woolly, consisting of many small Silky Threads, which are laid to shine in the Night, and therefore called by the Indians Luminous.

**CCXXI.** 7. Gramen Argentatum striatum, Silvery Grass breasted, called by some Lady-Lace, Lady Lace-Grafs, and Painted-Grafs. Its Root is small and hairy, and of a white color, like unto Meadow-Grafs. It has Leaves like to Alther in form, and rough or sharp pointed, like to the Reed, with many white Veins or ribs, and Silver Streaks running along their midle of the Leaves, fibbiong them like to Ribbons or Laces made of white and green Silk, very beautiful and deliverable to behold; it grows to the height of Wild Paniac, with a spoo top, not very much unlike, but more compact, soft, and fluffy.

**CCXXI.** 3. Gramen Argentatum Spicis Tornato, Silver-Grafs with Coton Spikes or Heads. It has a hard, long, thready Root, from whence proceed many Spikes, downy, griffy Leaves, of a mean length, seldom exceeding two Feet, or two Feet and half a foot in length, from among which rise up several Stalks, a Yard or Yard and half high, having but few Joints on them, not above one or two, with like griffy Leaves growing up from them; at the tops of these Stalks are long spiky Heads, set upon a long Paniac, which are a kind of chaffie and downy Tufts, regularly placed, from the bottom to the top, commonly at a frith of a reddish, or Murril like color, which when they come to ripeness are of a thinning Silver like whitens, and as soft as Cotton or Wool in handling.

**CCXXIII.** The Places and Time. The frith of these grows in Woods, Coples, Groves, and other like Woody places, in many places of this Land, the second grows in borders of Woods, and upon Woody and Hilly places in Springs, but with us only in Gardens, the third in borders of dry Fields, and by famous places, in many parts of England, and all thourh with the Common Meadow-Grafs, or in the middle and end of Summer.

**XXX.** Argentatum, Silver-Grafs, Corn Silver-Grass, or Silver-Grafs. Gramen Spicatum, Spiked or Erected Grafs, eleven Kinds.

**CCXXXIV.** 1. Gramen spicatum purpureum, Pratense Deltachampii, Purple Sphined Meadow-Grafs. Its Root is a bath of white Fibres, from whence rise many Grafs like Leaves, but narrower, fetter, and greater, having several short Stalks, not a Foot high, with two or three Joints on them, set with Leaves, at the tops of which, out of a round Skin or Husk, picked at the end, being the uppermost Leaf, break forth a thick, short, and somewhat flat Spike, of a delicate reddish purple color.

**CCXXV.** 2. Amblykoty Spicato, Gramen Anthraconium Lachnum, Gymnograptus concolor, Yellow flowered, Gramen sanguineum, Double yellow flowered Pratento, Yellos spicata Meadow-Grafs. It differs little from the last, either in Roots, Leaves, Tufts, or Quality, so thin some Authors have called the one the Male, the other the Female. The only difference is, that the Head or Spike of this is of a pale yellow color, and in some higher Grounds of a more reddish and shining color, and not enclosed in any Skin or Leaf, as the other, but standing naked or bare, being also flender and tender.

**CCXXXV.** 7. Gramen Spicatum, Spica multiflora, Red Spiked Meadows, Red Spiked Prateno, Red Spiked Alleghany. It has a small Root, made of a few Hair like Fibres, whence rife long and narrow Leaves, Ribbed thro their whole length, and so composed as is barely to the view in any other Herbs, and these are so jointed, as if one Leaf grew out of another; on the top of the Stalk stands a very long Head, consisting of a good number of reddish Spikes set together one above another, which are somewhat round in handling.

**CCXXXVII.** 4. Gramen Spicatum folius Coryphumes Pratento, Spiked Meadow-Grafs with Gigiloher Leaves. Its Roots run under the upper Grass of the Ground, folding one within and over another, its Leaves are somewhat hard, thick and short, and greater than those of Gigilofer or Bells, but so hard and Sphicul, that Cattel will not eat thereon; the Stalks are six Inches high, at the tops of which stand small Spikes, sometimes more, sometimes fewer, wider at first, and afterwards somewhat reddish, with many yellow Threads mixt among them.

**CCXXXVIII.** 5. Gramen Spicatum folius Coryphumes spicata, Spiked Grafs with Gigilofer Leaves, and a fealy Spike. Its Roots are small blackish Threads, it has small long Leaves, narrow, and bowing, the Stalks are small, about eight or nine Inches high, bearing a short feaky Head.

**CCXXIX.** 6. Gramen Spicatum album angustifolium Sphycatum, White Spiked narrow Leafed Wood-Grafs. This differs from the foregoing, in that its Root is yellowish, with small Fibres, growing aloft in the Ground, the Leaves are many, but very short and narrow, feasky and four or five Inches long, the Stalks many times exceed not the length of the Leaves, having small spiked Heads, either with short Hairs, scarcely an Inch long.

**CCXLI.** 7. Gramen Spicatum Coryphumes spicatum multiflorus, Double Spiked Grafs with Gigilofer Leaves. Its Root is a bath of many reddish hairy Fibres, whence rise several short narrow Leaves, like those of Gigilofer, among which spring up very many slender Stalks, naked, without Joints or Leaves, scarcely growing higher than those which bear short reddish Spikes, many far together.

**CCXLI.** 8. Gramen Spicatum Coryphumes Spicata Variebile Spered-Grafs. It Roots are small, long, and shrewd, bulding thick together, when rising long, narrow, Gigilofer like Leaves, from among which grow up several small naked Stalks, bearing a flender, long, spiked Head, sometimes single, and sometimes divided or branched into several long parts, made of many Husks.

**CCXIII.** 9. Gramen Spicatum Coryphumes Rubrum, Rubrum Banded, Gramen Rubrum Gynter, The chief or principal Gigilofer-Grass. It has a fibrous Root, proceeding from one Head, from which rise up many thick, firm, or fethy, and long pointed Leaves, like those of Gigilofer, lying in a round compass at the head of the Root, not having any Nerves or Veins in them to be seen, and of which Cattel will very well Feed.

**CCXIII.** 10. Gramen Spicatum, Spica Gemmae, Columnata, Double yellow flowed of Columns. It has a small, whitish, fethous Root, which sends up several weak and leathery joined Stalks, with small Grafs like Leaves upon them, at the top of each of these Stalks grows two or three other small Tufts, joined together at their Feet, dentled on their edges, with a middle Rib between, and consisting of three or four rows of Leaves like Scales, containing small, brown, conical Scales.

**CCXIII.** 11. Gra-
CCXLIV. 11. Gramen Spicatum Virginiaeum Spicae articulatae, Spiked Virginia-Water-Grass having a jointed Spike. It has a bushy Root, which lives long, and in a goodly Grass, growing great, with many fair, large, and broad Grassy Leaves, very small pointed, and something hard in handling, the Stalk is also great and tall, bearing a long Spike at the top, joined in several pairs, each of them almost half an inch a piece, being almost round, yet a little flat.

CCXLIV. The Places and Times. The first five grow in Fields, Meadows, or Pastures, or near to them, the next five grow on Hills, Mountains, Woods, and Woody places, in many parts of England, as also in other Foreign Countries; the eleventh grows particularly in Virginia, and they all flourished much about the same times when other Grasses do.

XXXI. Medicinae Gramen Baforum, vel Baforum, Vadendorum, Gramen fumecum parum, Holofielum Matthioli, Toad-Grass, three Kinds.

Toad Grass

CCXLVI. 1. Gramen Baforum, vel Gramen fumecum parum, The greater Toad-Grass. It has a florus reddish Root, and grows not to be above eight or nine inches high, the Leaves are very small, and those on the flender Stalks and Branches from the Joints lefser, whereat, and likewise at the tops, come forth small, yellowish, clawfe Heads or Husks, with short Awans at the ends, each upon a short Footstalk, one above another.

CCXLVI. 2. Gramen Baforum medium, The middle sized Toad-Grass. It differs from the former only in its magnitude, this being of a medium size between the former and the lefser, there is also one something smaller than this, whose Heads are clofer or thicker fit together.

CCXLVI. 3. Gramen Baforum minimum, Gramen fumecum minimum Holofielo Matthioli Congener, The flmilfe Toad-Grass, or smallest Toad-Grasses, like the former Toad-Grasses at Sec. 246 above. It has a very small and flinosus Root, and grows with severall small and Thread like Leaves, scarcely an Inch and half long, with yet smaller Leaves on the Stalks, which are not above three or four inches high, at whose tops there stand two or three small Heads, like to those of Rushes, but with rounder Grains or Seeds therein, and set clofer together.

CCXLIX. The Places and Times. The first grows in moist or wet Grounds, the second in moist or wet places near Hills, the third in low, moist, and Marshy Lands, they all flourish and Seed in the Summer Months, viz. in June and July.

XXXII. Medicinae Gramen fumecum multorum, Gramen Aquaticum, Water-Grass, seven Kinds.

CCL. 1. Gramen Aquaticum Paniculatum minus, Small Bearded Water-Grass. It has a thick, hard, hard Root, which sends forth a round Spraked Stalk, about two Feet high, composed with seve-

CCL. 2. Gramen Aquaticum aculeatum minus, The lefser prickly headed Water-Grass. This is like to the last both in Stalks, Leaves, and prickly Heads, but smaller, nor has it any Leaves growing with them as the others have.

CCL. 3. Gramen Aquaticum aculeatum alte-

CCL. 4. Gramen Aquaticum aculeatum alterum, Another prickly headed or Bar headed Water-Grass. It has long, smooth, and slender Leaves, am-

CCL. 5. Gramen Aquaticum, vel Flufiolicum Cornutum, Horned Water-Grass. It has a small and fibrous Root, which sends up a slender Stalk, about two Feet high, jointed at several places, and two small Rushy Leaves for the most part at each of them, growing something broad, and compounding at the bottom with a large Skin, from whence also rise one or two Stalks, ending in a skinny Head, which has at the end three or four narrow Leaves, turning downwards, and fowling like Horns.

CCL. 6. Gramen Flufiolicum Spicatum, vel Aquaticum Spicatum, Spiked Water or Toad-Grass. It has a Root compact and Tutfed, or bushy in the Mud, composed of many Strings and Fibres, it is also of several weak Stalks, leaing every way, full of crooked Joints, which are knobby, or round, taking Root again in divers places, having long and narrow Leaves upon them, which lie foating under and upon the Water, that part which grows up has three Leaves likewise thereon, and a long, slender, brown Spiked Head at the top.

CCL. 7. Gramen Flufiolicum, vel Aquaticum Spica multiplex, Many Spiked Water or Toad-Grass. It has a long and round Root, somewhat thick, like unto Dog-Grass, set on each Joint, with small Strings and Fibres, from which rise up long and crooked Stalks, crooping and winding, and folding one within another, with many Fluffy Leaves on them, more in number than the former, which Hor-

CCL. 7. Gramen Flufiolicum, vel Aquaticum Spica multiplex, Many Spiked Water or Toad-Grass. It has a long and round Root, somewhat thick, like unto Dog-Grass, set on each Joint, with small Strings and Fibres, from which rise up long and crooked Stalks, crooping and winding, and folding one within another, with many Fluffy Leaves on them, more in number than the former, which Hor-

CCL. 7. Gramen Flufiolicum, vel Aquaticum Spica multiplex, Many Spiked Water or Toad-Grass. It has a long and round Root, somewhat thick, like unto Dog-Grass, set on each Joint, with small Strings and Fibres, from which rise up long and crooked Stalks, crooping and winding, and folding one within another, with many Fluffy Leaves on them, more in number than the former, which Hor-

CCL. 7. Gramen Flufiolicum, vel Aquaticum Spica multiplex, Many Spiked Water or Toad-Grass. It has a long and round Root, somewhat thick, like unto Dog-Grass, set on each Joint, with small Strings and Fibres, from which rise up long and crooked Stalks, crooping and winding, and folding one within another, with many Fluffy Leaves on them, more in number than the former, which Hor-

CCL. 7. Gramen Flufiolicum, vel Aquaticum Spica multiplex, Many Spiked Water or Toad-Grass. It has a long and round Root, somewhat thick, like unto Dog-Grass, set on each Joint, with small Strings and Fibres, from which rise up long and crooked Stalks, crooping and winding, and folding one within another, with many Fluffy Leaves on them, more in number than the former, which Hor-

CCL. 7. Gramen Flufiolicum, vel Aquaticum Spica multiplex, Many Spiked Water or Toad-Grass. It has a long and round Root, somewhat thick, like unto Dog-Grass, set on each Joint, with small Strings and Fibres, from which rise up long and crooked Stalks, crooping and winding, and folding one within another, with many Fluffy Leaves on them, more in number than the former, which Hor-

CCL. 7. Gramen Flufiolicum, vel Aquaticum Spica multiplex, Many Spiked Water or Toad-Grass. It has a long and round Root, somewhat thick, like unto Dog-Grass, set on each Joint, with small Strings and Fibres, from which rise up long and crooked Stalks, crooping and winding, and folding one within another, with many Fluffy Leaves on them, more in number than the former, which Hor-

CCL. 7. Gramen Flufiolicum, vel Aquaticum Spica multiplex, Many Spiked Water or Toad-Grass. It has a long and round Root, somewhat thick, like unto Dog-Grass, set on each Joint, with small Strings and Fibres, from which rise up long and crooked Stalks, crooping and winding, and folding one within another, with many Fluffy Leaves on them, more in number than the former, which Hor-
Land, but the two last grow mostly in shallow Rivers, 
Brooks, and Hills, where the Water runs softly, 
smoothly and softly, they are also Round sometimes 
growing in standing Waters, and many times by 
Rite Rivers sides, they all Flourish and Seed in 
June, July, and August, according to the kindness 
of the Season.

XXXIII, *Hygroph, "Hygroes nauh, "Hymoio "hin h4, 
*Hygo, Bulcan Fliuii, Gramen de via, Gramen 
Anuriae, Gramen Scenita, vel Semitale, Way or 
Wall-Grafs, Four Kinds.

Way or Wall-Grafs Greater.

CCLVIII, 1. Gramen Scenitale vel Mariale majus, 
Gramen Hordeian, vel majus Scalainum maior, The 
greater Way Grafs or Wall Grafs, barley-like Grafs, 
or other Rye-Grafs. It has a bawhy and fibrous 
Root, which perishes not in Winter, the' never for 
ocold, from which spring up many Grafs Leaves, 
but somewhat harder in feeling, and not altogether 
of Juicy, from among these green Leaves springing up 
several Barly Stalks, a Root or more high, having 
several Joints on them, with Leaves thereon, or 
every one of which bears at the top a small, long 
whiteth, yellow Ear, an inch and half, two or three 
Inches long, having some Awns or Beards, within 
which are contained small, long, bawhy Seeds or 
Grains: This Ear Authors think has some resemblance 
of Barly, but it much more resembles Rye, and 
therefore may not improperly be called Rye Grafs.

CCLIX, 2. Gramen Scenitale, vel Mariale minor, 
Gramen Hordeian, vel Scalainum minor, The lesser 
Way or Wall, barley or Rye Grafs. It is in its Roots, 
Stalks, Leaves, Ears, and manner of growing very 
like the former, but it is shorter and lower, and 
looks as if it was a Barly Grafs of the same kind, 
I know many have taken it to be the same, but it 
does really differ, the Stalk is seldom above nine or
ten inches high, whereas the former comes to be 
sometimes sixteen or seventeen Inches. If in good 
Groun'd, the Ear is also much lefs, and shorter, and 
might without Awns, or else they are very short 
ones.

Way or Wall-Grafs Lesser.

CCLX, 3. Gramen Scenitale maximum, vel Gramen 
Scalainum maximum, The greatest Way or Rye Grafs. 
It has a running and jointed Root, with many fib 
es adjoining, the Stalks rise up to be sometimes 
two feet high, and better, having but few and short 
Leaves thereon, the Spike is sometimes two, three, 
or four Inches long, bearded, and very like unto an 
Ear of Rye.

CCLXI, 4. Gramen Scenitale nugnatum, vel Gramen 
Scalainum minus, The great, or rather leffer Rye-
Grafs. The Root in this is wholly Fibrous, but 
otherwise it differs not from the former, faving that 
it is every ways lefs, and the Ear (very like to Rye) 
is many times not above half the length of the for 
mer.

CCLXII. The Places and Times. They grow 
upon walle and unlitlled Grounds, by Ways and Path 
ides, and the second of them by Walls fides, and 
upon Walls, especially upon Mud Walls, in almost 
all places of this Kingdom, they Flourish and Seed 
in the Summer Months, viz. in June, July, and 
August.

XXXIV, "Simen Gladys, Gramen Nemerale, vel 
Nemorofum, Wood-Grafs, Four Kinds.

CCLXIII, 1. Gramen Nemerale, vel Nemorofum 
maior Spica albofuda, The greater brown Wood-
Grafs. The Root is a bulb of very small Smalls 
or Fibres, from whence springing up many narrow 
grafle Leaves, and among which rise up many 
smooth round Stalks, without any Joints or Leaf on 
them, at the tops whereof hard lofe, smooth, 
brownish
Wood-Grafs Greater.

CCLXIV. 2. Gramen Nemorosum, vel Syphiliticum Panicula alta, White Tufted Wood-Grafs. It has a Ranked or hairy fibrous Root, as small as Hair, from the head of which bunch of Fibers spring small Grafs Leaves, which grow thick and close together in a Tuft in a great number, and rising to be about a Foot long, the Stalks come up among the Leaves, about a Foot and half or more high, smooth, and bare, almost without Joint or Leaf on them, the tops of which end in a white Panicle, two or three inches long, composed of small Husks with Beards.

CCLXV. 3. Gramen Sylvaticum, vel Nemorale minus, The lesser Wood-Grafs. This differs not from the first or greater, but that it is in all its parts smaller and the lower, the small, chaffy, haired, Ears being smaller, and nothing so soft, but rather hard, and a little more hispid.

CCLXVI. 4. Gramen Nemorosum, vel Syphiliticum exitus durum, Small hard Wood-Grafs. The Roots are small and fibrous, being in a bush, from whence rise up many small hard Leaves, about a Span long, or a Span and half, the Stalks are slender, with very few Joints and Leaves on them, at which Joints, and at the tops also, come forth small, long, chaffy, Spiked Heads.

CCLXVII. The Places and Times. These all grow in Woods, almost everywhere throughout England, and they flourish when other Grafs do, nigh in the Summer Months, they are never used in Phyic, nor are they good Fodder for Cattle, but Grafs will grow fat therewith.

CCLXIX. 2. Gramen Lanatum, seu Bombycinum minus, Gramen Tussicale Lanatum minus, Small Woolly or Cotton-Grafs. The Root is somewhat black, and not much unlike the former, but this has many more Rushy Leaves than that, but the Stalks rise not much higher, they bear at their Heads Tufts of Woolly or Cottony Heads, not so large as the former, but are small, and somewhat longer, which being ripe fly away with the Wind, leaving a small Head of Seed, like a Cloathed Head, behind it.

CCLXX. The Places and Times. They grow in moists, wet, Boggy, and Moorth places, the first on the Bog or Hampstead Heath, near London, as also in Highgate Park, not far from the same; the second has been found about Montpelier in France, they Flower in July.

The Virtues.

CCLXXI. Carder says, that the Decoction of the first in Wine, being taken warm, gives ease in the gorging pains of the Belly. The Woolly Heads are gathered by fame to stuff Pillows, Bolsters, and Cushions with, far exceeding in softness and goodness any Thistle Down. Thus have we given you a short History of Grafs, which we think is enough, the
Salmon's Herbal. Lib. I.

CHAP. CCCXXVIII.

Of GROMEL the Greater.

T HE Name. It is called in Arabic Kibbi, Cult, Colt, and Calah, in Greek Milium, & e. Lapathen Semoi abartum, in Latin Lithospermum, & Mutilum Soli, also Gramum Soli, but Serapa says, from the Authority of Alen Julius, that it should be called Milium Soleri, from the form of the Seed, being small, as Mithrum, and the Abstraction Soler, upon which it grew, it is the Germinum Reginos, & Heraclea Plinii, in English it is called Gromel, also Peer-Plant, and Litch-Nettle.

I. The Kinds. It is twofold, viz. greater, of which we shall Treat in this Chapter, and lesser, of which in the next.

II. The greater Kind. Of this there are two singular Species, viz. 1. Lithospermum majus erectum, vel magnum Vegetum, Lithospermum Hortense, Great Garden Gromel, or Great upright Gromel. Saxifraga teres Brangelli, Milium Solli Sativum, Triticum, & Leguminosus Calix, Lithospermum alterum, tristis Johnsonii Thody. 2. Lithospermum majus erectum, Lithospermum major vellere, The Greater creeping Gromel, or Greater common Gromel.

Great Gromel.

Garden Gromel.

IV. The Descriptions. The Cull, or Great upright Garden Gromel, has a Root which is long and hard, or something Woody, with divers Branches and Fibres thereat, which perishes not, although the Stalks die away and perish every Year, from this Root rise up several upright, slender, woody, hairy, brown, and crested Stalks, very little, or not branched at all, on which do grow, without order, long, hard, rough, and dark green Leaves, sharper pointed, and somewhat longer and narrower than the next; at the tops of the Stalks grow several small white Flowers, in tough brown Buds, wherein, after they are fall, is contained a white, hard, round, hairy, shining Seed, greater than that of the following, and almost like unto Pearls.

Great Creeping Gromel.

VI. The second, or Greater creeping Gromel. It has a Root like the foregoing, oblong all the Winter, and shooting forth Stalks fresh in the Spring, which Stalks grow up slender, hard, and hairy, trailing, and taking Root in the Ground as they lie thereon, being also divided or parted into many other smaller Branches, with such like hairy, dark, green Leaves, but flouter and broader than the former, at the joints with the Leaves come forth very small white Flowers, and after them fuch like hard, round, hairy Seed, but smaller, and not fully so white and shining.

XI. The Liquid Juice of the Herb. It provokes Urine, helps the Strangury, and is good against the Stone
**Chap. 329. English Herbs.**

Stone and Gravel in Reins or Bladder, but is not so effectual as the Seed; you may give it Morning and Night, two or three Ounces for a Dose, in a Glass of White Port Wine.

XII. The Essence. It has all the Virtues of the Juice and of the Seed, being used in the same manner and Dose, but is not so powerful or speedy in its Effects as the Powder of the Seed is.

XIII. The Decoction of the Seed. It is to be bruised, and then to be boiled in Broth, or Poffler-Drink, or rather in White Wine: Dose from four to eight, or ten Ounces, according to the Age of the Patient, two or three times a day, against Strangury, Stone, Gravel, and Tararous Mictione, or after结石 impacted in the Reins, Urine, and Bladder, where note, it is to be used for some considerable time.

XIV. The Powder of the Seed. It is found to be of singular force to break the Stone and expel it, whether it be in the Reins or Bladder, it also provokes Urine being ripe, and helps the Strangury, or making Water by drops, caused by Sun, Shake, or Tararous Mictione disturbing those parts; it is indeed a pleasant, safe, and effectual Medicine for the Stone and Gravel, being taken every Night going to Bed, and every Morning falling, for several days together, when the Patient is troubled with a Paroxysm of the Stone it quickly gives relief, proving off. Dose from two Scruples to a Dram and half in White Port Wine, or in Broth, or in Barley Cream, or in Almond Milk, or in an Emulsion of the four greater cold Seeds. If it is given to two Drams in Women's Breast Milk, or in White Wine, or in Partly Water, it is very effectual to cause speedy Delivery to Women in Travail, who are not able to be delivered.

XV. The Composition. Take Powder of the Seed three Drains, White Amber in Powder one Dram, Ceterach or Spheneort in Powder half a Dram, mix them being taken a Dram at a time, or more, in the Morning falling, and left at Night going to Bed, in the Juices of Plantae, Purpae, and Lettice, and that for several days together; it certainly cleanses, heals, and cures a Congenialia, or running of the Reins.

---

**C H A P. CCCXIX. Of GROMEI the Lesser.**

I. THE Names. It is called in Greek αμπελονια, in Latin Lithospermum minus, or Tnium Solis minus, and in English Gromel the lesser, and Wild Gromel.

II. THE Kinds. Of this there are five Kinds, viz.

1. Lithospermum minus sulphurea Matthioli, Dodona, Grophert, Lobell, & aliorum, Our common small Wild Gromel.
2. Lithospermum angustissimum Umbellation Bouhni, vel angustissimum fratris Matthioli, Narrow Leaved Umbellaceous Gromel.
3. Lithospermum ciliata facie Lobeli, Lithospermum ericinum minus Bouhni, Small Gromel with tufted tops, or Alkanet like Gromel.
4. Lithospermum ascents Radice robustae, Lithospermum Sylvae Tragii, Pachy, & Grophert, Gromel, in forma Radice robustae, or Cor Gromel.
5. Lithospermum minimum Germanicum, Poffleria Tragi & Camerarius, Linguo Pallia-

---

**Lefier Gromel.**

III. The Descriptions. The first, or Common small Wild Gromel, has a Root which is not very long, but is repleted with many Fibres or small Strings, which feeds forth several upright, hard branched Stalks, fall of Joints, two or three feet high, at every of which joints grow small, long, hard, and rough Leaves, taller than the Record of the former, and of a dark green color, among which Leaves come forth small white Flowers, in their places, when they are pitt, greenish round Seed, like the other.

IV. The second, or Narrow Leaved Umbellaceous Gromel, has a Root which is hard and neatly, covered with a brownish red Bark, from which rise several woody rough Stalks, yet easy to break, formed into several Branches, about five or seven, or eight Inches high, with very many narrow rough Leaves growing on them, without any order, the middle Kilb in them bare, something greener, the Flowers stand at the tops of the Branches, and sometimes from the upper Joints, divers being set together, as it were in an Umbel, which consist of five small round pointed Leaves, of a blow color, or rather, being long and hollow, are parted, and set into five parts, set in rough green Hocks, in which, after the Flowers are pitt, there usually grow two or three and hand long pointed Seeds, set together.

V. The third, or Small Gromel with Tufted tops, or Alkanet like Gromel. Its Root is long and woody, spreading under Ground, and covered with a rough brownish red Bark, from which rise many hard, bristly, woody, low, and hairy Stalks, rising little above the fixed, seven, or eight Inches high, dividing themselves, even from the Ground, into many smaller Branches, which are set differently, small, long, and narrow, rough green Leaves, whole mid-

---

*pseudo*
Chamapitys, but Pliny the very, or small "take which here upon the the other (Grome), are. the flowers are small, of a pale whitish yellow color, like unto the former, but stand many together at the tops of the Branches, where, after they are pale, small round Heads, like Coriander Seed are, in which are contained round, hard, blackish Seed, like unto that of Grome.

X. The Places. The four first grow Wild in many places of England, in barren or untilled places, and by the Way Sides, the two first of them are laid to grow upon the Sea Shore and Beaches in the Isle of Thanet, near Reculvers, among the Kinds of Wild haulfs; there growing, the fourth has been found growing in Corn Grounds, as also in the way from Brifol to Bath, as Label Eyes.

X. The Times. They all flower from Midsummer to September, the Seed ripening in the mean while.

XI. The Specifick, Specification, Preparations, and Virtues of these are the same with those in the foregoing Chapter, living that those in the former Chapter are much the more effectual; and of those in this Chapter the first is only used in Phyick.

CHAP. CCCXXX.

Of GROUND-PINE, or GOUT-IVY, or FIELD CYPRESS.

I. THE Names. It is called by the Archbi3ites, Hamnmstres, & Chrombhit, in Greek Xympit, in Latin Chamapity, (qua. Humi Fino, vel Picea.) It is called alfo Ajina, & Algin, (ab Abietis odorus, as Pons thinks, but as most think, as Abigendi pumco fortunando Abortus, Pinzy bay, distint quens abortus, & alinum Thar Terps.) Some call it Hu Aristotica, (because of its Virunc in curing the Gout, and other Joint Diforders.) We in English call it Ground Pine, aka Gout Ivy, and Field Cypress.

II. The Kinds. There are several Species, as 1. Of the Field Kind, of which in this Chapter. 2. Of the Heath Kind, of which in Chap. 331. 3. The Sea Kind, of which in Chap. 352. of which all in order, as follows.

III. The vulgar Field Kinds. Of these we make five several Species, viz. 1. Chamapity vulgaris, which Matthiakes takes to be the first of Drinceres, Our Common Ground Pine. 2. Chamapity edulius, Chamapity minor, The Lefler Ground Pine. 3. Chamapity Ma, which I take to be the third of Drinceres, and is his Male Ground Pine. 4. Chamapity Austrica Chuf, Chamapity catulca Bambu, The Anfricai Ground Pine. 5. Chamapity Albens, Hymenocharto in Lobat & Chufi, Chamapity Spira Dedonat, Baffard Ground Pine.

IV. The Descriptions. The first, or Common Ground Pine, has a Root which is woody, and persisting every Year, the Herb grows low, and enters above an Hand breadth high, shooting forth several Small Branches, set with slender, small, long, narrow,
narrow, greyish, or whitish Leaves, somewhat hairy, and divided into three parts or triangules, many hending together at a Joint, and some of them growing sometimys also sattered upon the Stalks, sometimys something through, like unto Robin, or the smeal of the Pine Tree, the Flowers are very small, and of a pale yellow color, growing from the Joints of the Stalks all along among the Leaves, after which come small, long, and round Husks.

**Common Ground Pine.**

V. The second, or Lesser Ground Pine, has a Root which is somewhat long and fefty, like the Root of Succory, or Dandelion, with many Fibres thereof, but smaller, it is also a small Herb, growing up with many hairy and hoary white flender Branches, not above a Hand breadth high, on which are set many small long Leaves, yet shorter than the former, hairy all, and hoary white, not in Tufts or Bushes, but growing by couples, close together all along the Stalks, cut in, or divided into some parts, of a strong but sweet scent, much sweeter than the former, at the tops of the Branches grow the Flowers, many together, of a pale yellow with white color.

VI. The third, or Austrian Ground Pine, has a Root composed of many black Strings, and hard, growing deep into the Ground, and springing again fresh every Year, from this Root rise up several Square, strong, hairy Stalks, a Foot long, with many Joints on them, at which grow two something long and hard Leaves, a little like unto the fift, but broader, green, and shining on the upper side, hot something hoary and full of Veins on the under side, divided into three or four parts, and sometimys into more, a little hot in tafe, but not unpleasant, nor of any displeasing scent, from the Joints spring forth smaller Branches, with the like Leaves on them, but leffer divided, and towards the tops nothing at all, but smooth and long, like unto Rosemary Leaves, from the upper Joints, and ends of the Stalks and Branches grow several gaping Flowers, like unto Germander, of a deep Purple or Violet Color for the most part, but sometimys of a lively Red Color, and sometimys of a blaker Blue, or Sky Color, the lower Leaves or Chips of the Flowers being whi-

**Small Ground Pine.**

VII. The fourth, or Male Ground Pine, has a small single Root, of a woody Substances, which strikes pretty deep into the Ground, with some few Fibres growing from it. It is a small Herb, and very ten-

**Male Ground Pine.**

467
of upon the Ground, having small and crooked Bitches, full of joints, at every Joint from the thickest to the thinnest. There are two long Leaves, one on each side the Joint, which are long, narrow, and slender at the bottom, but as they proceed in length are hairy, and cut or jagged deeply, almost to the middle, growing single, two, three, or four deep jags, not much unlike to a Horn, having that the ends of these jags are rounded pointed, or broader, at every of these Joints, with the Leafe, as their joints in the Flower, without any Footstalk, one at the root of each Leaf, and springing out of a little rough Hack, being small, and of a pale yellow color, and sometimes also white, the Leaves growing on the upper Joints, as they approach the top, are for the most part divided into three long parts, not very much unlike to Rosemary Leaves.

XII. The fifth, or Buffon Ground Pine, has a Root which is juniper thick and white, abiding all the Winter. It grows like a small bushly Herb, very like unto the Common Kene, having small hairy Stalks, for full of long hairy Leaves all along them, parcel into three long parts, of almost no length, but an unpleasant Herby one; the Flowers stand at the Joints like to those of the Common Ground Pine, but somewhat greater, and of a white color, after the Flower the Seed follows, which is greyish, greater and rounder than the Common Kene, tour for the most part contained in every one of their brownish rough Hacks.

IX. The Places. The first grows Wild in England, chiefly in Kent, (not growing in many other places) that we know of, very much about Dorsetford, along to Southwark, Gros Ford, Cobham, Rochefort, Herion, and Sutton, and upon Chaldon Down, hard by the Beacon, and half a Mile from Rochefort, high a Route called Selfay, the other four are chiefly marked up in Gardens, but grow Wild in Italy, Savoy, Geneua, Spain, and Asperia.

X. The Uses. They all Flower in June, July, and sometimes in August, and give their Ripe Seed in the mean time, or not long after.

XI. The Qualities. Ground Pine is hot in the second degree, and dry in the first, it is Inciting, Aqueous, Acrid, Diuretik, Hepatic, Spline, Neptic, Hyptick, and Artick, Emenagog, 4, a little Sedative, Chalybick, Spermaco, Tropic, and Aleispalicnich.

XII. The Specification. It is peculiar against the Strangury, and Hyptick Fits, provokes the Terms, facilitates the Labour, and expels the Dead Child and Afterbirth.

The Virtues.

XIV. The Liquid Juice. It does admirably pravall against the Strangury, and all floppages of Urine, or any inward paralysing from those Diffeces of the Bladder, Urine, and Bowels, it may be given Morning and Night, from two to four Spoonfulls, in a Glass of White Port Wine.

XV. The Infusion. It is for all the former Virtues, besides, it is also very effectual in obstructions of Liver, and Spleen, cleanses the Blood, removing its grossness and impurities, it expels which is cored on in the Stomach, or other Bowels, and greatly opens the Body, it also wonderfully helps all Diffeces of the Mother, taken in any of, and outwardly used, by injection, it provokes the Terms, facilitates the Delivery of Women in Travail, and expels the Dead Child and Afterbirth, it is very powerful upon those parts, that it is forbidden to Women with Child, for that it is apt to induce Abortion, or Delivery before the time, it is very powerful and effectual also in all Pains and Diffeces of the Joints, as Gout, Sciatic, Rheumatomat, Cramps, Convolutions of the Nerves, Palfies, Falling-Sicknes, and other Distempers of like kind, being used both inwardly, and outwardly applied, or bathed upon the parts affected, it is also an effectual good help against the Jaundice, gripping pains of the Belly, or any pains in the other Viscera, proceeding from Cold and Phlegmatick Humors. Dole four, five, or fix Spoonfulls, mix with some Generous Wine, Morning, Noon, and Night, according, as the weakness of the Patient, and necessity of the occasion may require.

XVI. The Decotion in Wine. It has all the Virtues of the Liquid Juice and Infusion, and may be given Morning, Noon, and Night, half a Pint at a time, it ought to be made of the Plant or Herb, when it is in Flower chiefly, for then it is strongest and most powerful, it provokes Sweat, if taken when the Patient is in a naked Bed, that the sweat down upon it, it prevails also against the Poyson of the Ascolites of all sorts, and of other Poysonous Herbs, as also against the Biting of Mad Dogs, and other Venemous Creatures, the Stingings of Vipers, Horns, Wafps, Bees, &c. and is a singular good thing against a Cough, especially in the beginning, before it is grown inveterate.

XVII. The Dry Drinke. It is made by Turning it up in new Ale or Beer when it is first set on working, four Handfuls to a Gallon, and may be drunk after four or five days. Dose, against all those Diffeces for which the Juice, Infusion, or Decotion are given, and is more pleasant for queasie Stomachs.

XVIII. The Confitructions. The Converse of the Flowers participates of all the former Virtues, but in a much weaker degree, however Matthioli commends it against the Palte, it may be taken to the quantity of a Walnut every Morning fasting, and left at Night going to Bed, for some time.

XIX. The Pills. There are three sorts of Pills made with this Herb. 1. Pilula Chamaephyti Simplicis, Simple Pills of Ground Pine. They are made of the Powder of the Herb, and Mattpale or Pulp of Figs, and have the Virtues of the Juice, Infusion, and Decotion, givenMorning and Night, from one Drinke to two Drinques, with a Draught of the Decotion of Ground Pine in Wine afterwards. 2. Pilula Chamaephyti Compositionis, Pills of Ground Pine Compound. Take Powder of Ground Pine five Ounces, five Powder of Horendahu's three Ounces, Sal Nitre two Ounces, Scammony in fine Powder one Ounce, Venice or Strawberth Tartar a sufficient quantity min, and make a Molds of Pills. Dole one Dram, or more, in the Morning fasting. They cure the Droplee, Jaundice, Gout, Sciatica, Kings-Evil, Strangury, and all stoppages and heat of Urine. 3. Pilula Chamaephyti Komposti, Mandrillus, Mandribus, Pills of Ground Pine. Take Ground Pine, Botry, Rofeyerm Powder, Starches, all in fine Powder, of each one Ounce, of Agarique in Powder two Ounces, of Rhubarb, Tarhur in Powder, of each two Ounces and Half, Colchic in Powder, half an Ounce, Disgerstone, or rather Scammony, in Powder, one Ounce, Horne Hero, simples four Ounces, Ginger, Speckhard, Sal Gem, of each

in Pouder two Drums, take them, and with Juice, or rather a good Distillation, make a Muffle of Pilles. Dole one Drum, or Drum and half, at Bed time. These Pills he comments against the Palsie, and says they will give a present and speedy help: I have several times used them against the Scourvy, Dropsey, Jaundice, Gout, Rheumatics, Kings Evil, Obstructions of the Lungs, and in malignant and purulent Ulcers, Pituada, &c. with admirable success.

XX. The Ointment or Baifam. Anointed on the Fund of the Eye it prevails against the Piles, it ulcerated, it dissolves hard Tumors, as well in Women's Breast as in other parts of the Body, but for this purpose the Ointment is only to be used, the Ointment of Balm do not only cleanse purify, thinking foul, malignant and virulent Sores and Ulcers of all sorts, but they also congeriate the Lips of Green Simple Wounds in any part, and quickly heal the same; the Balm is an excellent thing against the Gout and Scarcity, being often and long applied.

XXI. The Cataplasia. Made of the Green Herb, with Pulp of Figs, or Honey, and being applied to Women's Breasts, it dissolves the hardnes of them, as also other hard Tumors In any other part of the Body, it cleanses also purify, malignant, and virulent Ulcers and old Sores in what part forever.

XXII. The Distilled Water. It is a good thing against Cold and Gravel, the Strangury, and other Distempers of the Urinary parts and Worm, but it is much more effectual if it is drank six Ounces a time, mixed with one or two Ounces of the Liquid Juice or Essence of the Herb.

XXIII. The Lotion. Take of the Juice or Essence four Ounces, of the Distilled Water six Ounces, Mulder in fine Powder three Drums, Alum two Drums, Honey four Ounces, mix, digest over a simmering bow for an Hour, then use it a Gargarizit, it cures a sore Mouth or a sore Throat in a very little time, after an admirable manner, and that when many other things have failed.

XXIV. The Spirit. It comforts the Head, Rein, and Nerves admirably, and is prevalent against Le- thargies, Palsies, Convulsions, Numbedness, and other like Dillempers, given from one to two, or three, or four Drums, either alone diluted, or mixed with any other proper Vehicle; it also is singularly good against Sickness at Heart, Failling and Swallowing Fits, and other Distempers of like Kind.

XXV. The Acid Tincture. It powerfully opens Obstructions of the Reins and Bladder, expels Vapours from the Spleen and Womb, is good against Sand, Gravel, and Stone, and of excellent use against the Scourvy, it relieves the obliterity of the Stomach, causes a good Appetite and Digestion and opens Obstructions of the Lungs, helps Wheezings, Hoarsness, difficulty of breathing, Throatness of Breathe, Coughs, Colds, and the like. Dole for many drops as to give the Vehicle a pleasing acidity, and to be used in all that the Patient drinks.

XXVI. The Spirituosc Tincture. It is good against Heart Qualms, Palsies, Convulsions, Lethargies, and other Dillempers of the Nerves, it frees the Stomach, and being given to three or four Drums it provokes Sweating, and is good against the Bitings of Mad Dogs, Serpents, and other Venerous Creatures. Dole, allowing only two Drums, in a Glass of Wine, or any other convenient Vehicle, twice or thrice a day.

XXVII. The Oil Tincture. Inwardly taken it prevails against the Stone and Gravel, of Tauratous Matter in the Reins or Bladder, and by fortifying the Stomach and Head, as also the Original of the Nerves, it is found by experience powerfully to relieve the Palsies, outwardly applied, by well anointing upon the part it cures all Pains and Aches proceeding from Cold, strengthens weak Limbs and Nerves, gives ease in the Gout and Sciatica proceeding from a cold Core, prevails against common Convulsions of the Nerves, and is asingular thing against the Palsie, the Spiritus Doffii being well anointed thereof in Morning and Night, together with the parts afflicted.

C H A P. CCCXXXI.

Of GROUND-PIECE Sea, or Sea GOUT-IVY.

I. T H E Names. It is called in Greek Πατρανός Βάτος, Mediolanum, in Latin Chama piper, Maritima, Antilobus herbaceus, Antilibus alae, Danguy, Antilibus Chama piperis, &c. in Alum, &c. by some, in English Sea Gound Pine.

II. The Kinds. It is the second generick Species of Ground Pine, mentioned in Chap. xii, Sect. 2, of the integrum, and a singular Plant of the Wind, it is the Antilybus alae Chama piperis, who says it is very like unto Chama piperis, but Badianus refers to Name this with the Antilibis in his Flores, and therefore puts it among its Chama piperis.

III. The Description. It has a Root which is somewhat thick and white, which sends forth several hard biry Stalks, without Branches upon them, upon which do grow many somewhat long and narrow Leaves, without order, one above another, buffing thick at the top, somewhat like unto thofe of Chama piperis, or Algae, but dented about the edges, and hairy also, something of a warming hot cafe, and strong unpleasant flavour; the Flowers grow among the Leaves upon the Branches, like unto the Flowers of Chama piperis, or Ground Pine, but of a purple reddish color, after which come small, greyh, rough Seed, a little long, and four for the most part in every Husk.

IV. The Places. It grows upon the Sea Coast in several Countries and Kingdoms, I found it in several places on the Sea Coast of Florida.

V. The Times. It Flowers in July and August, and the Seed is ripe in September.

VI. The Qualities. It is hot and dry in the second degree, Aperitive, Abstervative, and Diuretik, Nepurikick, Hypturik, and Alberiturbick.

VII. The Specifications. It is prevalent against Sand, Gravel, and Tauratous Matter in the Reins and Bladder, and to cure the Scourvy.

VIII. The Preparations. You may have therefrom, 1. A Liquid Juice, or Essence. 2. An Oil by Composition in Oil Olive.

IX. The Liquid Juice, or Essence. It powerfully provokes Urine, and cleanses the Reins and Bladder of small Stones, Gravel, Sand, and Tauratous Matter, whereby giving a Cure in the Strangury, if it is given to one or two Ounces, secondly to cm a cold Core, and Strength, in the Morning saffing, and half at Night going to Bed, in a Glass of Oxymel, or White Pine Wine, it does much good against the Falling, Sicknees, and takes daily or some time, a Specious at a time, in a Glass of Wine, it replaces Vapors, and Fits of the Mother.

X. The Oil by Inflation or Composition in Oil Olive, Injected
CHAP. CCCXXXII.

Of GROUND-PINE Heath, or, GOUT-IVY Wild.

The Name. It is called in Greek Kleio, ob pulberecinum, versus Hippocrates & Antiquis Kleio, i.e. Papillum, recente proper Saurum, Gaul Papula, fen anteriori Homeri Crystallo, umbra Speruncie, hand obtusus cornutus, in Latinis Cordis, and in English Heath Ground-Pine, and Fair Heath Ground-Pine.

Heath Ground-Pine.

III. The Description. The first, or Common Heath Ground-Pine, has a Root which is somewhat long and woody, with many fibrous Threads thereto adjoining, from which rising up several hard, woody, reddish Stalks, full of Joints, rising up to the height of a Foot, or more, and having also on them many small and long, thick and fat Leaves, let together at every Joint, something like unto Strepulis, or Frank Sperms at the tops of the Stalks grow several Flowers, each of them upon a short Footstalk, consisting of five or six Leaves, not much unlike to Hypericum, or Ornithogalum, Star of Bethlehem, as Levil combs them, but of a whitish red color, with yellow Threads in the middle, yet Matthiolius and others by the Flowers are all yellow, like Hypericum, dillinking a little Fever, which being being away, the Seed is round enclosed in round Heads. This Plant keeps its green Leaves all the Winter, but turn of a somewhat yellowish red color towards Autumn.

IV. The second, or Fair Heath Ground-Pine of Candy, has a Root which is long, spreading, and woody, abiding with green Leaves thereon all the Winter, this Plant, as Delsis birth, grows in good Ground to be a Club and half high, branching forth many ways, and bearing many small Leaves, like unto Heath, on woody Stalks and Branches, the Flowers grow at the tops of the Branches, and are much more like to those of Hypericum, and of a yellow color, which being past away the Seed follows, being enclosed in Hulks like the former.

V. The third, or Purple fair Heath Ground-Pine, has a Root which is reddish, hard, and woody, softer than the proportion of the Plant should seem to require, giving a Dye or Color, not only to the Fingers of them whom touch it, but also to the Dye Linen and any other things with which it makes contact; naturally, it abides all Winter, all the Leaves are more reddish than in Summer, but requires some care to preserve it with us. From this Root rise up many round, woody, and reddish Stalks, not so high as the former, having many small, long, thick, and roundish Leaves for thence, most commonly without color, and yet sometimes conformable one to another, somewhat like unto the greater Kind of Heath, the tops of the Stalks are furnished with a great Spiked Tuft or Bush of Purplish Blow Flowers, (but of a pale Red with us) flowering somathing toward each, and of Four Leaves an agreeable, double forked as it were at the ends, two whereof which stand uppermost are greater than the other two which are lower, which will continue long in their perfect color, being gathered in their prime, and each of them standing in a brownish Husk, parted at their tops into five points, and spotted with five blackish spots on the outside, wherein afterwards grows the Seed, which is small, round, and blackish, wrapped up as it were in many Coats or Films, whose Hulks do then grow somewhat hard, and sharp at the ends, when as before, while the Flower lasted, they were not so.

VI. The Places. The first Matthiolius grows in many places in Italy in dry and Hilly Grounds, which Pensa confirms, it grows by Corara, a Village in Liguria; the second grows in Candy, the lift, as Pensa Lens, about Monstreler, also near the Sea in Valence, and in dry Grounds about Salamanca in Spain, as Dasieus Lens, with us in England they only grow in Gardens, but I have found them all growing in dry Hilly Ground in several parts of Florida.

The Times. They Flower early in all those hot Countries, even in March in some places, and in others in April and May, but with us in England later, as in June and July, but do seldom perfect their Seed with us.

VIII. The Qualities. Specification, Preparations, Virtues and Uses, are fully the same with the Common Ground-Pine in Chap. 330. Sect. 11. to Sect. 26. and therefore to the name we refer you.

IX. Note. 1. The Seed of Heath Ground-Pine, either bruised and drank, or made into a Decotion in digestion...
X. Note. 2. An Oil, Ointment, or Balsam, made of the Seed, or Borage, cafe the Gout and Sciatica, anointing therewith: they also heal any old or running Sore or Ulcer, and dry up that superfluous moisture, which by an influx upon the part, hinders the Cure.

CHAP. CCCXXXIII.

OF GROUNDSCEL. CCCXXXIII.

The Name. It is called in Greek Βιονερ γενικ, Eriogonum, and came from Senea, in Latin Eriogonum, Seneio, et Senea; genic et Senea: and in English Groundsel, and Graunfel.

II. The Kinds. There are two several sorts of Groundsel. 1. The Common Kind, of which in this Chapter. 2. The Oran Groundsel, of which Chap. 223. following. Of the Common Kind there are also two sorts. 1. Senecio, vel Seneio vulgaris, (called by some Ambros Seneio minor, because they call Flowers) Senecio major) and Eriogonum, from the Greek Name, Common or Vulgar Groundsel. 2. Senecio, vel Eriogonum Montanum, Seneio Montanum, Seneio secundus Tubernontani, Mountain Groundsel.

III. The Description. The first, or Common Groundsel, has a Root which is small and threadlike, and forms clusters, from whence rises a round, green, and somewhat brownish Salk, spreading it self towards the top into some Branches, set with long, and somewhat narrow green Leaves, very much jagged, or cut in on the edges, something like unto Rocket, or rather as some Leaf, but softer, and round at the ends, at the tops of the Stalks and Branches grow many small green Heads, out of which grow small yellow Thickets or Thorns, which are the Flowers, which continue many days blown in that manner before they pass away into Down, and with the Seed, which is long) is carried away with the Wind, but from this Seed which is thus freed it soon dies again, so that it may be seen many Months in the Year young and green, and in Flowers, and a Seed, for it will bring up and Seed twice in a Year at least, if it is suffered to grow in a Garden.

V. The Place. The first is found everywhere in abundance, as well as on the tops of Hills as on the Ground amongst Rubblish, and is usual in Gardens, but more especially in Gardens, the other grows upon Hills and Mountains, both in England and places beyond the Sea.

VI. The Times. The first is found to Flower almost in every Month of the Year, perfecting its Seed in the mean season, the second comes somewhat near unto the first, but its Flowers do not so suddenly desic.

VII. The Qualities. It is cold and moif, in the first degree, is Digestive, Alterative, Diuretic, and Emetic.

VIII. The Specification. It is a peculiar Remedy against the Yellow Jaundice, Stoppage of Urine, Diseases of the Eyes, and the Falling-Sickness.

The Virtues.

X. The Liquid Juice. If it is drank from one Ounce to two Ounces, mixed in any proper Vehicle, it cleanses the Stomach from all corruptions and crudes. Humors by vomiting, whereby it stirs the Pains of the Stomach caufed from the abounding of Choler, it is also good against the Jaundice and Falling-Sickness, in which two Cures it ought to be several times repeted; it also takes away the Heat, flooding, sharpness, and Stoppage of Urine, and the pain in caufing Water, expelling Sind, Gravel, Stones, and Tumours. Matter out of the Reins and Bladder.

XI. The Essence. It has all the former Virtues, and is much more pleasant to take, it prevails against Colick, and Griping of the Guts, as also the Gout, Sciatica, and Rheumatism. It purges the Liver and its Secretions, and provokes the Terms in Women, giving it from two Spoonfuls to four to White Port Wine, it Vomits as the Juice does, and therefore must be given with the same caution.

XII. The Decotion in Ale, Beer, Wine, or Water. It has all the Virtues of the Juice and Essence, and works in the same manner, but not all our forces, and therefore may be given from four to eight, or ten Ounces, according to Age and Strength.

XIII. The Powder of the Herb. It may be given to a Dram, or more in Oxygen, proportioning the Dose...
Salmon's Herbal. Lib. I.

472

Of GROUNDSEL Cotton.

I. THE NAME. It is called in Greek Πλοίον γωνοφθορίακα, in Latine Erigeron Tomentosus, Senecio Tomentosus, Senecio Tragi, and in English Cotton Groundfel, or Woolly Groundfell, also Glumis Groundfel, from the Leaves sticking as it were unto ones Fingers.

III. THE DESCRIPTION. The first, or Common Cotton Groundfell, has a Root which is small, and full of Fibres, it has much larger Leaves, and more yellowish roots in on the edges than the former Common sort, and of a growth or Ash Color, soft and hairy, or rather hairy all over, the Stalks are higher and greater, but with fuch like yellow Flowers upon them, and as soon fading and running into Brown as the other: this differs chiefly from the for-

mer Common sort in the hoariness and lagenista, as well of the whole Plant as of the Leaves.

Cotton-Groundfel.

IV. The second, or Stinking Cotton Groundfell, has a Root which is very fibrous, yet softer not after Seed time, but perifhes as the Common does, and springs again of the fild or fallen Seed: It has many fair, large and long Leaves lying next the Ground, very much fugged or torn in on the edges, whereby they confift of many divifions, somewhat like unto thofe of Mugwort, for which reafon some have caled it Artemefia Iterta, but it is foft, and in handing very hairy, being also bedecked with a fatty olimblen, fo much that the Leaves will flick to the Fingers of thofe that touch them, and one Leaf will alfo flick unto another, fo as with fome difficulty to be taken andd, it finnels fomewhat strong, and of an ill fcent, (theo not unpleafantly to fome) as Cliffs fays, but like Scrophularia, or Eleabane, or others fly, from among which Leaves rise up hairy crefted Stalks, half a Yard high, fpread out into feve- ral Ramifications or Branches, but bearing at their tops fewer Flowers, fuffer, and of a paler yellow color than the Common Groundfell, and upon longer Brodths, which quickly fide, and turn into Down, as the others do.

V. The third, or Sweet smelting Cotton Groundfell, has a fibrous perifbing Root, as the others have, from which rife up Leaves and Stalks, like the others, and indeed this Groundfell is somewhat like the lat- freedom in the soft and woody Leaves, but not fo much fugged or torn on the edges as its, its fmall is fweet, something like unto Armofoia, or Oul of Copabatex, or the middle Coma, or Blefsony, the Flowers are like the red, and as soon growing old and Downy, as the others do.

VI. THE PLACE. The fift grows by Wood fides, and borders of Fields, as also upon old Walls, in many
many places, the second grows also in woody, bon-
ren, and marshy places: the third was first by Jo-
sephus de Calabria, Herbartif to the Great Duke of 
Tolcyng, to Cameraria out of Italy.

VII. The Time. The first Flowers almost every 
Month, as the Common Kind does, the second 
Flower in May, June, July, and August.

VIII. The Qualities, Specification, Preparations 
and Virtues of these are the fame with those of 
the Common Kind, delivered in the former Chapter from 
sect. 7. to sect. 18. and therefore we shall lay no 
more thereof in this place.

C H A P. CCCXXXV.

OF HARES-BELLS Enlilsh, 
or,
"English HYACINTH.

I. THE Name. It has no known Greek Name, 
but in Latin it is called Hyacinthinus Anglicus, 
Hyacinthinus Belgicns, and Hyacinthinus Hispanicus, in 
English: Hares-Bells, or English Hyacinth.

1. The Kinds. Of this Plant there are four 
Kinds, viz. 1. Hyacinthinus Anglicus Carnelian, Hy-
acinthinus non scriptus Dodecan, (because none wrote of 
it before him) Blew English Hares-Bell, and Blew 
English Hyacinth, but it is as well called Belgicns 
and Hispanicus. 2. Hyacinthinus Anglicus Albua, Hy-
acinthinus Belgicns Candidus, White English or Dutch 
Hares-Bells, or White English or Dutch Hyacinth. 
3. Hyacinthinus Anglicus, and Belgicns Floræ Luminaræ 
Carnation English or Dutch Hares-Bells, or Hyacinth. 
4. Hyacinthinus Hispanicus major, Floræ Capanula in 
flor, The greater Spanish Hares-Bells, or Bell-Flow-
eral Hyacinth.

Blew English Hare Bell,

III. The Description. The first, or Blew English 
Hares-Bells. The Roots of all Hare's feet agree, 
and are alike, being oblong, and very slimy, some of 
which will be great and round, others longer and 
Round, and those which are near the top of the Earth have, 
will be of a green color. From this Root rises up several 
long and narrow green Leaves, too flanging upright, 
or yet fully lying upon the Ground, among which 
Springs up the Stalk, bearing at the top many long 
and bellow Flowers, hanging down their Heads, all 
Forwards for the most part, and dividing the heads 
into six Leaves or Divisions, turning up their Points 
a little span, of a sweeter long and heady Kenn, Somewhat 
like unto the Grave Floure, the Heads for 
Seed are long and figure, in white, have contained 
much black Seed, the color of the Flowers are in 
Borne a deeper Blew, tending to a Purple, in others 
Blue or a paler Blew, or of a blew Blew, tending to an 
All color, and some are Purr Color.

IV. The second, or White English Hares-Bells, has 
Roots, Leaves, Stalks and Flowers very like the for-
mer, faving, that the Leaves in this are somewhat 
broadier, and the Flowers more open, and of a very 
wide color, yet sometimes they are White and 
Blew mist mixed together.

V. The third, or Carnation English Hares-Bells. 
Stalk in their bumble Roots, Leaves, Stalks, Blow-
ners, and Seed, as also in their color: and for the 
Stalk of growing, are very like to the first and second 
Kinds, faving that the Flowers in this are of a fine 
Carnation Color for the most part, of a fine delay-
d purpled Red, or blull Color, which some call 
Feath Color.

VI. The fourth, or Greater Spanish Hares-Bells. 
It has a bulbous Root, from whence fpringing up sever-
al long and narrow green Leaves, the form hereby 
not strength enough in themselves, to fland upright, 
or a little incline or bend downwards, This Plant is 
very like to the first aforesaying, but that it is greater 
in all its parts, as well of Leaves as Bells. There are 
young growing together at the top of the Stalk, with 
merry short green Leaves among them, hanging down 
their Heads, with larger, greater, and wider open 
Mouths, like unto Bells, of a dark Blew Color, and 
of no pleasing smell.

VII. The Places. The first Parkington Eys is so 
common everywhere, that it hardly needed any 
Description, and that it is more frequent in England 
than in the Low Countries, or in Spain; it grows 
in Woods, Copedts, and in the borders of Fields, ev-
ery where throughout England; the second and third 
are not so common, but they grow in the Woods by 
Colchester, in Essex, in the Fields and Woods by 
Southwark, near unto Gravesend, in Kent, as also 
in a piece of Ground by Canterbury called the Clapper, 
also in the fields by Bubl, and in the Woods by 
Warrington, in Lancashire, and in other places.

VIII. The Time. They Flower from the begin-
ing of May to the end of June, and the Seed ripens 
in the mean Season, and in some little time after.

IX. As to their Qualities, Specification, Prepara-
tions and Virtues Authors have laid nothing, nor do 
we know any thing by Experience concerning the 
Fame, saving, that an Ointment being made of the 
Roots hereof, is of singular use, to strengthen weak 
Joints.

X. Note. The Root of Hares-Bells, as it is gene-

rally bulbous, so it is full of a thick, flimy, Emul-
flack Juice, which is of too strong a body, that it will 
serve to set Feathers upon Arrows, instead of Glue, 
or to patch Bows with, and hereof was formerly 
made the bell Starch, next to that of Arum, or Wabe-
Roths Roots.
Salmon's Herbal. Lib. 1

CHAP. CCCXXXVI.

OF HARES-EARS.

The Name. This Plant is called in Greek Bupleurum Thyphraéum, in Latin Bupleurum, Auricula Lopherium, a plant of the tribe of Bupleurum, in English Hares-Ears. It is doubted the Bupleurum Hippocrates, mentioned by Pliny Lib. 22. Cap. 22. and by Nicander in Thess. Génet 

Hares-Ears

some take it to be Bupleurum, mentioned by Pliny Lib. 22. Cap. 22., and by Nicander in Thess. Geanet says that the French call it Bupleurum, and Gratia 

Sedum perfoliatum Auricula toloexplor

Domes in his History of Plants calls it Byphilium, so that there is great difference of Opinions among Herbaists in judging to what Plant of the Ancients it ought to be ascribed, however, as long as we know what Plants it is to which we give the present Names it is sufficient.

The Kinds. There are three Kinds hereof, viz. 1. Bupleurum Angustifolium, Auricula Lopherium Angustifolia, Hares-Ears narrow Leaved. 2. Bupleu-

Hares-Ears.

rum Latifolium, Auricula Lopheria, Herba Vulnerta-

Bupleurum

ris, Hares-Ears broad Leaved. 3. Bup-

Hares-Ears

pleurum Angelaphyllum Montanum, Sedum petraeum 

Hares-Ears

Bupleuri folio, et patris Bupleurum petraeum Grami-

Hares-Ears

nico Volto Páne, Perfoliata Alpina Gramineo Foliis, 

Hares-Ears

et Bupleurum Angelaphyllum Alpinum, Bupleurum 

Hares-Ears

Anguifolium Folio Batahii, Narrow Leaved Mountain Hares-Ears.

Hares-Ears

III. The Descriptions. The first, or Common narrow Leaved Hares-Ears, has a Root which is some-

Hares-Ears

what hairy, but small, and white on the outside, much

Hares-Ears

like to a Parsley Root, with divers Fibres adjoining, 

Hares-Ears

which with us in England perishes every Year. This 

Hares-Ears

Plant rises up with a round, flat, green stalk, two 

Hares-Ears

Feet high, at the several Joints whereof grow sev-

Hares-Ears

eral long and narrow, very dark, green, smooth, thin-

Hares-Ears

ning Leaves, broad at the bottom, and narrow at the 

Hares-Ears

ends, with divers Ribs running thro' them, the middle Ribs whereof is greatest, yet nothing to compare as Oregii Leaves, tho' some Authors do compare them with them, these Leaves 

Hares-Ears

stand one above another up to the top, growing smaller and smaller, being placed likewise at the 

Hares-Ears

Joints, on the middle of the Stalks, at the leaf 

Hares-Ears

upwards (if it grows in any good Ground) come 

Hares-Ears

forth small Branches, and (sometimes with few or 

Hares-Ears

no Branches at all) at the tops whereof stand many 

Hares-Ears

small Tufts or Bunches of yellowish Flowers, which 

Hares-Ears

turn into small Seed, not much unlike to Parsley 

Hares-Ears

Seed, but of a darker color, and somewhat longer.

Hares-Ears

IV. The second, or Broad Leaved Hares-Ears, 

Hares-Ears

has a Root like the former, and grows in the same man-

Hares-Ears

ner, with like Stalks, Branches, Flowers, and Seed, 

Hares-Ears

but herein this thinly differs from that, one that 

Hares-Ears

this bears broader but shorter Leaves, falsified at the 

Hares-Ears

foot, broadest in the middle, and ending in a small 

Hares-Ears

sharp point, somewhat hollow, and bowing down-

Hares-Ears

wards, with several long Nerves or Ribs therein, 

Hares-Ears

as in the former, and the middle Ribs most eminent, 

Hares-Ears

or ruffled highest.

Hares-Ears

V. The third, or Narrow Leaved Mountain Hare-

Hares-Ears

Ears, has a round thick Root, about a Foot long, 

Hares-Ears

set with Knobs or Bunches instead of Branches, which 

Hares-Ears

has a thick Bark, of a dark red on the outside, 

Hares-Ears

and pale within, and divided at the head into many parts; 

Hares-Ears

from these Knobs or Heads arize several long and 

Hares-Ears

narrow Green Leaves, lying on the Ground, compas-

Hares-Ears

sing one another at the bottom, like a Star, for the 

Hares-Ears

form of them like to the first Hares-Ears, but nar-

Hares-Ears

rower, from divers of these Tufts of Leaves rise up 

Hares-Ears

dark round Stalks, about an Hand broad high, 

Hares-Ears

bearing at the tops many pale yellow Flowers, made 

Hares-Ears

of several pointed Leaves aspinous, and in the middle 

Hares-Ears

of them several small Seeds for thick together, some-

Hares-Ears

thing like unto Thistles, or as the former
Chap. 337. English Herbs.

Lagopus, which small very strong, the whole plant the takes like an arbilla.

VI. The Place. The two first Leporis eyes grew among Monarchies in France, and Lagopus eyes in dry fryy places in Germany, and are both of them found in several places of England, the third Pinnato eyes grows up in mountains, and has been found upon Mountainous places in Florida, near the English Plantations.

VII. The Time. They all flower late, not until the end of July, and in August, and their Seed is ripe in September.

VIII. The Qualities. They are temperate in respect to the first Quantities, as to heat and cold, dryness and moisture, are Adverse, Vulnerary, Diuretic, Cardiac, Nephrat, Hydric, and Alumquamic.

IX. The Specification. They are peculiar for healing of Wounds in any part, whether inward or outward.

X. The Preparations. You may have therefrom, 1. A Juice or Essence of the Leaves. 2. A Decoction in Wine. 3. A Powder of the Root or Seed. 4. An Ointment or Balm. 5. A Cataplasm.

The Virtues.

XI. The Juice or Essence. Taken to three or four Spoonfuls, either alone, or mixed with Wine, it is good against the Biting or Stinging of Serpents, or other Venomous Creatures, the place also outwardly bathed with the same, it also provokes Urine, and prevails against the Strangury, and is of good use to bring down Women's Courses when flopped, being taken Morning and Night in White Port Wine, taken also inwardly Diuretically it singularly contributes to the Curing of Wounds, old running Sores, and rebellious Ulcers.

XII. The Decoction in Wine. It has all the Virtues of the Juice or Essence, but not full out so powerful, yet it more excellently clears the Heart and revives the Spirit, and is prevalent against Painting and Swelling Fits in Men or Women.

XIII. The Powder of the Seed. Being given to one Dram in a Glass of White Port Wine, it refills the Poyplon of Vipers, Rattlesnakes, and other Venomous Beasts, it also Diuretic, cleanses the Reins and Bladder of Tartary Matter, and prevails against the Strangury.

XIV. The Ointment or Balm. It heals simple Wounds at once or twice dressing, and is good a gainst all sorts of Sores, whether they be fresh and green, or old and maligine, when rebellious and difficult to be Cured.

XV. The Cataplasm. Applied to the Biting of Serpents, Mad Dogs, and other Poisonous Animals, it attracts and draws forth the Venom.

C H A P. CCCXXXVII.

OF HARES-FOOT, OR, TREFEOIL Spiked.

THE Name. It is called in Greek λ慰问ος, Lagopus, Lagopodium, Trifolium Humile, Leporis Cornum, & Pus Leporis, a Lepo-

Haresfoot Common

III. The Descriptions. The first, or Our Common Hares-Foot. It has a small, long, brisny Root, which sends forth Stalks, with small, white, woolly, Trefoil Leaves set upon them, with short Forkings, the Heads at the tops are with their roundnesses somewhat long, and composed, as it were, all of a hairy or hoary Downimets, whole Flowers in some are of a White, in others of a Blush Color, it is an Annulal Plant, as are the two following, but this is especially to be noted in this Stock of Hares-Foot, or Spiked Trefoil, that these perish Yearly, whereas most of the other sorts of Trefoils do not: This Common Hares-Foot is well known to be a small Plant, but it grows greater and higher in some places, and smaller and lower in others, according to the goodness of the Soil or Ground it is found in.

IV. The second, or Greatest Hares-Foot, has an Annual, small, long, thready Root also, which sends forth several Trefoil Leaves, each standing on a long Forkstalk, being almost round, and divided about the edges, very like to the Meadow Trefoil, as well in biggest as form, very soft, and of a pale green color, from among these rise up weak bending Stalks, a Foot or more high, branched out, and bearing the like, but somewhat longer Leaves on them, and at their tops close Spiked Heads, with many small Flowers round about them, each in a few corneated Cup, of a delicate Crimson Color, in which Husks,
after the Flowers are past, grow small yellowish round Seed, one only in a Husk, whose beaks or corners then stand displayed, something like unto a Star.

Hares' Stones, See Goats' Stones.

Chap. 321. aforgoing.

Chap. CCCXXXVIII.

Hartichoke Garden, or, Artichoke.

Tm Names. It is called in Greek Rosoko, al-
so Kohrous, in Latin Cynar, and Cynara, as being of an ath color) and in En-
glish Artichoke, and Hartichoke.

II. The Kinds. There are three principal Kinds, viz. 1. Cynara Hortensis, Garden Hartichokes, of which in this Chapter. 2. Cynara Spinosi, or Spinosi, Wild Hartichokes, of which in the next Chapter. 3. Helianthus Canadensis, Jerusalem Hartichokes, of which in Chap. 330. following.

I. The Garden Kinds. They are manifold, as 1. Cynara Rhydra, The Common Green-Ked Harti-
choke. 2. Alba, The White Hartichoke. 3. Viridi-
dis, The Green Hartichoke. 4. Prosera, The Tall Hartichoke. 5. Paunina, The Dwarf or Low Arti-

Haresfoot

V. The third, or Longer Bearded Hares' Foot, has
a Root much like the former, its Leaves are hairy,
large, and larger than the former, with several con-
spicuous Vains in them, making them Seem like Wings,
the middle Rib on the back of them being somewhat
great also, the Flowers are like the former above,
both in form and color, but the whole Head is long-
er and larger.

VI. The Places. They grow with us almost
every where throughout England in dry Grounds,
the two latter growing chiefly with us in Gardens, but
are found growing wild in many places of Italy,
France, and Germany.

VII. The Times. They Flourish and Flower in the
Summer Months only, and their Seed is ripe in
August and September.

VIII. The Qualities. They are temperate in re-
spect to heat or cold, and dry in the first degree,
Astringent, Vulnery, and Stomachick.

IX. The Specification. They are peculiar against
Fluxes of the Bowels, chiefly the Bloody Flux, and
other Fluxes of Blood, as Spitting Blood.

X. The Preparations. You may have therefrom,
1. An Efficacy. 2. A Decoction of the Herb in
Water. 3. A Pouder of the Heads and Seed. 4.
Afoon of the Heads. 5. An Ointment or Balsam.

The Virtues.

XL. The Influence of Leaves, Stalks, Spiked Heads.
It dries and binds admirably, and it is known by
most certain Experience to Stop a Looseness, and other Fluxes of the Bowels, chiefly the Bloody Flux, being taken two, three, or four Spoonfuls at a time
in a Glass of Red Port Wine, but if a Fever is pre-
sent, it may be given in a Decoction of the Herb in
Water, it is good against Cholerick Belchings of the
Stomach, and griping pains of the Belly, and is
profitable to be given to such as have Pud and
d hollow Ulcers, which are stubborn and of difficult Cure.

XII. The Decoction in Wine. It has all the for-
mer Virtues, but not full out so powerful, being
mixture given with Juice of Alliums, or
Arbor Villiana, it eases the pains of the Bladder and
Urethra, and abates the fealding and heat of
Urine, and this Decoction, as also the Efficacy, it is
told to be admirably good against the Running of
the Reign in Men or Women, and may be used as a
Vulnary Diet-Drink.

XIII. The Pouder of the Heads and Seed. Taken
to one Dram Morning and Night in a Glass of Red
Port Wine, or in a Decoction of the Plant in Wine or
Water, (according as the Nature of the Distem-
per and Habit of the Patient may require) it helps
Spitting or Pilling Blood, prevails against the Bloody
Flux, and is a peculiar good in the Cure of a Con-
strictione, (Universties being premied) it is an Abil-
five, and not only cleanses foul and hollow Ulcers,
but also incanates, or fills them up with Flesh, and
Cementises them.

XIV. The Afores of the Heads, &c. Being appli-
ced to the Hamorrhoids or Piles, it stops their bleed-
ing, eases their pain, and heals them.

XV. The Ointment or Balsam. It is Vulnary,
cleanses, incanates, dries, and heals old running
Sores, and rebellious Ulcers, &c.
V. The second, or Great White Hartlechoke, is in all things like to the former Red Kind, but that the head thereof is of a whiter Abl color, like the Leaves, whereas the former is reddish. The head of this is more apt to dilate or spread it self farther abroad,

VI. The third, or Green Kind. It is not much unlike the two former Kinds, fasting, that the head of this is green, and very sharp upwards, and is found very common in many places; nor does it differ much in goodness from the former Kinds, but it is not altogether so sweet in taste.

VII. The fourth, or Tall Kind. It grows to a Mens height, and is branched into divers stalks or arms, every one bearing a head thereon, almost as large as those of the first Kind. This, though commoner formerly, is more rare to be met withal now.

VIII. The fifth, or Dwarf or Low Hartlechoke. This is a French Kind, and grows much about Paris, and which the French esteem more than any other. It is lower than the following French Kind, the head of which, as well as the Leaves, are of a lighter green Color, almost yellowish.

IX. The sixth, or French Hartlechoke. It has a white head, the scales of which bend flaring for a tender one from another at the ends, which are sharp: it is well known by this Quality, that whilst it is hot, after it is boiled, it smells so strong, that one would verily think that it had been boiled in thinking Water: this Kind was brought over to us in England after a great Froth, which had almost destroyed our beft Kinds, but we have now almost loft them again, not being willing they should take up the room or place of better.

X. The seventh, or Muskated Hartlechoke. It is a Kind which grows much like the former French, but it is much better in speding, though it has a leater bottom.

XI. The eighth, or Thistle like Hartlechoke. It is almost like the Wild Kind in its manner of growing, but it grows smaller, and with a more open and prickly head than any of the former.

XII. The ninth, or Prickly Hartlechoke, which the French call Chandon, or Cardon, because it is almost of the form and nature of a Thistle, or Wild Hartlechoke; it grows high, and full of sharp prickles,
Salmon's Herbal. Lib. I.

A greyish color. John Tradescant said that he saw Three Acres of Land about Enfield Planted with this herb, which the owner whisle like Enfield, and then told them in Winter for Winter Salleting. X. The Plants. These all grow in Gardens, but the two or three are the most common with us; we find by daily experience that our English Red Horseshoe is the most delicious of them all; they have been sent from us to France, Holland, Italy, and other Countries, where they have grown well for a Session; but they have not in these places retained their excellence and goodnes for above Two Years, but have much degenerated, whereas with us they daily improve, so that it seems our Soil and Climate has the preeminence, and is the most natural to this Plant in excelling it to its highest perfection.

XIV. The Times. All these Kinds are increased by slippering the young Shoots from the Roots, which being replanted in February, March, or April, have many times the same Year, but the best at furcibed from very good Heads. The Horseshoe is to be planted in a very fair and fruitful Soil, and they love Water, and a moif Ground; it is a great Error to cover over the Sides, or Superficient Leaves which grow by the sides, thinking thereby to increafe the greenness of the Heads, when in truth they deprive the Root of much Water by that means, which would make it, to the feeding and inlarging of the Heads, for if you mark the Trough or hollow Channel which is in every Leaf, it will appear very evidently, that these Furrows were designed, even from the extreme point of the Leaf to the Ground, where it is infined to the Root, for no other purpofe, but to guide that Water which falls far off unto the Root, for that without much Water the whole Plant would wither, and the Heads pine away and come to no thing; they are planted for the most part about Others, or somewhat sooner, the Plant must be let, and nourifhed with good Room of Air, for that kind of Manure is thought to be bett for the Plarming thereof, and ever Year the Slips must be taken or flippd off from the Root, and are to be let in April, as aforesaid, which will be fruitful about August following, as Columella, Palladino, and others, as alfo daily experience teaches.

XV. The Qualities. They are, viz. the nails or bottoms of the Scales or Fives, as alfo the bottoms, on which down and Seed fand, hot and moif in the fift degree, Diuretic, Analpleptic, and Spermaticetic.

XVI. The Specifcation. Being much eaten, they are fit to be irregular in foping the involuntary coufe of the Seed in Man or Woman.

XVII. The Preparations. You may have therefrom, 1. An Efferce, or Blood of the Heads. 2. A Decoction of the Root in Wine, the Fish being flirred up. 3. A Powder of the Seed. 4. The Sallet.

The Virtue.

XVIII. The Efferce, Sangus, or Blood. It is made of the bottoms, as the Blood of Paffrage, it is Diuretic, nourifhes much, and softens in Conflitution, the of the Lungs, and being taken from two to four Drams in Red Wine Morning, Noon, and Night, it raps the involuntary flux of Seed, commonly called Gonorrheæ simplex, yet it provokes Luft extremely, for it strengthens the whole Body.

XIX. The Decoction of the Root in Wine. Being drank liberally, it takes away the rank fweet of the

Wild Artichoke.

II. The Kinds. There are two ferveral Kinds, viz. 1. Scylmus Disperdis, Cyanae Sylvestris Lobati, because it so nearly resembles the Cyana auctiud.

Scolymus Sylvestris, Cyana Sylvestris Latifolia Batrani, The Wild Hartichoke, or Artichoke Thistle.

The Virtues.

XI. The Juice or Sauce. It opens the obstructions of the Reins, Urine, and Bladder, and is very diuretic, thereby expelling much phlegm and flinking Urine, and by that means attends the strong, rank, or flinking smell of the Armpits, and of the whole Body. Dote three or four Spoonfuls Morning, Noon, and Night, in a Glass of Generous Wine, or other fit Vehicle.

XII. The Decoction in Wine. It has the same Virtues, but not altogether so powerful, if it is made in Red Port Wine, it is a singular good thing to prevent Abortion, and to strengthen the Womb, as to cause a Woman to go out her time.

XIII. The Milky Juice. Althea Fays, that with this the People in some parts of Spain do copulate or cuddle their Milk, in order to the making of Cheese, but this is to be understood chiefly of the Juice of the third Kind.

XIV. The Flowers of the first Kind. They are used by the Italians, as Pensa and Lebed Say, to curdle Milk, of which they make Cheese, and that the old Flowers, being given to Women with Child, in their Broth, or Drink, do hinder Abortion, and cause them to go out well their whole time, they are also very good for such Women as are barren, and to enucleate.

XV. The Sallet. The young Shoots of the first are eaten like Asparagus, as also the young Heads, in Spain before they Flower, but they use to raise the Earth over the young Shoots till they are riven a good height, which are then white, and very tender and delicate to be eaten raw with Pepper, Salt, Vinegar, and Oil, or boiled, but chiefly when in Flower, and that the inner substance of the Heads is eaten, and with the Flowers they counteract Suffer, as we do with the Bedford Sufferon, or Suff LOWER.

Canada POTATO. |

I. The Name. It was unknown to the Greeks, but has variety of Names given to it by the Latin Writers: Pelletarius calls it Helianthus Indicum Taberanum, Colonna in the second Part of his Phytobonosus calls it Rsa Solis Varmosus, (because growing in the Cardinal's Garden) also After Peretius Taberanum, Badianus in his Prodromus calls it Chrysanthemum Latifolium Brachytum, but in his Pinus, Helianthus Indicum Taberanum, but our Parkinson in his Paradisus, as also in his Theater of Plants, calls it Batara of Canada, which he English Writers, Potatoes of Canada, but our usual English Name is Jerusalem Hartichoke, Badianus also in his Pinus calls it Arborech Sub Terra.

II. The Kind. It is a singular Plant of the Kind, but how it should be accounted among the Species of Artichoke is difficult to conceive, because it has no resemblance to any of thefe Plants in any of its parts, but the vulgar feldom give Names to Plants according to Judgment, and therefore it is not to be wondered
Salmon's Herbal. Lib. I.

III. The Description. This admirable Plant has at first but one small Tuberous Root, which sends up sometimes one or more fliifh round Stalks, which grow in our Country to be eight or ten feet high, but scarcely blow or show their Flowers, whereas the Head of Flowers in their Native Countries, (as Columnzus) being of a Pyramidal or Sugar-Loaf fashion, spreading broad below, and growing smaller upwards, almost to a point, is nearly of the fame length, on which are fliifh and broad, rough, green Leaves, very like unto the Leaves of the Sunflower, but smaller, and growing in the very fame manner round about the Stalks, at the very latter end of Summer, or beginning of Autumn, if the Root is well plant'd and defended, it will give a flow of a few fmall yellow Flowers at the tops, like to the Flowers of After, or Starwort, and much fliifter than any Sun-flower, which come to no perfection with us, the Root, while the Plant is growing above Ground, increases not to its full growth, but when the Summer is well fpent, and the fpringing of the Stalks is past, which is about the end of August, or in September, then the Root is perceived to be increafed in the Earth, and will (before Autumn is fpent) in October, fwell like a Mountain or Hilllock round about the feet of the Stalks, and will not have its Roots fit to be taken up, until the Stalks be half wither'd at foonet, but after they are wither'd, and fo all the Winter long, until the Spring again, they are good and fit to be taken up and used, which are a number of almost roundlih Tuberous Roots, growing clofe together, fo that it has been observed, that from one Root, being fat in the Spring, there has been forty or more taken up again, and to have done more than to have filled a Peck Measure, which Roots are of a pleafant good fhape, much like to the bottoms of the Heads of the Common Red Hartichokes.

IV. Another Decription from Gerard. Urs Solis Pyramidatis pars Flava, Radix Tuberosa. This wonderful Plant has growing up from one Root one, sometimes two, three, or more round, green, rough, hairy, fliifh Stalks, commonly about twelve Feet height, or sometimes fliifh Feer, or higher, as big as a Child's Arm, full of a white fpungy ftrike within, the Leaves grow all along the Stalks, out of order, of a light green color, rough, fharp pointed, about eight inches broad, and ten or eleven inches long, deeply notched or indented about the edges, very like the Leaves of Urs Solis Pernianus, but nothing crumbled, nor fur to broad as they, the Stalks divide themselves into many long Branches, even from the Roots to their very tops, bearing fliifhier Leaves and finer towards the tops of the Plant, making the Plant appear like a little Tree, narrower and ſhniower towards the top, in edition of a Sotifele or Pyramid, the Flowers with us grow only at the tops of the Stalks and Branches, like thole of the faid Urs Solis, but no bigger than Our common Single Marigold, confifting of twelve or thirteen divided, fharp pointed, bright, yellow, bordering Leaves, growing ftrong of a fliifh, fmall, hairy Head, with a fmall yellow threfh fliifhneffe within, the Flowers being taken in the培养学生 flowering, which is common two or three Weeks after Michaelmas, never with us bring their Seed to perfection, and it makes a show of abundance of fmall Heads near the tops of the Stalks and Branches, forth of the bottoms of the Leaves, which never open and Flower in our Clime, by reason they are prevented with the Frofts, which otherwise might possibly be a noble Sight, the Stalks and fliifh Stems, being covered with the Tuberous Roots, by which the nourifhment is received, which are full of hairy Threads, even from the upper part of the Earth, spreading far abroad, among which, from the main Root, grow forth many Tuberous Roots, clustering together, fomtimes hid in the great Root it felf, fometimes growing on long Stings, a Foot or more from the main Root, rising or heaving up the Earth above them, and fometimes appearing above the Earth, producing from the inceffent of one Root thirty, forty, or fifty in number, or more, making in all commonly about a Peck, and many times near half a Bushel, if the Soil or Earth be good. thes Tuberous Roots are of a dirty reddifh color without, and of a fliifh white fubftance within, bouching in many ways, sometimes as large as a Mars Pea, or not fo big, with white procequence, whence they will ftain or grow up again the next Year, the Stalks are bowed down, and fometimes some part of them continue to be wither with the S arp, from Thel small creeping thready Roots, and alfo Tuberous Roots, like the former, as by experience has been found, these Tuberous Roots will abide and live in the Earth all Winter, tho' the Stalks and Roots by which they were nourifh'd do absolutely rot and wither away, and will begin to ftand up again at the beginning of May following, feldom sooner.

V. The Places. It is native of Brazil, Canada, and Peru, and other fome other parts of America, and now it grows as plentifully with us in England as in any of the places where it grows naturally; Mr. Good- fer fays that he received two small Roots of this Plant from one Frazzall of London, no bigger than Hen's Eggs, the one he gave to a friend, and the other he Planted, and it brought him forth a Peck of Roots, wherewith he bore Huftefrof, and now it grows in great plenty in many other parts of this Kingdom.

VI. The Times. It flowers generally in October, but Seeds not with us, and its Roots are in perfection on all the Winter Months.

VII. The Qualities, Specification, Preparation, Virtues and Uses, are the fame with thole of Hartichokes in Chap. 338 foregoing, fave, that whereas in thefe the Heads of the Hartichokes were only used and eaten, in thefe the Tuberous Roots only are taken.

VIII. Note. They are boiled in Water till they are tender, after which they are peaded, liled, and Stewed with Butter, Salt, Pepper, and a little Red Port Wine, by which means they become an Excellent Dift, and more plentiful than the bottom of an Hartichoke, being now very plentiful and cheap, they may become good Food for Poor People, and keep Thoufands from Starving, which might otherwise perish.

HARTSHORN. See BUCKSHORN, Chap. 91. foregoing.
HARTS-TONGUE True, or DEERS-TONGUE.

I. THE Names. It is called in Greek Phyllitis, Phyllitis quafi foliosa, in Latin alfo Phyllitis, and Lingua Ceranae, in English Deer-Tongue, and Harts-Tongue, I fuppofe from the form of the Leaf. II. The Kinds. It is either, 1. Phyllitis vera, of which in this Chapter, or 2. Phyllitis Notha, feu Hafard Harts-Tongue, of which in the next. The Phyllitis vera, or True Harts-Tongue, is alfo threefold, viz. 1. Phyllitis, fei Lingua Ceranae vulgaris, Our Common or Ordinary Harts-Tongue. 2. Phyllitis laterana orcruged Harts-Tongue, or Finger Harts-Tongue. 3. Phyllitis ramosa Alpinus, Branched Harts-Tongue of Alpina, which he has notified in Libro de Existenti.

III. The Descriptions. The first, or Common True Harts-Tongue. It has a Root which is a bunch of many black fivers or Threads, folded or interlaced together, which sends up fome Leaves, every one of them riving up fingly from the fame Root, which, as other Ferns, fold themfelves in their fift sprouting and spreading, thofe Leaves when they are full grown are about a Foot long, smooth and green above, but hard, or with little Sap in them, and flaked on the back thereof with both fides of the middle Rib with fmall and somewhat brownifh marks, the bottoms of the Leaves are a little bowed on each fide of the middle Rib, somewhat narrow with the length, and fomething small at the end. Some do make two fhort hereoif, and diftinguifh them by the Epithets of Latifolia and Anguiijofla.

IV. The second, or Jugged Harts-Tongue, after growing from the former neither in Root, Leaf, nor manner of growing, but only in the division of the tops of the Leaves, which in this are deeply riven or jugged, fome Leaves much and fome fittle, according to the place of growing and time of advising. Now it is to be observed, that neither of thefe Plants have either Stalks, Flower, or Seed.

V. The third, or Branched Harts-Tongue. It has a Root which is something woody, with black black fivers thereof, fothing forth many slender broad Stalks of Leaves, of two or three feet long, a little Downy at bottoms, divided into many long and narrow Leaves, denoted about the edges, and for one against another, with an odd, one at the end, each refembling the Head of a Livin, and the three with a ftraight leaf on both fides unto the middle Rib, the whole Plant is without fmall, but of an infufle title, containing fome heat, which is not prefently felt, but continues long.

VI. The Places. The fift, or Common Harts-Tongue, grows by the way fides in great plenty as you go from London to Exeter, in shadowy places, and in moist from Vallys and Wells, alfo is much planted in Gardens, the fcond grew in the Garden formerly one Cranwebbe's, a Chirurgiun, living at Much Dragon in Eflor; the third is partly a ftren- get with us.

VII. The Times. They are grown all the Yeat long, but let's green in Winter, and in Spring and Summer they fometimes bring forth new Leaves.

VIII. The Qualities. They are drying and cooling in the full degree, Aperitive, Alkalin, Hepatic, Splenietick, and Alexiapharmick.

IX. The Specification. They enter the Splenietick, stop Fluxes of the Bowels, and bloody Fluxes, and wonderfully ftrongen the Vifcera.

X. The Preparations. You may have therefore, 1. A Decufion in Wine or Water. z. A Spirituous Tincture. 3. A Phyllitic Water.

XI. The Decufion in Wine or Water. It opens obfiurations of Liver and Spleen, taking away also the pain and hardness of the Spleen, and it is a fine- ful good thing againft the Rickets in Children, and the Cachexia in Virgins and Young Women, it stops all forts of Fluxes of the Belly, more efpe- cially the bloody Flux, strengthens the Stomach, and refhores the Tone of the Bowels, being deprived or hurt, made in Water it fbrates the heart of the Liver and Stomach, and is good againft the filling of the Palliar. Dope four or fix Ounces.

XII. The Acid Tincture. It more powerfully opens obfiurations of Stomach, Liver and Spleen than the former, and therefore is a ftronger thing to cure the Cachexia and Green-Stomach in Virgins, and being continued to be given to Children troubled with the Rickets, it perfectly cures them, give it to them in all that they drink, fo many drops at a time as may make their Drink be garefly pleafing, it opens the obfiurations of the Lungs and Stomach in little Ones, and makes them breath freely, it is good againft the bleeding of the Gums, and a lu- gar thing againft the Bitings of Serpents, or other Venonous Bealls.

XIII. The Spirituous Tincture. It strengthens the Stomach, Liver, and Spleen, and more powerfully stops Fluxes of the Belly, and in effeetal Boodly Fluxes, than the Decufion in Wine, for any other Preperation of the Herb, it is good to refir the force of Poyfon, and refhores the Tone of the Bowels being hurt, strengthening them so admiration. Dope from one Dram to three Drams, in any Q u a t.
proper Vehicle, Morning, Noon, and Night, for some time.

XIV. The Diluted Water. Taken with some of the Species in Tincture it is good against Fluxings, Swocings, and other Parishes of the Heart, and so mixed it stops the bleeding of the Gums, and taints the Teeth if loose.

CHAP. CCCXLII.

OF HARTS-TONGUE Bafiard, or MULES-FERN.

I. THE Names. It is called in Greek Αὐξάνει, in Latin Hemionitis, and Splenium, the former gaud Matarrin, the latter Splenium, ex Splen, a Splenius fignus; in English it is called Bafiard Harts-Tongue, Mule-Fern, and Moon-Fern.

III. The Descritions. The first, or Common Bafillard Harts-Tongue, in its Roots, Leaves, and manner of growing, does very much resemble the former kind, or True Harts-Tongue, both in form and color, but that the Leaf is somewhat broader or larger, and that the Leaves, being breadth-below, have a larger hollow bowing, like unto an Half-Moon, on each side of the middle rib, and the spikes on the back of them are more foping.

IV. The second, fettler, or Barren Bafillard Harts-Tongue, has a small thread root like the former, quickiy gathering, its Leaves exceed not the breadth of three Fingers, not hard, nor rough, but smooth and gentle, and without any marks on the back sides of them, yet with a hollow round bowing at the bottom of them, as in the former, and besides somewhat unevenly-dented about the edges: Clusius says, that Lobel having lent him some Plants of this Species, after that he had kept them in a Pot, because of their tendernefs, in two Years time they chang'd their form into the Jagged Harts-Tongne, at which he much wonder'd, for afterwards, (as he fays) when he came into England, he gathered with his own Hands in the fame place the like Plants, which there held the form of Hemionitis, or Baflard Harts-Tongue.

V. The third, or Strange Bafillard Harts-Tongue, differs in nothing from the frft of thefe three kinds, but in the bottoms of the Leaves, which have a small Ear, or piece of Leaf, feft on each fide of the arch'd or hollowed bottoms.

VI. The Places. Thofe all grow upon shadowy Rocks, and mollit hollow places, where little heat of the Sun comes, and are given all the Year in the True Harts-Tongue in the former Chapter: The fettles of thefe Louflays he found on St. Vincent's Rock, not far from Bristol, in a hollow Cave or Hole.

VII. The Times. They are in their perfection in the advance of the Spring, but keep their greennefs all the Year long.

VIII. Their Qualities, Specification, Preparations and Virtues, are the fame with the True Harts-Tongue in the former Chapter, they are specially good against Diffickles of the Spleen, and may be used instead of the true Tingia tingens to all Inten- tions and Purpofes.

CHAP. CCCXLIII.

OF HARTWORT.

I. THE Names. It is called in Greek Μαραθών, in Latin Safell, and of some Sort,丑, and in Eng- luf Hartwort.

II. The Kinds. Authors make many Kinds here- of, but the following four are chief, viz. 1. Safell verum, and Disfordiris confufus, Safell Melan- ienne Putea Famulicis Lobelii et Clusii, The True Safell or Hartwort of Dioscorides. 2. Safell Cretonis, Safell Melanique Lobelii forma aut Dauri Cretau facie, Safell Melanique Mathioli, Safell Melanique monilarius Clusii, Candy Hartwort, or another Hartwort of Mathifles. 3. Safell Melanique Præ- rene, Safell Pratæse Moscelicium, Hippoma- theum Tuttonianum, Meadow Hartwort of Mar- ifles, or Mampelli. This Caffian in Hone thinks to be Largifate Autumn, Pufillana calls it Mos- celicium Pratæse, and Batchelors thinks it to be Silus Pinnis, in Lab. 36. Cap. 8, and fays it is Pöllianca nigra Cord, but that of Cordas has divided Leaves, like Wild Carrot, and has yellow Flowers, whereas this is more like Fennel, and Hill Flowers. 4. Safell Polopônicae reccomparum, Safell Polopo- nica verum, Safell Polopônica Putea Comps Disfordi- dis, as Lobel fays, The Common or True Hartwort of Polopônica of Dioscorides. 5. Safell Pratæse tenuifilium Lechium, for Dauris Pefaræ Pratæse tenui- folium, which is the true Pöllianca nigra Cord, Nar- row
Chap. 343. English Herbs.

row Leaf'd Meadow Hartwort of Germany. 6 Sefci Apium Criticalum minus Lobelii & Lugdunensis, & Canadarius, Tordylium Lobelii, Pimpinella Romanus alterum genus Sefeli Caipulina, The Greater Candy Hartwort. 8 Sefci Criticalum minus Ordinon Nicolosi, Tordylium Dunfordiz, as Angelica Lys, Tordylium and Gordonian Dodons, Gesiers, & alterum, Canntii Cretica, & Grassorum Berti, Pimpinella Romanus, Gesiers & Berti. 10. Sefci Criticalum minus Tordylion, The small Candy Hartwort. 9 Sefci Criticalum minus Tordylium alterum luteum Columna, Great yellow Hartwort of Candy. 11. Sefci Montanum Folio Genteus glabrum, Sefci primum Montanus Cliffs, Mountain Hartwort with smooth Hemlock like Leaves. This Bulkent is thought to be Levillicum alterum Lobelii & Lugdunensis, and Lignillicum secondum Herbarium Tuberamontani, all the Sefci Peloponecitum Dusforiz. 12. Sefci Montanum Folio Genteus Lobulatum, Hairy Mountain Hemlock Leaf'd Hartwort. 13. Sefci Ethiopicum brutex, Sefci Ethibicium verum Dusforiz, as Lobel Lys, Sirap Ethio- 

III. The Description. The first, or True Hartwort of Dioscorides, has a very white, long, flaker Root, like unto Fennel, but smelling better, and taling better and sharper, having a few Fibres adjoining thereto; from whence rise one or more Stalks, having but few Leaves, thinly set thereon, which are thicker and shorter and harder than Fennel Leaves, turning downwards, of a greyish Aeth color, as all the rest of the Plant is, more especially in the hotter Countries, for in some places they are thicker, or longer, or thicker than they are in others, as Bulkent has observed. the middle stalk seldom rises up above a foot high, bowing to and fro sometimes, having many Branches from its bottom, with the like Leaves on them, and each bearing Umbels of white Flowers, but sometimes purplish, though seldom, after the Flowers are gone, small seed follow, more like to Mr. Aemidus than Fennel seed, pretty pleasing in taste, yet sharp and hot.

IV. The second, or Candy Hartwort, being another Hartwort of Marfellis. It has a thick, long, and white Root, with several Strings and Fibres adjointing thereto, from whence rise up several Stalks, the mid-dlemost of which is about a yard or more high, of a

Fingers thickners, crested, jointed, and spread first into several Branches, and other smaller putes, the Leaves are Fennel like, but thicker, and thicker divided, green, and hard, with white points, its winged Stalks or Branches are large, and more spread out than Fennel at the top of each stalk and Branch is an Umbel of white flowers, which turn into the Seed, not much unlike to Angelica Seed, but larger than Dill Seed, hot, and very aromatic.
The third, or Meadow Hartwort, has a Root which is black without and white within, divided into several Branches, with leaves adjoining to them, and of a size and form to them, from this Root rise several Stalks of Leaves, as also Stalks, two or three feet high, with several large spread Stalks of winged Leaves, very finely cut into many parts, each being like unto Fenella, but larger, broader, and of a dark green color, set at the joints, and branching forth towards the tops, bearing Umbles of white Flowers, which being paff, small, long, and somewhat flat Seed comes in their place, which is larger and blacker than Fenella Seed, and never unto Anemone, or Spiget, of little small, and a small sharp taste.

Salmon's Herbal. Lib. 1.

VI. The fourth, or Common or True Hartwort of Peloponnes is Dioscorides. This Greater Hartwort has a great Root, blackish on the outside, and white within, growing deep into the Ground, like Venula, or Vipis, something sweet in smell, and hot in taste, the Stalk grows to be about two Feet high, or more, as thick as once Finger, with several large fixed Leaves at the bottom, as green as Hemlock, but crumpled, rough, and hairy, the Stalks and Branches bear large Tufts or Umbles of yellow Flowers, which being paff away yield broad, flat, winged Seed, or a pale yellow color, somewhat like unto Angelica, but greater, and nothing to thick, of a very sweet smell, as sweet as the Sefect Abipionis, this, says Lelot, the most Learned and Judicious Herbarist of Alpantier acknowledge to be the true Sefect Peloponnes Dioscoridis, though formerly they took it to be a kind of Thapsis, but the true Thapsis is much differing from it both in form and color, as those who please to observe may find.

VII. The fifth, or Narrow Leafed Meadow Hartwort of Germany, has a Root as thick as once Finger, and very long, black without, and white within, of a sharp and somewhat bitter taste, from this it grows up a round, erect, or peaked Stalk, three Feet or more high, with several Joints and Leaves at them, very like for their form and divisions unto Wild Carrot Leaves, but smooth, and not rough, and of a deep green color, spreading it off forth in several Branches, bearing at their tops Umbles of whitish yellow Flowers, after which fall small long Seed, somewhat like to those of Fenella or the money, or between them both, and a little Aromatic in taste.

VIII. The sixth, or Milly Musk Hartwort. It has a long Root, which is brown on the outside, white within, and of an unpleasant taste, joined with much heat, by which it inflames the Throat, but being planted in a Garden it loocks much of that evil taste and burning quality, becoming much more mild, the Root feeds up a Stump or Skul four or five feet high, with Joints, and long Stalks, or Branches of well spread Leaves set at them, the divisions of which are small, and much cut in, almost like to those of Common, or between them and Fenella, in the top of the Stalks it spreads forth into Branches, which bear at their tops small Umbles of whitish Flowers, which being paff away, flat, thin, winged Seed follows, the whole Plant, or any part thereof being broken, there flows from it a certain Milk like Juice, as there likewise does from many other Umbelliferous Plants.

IX. The seventh, or Greater Candy Hartwort. It has a Root which is white, somewhat long, and woody after it has Seeded, and then perishes, rising again plentifully from the Sowing of its own Seed. This Root feeds forth rough, hairy, round Stalks, about two or three Feet high, set with long Stalks of winged Leaves, much resembling Forsfep Leaves, both in form and magnitude, yet somewhat round and narrower, dented about the edges, and pointed at the ends, being rough and hairy likewise, and running themselves a little backwards to the Stalks, towards the tops of the Stalks they spread themselves forth into Branches, and have smaller Leaves set at the Joints than grow below, bearing Heads or Umbles of purplish white Flowers, whereon, after they are gone, grow whithish, flat, round Seed, circled about, as it were, with a border, and cut in round about it alo with round dents, of little or no smell or taste.

X. The eighth, or Small Candy Hartwort. It has a Root which is unprofitable, and as perishing as the last, which tends up such like Skalks of winged Leaves at the former, but smaller, rounder, and shorter, a little hairy, and whitish; the Stalks are longer and lower, fuller of Branches, bearing paler purplish Flowers in Umbles, and Seed after them, of the same form or shape, but quicker, in the Herb also is, and therefore the more accepted, and used as a Salier Herb in Italy, and other Southern and hot Climates.

XI. The ninth, or Great yellow Candy Hartwort. It has a Root which is unprofitable, and as perishing as the foregoing, or Greater Candy Hartwort, having the like Leaves on the Stalks, but somewhat broader and shorter, a little sharp in taste, and not above two or three paces together, set on the like Stalks, but finer, and fuller on the Branches, and bearing Umbles of yellow Flowers, like Dill, without any Leaves under them, as the others have, which being paff away the like whithish, flat, round, Buckler like Seeds, ringed and dented about the edges below, but they are larger and smoother, and divided in the middle, with a brownish broke or line, making the Seed form like unto a kind of Thapsis, or Trinelle Mussard Seed. Commonly says that this Flowers and Seeds at Naples in May, and grows only in Gardens there.

XII. The tenth, or Small Skiff Candy Hartwort. It has a Root which is small, white, hard, and a little hot in taste, this Plant is very like unto the Lesser Candy foregoing at Sect. X. above, but it has Leaves like to the lower Leaves of Coriander, but larger, a little hairy, the first Leaves being of an Inch and half
English Herbs.

Chap. 343.

half long, and an inch broad, and denoted about the edges with round dents, the second Leaf is of two kinds, one of which has two leaves set theron, smaller and rounder than the other, about half an inch broad, and a bigger Leaf at the end, yet smaller and longer than the first Leaf, now are left big and larger, and the Stalk is naked of Leaves below, being small, hairy, hard, and flanked, and carrying thick Umbles of white Flowers, with yellow Throats in the middle, and outstand with long hairy Leaves, the outward Flowers being larger than the inner, thereby making the Umbel resemble that of the Wild carrot; after which come such like Seed as the former, but not half so large, the middle part being of a darker color, before they are ripe they look of a purplish green, but when they are full ripe white, of an aromatic taste, somewhat bitter, and a little sweet in small.

XIII. The eleventh, or Mountain Hartwort with smooth Hemlock like Leaves. It has a long Root, divided into two or three Arms or Branches, of a brownish black on the outside, and white within, from whence it growing a Stalk, which is hollow, and rises up to the height of two Feet, or two Feet and a half; from which Stalk come forth (at joints) large thread Leaves, divided into many smaller parts, like unto Hemlock, or Sefol Palmifone, the highest, up the Stalk the smaller and longer the Leaves, which are covered with small down; and on the top of the Stalk comes forth larger Umbles of white Flowers, which turn into yellowish crefted Seed, two joined together, of a hot and aromatic taste.

XIV. The twelfth, or Mountain Hartwort with hairy Hemlock Leaves. It has a long, thick, dark colored Root, which sends forth broad Hemlock like Leaves, or like to the Greater sweet Chervel, of a good green color, and long, smooth and hairy, especially the footstalks of the Leaves, from the midst of which rises up a thick, hollow, crefted, hairy, and jointed Stalks, about two Feet high, divided into several Branches, with some few Leaves themon, but much lefter, and in like manner divided, near the top of the Stalk it floots it self forth into many Arms or Branches, at the tops of every one of which grows a pretty large Umbel of white Flowers, covered by long thread pointed Seeds, two joined together.

XV. The thirteenth, or Shrub Athiopian Hartwort. It has a Root which is great and woody, an Arm or Branch, sitt out into several Arms or Branches, with several Vires issuing thence, and which after many years, if it is defended from the cold, from this Root therefrom several woody rough Branches, covered with a blackish Bark, divided into many Branches, two, three, or four Feet, or more long, better with many fair, large, thick, hard, smooth, pale green Leaves, being long, and some what like unto Woodland Leaves, but not so broad, smooth or even on the edges, and not faint or daint at all, on the tops of the Branches stand small Tufts of yellow Flowers, which afterwards bear brownish, round, and long Seed, bigger than sweet Krauter, which whole Plant finally very fragrant, and the Seed beft, being of an aromatic taste, somewhat bitter, and sharp wirft: This is commended by Disforicles to be the beft of all the Hartworths, beyond that of the other.
Salmon's Herbal. Lib. I.

Of Hawkweed Common.

I. The Name. It is called in Greek Ακρων, ab hiek, Accepter, An Hawk, (σι διδωμα γονδ Ακινθη παν η λυτον ιενων) in Latin Hieracium, and by some Authors Accipiterin, in English Hawkweed.

II. The Kinds. Authors make a vast number of the Kinds of this Plant, many of which grow not with us in England. Parkeinson divides them so many as he Treats of into nine general Heads, making them in all Fifty five Several Species, viz. 1. Sharp pointed Dandelion like Hawkweeds, Seven Kinds. 2. White pointed Dandelion like Hawkweeds, Ten Kinds. 3. Gum Succory like Hawkweeds, Four Kinds. 4. Garden Succory like Hawkweeds, Three Kinds. 5. Wild Succory like Hawkweeds, Four Kinds. 6. Mountain Hawkweeds, Five Kinds. 7. Haire Mountain Hawkweeds, Thirteen Kinds. 8. Meadow Hawkweeds, Three Kinds. 9. Dusky Hawkweeds, two Kinds. We shall not follow this Division, nor yet Treat of all those several Species, but only of so many as are to be found growing in England, and therefore we divide them but into two principal Heads, one of the Common Hawkweeds, of which in this Chapter. 2. Of the less common Kinds, of which in Chapter 337 following.

III. The more common Kinds. These are in number Eleven, viz. 1. Hieracium majus Somchilles, Hieracium majus Matthioli, κυσθιον, Dodona, Lobetij, (or alorum, Taraxacum major Loniceri, Intusius fentvus Tragi, Hieracium Sono folio varius, Hieracium minus Laguanensis, (because he makes the Chondrilis prior Diaphorides is his Hieracium magnun Common Great Hawkweed with Sow-Thistle Leaves. 2. Hieracium Dennis Leonis folio album, and bifurca album, and magis Inametiliam Lobetij, Hieracium alatum Saxatilis Montanum Colchom, Rough Dandelion like Hawkweed. 3. Hieracium Dennis Leonis folio trifurca album, Dandelion like Hawkweed. 4. Hieracium Dennis Leonis folio Florus paruis, Dandelion Hawkweed with small Flowers. 5. Hieracium orator Hypornia, seu Portulaca dillum Tibermonum, Hieracium minus Dennis Leonis folio sub albus, Dandelion like Hawkweed. 6. Hieracium Dennis Leonis folio Florus paruis, Dandelion Hawkweed with small Leaves. 7. Hieracium orator Hypornia, seu Portulaca dillum Tibermonum, Hieracium minus Dennis Leonis folio sub albus, Sowes Hawkweed with rough Leaves. 6. Hieracium volv. et folia Chondrilis Lobetij, Gum Succory like Hawkweed of Leech. 7. Hieracium Chondrilis folio glabrum, Smooth deep jagged Hawkweed. 8. Hieracium minus Radici preseroa Lobetij, Hieracium minus Matthioli, Tragi, Pabphi, Gesnori, Tibermonum, Gerardi, & alorum, Hieracium Lepironia, Succel Tartugia, & Lullia Lepironia, Tieris Dalechampian & Ludiofominis, (because of its bitterheds Hieracium Cordifolia folio Radici Sowetia Bani, Sowes Hawkweed, or Yellow Devil's-bit. 9. Hieracium sinuatum profunst Praeferte, Meadow Hawkweed with deep cut Leaves. 10. Hieracium Praeferte non sinuatum major, Greater undescribed Meadow Hawkweed. 11. Hieracium Praeferte non sinuatum minus, The lesser undescribed Meadow Hawkweed. This being said, it is to be understood, that the Hawkweeds grow as in a medium between the Scoparia and the Sow-Thistles, as in some medium of parallelating of them both.

IV. The Description. The first, or Great Hawkweed, has a Root which is long, and somewhat great, with many small white thorns, from whence spring...
Chap. 343. **English Herbs.**

up many large hairy Leaves, lying on the Ground. much rent or torn on the sides into several, others, and jaggs, somewhat like unto Dandelion, but with greater parts, more like unto those of the Smooth Son-Thistle, the whole Plant being full of a bitter Milk, from among which rises up a hollow rough Stalk, two or three Feet high, Branched forth from the middle upwards, on which are fat, at every joint where it Brancheth, longer Leaves, little or nothing rent or cut in, bearing at their tops several pale yellow Flowers, consisting of many small narrow Leaves, broad pointed, and notched in at the ends, fat in a double row, or more, the outermost being larger than the inner, which form most of the Hawkweeds, do keep in all their Sorts or Varieties, which being past away turn into Down, and with its small brownish Seed is blown away with the Wind.

Great Hawkweed.

V. The second, or Rough Dandelion, like Hawkweed. It has a Root which is small, some more like a Finger, with a few Fibres adorning thereto, from whence springing several long and narrow hairy Leaves, reddish at the bottom next the Root, deeply waved or torn in on the edges, being about two Inches long, from among which rise one, or two, or more bare or naked Stalks, rough or hairy, bearing each of them a double yellow Flower, like unto the Hawkweeds, which being past away turn into Down, as the former does.

VI. The third, or Dandelion Hawkweed, has a small and fibrous Root, which sends forth six or seven thick rough Leaves, lying on the Ground, about two Inches long, and half an Inch broad, round pointed, and jagged about the edges, as other Hawkweeds are; the Stalk is hairy all, and Branched, about a Span, or eight or nine Inches high, having smaller Leaves thereon, with smaller divisions, at the tops stand very yellow Flowers on very short Footstalks, shooting out very fine hoary Hanks, pointed at the leaflets, with many points.

VII. The fourth, or Dandelion Hawkweed with small Flowers, has a Root which is small, white, woody, and fibrous, the Stalk is round, a Foot high, and somewhat hoary, at the bottom of which grow a few rough Leaves, bitten in (as it were) about the edges, and about three Inches long, and half an inch broad, having but few Leaves thereon, and those about the middle, which are but only dented, and encompass it at the bottom, bearing very many small yellow Flowers together at the tops thereof, which grow upon very short Footstalks.

VIII. The fifth, or Swines Hawkweed with rough Leaves. It has a small and long Root, and is but a small Plant, having several somewhat long and rough Leaves lying on the Ground, smaller at the bottoms, and broader towards their ends, unevenly waved about the edges, the Stalks are a little rough, flender, and bare of Leaves, Branching into several long Stalks, about half a Foot in length, bearing every one a large yellow Flower, like unto the Hawkweeds. There is another Plant of this sort, whose Leaves are smooth and narrower, but differing little in any thing else.

IX. The sixth, or Gum Suckery like Hawkweed. This grows not so high as some others, and has its Leaves thicker jagged, but not so large, each jag something dented all, and something hairy, the Flowers are yellow, but not so thick or double, but growing in a Tuft together, which being ripe, and turned into Down, are, with its Seed at bottom, blown away with the Wind, as the Down of other Hawkweeds are.

X. The seventh, or Smooth deep jagged Hawkweed. This differs not much from the last, but that the Leaves hereof are smooth, and very much and very deeply jagged, even to the middle Rib, each jag being small, narrow, and pointed, its Stalks, Flowers, Down, and Seeds are like unto the former.

Small Hares Hawkweed.

XI. The eighth, or Hares Hawkweed, or Yellow Devilish-Bit. Its Root is made up of many Strings, like a Plantain Root, but the middlemost part, which is greater, is short, as if it had been bitten off, like the Root of Devils-Bit. This Root sends up many Leaves, of which those which lie next the Ground are somewhat long and narrow, cut in on the edges into small
and short pointed galls, the Stalks are small, and closely grown to be a foot high, spread out into a few Branches, with some Leaves here and there upon them, which have no division or dents on the sides, at the tops of the Branches stand the Flowers, which are much flattened one from another, each upon a long Footstalk, consisting of fewer Leaves, or being less double, of a Gold yellow Color, which, being tall up, are succeeded with Down, like the other Hawkweeds, the whole Plant, and every part thereof is very bitter, rather more bitter than any of the others.

XII. The third, or Meadow Hawkweed with deep cut Leaves. The Root is blackish and woody, the Leaves lying next the Ground are many, long and narrow, and deeply cut or torn in on the edges, and pointed at the ends, each Leaf standing on a long Footstalk, and covered with a Downy palisade, as the whole Plant besides is, the Stalk is hollow, round, and about a Yard high, having a few sick-like deep cut Leaves thereon, it is spread throug several Branches, at the tops of which stand Gold yellow Flowers on several long Footstalks, succeeded by Down, as the others are.

XIII. The fourth, or Greater dented Meadow Hawkweed, but a small and black Root, with several long Strings adhering to it, from whence rise up several rough Leaves, lying upon the Ground, each about five inches long, and an inch and half broad, without any galls or dents on the edges, being very green, and ending in a round point, from among which rises up one angle, straight, and crested Stalk, about a Foot and half high, wholly naked, or diti- tute of Leaves, bearing at the top a number of small yellow Flowers, set close together, as it were in a Tuft, every one upon a short Footstalk, which being past away, do, like the reft, turn into Down, and pass away with the Wind.

XIV. The eleventh, or Lobefie undentated Meadow Hawkweed. Its Root is something long, and of a mean thickness, the Plant is leffer than the former, and has many leafer Leaves undentated lying upon the Ground, of an inch and half long, and an inch broad, being almost round, and rough, the Stalk which ris- ses from the middle of them stands upright, and is crested, bearing at the top a few sick like Flowers as the former, which being past away turn into Down, which is also carried away with the Wind.

XV. The Places. The first and second grow in several places about Fields and Pathways in dry Grounds, the third, fourth and fifth grow also in Fields, with grounds, lanes, and By-Ways in many places of England, the sixth, seventh and eight grows plentifully enough in many places of our Land, and sometimes in Gardens, the ninth, tenth and eleventh grow in Fidds and Meadows, and by Wood sides which lie open to the Sun.

XVI. The Times. They all Flower, and the Down flies away in the summer Months, viz. in June, July, and August, and rise again of their own Scoring.

XVII. The Qualities. They are all cold and dry in the first degree, Adstringent, Astringent, Apyrid, Diuretic, Pectoral, Stimulant, and Alepharmac.

XVIII. The Specification. It caifes pains of Liver and spleen, and opens obstructions of the Lungs.

The Virtues.

XX. The Infipitate Juice. A Diam thereof dissolved in White Port Wine, adding a Little Vinegar when it is given, opens the obstructions of the reins, ureters, and bladder, provokes Urine, and prevails against the Dropleth, it is also good against the Sting- ing of Scorpions, and Biting of Serpents, or other Venemous Beasts, it is also good against the pain and hardness of the Spleen, and procures Rest and Sleep.

XXI. The Essence and Liquid Juice. It is cool- ing, drying, and binding, and therefore good for the heat of the Stomach, and growing thereof, for In- flammations, and the hot Fits of Ague, the Juice given to two or three Spoonfuls in Wine helps Di- gestion, diffuses Wind, hindereth Credities, helps the depredated Tone of the Stomach, is good against the Strongyly, or Ruptures of Urine, and prevails against all the Diffares for which the Infipitate Juice is given.

XXII. The Decotion in Wine. It has the Virtue of the Juice and Essence, but not full out so powerful, made with Wild Sworshy and taken, it helps the Wind Colick, pains and hardness of the Sp'een, procures Rest and Sleep, hindereth Vomery, and Noctur- nal Pollutions, cools and purifies the Blood, opens obstructions, and cleanses the Stomach, Reins, and Bladder: The Decotion mixed with Hossy and taken, it digests thin Flegm in the Lungs or Lungs, helps the Cough, Houffens, Wheezings, obli- cations of the Vicfors, and caues Expiration.

Dole for eight Ounces twice a day, viz. Morning and Night.

XXIII. The Collyrium. It is thus made. Take clarified Juice of Hawkweed eight Ounces, Honey four Ounces, Rock Alum six Drums, mix, and, and make a Collyrium. It is singular good for all Dif- feases and Diffaures of the Eyes, in tender Sigaret that it may be mixed with Womenes Beet Milk, or with Cows Milk, and so used, it is also used with good success in curing fretting and curing Ul- cers in any Part, especially in their beginning.

XXIV. The Cataplasm. Outwardsly applied it is good for hot Dissemps of the Eyes; if it is made of green Herb briiled, and with a little Salt ap- plied to any place burn'd with Fire, before Blisters do arise, it takes out the Fire, and gives ease it also allays Inflammations, and St. Anthonly-Fire, cases Pulpes and Eruption in the Skin, drives heat and draws forth all violent Humour, if it is made by boiling with a little Milk and Barley Flower, or White Bread, and applied to any place affected with Fire, it draws out all. But when there is a Swelling Contusion, it relieves the Tumor, and eases the pain.

XXV. The Diftilled Water. It is used to cleanse the Skin, and take away Freckles, Spots, Morpoph, or Wrinkles in the Face and Skin.

XXVI. The Acid Tincture. It removes the par- tumours heat of the Stomach, cool's the heat of Fe- ver, and helps a hot and dry Liver. Dole so many drops as to make the Ale, Beer, or Wine pleasantly acid, and to be drunk in all that the Patient drinks, it caises also a hot Scars.
of HAWKWEED Lfs. Common.

L T H E N a m e r. It is called in Greek Ἀ ανδρόκλης, in Latin Hieracium commune, vel varium, Hieracium minus commune, in English Hawkweed lfs. common, or not so rare as to be met with, as being either rare, or otherwife, Exotic, and so only Garden Plants with us.

IV. The second, or other Great Hawkweed. The whole Plant is bitter, and persifes as the first approach of Winter, being both Annual, and to be new Sown every Year. its first Leaves are little or nothing dented, but something like Fandore, yet those which follow are cut in on the sides, not so much as the Son-Thistle, else not much unlike, which are more tender, yet larger than the left in the former Chaper, as the Stalks are likewise, bearing on the Branches greater Husks, wherein the Flowers grow, which pass into Down, with rough crooked Seed lying therein, and are both dispersed and blown away with the Wind.

V. The third, or Long Rooted Hawkweed. Its Root is white, small, and long, running down as deep into the Ground as may be seen, and not Root, but some of it has been observed with more and shorter Roots; the Leaves which ly upon the Ground are long and narrow, richly torn and jagged on the edges, somewhat like unto Dandelion, but cut into many short round pointed pieces, of a dark green color, the Stalks which arise from among the Leaves are smooth and blackish, scarcely a Foot high, bare, or without Leaves on them unto the tops, but at the upper Joint, from whence spring several Flowers, each standing upon a long Foot-thick, which are of a yellow color, like unto other Hawkweeds, and being once past away, the Heads are filled with Seeds covered with Down, which is carried away with the Wind.

VI. The fourth, or Garden Succory like Hawkweed with yellow Flowers. It has a long down right Root, of a deep Ear for the thicknes, and Compassion adjoining to it, which sends forth of blander finch-footed Stalk, about a Foot high, yet somewhat leaning.
downwards, spread into many Branches, or the foot of which is long, fimbriated, dark green Leaves, about four inches in length, and an inch and half in breadth, some of them without divisiones, and others very much rent, torn, or jagged, very irregularly, almost (in some places) to the middle Rib, as are all those especially which grow higher and upperward on the Stalk and Branches, each of the Branches and Stalk being about an inch breadth below the top, bare of Leaves, and at the tops of each of which grows a yellow Flower, of a middle size, which turns into Down, and is carried away with the Wind.

The fifth, or Garden Sow-curry like Hawkweed with White Flowers. This Plant in its Root, Stalk, Branches, Leaves, and Flowers, is very like unto the former fourth kind, but that the Leaves in this Plant are longer and broader, and more cut in, or jagged and torn on the sides, even to the middle Rib, (tho' they can hardly be more irregularly torn or jagged) than the flowers aforesaid in this Plant are of a whitish color, and more yellow in the middle, also somewhat reddish underneath, which paling away turn into Down.

The sixth, or Garden Sow-curry like Hawkweed with yellow Flowers. It has a Root which is composit of a down right Stem, with several Fibres adhering thereto, which always perish after Sow-curry. This Root having several long and somewhat narrow rough Leaves, lying next the Ground, very much rent or torn in on the edges, and among these leaves the Leaves rise five, or six, or more, slender, short, brown, and hairy Stalks, about a Foot or more high, shooting forth into one or two Branches, with fatter Leaves, and left divided, up to the tops, which are several large Flowers, consisting of two or three rows of Leaves, of a deep yellow color, and of a somewhat strong Opium like smell, which Leaves of Flowers are broad pointed, and nicked at the ends, the outermost Row being larger than the inner, standing in rough Feaky Husks, in which afterwards the slender, long, brown Seed is contained, which lying among much Down, are carried away together with the Wind.

The seventh, or Wild Sow-curry like Hawkweed with yellow Flowers. It has a Root which is long and white, with some small Fibres adhering thereto, which feeds up some few Leaves, lying next the Ground, something long and narrow, waved, or unevenly dented about the edges, in some more, in others less, and sometimes hairy within, yet which in Caulis has little or none at all. It also feeds forth many slender Stalks, with a few Leaves set differently upon them, which are smaller than those below, and sharp pointed. Those Stalks being forth at their tops, on which stand several green Feaky Husks, with yellow Flowers in them, a little binding their Heads before they are blown, in which grow crooked Seed, lying in the Down, which after the Flowers fall away, are both carried away with the Wind.

The eighth, or Great broad Leaf'd smooth Mountain Hawkweed. It has a hollow Root, wholly made up of a great number of Fibres or Strings, which feeds forth several fair green Leaves, something narrow at the lower ends, and broader to the middle, where they are broadest, then strolling in their breadth, and ending in a point, being unevenly dented or waved about the edges, and encompassing the Stalk or Branches as they rise up, the Stalks and Branches bearing every one of them three or four Flowers, yet not in an Umbel like manner, these Flowers seldom appear open, but when they do they are yellow, like unto others, which afterwards fall into Down, and are all carried away with the Wind.

The ninth, or Small broad Leaf'd smooth Mountain Hawkweed. This Plant in its Roots, Stalks, Leaves, Branches, Flowers, and Seed, as also in its manner of growing, differs not from the former great kind, but only in its magnitude, the being in all respects smaller, and the whole Plant lower and lefter.

The tenth, or Turnep Hawkweed. The Root is something long and briny, of a reddish yellow color, which sends forth a few Leaves, standing upon long and rough reddish Footstalks near the Ground, something like unto Turnep Leaves being rough, and torn on the sides, into round pointed jags, from among which rises a rough, reddish, frayed Leaf, a Foot, and half or more high, with one or two small Foot Leaves thereon, divided towards the top into many small Branches, on each whereof stands one Flower for the main part, and sometimes two, of a middle size, and a yellow color, which being fall away turn into Down, which (as the cold is) is carried away with the Wind.

The eleventh, or Dent'd Hawkweed with a great Flower. The Root is much like the former, which sends forth Leaves, lying for most part upon the Ground, being four or five inches long, and an inch broad, a little woody or hoary, and finely dent ed about the edges, of a fat green color, the Stalk rising up to be about a Foot high, in a manner bare of Leaves, rough, and hollow, bearing one reasonable large deep yellow Flower at the top, standing in a fine feaky Husk, which turns into Down, as the red do, and is blown away with the Wind.

The twelfth, or Great Flowered Hawkweed. This is a large Hawkweed, and has a round rough Stalk, three feet high, spread out into many Branches, on every one of which stands a large Gold yellow Flower, like unto Dandelion, the Leaves are three or four inches long, and two or three inches broad, with a great Rib in the middle, and many Veins running through them, of a pale green color, somewhat rough, waved about the edges, and set about with small Hairs, and many Veins running from the said Rib.

The thirteenth, or Starry broad Leaf'd Mountain Hawkweed with a large Flower. It has a pretty thick Root, with many Fibres springing from it, and that is a broad Leaf'd Hawkweed, yet in lesser Leaves are long, and sometimes covered with a long hairy Down, almost hoary, but those which grow up higher upon the hairy Stalk, which is about a Foot high, are something thiner, but three times broader, being set at the ends, and torn hairy, the Stalks fryed it fall out into two or three Branches, every one bearing commonly one Flower, and sometimes two or three, out of woollily or very hoary Husks, of the form and color of other Hawkweeds, turning all in like manner into Down.

The fourteenth, or Mountain hoary Dandelion like Hawkweed. The Roots of this Plant are spreading themselves under the upper Crust of the Earth, finding forth several Fibres, shooting downwards; from this Root come up divers heads of Leaves, which are not all of an equal length, but some longer, and some shorter than others, as being one, two, or more inches long, and half an Inch broad, with a great or thick middle Rib, covered with a few hairy Down, bearing the lower parts of them being narrower, and much torn on the sides, and the upper part broader, but only denser, from among which rises up two or three Stalks of Leaves, or Shoots, standing at top one large Flower, of a deeper yellow color than in many others.

The fiftenth, or English Fleeting like Hawkweed. It has a Root which is composit of many
many black Strings, which perdth not; but altho' many Years, this Plant rises up with round, fracted, reddith, green Stalks, a Foot and half high, set with somewhat large rough Leaves, like unto those of Hawkweed, without broader, but nor more thick, and dented about the edges, encompassing them at the bottom, and pointed at the ends; the Flowers are yellow, like to other Hawkweeds, set in hairy Hoypothalls, which turn into Down, and with the whitish long Seed is blown away with the Wind.

X. The twentieth, or Broad Leaved Hawkweed, with a great yellow Flower. It has divers large hoary Leaves lying next the Ground, sometimes a little waved, sometimes again torn on the edges, sometimes with black spots on them, and sometimes without any, from among which rises up an hairy Stalk, with many small Leaves thereon, spread out at the top into two or three other Branches, at the tops of each of which is a large yellow Flower, like to the Great Hawkweeds.

X. The Proportion, or Round Leaved hawkweed. It grows about a Foot and half high, the Stalk being fracted, round, and somewhat rough, spread out at top into several Branches, three or four inch thick, each having at its head a pale yellow Flower, the Leaves encompass the Stalk at their lower ends, and are somewhat round, about an Inch and half broad, yet ending in a little point, dented about the edges, hoary, and of a light green color.

XX. The eighteenth, or Rough broad Leaved hawkweed, has a Root wholly composed of Strings and small Fibers, which being cut up broken yield a Milk like Juice, as most of the Hawkweeds do; it has broad and something long, hard, rough, dark green Leaves lying on the Ground, without any incisions or dents on the edges, the Stalk which rises up among them is two or three feet high, thick set with such Leaves unto the top, but left, and growing leffer and leerrer; at the tops stand a few yellow Flowers, composed of fewer Leaves than the former, and the Heads grow against the Lungs; the Leaves are firm, and of a dark green color.

XXI. The nineteenth, or Greater narrow Leaved hawkweed. It has a Root which is whithit, very long, and deeply spreading into the Earth, quickly over running a great deal of Ground; for every little piece being broken off will grow, and so is not easie to be rooted out of that place where it has once taken possession; this hawkweed grows very like the last, but has longer and narrower Leaves, somewhat rough, and dented or waved about the edges, the Stalk is more Branched at the top, where the Flowers are more and thicker, the Leaves of which are of a fair yellow color.

XXII. The twentieth, or Leiffer hawkweed. It has a Root which is short, and as it were broken off, without any Fibers at it; this leiffer hawkweed rises up with a single Stalk, about a Foot and half high, with about broad and smooth Leaves in some places, and with almost round rough Leaves in others, dented about the edges, and the top bearing several yellow Flowers upon short Footstalls, much like the last.

XXIII. The Places. The first six are Planted for the most part in Gardens, having been first brought to us out of Italy, and the sixth and seventh of them has been found growing Wild in England, the seventh is a native of France, but transplanted hither, the eighth and ninth only grow with us in Gardens, the tenth, eleventh, twelfth, thirteenth, fourteenth, fifteenth, and sixteenth, grow upon Mountains and Hills in several parts of England and Germany, and are many of them transplanted all into our Gardens; the four last kinds grow with us in Gardens, as also naturally Wild in several places of England and Germany, the eighteenth and nineteenth have been found growing in the way Hawkweeds are planted, going from London to Hampsted Heath, or all of them several other places.

XXIV. The Times. They all flower, and their Down flies away in the Summer Months, and rise again of their own Seed, but some of them will abide until the cold of Winter comes upon them; and but the most tender of them will flower with us till the end of August, the Seed ripning in the mean time.

XXV. The Qualities, Specification, Preparations and Virtues of all these are the very name with the Common Kinds in the former Chapter; and are thought to be no less effectual than they in all the Effects and Properties pertaining to them, to which you are referred.

XXVI. An Observation. It is to be noted, that tho' the properties and force of all these Plants may be said to be over and the name with the former Common Kinds, both from their form and their Virtues, which indicates in a great measure their Qualities and Virtues, yet the sixteenth, or Broad Leaved Hawkweed abovesaid, is particularly commended by Galen as a thing singularly good for the Patesick, or Consumpation of the Lungs, being made into a Conserve or Syrup, or the Powder of the Herb being taken with Honey, he says that in Myia they partake of their Sallers, Broth, and Means, for the same purpose; and that it is available for the Pleasure also, being so affirmed by several Authorities, and that without any help of Blood letting; If the Powder, Conserve, or Syrup, be so effectual and mercurous, that without the use of the Liquid Juice or Elixer must very much transcend any of those Preparations: The Elixer may be given three or four Spoonfuls at a time, Morning, Noon and Night, either alone, or else mixed with any proper Vehicle and so to be continued till the Uceration of the Lungs is digested, cleansed, and healed, which you may easily know by the fresh Cognizance of the Diseased Patient, and by his getting a new production of Flesh upon his Back, as also by his coming to spit Matter and Corruption.
Salmon’s Herbal. Lib. I.

This Chapter. 2. Flox Trifolitis Sylvatica, Wild Hearts- Ease, of which in Chap. 337.

nothing else but a bunch or knot of fibrous Strings, and after every Year, the Plants raising at first very small, grows manifestly by its own Sowing, where it is sown, its Leaves are larger, and more indented or cut in on the edges than those of the Violets, the Stalks are upright, erect, and ready to fall down and lie upon the Ground, set here and there with the like Leaves, from whence come forth the Flowers, having little or no stalk, and made in form like unto a Violet, yet more open, and with larger Leaves, but so variably mixed with Blow, or Purple, White, and Yellow, that it is difficult to sort down all the varieties, for some Flowers will be more White, and but some spots of Purple or Blow in the two upper Leaves, and the lower Leaves with some stripes of yellow in them, others will have more Purple in them than any other color, both in the upright and lower Leaves, the file Leaves Blow, and the middle Yellow, and others White and Blow, with yellow stripes, as Nature is pleased to vary the Colors: The Seed is small, white, and round, and contained in small round Heads. The flowers are like this.

V. The second, or Hearts-Ease with double Flowers. This is a very pleasing Plant, and bears flowers with more Leaves than the former, making it seem to be twice double, and that only in Autumn, for the first Flowers, which come in Summer, are single; this is of that sort which bears Purple Flowers, and it is to be noted, that the Seed of this Kind will not all bring double Flowers, but only some of them, where the Ground is fit, and the Plant thrives and takes a liking to it, so that if you have once had of this Double Kind, you shall from milts to have double Flowers again every Year of its own growing or sowing.

VI. The third, or Great yellow Hearts-Ease. This is another Species which does and adorns our Gardens, and therefore is not to be left out; its Leaves and Flowers are like the former, but more plentiful in Stalks and Branches, and better abides our Winters; the Flowers are larger than any of the former, of a fair pale yellow color, with some yellow stripes now and then about the middle, for it is sometimes without any stripes, and also of a little deeper yellow color; this Plant is to be encreased by slips, which will soon multiply in a fertile and moist Ground, for it has hitherto been observed to bear Seed.

VII. The Flowers. All these Plants were first Wild, and by being brought into the Garden, and Manuring, they have been brought to a very great sparing of color, and the beauty which they now possess, and also to a better fireill than when they were Wild, and in the same manner I believe many other Wild Plants might have been improved, even to a kind of perfection.

VIII. The Times. Hearts-Ease seldom Flowers until May, but then some will show Flowers until the end of Autumn almost, if Frosts, by their being too early, hinder not, as those of the Double Kind.

IX. The Qualities. Hearts-Ease seems to be temperate as to its first Qualities, and Excellent and Glorious, in all its Parts and Qualities like unto Violets, but in its glorious quality more like to Malvaceus; it is Crataegic, Valeriany, Pectoral, and Alumminick.

X. The Specification. It is said to be good against Ulcers of the Lungs, and the Epileptic.

XI. The Preparations. You may have therefrom, 1. A Juice or Elixer. 2. A Decoction in Milk or Water. 3. A Syrup. 4. A Cataplasm. 5. An Ointment or Balsam. 6. A Powder of the Herb and Flowers.
Chap. 346.

**Flowers.** 7. A Distilled Water. 8. An Acid Tincture.

---

The Virtues.

XII. The Juice or Essence. They are very vicarious, and excellent, good against hot Difficulties of the Breast and Lungs, and against Agues, being taken three Hours before the coming of the Fit, as also against Convolutions, and the Falling-Sickness in Children; it is also good to bath the places troubled with the Itch, Tertians, Scabs, or other breaking out in the Skin, and to cleanse old Sores and festid Ulcers, being washed therewith; You may take from three to five Spoonfuls at a time in the Morning lifting, and last at Night going to Bed, either alone by it felt, or mixed with some hot Vehicle.

XIII. The Decoction in Water or Wine. It has all the Virtues of the Juice or Essence, but not altogether so powerful, but is something better to wash old Sores and Ulcers withal, because it cleanses more, dries and heals; neatly it may be given from four to eight, or ten Ounces, according to the Age and Condition of the Patient.

Chap. 348. English Herbs.

495

Black Hellebore, called Christmas Flower. It has a Root which confifts of a great number of brownish black Strings, which run deep into the Ground, and are foliated to a thick bed, of the bignefs of ones Finger, growing nearer from its top or head downwards; from this Root rise several fair green Leaves, each of them standing upon a thick, round, fliff, green Stake, about a Half breadth high from the Ground, divided into nine or ten parts, or Leaves, and each of them thick or dented from the middle of the Leaf to the Periphery on both fides, being green all the Winter, at which time the Flowers rise on the fliff Stake as the Leaves grow on, without any Leafthereon for the mott part, yet fometimes having small, fliff, pale green Leaf, reftecting rather to Skin than a Leaf, a little under the Flower, and grow but little higher than the Leaves, each Stake all bears usually but one Flower, very barely two, conifling of five large round, white Leaves apiece, like to a great fliff White Rose, changing fometimes to be either dilated with a Purple about the edges, or the wholly Purple, without any White in them, as the Season, Weather, or time of continuance do contribute to effeft the fame; this Flower has mar pale yellow Thums in the middle, standing about green Head, which afterwards grows to be the Silver, divided into feveral Cells or Pods, like to a Columbine Head, or Aconitum Hypecele, but not as much thicker, in which is contained feveral long and round Black flied Seed, like to the Seeds of a Wolf, or Bear-Root.

V. The Place. It grows in Greece, Iria, England, France, and Germany, in many places, in Woodlands, as also in Asia, as fays the Houfe over again the Hill in Thylge, where it is faid to grow in an extraordinary plenty, whence came this Word (Spaking to a Melancholy or Mad Man.)

VI. The Tanner. It Flowers in December, and January, if the Season or Weather be any thing temperate, if the Air is mild and warm, it generally Flowers about Christmas time, from whence with us came the Name of Christmas Flowers.

VII. The Qualities. It is hot and dry in the third degree, Aperitive, Alterative, Cofmetick, Hepatick, Splenetic, Arthratick, Cathartick, Emetic, and it is given by an unfeifHul Hand divided of the Vefsey.

VIII. The Specification. It is peculiar against Majness and Melancholy, Quartern Agues, Scabious, and Leprous, kills Worms, and cures the Kings-Evil, Drople, Yellow Jaundice, andG.

IX. The Preparation. You may have therefrom,
1. The Liquid Juice of the Leaves.
2. An Infufion or Decoflion of the green Leaves.
3. An Infufion or Decoflion of the Root.
4. A Syrup.
5. A Powder of the Leaves or Root.
7. An Extre of the Root.
8. A Perfury of the Root.
10. An Infufion or Decoflion of the Green Herb.
11. An Acid Tincture of the Herb.
15. An Oily Tincture.

The Virtues.

X. The Liquid Juice of the Leaves. It is used for most Dilies which White Hellebore is available, but it is nothing to violent or dangerous, the Juice of the Leaves made up with Flower into small Cakes and baked, has been used to good purpose against the Drople, Jaundice, Cachexia, and other evil dispositions of Liver, Spleen, and Gall.

The Virtues.

XII. The Infusion or Decoction. It may be made with Water (if for hot Diffcates) or Wine (if for cold Diftcrners) but Authors advise, that the Herb or Root be first covert, by steeping it in Vinegar, because of its dangerous and obnoxious Qualities, a day and a night, and then dried again, yet our English Kind seems not to be fo violent as that which grows in hotter Countries, nor has it fo much a violent operation in working, for which reason that prccious connection of it may be boasted, there have all the Virtues of the Juice and Infusion, but with much more moderation, and are much fatter to be taken, and may be used in all the Cakes aforefirmed. Dote from half an Ounce to two, three, or four Ounces, according to Age, &c.

XIII. An Infusion or Decoction of the Root. It has all the Virtues of the Leaves, but it yet operates more moderately, and therefore is the more fife to be taken. Country People give the Infufion or Decoflion of either Leaves or Roots to kill Worms in Children, I confefs they may be given to such
Salmon's Herbal. Lib. I.

Fich as are come to Mans Strength and growth, but
to Children it ought to be given with a great deal
of cannon, or else fathers, since there are many
other things which will do the fame safely, and ful-
ly as effectually as these can.

XIV. A Syrup. It is made of the Infusion or
Decoction of Herb or Root, boiled up to a confiten-
cy with Honey, or as fame will have it, with, Ho-
ney and Vinegar, which is indeed better, it is both
Emetick and Catarrhick, and evacuates Tumours.
Matter from the Lungs, it cleans also the Tuni-
cles of the Stomach and Guts from evil juices adhere-
ting to the fame. Dose from one Spoonful to two,
or three.

XV. The Powder of the Leaves or Root. It has all
the Virtues of the Liquid Juice, Efficace, Infusion,
Decoction, or Extrakt, but it works much more
curately, causing Gripping, Painful, &c. Sickens at Heart and sometimes Swooning away
ills Worms, and is good to give in Madness, and
to such as are troubled with a Byppochordick Mel-
ancholy, if an Ilice be cut in any Bitty part, ye-
A in the Neck, or upon the Shoulder, or brawn of the
Arm, or Thigh, or Leg, and a Pea be put into it
for a day or two, and then the hole of the Ilice be
flapped up with the Powder of Hellebor Leaves, and
left there for one, two, three, or more days, it will
make a Tumor nearly as large as an Egg, and draw
all the ill Humors from all, ye, the most remote
parts of the Body to that place, and expel them
there, and by this means it the Kings-Evil, Leprosy,
Gout, Sciatica, and Pocky Symptoms, have been
cured, yea, after that a number of Purgings, Vo-
rinings, Bleeding, and Salvation, have been all
used in vain, and had no effect upon the Patient.

XVI. The Scurv of the Root. It is used to Rovel
Cartel within, as Country People call it. Pliny Lib.
7, Cap. 7, says, that a piece of the Root of Black
Hellebor being drawn through a hole made in the
Ear of a Best troubled with the Cough, or having
taken any poisonous thing, cures it, if it be taken
out the next day at the same Hour. Abysses and
Hieraticke say the fame thing, as also Calomelum. This
manner of Curing is used with us, but the place is
changed from the Ear to the Dewlap in Oxen, and
that a Leg or hinder Leg of an Herbe ab ovo
above to the Sowter among the Hair to the
Pattern.

XVII. The Pelfury. Being applied to the Womb,
it mightily prevails to bring down Woman's Courses,
and if there is any calous or hard Fitch grown in the
Vagina, leading to the Womb, or in a Fittula, the
Root being left therein for two or three days, it will
affirms this, and Julian Alexandrinus says he often
tried it to be true.

XVIII. The Extrakt of the Root. This has all the
Virtues of the Juice, Efficace, Infusion, Decoction,
and Syrup aforegoing, and is more mild and fit to
be taken than any other, and as it may be always
ready at hand, so it may be given in all those Pre-
parations for which the Preparations are to be ex-
blished. Dose from a Spoonful to a Dram, or Dram
and half, in the Morning fasting.

XIX. The Lotion of Herb or Root. It is made by
Infusion or Decoction in Wine, Vinegar, or in half
Vinegar and half Wine, it is good to wath any place
troubled with Scubs, Wheals, or Pustes, Leprosy,
or any other like breaking out, ye, altho' it be a
Ctenodont or Phlegmonick Sore or Ulcer, it eaves
their spreading or eating, and preserves the Fith
from putrification; this same Lotion helps also the
Toothach, if the MOUTH be gorged therewith, and
in loud some small time therein, also dropped into
the Ears, it eaves the pain, helps against the
rolls of the Ears, and removes the deafness; if any
foul or callous Ulcer or Fittula he waffled with this
Lotion, and then the Powder of the Root be strewn
thereupon, it dries, heals, and suddenly cures them.

XX. The Ointment of the Herb. If People be
afflicted with Lice be often waffled with the Deco-
ction of Hellebor hot, and then the Head or other parts
anointed with this Ointment, it kills them, and per-
fectly deters the breed.

XXI. The Distilled Waters. It is of good use to
remove black and blow Ips or marts from the
Skin, and to take away the yellowness thereof, as
to Tanning by the Air, Sunburning, Pimples, Moro-
slow, and other like deformities of the face.

XXII. The Acid Tincture. Given to a grateful
ability in any proper Vehicle, it kills Worms in Old
or Young, it gently Purges, and provokes against all
the Diseases the Herb or its Root is good for; it
also overcomes Poyson, if the Patient takes it soon
after the receiving of the Poyson, mixed with Dar-
mark Rose Water, it is good to with Pimples in
the Face and Skin, as also Luntis, Freckles, &c. if
it soon takes them away, and cures the Skin to its
true and natural color.

XXIII. The Spirituous Tincture. It is an extra-
ordinary thing to bath hot wathal in a Gangrene,
preventing and curing se fame, it may be given
within from half a Dram to two Drams, and
more, according to Age and Strength, against the
Kings-Evil, Jaundice Dronchic, Gout, Leprosy,
French Pox, and other Diseases of like kind, it
something troubles de Stomach, otherwise it works
well enough.

XXIV. The Oily Tincture. It is very good a-
gainst the Sciatica, stout, and weakness in and
pains of the Joints and bones, it relieves Convulsions,
and yet strengthens the Nerves, and restores in a
Palse, it is good, if to anoint wathal upon any
fraying of the Nerves, or when the Bones are one
of Joint, because it warms and comfort the part,
and restores the Time thereof being hurt.

XXV. The Sake Tincture. It is to be used as
hot as can be endured upon the part or parts afflict-
ed with Scabsomes, Totts, Ringworms, Pimples,
or other breakings out, so against yellowness,
blackness and blueness of the Skin, Luntis, Freckles,
Sunburning, Tanning, Scurf, Morphiw, Leprosy,
or any other like devastation; it is so usefully used
two or three times a day for some time, it certainly
cures those deformities and leaves behind it a pla-
ning smoothness and beauty.

CHAP. CCCXLIX.
Of HELL-BOR BLACK Baitard. O R.

BIARS-FOOT.
III. The Description. This is a Greater Bastard Black Hellebor. It has a Single Root, with nothing so many Strings growing to it as the True in the former Chapter but and oftentimes perishes after it has given Seed, yet it is more, nor in all places, from this Root proceed several fat green Leaves, each upon a long Footstalk, which are divided into seven or nine Leaves, and of which are narrower than those of the Lesser Bastard Hellebor in the next Section, a little smaller than the edges, but not to deeply into the Lesser, and being round. Ground green, all the Winter, whereas the following perishes every Year, and rises again in the Springs; from among these Leaves growing a reasonable large and tall Stalk, higher by half in the Small following, with such like Leaves thereon, as grow below, but smaller up to the top, where it spreads itself out into divers Branches, bearing any hollow Cup-like Flowers, divided at the brim into five parts, but do seldom spread themselves over, of a whistled yellow green color, somewhat like the next Bastard Kind, and sometimes purplish about the brims or edges, with a green Head in thistle, and a few white Threads about it, by which it is seems to be Veratrum nigral quinum persung Cubif: This green Head growing to be the Vid, wherein the black Seed is contained, flowers for, into four, five, or six Horns, fashioned like the flowing Bastard Kind, saving, that it is smaller, as Seed also is for the most part, the whole Plant and every part thereof, is of a worse kind than the flowing, the Root of this, with the lower part of a Stalk next to it, is of that Bears-Foot, or Setterots, which Country People use to Kowell their Cat with.

IV. The second, or Lesser Bastard Black Hellebor. It has Roots which are more bristly, kild, and hard than the former in Chap. 348. It is in 18 things like unto that True Black Hellebor, for it has also many Leaves, as seven, eight, or nine, un short Stalks, divided into many parts, but each of them are longer and narrower, of a darker green color, and dainted on both sides, feeling something hard, these perish every Year, but rise again the next Spring; the Flowers hereof, hang on higher Stalks than the True, with some Leaves on them also, yet very few, and are of a pale green color, like the True in the former Chapter, but smaller by half at least, having likewise many greenish yellow Threads or Thrums in the middle, and fuch like Seed Veficles, and blackish Seed in them.

V. The Places. The first grows, as Trogus Eys, in the borders of Stony Hills and Grounds, also on Rocky Hills, as by the Meffala and Rhine, also in Sibiu Harriyus, and as Pens Eys, in Aquitaine in France, and by the River Lamps at Montpelier, it grows Wild in many Woods and thundow places in England, as also in almost all our Gardens about London, and several other parts of the Kingdoms; the second has been found in some Woods in Northwest-anglia, and in other parts of this Land, as also in some places within Eight or Ten Miles of London.

VI. The Times. They blow Flowers in February or March, according as the preceding Winter and Spring Season are in miltilde, and their Seed is ripe in May, or towards June.

VII. The Qualities, Specification, Preparations and Virtues of these Bastard Black Hellebors are the fame with those of the True in the former Chapter, fo that no other declaration need be made thereof.

VIII. Observat. 1. That the Greater Bastard Black Hellebor, Bears-Foot, or Setterots, was held by Dodonæus to be a kind of venemous Aeonite, or Toes-Foot, not to be used, and that it would kill Worms, Poxes, Dyes, &c. I have found it used in Decoction to kill Worms in the Belly, which it would effectually do, but it had a deleterious or poisonous quality, which some Bodies could not overcome, where it killed not the Patient, it would indeed kill the Worms, but it is so dangerous a Medicine, that it ought not to be internally used, but by a very Skillful and Prudent Hand, and yet nothing scarcely is more common to be used by Women in the Country than the Decoction of this Herb for the purpofe aforesaid, I knew a little Youth take it to kill Worms, but it killed him first; also a Woman between Forty and Fifty Years of Age, whom it killed in about Three Hours time, at the same time, by a Womans Advice, the Decoction was given to my self, being then about Eight Years of Age, but I met with a better Fate in the like thereof, yet my danger was great, it vehemently Vomited me, and made me Heart-burn, to frothing away, the Vomitting being over, I revived, but had such an effect upon me, that it made me looke my Hair, and Nails both of Fingers and Toes, and all the Skin of my whole Body peeled off, from Head to Foot; whether my good hap was from the strength of my Confitution, or the small Dose of the Medicine, I leave others to determine, but since that bad effects it is manifest that it is not very safe to be given, not to very strong Bodies, but outwardly applied it may be of good use.

IX. Observat. 2. That the Powder of the Leaves of this is much more effectual than the Powder of the Leaves of the True in Chap. 345. Sect. 15, to all the external Intemptions and Porphous there mentioned; and that the Leaves of this ought rather to be chosen than the Leaves of that, especially being put into the hole of a little; as in those directed, it is a wonderful thing to see what a small quantity...
Salmon's Herbal.

Lib. I

Chap. CCCL.

Of HELLEBOR BLACK Wild.

I. The Name. It is called in Greek Χελλόβορον, in Latin Helleborum nigrum, Helleborus niger Synetritis, and in English Black Hellebor.

III. The Description. The first, or Greater Wild Black Hellebor Stately Leaf. It has a Root composed of small black Strings, floating forth from a top head, like unto the Root of Bear-Foot, from this head of a Root come forth several broad dark green Leaves, each of them growing upon a long Footstalk, which are cut in the edges into five divisions for the most part, and dented about the sides, resembling the Leaves of the Common Sambuce, but much more thick than the Leaves of the Field Rumiantes, or Crocfoot, or Crampton Toad-Flowers, or Crocfoot Greenshanks, from among which rise up several slender, smooth, green Stalks, having some Leaves up on them, and at the tops of them two, or three, or more Flowers together, each of them consisting of many small, hard, whitish Leaves, as a pale balsam, exuding many orses in the middle, which being dried, they file up many flat, whitish, and long Seeds, somewhat like unto Sweet Fennel Seed, but not altogether so big, nor so yellow.

V. The second, or Stately Leaf black Hellebor. It has a small black fibrous Root, like the former, from the head of which rise up several small and somewhat round Leaves, every one of them upon a long Footstalk, being not much broader than the Nails of a Man's Thumb, yet divided, even to the middle Rib, into four parts, every one of them being short, narrow, and dented about the edges; the Stalks are many, and small, not above an Hand breadth high, with one or two Leaves on them, more cut in and divided than the lower are, at the tops of them three several round Flowers, very thick set together in Tufts or Umbilks, like unto the fist, but smaller, after which come small black Seeds, something like the former, but softer by much, as it is also in all the other parts thereof.
The English Herbs.

Chap. 351.

Of HELLEBOR White, or SNEEZ-Root.

The Hellebor. It is called in Arabick Charbchern, in Greek E Providers, in Latin Helleborus album, Veratrum album, and Sanguis Hercules, in English White Hellebor and Sneezroot.

1. The Name. It is called in Greek E Providers, in Latin Helleborus album, Veratrum album, and Sanguis Hercules, in English White Hellebor and Sneezroot.

2. The Kind. It is twofold, viz.: a. Garden or True, called simply Hellebor albus, Eleborum album, and Veratrum album, of which in this Chapter. b. Helleborum, or Eleborum albus, Wild White Hellebor, of which in Chap. 352.

3. The Kind of the Garden or True. Its twofold, viz.: a. Hellebor albus, Helleborus albus, Helleborus album, Helleborus album varietatis, Helleborus album vulgaris, Veratrum album vulgaris, Helleborus Candidus, and Elearous adds, for distinction like Eleborum album, and it is certainly the Conifite Vegetis, Alphyr, Chamaeleon et Pilars, The

Common White Hellebor.

2. Helleborus album praecox, Eleborum Flera varitubers, Veratrum album praecox purpurea migrans, The early Flowering White Hellebor, or Early Sneezroot with dark red Flowers.

Hellebor.

White.

IV. The Descriptions. The first, or Common White Hellebor. It has a Root which is great, and reasonable thick at the head, having a number of great white Strings, running down deep into the Ground, and that is strongly scented, this Plant rises out of the Ground with a great, round, whitish green Head, which growing up open it falls into many goodly, fair, large, green Leaves, planted as it were with many Knobs all along the Leaves, containing one another at the bottom, from the middle whereon rises up a strong round Stalk, with several Knob like Leaves, but smaller, to the middle thereof, from whence to the top it is divided into many branches, having many small yellowish or whitish green Star like Flowers all along upon them, which being pulled away into small, long, thin, square, whitish Seed, handling naked, without any Head or Husk to contain them, tho' some Authors have wrote to the contrary.

V. The second, or Early Flowering White Hellebor. It has no such tuberous headed Root as the former, but as it were a long bulhorse jolly head, from whence short as many long white Strings as the other. This Hellebor is very like that just now described, but that it springs up a Month or two before it, and that the Leaves are broader, longer, thinner, and no I'ts planted, folding themselves backwards occasionally, and sooner put forth away from the Plant, the Stalk hereof is higher than the other, with fewer Leaves thereon, bearing Knobs like Starry white Flowers, but not of dark or blackish a red color, that they are clearly discernable, but at a near distance, after which come small Seed, very like the former, both these Plants have their Leaves wholly, from that springing up again every Year.

Sff 2

VI. The
VI. The Places. Both these grow in several places of Germany and Austria, as Osbian Lys, as also in some of the Islands about Ragusa, where a large Ship might be refitted with the Ropes of the first of Fort, as Tradescant the Elder affirmed, it is also to grow on the Alps, and fuch like Mountains where Osbian grows. Gedner says that the Eclipse of Nov. shold hold in that White Helickor grows in a Wood of his own, near to his House at Navegna: Some fry likewise (fays he) that it grows upon the Mountains in Wales, this, tho' it is not often reported, yet he thought it might be true, but they both are generally carried up in Gardens in England.

VII. The Times. The firft Flowers before the second, the second firft Flowers out of the Ground, the firft Flowers in May, the second in June.

VIII. The Qualities. It is hot and dry in the third degree, aromatic, astringent, Splenick, Arithick, Catarrick, Emetic, and Ieuchsick. IX. The Specification. White Hellickor is peculiar for curing the King's Hill, Dropofle, Scourvy, Jaundice, Gout, Scirrhus, Rheumattick, Frenzy, Melancholy, Madness, Fulating-Sicknefs, old running Stores, Ulcers, and Fihthaps.

X. The Preparation. Neither Leaves, Flowers, nor Seed of this Plant have been in use at any time, but the Root only, to far as ever I could learn by Reading of Authors, or from the Practice of other Men, and from the Root the following Preparations may be made.

The Virtues.

XI. The simple Powder of the Root. It works very strongly and chaftityful with any that shall take it, provoking strong Vomitings, not much inferior to Poyson, yet being given to very strong Confiduations, and which convenient Preparations of the Body before hand, and Dioted by advice, as Diforders directly, it may do much good, it causes an evacuation of much tough, violent, clamy, and corrupt Humors. But let's eat the Stomach, it provokes Women's Curfes, but is to be forborn by Women with Child, for it will kill the Fetus, it removes a deep Melancholy, even FVy, or Madness, altering the present Humors, and giving cafe to the Patient, it prevails also against the Falling-Sicknefs, Lachrymary, Megrim, Cephalus, or old Hundach, Scabs, Tetrez, Ringworms, Pothes, Hiers, Leprofia, Scarf, Morphey, or any other Diforders of the Skin, Quertan Agues, Puthickles, old Coughs, Dropofle, Jaundice, Scirrhus, Gout, Rheumattick, Vertigo, and other Diforders of this kind. Dofe from eight Grams to twelve, or fifteen, in Syrup of Quinces, or Juice of the fame mixed with White Wine, it is not to be given fallet, but a little after eating, and always to follow and very strong Bodies with a Sip of Wine, so drink five, six, or more Quarts of Poffle-Drink, Water-Graud, or Mutton Broth in the time of its working, and after Vomiting fill to drink a heavy draught of Poffle-Drink, therefore to keep Stomach always falt, for by this means it works to much the effer, but because of the extraordinary danger of it, I should never advise the unskilful or unlearned to give it; I will only add and unparaphrased, but rather to make use of the following Prepara-

SALMON'S HERBAL.

XII. The Powder of the Root prepared. It is done by burning with Water, impregnated with Spirit or Oil of Vitriol, after the fubdiation of Coal upon the Root reduced to Powder, digesting for twenty four Hours, and drying it, and repeating the Work the second and third time. Dofe from half a Scripule to half a Dram. It is the nature of Acids to destroy the power of any mixture whatsoever, and if they will do it in Antimonial Preparations, as in the confection of Flowers of Antimony, Vitrum Antimonii, Mercarcus Ves, &c. much more may it be sup-

XIII. If you give it only as Cathartick, you may give it thus. Take half a Scripule of this prepared Hellickor from ten Grams to twenty, mix them for a Dofe. Or thus. Make an Infufion of Scene half an Ounce in half a Pint of White Wine, strain out, then add the prepared Powder of Hellickor from half a Scripule to half a Dram, (according to Age and Strength) and let it be taken in the Morning, faling, against Melancholy, Madness, Gout, Scirrhus, &c.

XIV. If you alfo give it for a Vomit, you may give it either per fe in any proper Vehicle, from fifteen Grams to two Scripules, or you may compound it as follows. Take the prepared Powder of Hellickor afore-

XV. Another Preparation of the Root. Molt Au-

XVI. The Juice of the Root. If it is mixed with

XVII. If you give it only as Cathartick, you may give it thus. Take half a Scripule of this prepared Hellickor from ten Grams to twenty, mix them for a Dofe. Or thus. Make an Infufion of Scene half an Ounce in half a Pint of White Wine, strain out, then add the prepared Powder of Hellickor from half a Scripule to half a Dram, (according to Age and Strength) and let it be taken in the Morning, faling, against Melancholy, Madness, Gout, Scirrhus, &c.

XIV. If you alfo give it for a Vomit, you may give it either per fe in any proper Vehicle, from fifteen Grams to two Scripules, or you may compound it as follows. Take the prepared Powder of Hellickor afor-

XV. Another Preparation of the Root. Molt Au-

XVI. The Juice of the Root. If it is mixed with

XVII. If you give it only as Cathartick, you may give it thus. Take half a Scripule of this prepared Hellickor from ten Grams to twenty, mix them for a Dofe. Or thus. Make an Infufion of Scene half an Ounce in half a Pint of White Wine, strain out, then add the prepared Powder of Hellickor from half a Scripule to half a Dram, (according to Age and Strength) and let it be taken in the Morning, faling, against Melancholy, Madness, Gout, Scirrhus, &c.
Galls, &c. come, it kills them upon the foot, mixed
ed with Crumbs of Bread, Chedd, and Butter, and
set in proper places, it kills Rats, Mice, and the
like; if Hens, Ducks, or Geese should become sick
to eat it, it would quickly kill them, being made up into a
Malt with Meal and Butter, and put into Mole
Holes, or their Burrows, it will quickly defray
them. The liquid Juice drop into the Eye; and
washes away the noif, and ftinging in them, and kills Worms
in that Organ, if any be, which is known by their
extraordinary lefching, and sometimes by a pain in the
Eye, mixed with White Wine in equal quantities. It is
good to cleanse the Hands, or other parts of the
Skin troubled with Scabs, Morphew, Leprofa, Lepro-
tas, Ringworms, Harsps, Scabs, litch, Freckles, Lent-
tils, and other like deformities thereof.

XVII. Mel Extractorum. Honey, Hellebore, and
incorporated with the Virtues of Hellebore. Take
Roots of White Hellebore dried and cut a Pound, fair
Water fourteen Ounces, digeft three days, then boil
gently till the half be confum'd, strain it carefully out, and take the clarified and digested in a Pound again
to the confumption of Hellebore. It is a strong Medicament.
and to be given but in a small Dole, viz.
from one Dram to two, or but at three mols; it is
prevalent against Melancholy, Doting, Frenzy, Mad-
ness, Gout, Scars, Rheumatism, Dropsy, Lethargy,
Verigo, Puffie, Apoplexy, Epilepsie, and such like
dangerous deftations; you may mix it with
chained Whyn, or Decotion of Sars, or Ephy-

XXX. Oxymet Ethlohoratum. Honey and Vinegar
incorporated with Hellebore. Take Leaves of Rue,
tops of Tyme, Bette of Crete, tops of Potent-
Uonio, Menthae, Roots of Greek Nord.
of each a handful, Calamin two Fagles, Seeds of
Anife, Bafli, Dill, Pernell, Roman Nettlets, of each
twenty, Drums, Roots of Angelica, Arun, Quillpips pre-
pared, Berenices, quino, and clove, Cypri-
Eodrachis, Poppies, Turbith, Lincon Peels, of
each an Ounce, Strings of Black Hellebore, Spurge,
Aphrig, (added towards the end of the boiling of)
each two Drums, and a fourth of the Roots of White Helle-
bor four Drums, all being dried and brauffed digcif
in a Glass or glazed Vellef clofe in the heat of the
Sun, or of a Furnace, in Joes, (which is a mixture
made up of equal parts of White Vinegar and Water)
Right or Screen two Ounces, three days digcfion
being full, boil it gently till it is coughed a little more
than half away, strain it, preparing it gently, and to
the strained Liquor add Honey of the same Kind. (in
which
Great Precaution all Deer have been intested) a Pound
and half, boil to the thickness of Honey, and with
Cloves, Saffron, Ginger, Galangal, Mace, of each a
Dram, aromatic it according to Art. It is flematic,
and ought to be given after other general Remedies,
being then profitable against Madncfs, Frenzy, Epi-
lepfe, Apoplexy, Convullions, Melancholy, Verigo,
Lethargy, Migrin, obstructions of the Stomach,
Liver, Spleen, Melanony, Reins, and Womb, it
provokcs Urine and the Courses, and is prevalent
against Age. Dofe four or five Drums to an Ounce
in a Glass of White Wine.

XIX. Another Oxymet Ethlohoratum. Take
Strings of Black Hellebore well brauffed half an Ounce.
Seeds of White Hellebore well brauffed an Ounce
Vinegar, Juice of Quinces, Partly Waters, of
each three Pints and half, Winters Cinnamon, Je-
monica Pepper, of each in Powder, of each two Ounces,
irix, digef in a Glass Vellef in a gentle Sand heat
for four days, then boil gently in Balme till almost
half is coughed away, strain out, and to the Liquor add
clarified Honey three Pounds, Coredal Vertues in line
Powder one Pound, boil to the confumption of Honey,
being cold add Chemical Oil of Limons one Ounce, mix
well, and keep it in a Veffel clofe stop for ufe. This
Preparation has not the tenth part of the trouble and
difficulty of the former, yet is double in its curative
and expidions, having all the Virtues attibuted to
the former, you may give it from half an Ounce
to an Ounce, or more, according to Age and Strength.

XX. Ethlohoratum, or an Elecution of White Hel-
rebore. Take White Hellebore Root out thin one Pound,
Spring Water twelve Pounds, digef with three whole
days, then boil to the confumption of the half, strain
out, preffing a strongly, adding Honey three Pounds,
but it again to the confumption of Honey, the Elec-
ution put into a Glafs or glazed Vellef and keep it for
ufe. This is no Elecution, but rather a Lobothy
it cures Melancholy, Frenzy, and Madness, and is
appropriated to all the Diffes, the two former Pre-
parations are applied to; it may be given from two
Drums to four, or more, in a Glafs of White Poet
\;
}

XXI. The Lecion. The Root very thinly 
dixed, and in grofs Powder boiled in Vinegar,
and /n Juice of Quinces, or in an equal mixture of both, makes
an excellent Gingle for a Gingle in the Mouth, as also
to take the pains of the Toothach; it kills good
against Taming of the Skin, Sunburning, yellowfefs
of the Skin, Scurf, Morphew, Scabs, litch, Lepo-
fa, Freckles, Lentils, and other like deftations of the
Cutis; it also cleanses and drys over any Scars,
bull Ulcers, callofs Fiftuffs, and the like, in the
Legs, Thighs, Feet, Atma, Hands, &c. and is also
of good ufe against Kings-Evil Scars, if it is boile
in Lye made of Pur Ashe; it kills Lice in the Head,
being wafted thither with Mourning and Evening,
and bulls running Scars and Scabs of the Head, Scid
Heads, Kings-Evil Scars, &c. being often wafted
therein, and a little kind of Cataplasm it also
therefor made in this manner. Take four Hundred
of White Hellebore Root two Ounces, Wheat or Barro
Flower six Ounces, Honey enough to make it up into
a Cataplasm, mix and apply it, some instead of the
Honey use Hop, Butter, some Horse Feed, others
White Bread defined with Milk, &c.

XXII. The Veneficm. Take the Juice of White Hellebore
Roots, put it into a Horn, or some wooden
Gap, and let it ferment for some little
Time, and the Juice is wafted into a Needle
and Thread and wet them therein, and draw
it thro' a Frog, or Chickcan, and if it do presently
it is good and ready, if not, you must ferment it
for some time longer, till it will well upon dry
be very efficaciously perform that Work. This is the
Poyfon the Spaniards use in poifonying their Arrow heads,
they dip their Arrow heads therein, and then what
Beefs foreuer shall be Wounden therewith shall
died. This thing Matthiolus says he trided on
Dogs and on Chickens, which died presently after
they were Wounden. This Poyfon is only ufed while
it is fresh, for if the Juice drys upon the Arrow head
it lofs its Strength, and therefore to keep them
the better they ufe to keep them in a Cafe, the Iron
heads being wrapper in Wood, and Cloths dip therein.
But this is very admissible, as it is related, that
this Poyfon being drank gives almost this:
Take a
Day and more, after that they take it, unless they take too much;
and it is said that Hauers oftentake it themselves,
or purge them from evil Humors, and preserve their
Health. This is also remarkable, that the Death of
chofe Beasts killed by this Poyfon is not in the least
hurtful, but is more tender and pleasant in eating
than the Death of other Beasts not killed therewith,
more especially that part above the Waist.
An Observation. That the Black and White Hellebores much sympathize together, with relation to their Virtues; and what the one will do, the other will do also, but the latter much more powerfully, and with far less Violence, than the former; that by reason of its Violence, and dangerous Ufc, the Internal Practice with the Root of White Hellebor unconcocted, is wholly almost given over, and left off: otherwise, as to the Virtues and several Preparations of the True Black Hellebor in Chap. 536. aftergoing, the same things in a manner may be said of the True White, with Advantage.

CHAP. CCCLII.

OF HELLEBOR. White Wild.

THE Names. It is called in Greek, Θεραπεύονες, or Θεραπεύοντες, in Latin, Helleborus albus, Helleborus alba ferrugineus, or Helleborus albus aegris. and in English, White Hellebor.

II. The Kinds. 1. Epilobium recentarium Clusii, Helleborus albus major, Helleborus albus plantago, Helleborus albus crithmum, Helleborus albus minorem, Helleborus albus aegris, Helleborus albus ferrugineus, Helleborus albus aegris ferrugineus, Helleborus albus marinus, and Pseudohelleborus aegris ferrugineus; The great wild white Hellebor, called also Ladies' Slipper.

3. Epilobium minor flore albo, Helleborus albus, Helleborus albus minor, Helleborus albus ferrugineus, and Epilobium aegris ferrugineus; The leaff wild white Hellebor with a white Flower.

3. Epilobium albus purpureus flore, The leaff wild white Hellebor with blifl flores.

3. Epilobium albus flore ferrugineus, The white Hellebor with white Flower.

3. Epilobium albus ferrugineus flore, The leaff wild white Hellebor with white flores.

3. Epilobium albus ferrugineus flore ferrugineus, The white Hellebor with white Flower.

II. The Differences. The leaff, or Great wild white Hellebor, or Ladies' Slipper. It has a Root composed of a number of Strings, intermixing themselves one within another, very thick within the upper part, and not spreading downwards; and the latter part is of a brownish color. This Root feeds up itself one, two, or more Stalks, a Foot and half high, bearing broad Green Leaves on each side, one by one, somewhat, like those of the Tulpe true white Hellebor, but smaller, and not so ribbed, and each compassing the Stalk at the lower end. At the top of the Stalksstands sometimes but one Flower, and sometimes two, or but three or more, one above another, upon the small florefl Foot-stalks, with a small Leaf at the foot of every one. Each of these Flowers are of a long oval Form, and hollow within, whitish at the upper part, the lower being round, and fowled like a Belfy; at the hollow part there are pieces like Fars or Flippers, which at first do cover that hollow place, and afterwards stand apart one from another, all which are of a fine pale yellow color in most Plants; but some have been found of a brownish color, as tending to purple. There are also four long, narrow and dark colored Leaves, at the footing on of the Flower upon the Stalk, which in the Flower, as it were, at the first was enclosed. The whole Flower is of a pretty sweet Smell: the Stalk is very small, and like unto that of the Orchis or Dog-flower, and is composed in the like kind of Pods.

IV. The second, or leaff wild white Hellebor with a white Flower. It has Roots like the former, but smaller; and this small Plant grows with two little

Salmon's Herbal. Vol. I.
manner, and not much lower, bearing the like Leaves, but smaller, and of a white green color, much like those of Lily Convolu.: The top of the Stalk has many more Flowers, but lefser, growing together Spike-fashion, with small short Leaves at the Stalk of each Flower, which consists of five small white Leaves, with a small close Hood in the middle, without any Smell, and having also like Seed.

V. The third, or Small wild white Hellebor with blufli Flowers. The Roots, Stalks, Leaves, Flowers, and Seed, are all the Manner of Germany, are all much like the fuppofed that herein this differs from that, that the Leaves hereof are narrower than those, and the Stalks and Flowers smaller, the Flowers in this being of a pale purplifli or blufli color, with very small dufy Seed.

VI. The fourth, or Wild white Hellebor with whitliufli green Flowers. This is also one of the small kinds of the Wild white, and differs not much from the lift, either in its Root, Stalk, Leaves, Flowers, or Seed, but only in the Color of its Flower, for whereas that was of a blufli color, this is greenish-colored on the outfide, and of a blufli color within, with like small Seed.

VII. The fifth, or American white Hellebor. This is a Species of the ninth Great kind of Wild white Hellebor, or Ladies Slipper, which has been brought to us from the Northern parts of America, and differs in this only, That it is greater in its Stalks, Leaves and Flowers, which are not yellow, but white, with redifih Strakes thro' their Birds.

VIII. The Places. The fift four grow not only beyond Sea, as in Germany, Afturia, Hungary, but also are round Wild in many places of England. The fourth particularly in a Wood called the Hele in Lancashire, near the Border of Yorks:hire. The fifth grows in the Northern parts of America, as New-England, New-York, Mary-land. The second was found in the Woods by Duget-Pictures, half a Mile from Welower in Hertforshire; it grows alfo in a Wood five Miles from London, near a Bridge called Lockbridge, and by Robin Hood's Well, in the Woods by Damnore in Effe:; by Sunthife in Kent, in a little Grove of Juniper, and in a Wood by Clare in Effe.

IX. The Times. The first flowers about the middle of June, the other four in the Month of Aug., and if the Weather proves cold, in the beginning of June: some earlier and some later than others, according to the Richesse of the Soil, and Warmth of the Summer, and perfect their Seed in Aug.-Sept.

X. The Qualities, Specifications, Preparations and Vertues of these, are the very fame with thofe of the True black and True white Hellebor in Chap. 347. and Chap. 351. afo foregoing, tho' possibly not full out so strong, and therefore the more fit, and the rather to be chosen for the more vulgar Use.

XI. An Observation. The fecd of thofe is Supposed to be the Epiftol of Deferedum, but if either that or any of the two following be it, he fays it is good againft the Diffempers of the Liver, and againft Poison, and to procure Vomiting, which Thaophyllus alfo affirms: and Gerard fays, that the Decoction of Wild white Hellebor being drunk, opens the Oldulations of the Liver, and helps any Impediments of the Same. This is certain, That the Juice, or a very strong Decoction of any of them is good to wash and bathe the Skin withal, in order to the taking away of Scurf, Morphew, Scabs, Irish. Leprofy, Hares, Pimply, Freddles, Lefuls, Yellowwufs of the Skin, or any other Dificatlions thereon.
Helmet-Flower.

Helmet-Flower, or the small Carrot Root, or as much alike to a long Turnip, and sometimes two of them are joined at the Head together. This Root yields forth divers Leaves of a fresh green color on the upper side, and grevillish underneath, much spread abroad, and cut into many Slices and Notches, more than any of the Wolf's-bane. The Stalks rise up two or three Feet high, being like to the top with the like Leaves, but smaller. The top is sometimes divided into two or three Branches, but more usually without, on which stand many large Flowers, one above another, in form very like into a Hood or open Helmet, being composed of five Leaves, the uppermost of which, and the greatest below is like unto an Helmet or Head-piece; two other small Leaves are at the sides of the Helmet, cloathing it like Cheeks, and come somewhat under, and two others, which are the smallful, hang down like Labels, or as if a close Helmet was opened, and some pieces hang by, of a perfect or fair blew color, (but grow darker, having stood long) which causes it to be nestled up in Gardens, that their Flowers, as was usual in former Times, and yet is in many Country Places, may be laid up among green Herbs in Windows, and put in Pots to blow in Chimneys, in the Summer time. But that they may be thus entertained for their Beauty, and put to the Uses aforesaid, you must be ware that they come not near your Tongue or Lips, lest they difcover, to your Cost and Pest, their violent, poifonous and dangerous Qualities. In the middle of the Flower, when it is open, and grows wide, are seen certain small Threads, like Beads, clinging about a middle Head, which, when the Flower is full, grows into three or four or more small blackish Pods, containing black Seed within them.

Helmet-Flower.

Mill's Herbal.

VI. The Places. They all grow naturally Wild on Mountains, and in Woods and shadowy places in Italy, Germany and other places: and it is said, that they grow upon some Hills in England; however, with so they can be nestled up in Gardens, where they flourish extraordinarily well.

VII. The Times. They all flower in the principal Summer Months, viz., in June and July, and their Seed is generally ripe in August.

VIII. The Qualities. They are hot and dry in the Ultimate of the fourth Degree; Deteriorous, and a most moral Poison both to Men and Beasts, and therefore they are called Wolf's-bane, because they kill Wolves, Dogs, Rats, Mice, &c., whether the Juice of the Herb or Root, or the Herb or Root itself, be mixing with their Food or Flies, and will make them eat. And that this Manks-head as well as Wolf's-bane is as destructive to Mankind also, is manifest from that accidental Tryal that had thereof at Antwerp, as a Treat there, where certain ignorant Persons gathering of a Sallet in the Garden, among the Variety of Herbs, gathered also Napolens or Lapars, which with the other things was laved up in a Table, where all who did eat thereof, were taken with most cruel Symptomes, and after the violent Tortures which they endured for some considerable time, died miserably.

IX. The Specification. Helmet-flower (as also Wolf's-bane) is a peculiar thing to kill Lice and Nits in the Head, and to cure the fame of Scurf, Dandriff, Scales, &c. to cleanse old and peeling Sores, running Ulcers, take away dead Flesh, (provided their Sores, Ulcers, &c. be not in the Mouth, Nose, Eyes or Privy Parts, by reason of their Vicinity to the principal or more noble Parts;) as also to cure Distension of the Eyes by a special Application.

X. The Proparation. You may have therefrom, 1. A liquid Juice. 2. A Powder of the Herb or Root. 3. An Oil of the Juice, green Herb or Root. 4. A Poudrine or Lyce of Roots, Leaves or Seed. 5. A distill'd Water.

The Vertues.

XI. The Juice. It is a deadly Poison taken inwardly any way: it is also as deadly to Wolves, Dogs or other Creatures who shall take thereof, or eat in any manner of ways of the Herb or Root. The Juice of the Roots especially Hunters of Wild Beasts do use, dipping the Heads of their Arrows into the same, by which means they quickly kill the Beast.

Bay which is wounded with the flame: yet it is certain, that the Heli of the Bath so killed is not at all palloors, but all alive, and eats more tender than it had been otherwise killed, more especially if it be kept for a Day and Night.

XII. The Powder of the Herb or Root. Mixt with Calendula, Sunflower, or Carys, and let it also be used in the place of a Beeswax, or Oil, or Fats. It kills and puts a Mixture, kills them, if they eat it. Mixt with Powder of Lysoronic and Resin upon foul Ulcers, it cures them, days in some measure, (if skillfully applied) and disposes them for healing, which may afterwards with proper Incuratives and Ulceratives, be perfected.

XIII. To Oil or Ointment of the Juice, or green Herb, or Root. It kills Lime and Vermic, if the Head or any part of the Body, in which Lime and Vermic breed, be anointed therewith, it quickly kills them, and frees the Patient from the same.

XIV. The Distilled or Essence of the Roots, Leaves or Seeds. If it be a simple Distillation, it is then made in simple Elixir only: but if it is a Lyceum, it is made in a small Lyceum of Powders. It cures the Head and other parts from Morphe, Scur, Dandruff, Scaums, Itch, Pimpls, Tacks, Ringworms, Leprocy, and other like Breakings out, the Parts affected being bathed therewith.

XV. The distilled Water. Being dropped into the Eyes, it takes away the Inflammation on Redness in them, also eases them from any Haw, or Pin and Web, growing in or upon them. The same thing is said of the Juice: but I fear it is dangerous, and if it is used to the Eyes, it must be done with much Caution, and by such as have Judgment and Skill, and not by Fools. It ought to be mixt with a sufficient quantity of Damascus-Rose Water, both to assy its Heat, and to take off the Violence of its Operation.

XVI. To Cure such as are Poisoned therewith. The first thing you are to do, is to give an Emetic, as two, three, four, five or six Grains of Emeritc Tartar, from half an Ounce to an Ounce or Two, and half of Infusion of Coccus Metallorum, or Vinum Benedictum, or Vinum Antimoniale, or a Dreke of any other proper Emetic which you have at hand, proportioning the Dreke according to Age and Strength. The next thing you are to do, is to exhibit Calendula Officinalis, or this following, if the Patient is weak: Take Potar-drink or Mutton-broth a quart, brown Sugar four Ounces: mix, well or delightful, and exhibit it warm. This is to be done, that the Body be effectually, and as soon as may be, discharge of the Poison: which being performed, Cordial and Antidotes are to be given, the one to defend the Heart, preserve and keep up the Vital and Animal Spirits, the other to remove and destroy the force and power of the Poison; for the first of these, we commend our Aqua Beantoria, Tinctura Beantoria, or some other like Coutil Water, Spirit or Tincture, to be mixt and given with some noble and generous Wine. The Antidotes we commend in this cattle, are, Altrihoris, Venen Troce, the Antidote in our Phyloce, or for want of them, to drink a Distillation in Wine of Orange, Penny royal, Sagorr, Sage, Southernwood, Wormwood, Gentian, Winter Common, Edd. Distillation is good, for also a mixture of Cutilusium, Pepper, Calotis and Rose, of each a like quantity, being in fine Powder, and mixt up with Honey into a Balsam. Peter Aposello commends a Dreke or two of Terra Leu- nas to be taken in warm Drink or Wine, but above all be pays, that Arfiscola larga is the most especial Antidote or Remedy against all Acutees. Avo- cen has an Antidote against this Poison, which is made of the Fly which feeds upon this Poisonous Plant, which he found to be very effectual, not on-

by against other Poisons, but chiefly against that of Napellus or Helmet-flower, and Poison of the Tar- tonal. It is thus made: Take Arfiscola larga, fine Boles, each in fine powder, a Dron, Piles which feed upon the Napellus number twenty: make a fine Powder, and mix them: Doe a Draught at a time in a Glass of Wine. Galiherius his Antidote is this: Take Bay-flower, Terra Leu, both in fine powder, Altrihoris, of each two Ounces, Piles which have fed upon Napellus number twenty four in powder: mix them, and with a sufficient quantity of Honey and Oil, make an Elixir. Doe from a Draught to two Draughts at a time, with a Glass of generous Wine. But the true Antidote against this Poison is the Antidote or Antidote in the Chapter following, of which we shall there speak more largely.

CHAP. CCLIV.

Of HELMET-FLOWER Alexipharmic, O R.

M N K S - H O O D Antidotal.

I. THE Names. It is called in Greek, Artemisia; in Latin, Antiphasor or Antithora, but most commonly, for Shortness sake, Antithora, (as being the Opposite or Antidote to Apoth., Helmet-flower of Wooly-bone:) in English, Helmet-flower Alexipharmic.
of these Dileases, causing them orderly to come forth: you may give from one Dram to two Drums, (according to Age and Strength) in any proper Vehicle. It defends the Heart, and strengthens the Spirits as a most Sovereign Cordial.

XII. The Acid Tincture. It has the Virtues of the Root, Decoction and Spirit, besides which, it is more effectual than any of them against the Plague or Pestilence, and all sorts of Malign or Pernicious Dileases, as also against all malign and burning Fevers, destroying the Malignity, and extinguishing the burning Heat of the Diseas. It is also good a

against the Stomach and Poison of Mad Dogs, Serpents of all kinds, as Viper, Rattle-snake, Slow-worm, £c. and the Stinging of Scorpions, Hornets, Wasps, Bees, £c. Let the Patient take it in all that they drink, so many Drops at a time as may make the Vehicle pleasant, and continuing the Life of it for some days. The Figure which we have given you in this place, is from Matthioli his Ex

CHAP. CCCLV.

Of HEMLOCK Common.

I. THE Name. It is called in Arabic, Sawrasm: in Greek, Λιασσας, and in Leonardo, a circun vertendia, quod Vertigine, & imaginem eorum erat quae affluat. Quamvis circumspecta et in tendentia inducunt tis que bene herbas: in Latine, Centa, and in English, Hemlock.

Common Hemlock.
English Herbs.

III. The Common Kinds. Of this there are two several sorts, viz. 1. Tragacanth, Grecia vulgaria, Grecia major, (by almost all Writers) Grecia Catala, Our Common Hemlock. 2. Tragacanth, Grecia major, vol mucina, Grecia trillfolia ferdinanda, Grecia mucina Bronchites by Label, Grecia Myrthus Thallus, Solfex Pelagonia, Matthiath, Gefehret and Lugdunensis, which Label contra- diets, The great or greatest Hemlock. That this is a Hemlock, and no Solfex or Harnerus, no doubt is to be made of it.

IV. The Descriptions. The first, or Common Hemlock, has a Root which is long, white, and sometimes crooked, and hollow within: from the Head of which Root it grows up with a hollow green stalk, three or four feet high or more, full of red Spots sometimes, and having at the Joints very large winged Leaves, one foot against another, dented about the edges, of a fad green color, branched towards the top, where it is full of Umbles of white Flowers, which being puffed away, give white, har- thorn, leaf Seed. The whole Plant and every part has a strong, heady, ill-conditioned Smell, offending the Sense.

V. The second, or Great or greatest Hemlock. It has a Root which is very great and white, growing as well deep into the Ground, as spreading many great Branches therein, which sometimes dies after it has given Seed, and sometimes not, abounding all Winter in some Seafonis, and in some Places. This Hemo- lock has much larger winged Leaves than the former, thicker set, more spired, and of a fadder green color, having a Smell which Label calls Pertuisa, yet Farthing says, that he had it growing many Years in his Garden, he never before any offensive Smell it had. The Stalk is great, but rides not so high as the Common sort does; but bears as large Umbels of white Flowers, where, afterwards grow large and thick white crooked Seed, of no evil Smell.

VI. The Places. The first grows in all Countries throughout England by Walls and Hedge-sides, and in walled Grounds and untiled Places, as also in Gardens of a fat and rich Soil. The second I have found in moft and fertile Medows among that other Weeds near their Borders, but grows with it mostly in Gardens, where it is generally needed out.

VII. The Times. They both flower in July and August, and set in August and September.

VIII. The Qualities. Hemlock is cold in the fourth Degree, and dry in the second, Repercute, Anodyne, Altering, Arthesis and Venenick.

IX. The Specification. It is chiefly of External Use, for the Cure of the Gout, Scirrhous Tumors, Erythema, Inflammations, Wheals, Pufhes, creeping Ulcers.

X. The Preparations. You may have therefrom,

The Virtues.

XI. The liquid Juice. It is applied outwardly to the Teplitids of such as have Veneous Dreams, or the like, to suppress them: alfo to Maidens and Women Breaks, to remove their Swellings, and repel their Milk: yet by reason these places are not principal, and full of Viral Spirits, it sometimes happens that the Remedy is worse than the Disease. It may easily be applied to an Inflammation, an Erythema, Pains of the Gout, arising from hot or fiery Humors, and to Wheals, Pufhes and creeping Ulcers, accompanied with a hot and sharp Manner, be by cooling and repelling the Heat, it passes a Flap to the Humor.

XII. The Cataplasm of the Leaves. A Cataplasm being made of the raw Leaves by only bruiling, and to laid to the Brows and Forehead, is good for the Defusions of Rheums falling into Red Eyes, so as quickly to ease the Pain, and take away the Swelving and Redness. And being applied with a mixture of Bay Salt in fine Powder to the Whiff, (renewing it twice a day for three or four days) it takes away a Pin and Web growing in the Eye, but it ought to be applied (as they lay) to the contrary Whiff. Applied in Pains of the Joints, it eafe them.

XIII. The Cataplasm of the Root. It is to be roufed under the Embers, wrapfed in double wax Papers, until it becomes foft and tender, then to be beaten in a Mortar to a Pulp, and applied: it prevails admirably against the Gout in Hands or Fingers, as alfo in other Pains, quickly ealing the Pain.

XIV. The Venenick. The Juice mixed with Wine, if it is given to any one, is prefent Death, as Trav- gus lays. And this pudsly might be the Venenick which the Athenians adjudged the Wife Socrates to die by, for not thinking respectfully of their Gods, or rather Devils, being accived by Aristof and Meri- litus. The Cure. If any one has taken the Juice of Hemlock, or this Venenick, or by inftance has eaten this Herb instead of Porphy, or its Root instead of Porphy, which cudes a Furry, or Perturbation of the Sense, as if stupefed or drunk: the fift thing I lay in this Cafe which is to be done, (if it is Root enough) is to give the Patient a Pound of Viuna Benedixu, Viuna Arijunia, or this Tare Enameck, which being effected, a good Delight of Wine (in which Gcretion has been infufed) is to be drank, as Tregus alvides. Tragus says, he cured a Woman who had eaten the Root, by giving her a Draught of good Vinegar: and this may be promi-
Salmon's Herbal.

Lib. I.

CHAP. CCCLVI.

Of HEMLOCK the Leffer,

HEMLOCK Partly Leav'd.

I. THE Name. It is called in Greek Κικυτα, in Latin Cicuta, vel minor, and in English The Smaller or Lesser Hemlock.

II. The Kinds. This is the most general Species of this Plant, and tho' it is a singular one of its kind, yet Authors have given it a plurality of Names, as Cicuta minor Cordis & Canariar, Cicutaria Potata, Lobelia, Crata Vora, Apion Lactuerum Thalit, Petrollium Canum Liberum, Ammonium Canum Liberum, and Vomifor, and Apfi Comes Cicerarum Gafferi in Horto, Poeta Hemlock, Partly Leav'd Hemoth, &c.

III. The Description. This Smaller Hemlock has a small, tough, white Root, which perforis every Year, from which rise up divers flint Stalks, scarcely a Yard high, hollow, somewhat reddish towards the Sun, otherwise they are whiter than the former, smaller, and not spotting at all, and jointed or knotted at certain distances, from which Johns spring forth, long Leaves, very green, and finely jagged, like the Common Canter, or Parly, indeed as the Leaves are much smaller than the Common Hemlock, so they come to mix with Parly, that many are mistaken, in gathering one for another, being often found (the Wild Weed) in Gardens, of a paler green color, and with few Branches, the Flowers are white, and grow at the tops of the Stalks in small, dry, spiny Hemlocks, with small, longish, green Leaves about them, the Seed follows, like that of the Common Hemlock, of a white color, or as they grow together on the tops of the Stalks, resembling Geranium Seed, but leaffed, the whole Plant seems not to me to be of any evil smell.

CHAP. CCCLVII.

Of HEMLOCK Water or Marsh.

I. THE Name. It is called in Greek Κικυτα, in Latin Cicuta, vel Polyartis, or English Water or Marsh Hemlock.

III. The Description. The seventh, or White Wa-
Cannabis

going from Deptford to Deptford, near London, and in many other places.

VII. The Times. They Flower throughout July and August, and Perfect their Seed in August and September, as other Hemlocks do.

VIII. The Qualities. Specimens, Preparations, Virtues and Uses are the Same (as Authors think) with the Common Hemlock in Chap. 355, abovegoing, but of this I confess I very much doubt, seeing in I. are cold in the Fourth degree, and those on the contrary are hot, at least in the Second degree, and aromatic, as the hot and spicy Taste of the Seed seems to indicate; however, since Authors have laid nothing in particular of the Matter, nor we have had any experience of our own concerning the same, we shall cease any farther Declaration thereof.

CHAP. CCCLVIII.

OF HEMP MANURED.

HE Name. It is called Arabick Cannabis, and Schiedmeyeri, in Greek Kanna, in Latinina Cannabis, and in English Hemp.

II. The Kinds. It is twofold, viz. 1. Cannabis Sativa, Manual Hemp. 2. Cannabis Spuria or Spurious, Cannabis Sylvestris, Cannabis Sppara, Wild or Ballast Hemp.

III. The Manured Kinds. The Manured is also twofold, viz. a. Cannabis Mai, The Male Hemp, of that which bears Seed. b. Cannabis Femina, The Female Hemp, or that which bears Flowers and no Seed.

V. The Third, or Marth or Water Hemlock. It has a long and blackish Root, with several Points and Fibers growing from them, from this Root springs up a great, thick, and hollow Stalk, three, four, and sometimes almost five Feet high, full of Joints, and Leaves at them, at the Joints with the Leaves, which are cut into divers parts, somewhat like unto Parsley, but smaller, come forth the Branches up to the top, bearing small Umbles of White Flowers; the Seed is smaller in size, and black, somewhat greener than the Last: This is that Plant which De- domans and Lagensagis take to be Phleumendrum Pflami, and they make it to be Siam, or Laos, the Significant Silvestre Volvi, which Cephalinae and others think to be the Silves Pflami.

VI. The Places. They all grow in moist and watery places in several Countries of Europe, the third, or Marth or Water Hemlock by Rivers Estuaries, in many parts of England, in several places by the Thames side, also in the midst of Water Ditches, and standing Pools and Ponds, in moist places of this Land, it grows very plentifully in the Ditches by a Causey

VII. The Times. They Flower throughout July and August, and Perfect their Seed in August and September, as other Hemlocks do.
Salmon's Herbal. Lib. I.

By high, according to the goodness of the Soil, with many Leaves for thereon at distances, this Stalk is rough and boughly, with many Leaves also on the Branches, each one of them standing upon a long Footstalk, and divided into five, six, or seven several Leaves, joined together at the bottom of them, and devoid of the edges, something like unto the form of the Leaves Palms Whiffi, or Hibbard Black红枣, of a dark green color, and of a strong finell, but not unpleasant towards the tops, from the bottoms of the Wings and Leaves, comes forth the Seed on long Branches, without any kind of Flowers, which is round, somewhat hard, and full of an oily Nuc like white substance, and contained in round Heads, every particular Leaf is narrow, long, and sharp pointed, truly matched in about the edges, this is called Winter Hemp.

V. The second, or Female Kind, has the Root and Stalk as the former, but the Leaves are lesser, and of a lesser green color, yet like in form and shape; the Stalk is single for the most part, with few or no Branches, having a like kind finell as the other, it bears a great number of Flowers, which are small, and of a whitt yellow color, standing many together upon long Branches, which turn into dust, and are carried away with the Wind, not having any Seed after them, for which reason it is called Barren Hemp, and by reason of its bearing no Seed it comes to ripeness sooner than the other by a Month, or more, being the tenderer and weaker Plant, the Stalk being hollower, and not so strong, for which reason it is generally called Summer Hemp.

VI. An Observation. These two sorts, Male and Female are not originally two differing Kinds, but both rise from one and the self same Seed, that is, they both spring from the Seed, growing up like one and the same Stalk or Plant, being born somewhere like unto the French Mercury, but how this change in Nature should be, or how it is brought to pass, is very hard to determine; The Summer Hemp, as it is the tenderer and weaker Plant, so it makes the finer Brass or Tare, and that makes the finer Thread, and by consequence the finer and softer Linnen Cloth.

The Winter Hemp, as it is the stronger Plant, and harder peeling, so it makes the coarser and harder Thread and Cloth, and of this sort it is they usually make their Cordage. As for the way and manner of keeping or watering of Hemp, and how it is dried, pickled, cleansed, and beaten, 

VII. There is also a third Kind of Hemp growing in Virginia, and other of our Eastern Plantations, which in Roots, Stalks, and Seed differ not much from our Manned Kind, having, that the whole Plant is much bigger, the Stalks are greater, and the Leaves and Flowers much larger.

VIII. The Places. Playg Lib, 20, Chap, 22, says that Hemp was formerly growing Wild, but we in our days can find no such thing, for in all Plant-places of the World it is now Sown in enclosed Fields chosen on purpose for the same, Collected to give it a due price, and Watered, and in plain and moist Grounds deeply Ploughed.

IX. The Time. It is Sown in the end of March, or beginning of April, and is ripe in August or September, according as the two sorts grow ripe and fit to be gathered, theSeed of thife, or Summer Hemp is ripe and fit to be gathered in the end of July, and beginning of August, the fall, or Winter Hemp, is gathered a full Month after, viz. in the end of August, beginning of September.

X. The Qualities. It is hot and dry in the end of the fruit, and thenceforth it is Astringent, Cathartic, Digestive, opening Obstructions of the Gall Bladder, and is Amygdale, Neuronic, and Arthretric.

XI. The Specification. It is a peculiar thing in curing the Jaundice and Colick, in killing Worms, and curing pains of the Gout.

XII. The Preparation. You may prepare there-from, 1. A Liquid Juice of the Leaves. 2. A Decotion of the Leaves. 3. A Decotion of the Seed. 4. A Decotion or Emulsion of the Seed. 5. A Dyed Filled Water of Root and Herb. 6. An Oil by Infusion. 7. The Leaves Fried.

The Virtue.

XIII. The Liquid Juice of the Leaves. Taken to an Ounce or two in a Glass of Wine it is an extraordinary thing to kill Worms, whether in Man or Beast, dropped into the Ears it kills Worms in the Ears, and drives forth any other living Creature which has crept into them: And to show the Strength hence of for this purpose, Mathewson says, that it is poured, (yes but the Decotion of the Herb) into the holes of Ears-Worms, it will drive them forth, and that Fishermen and Anglers have used this Plant to get Worms to bait their Hooks.

XIV. The Decotion of the Leaves. It has the former Virtues, but not altogether so strong, and may be given from three to eight Ounces, according to Age and Strength, but is no very agreeable thing for the Stomach.

XV. The Decotion of the Root. It has the same Virtues also, but this in especial it is said to be good against, viz. to allay Inflammations in the Head, or any other part, to ease the pains of the Gout, to help hard Tumors or Knots in the Joints, Cramp and Shrinking of the Sinewes, and to ease the pains of the Hip, or Sciattia, being applied thereto by Fomentation.

cannabis Spuria tertia, Cannabis Spuria Silva
Urtica Lobelf, Urtica aculeata Foelis, non ferrutii
Urtica altera Matthioli, The third Ballard
or Wild Hemp.

Hemp

Bastard

III. The Descriptions. The first, or First Ballard Hemp, has a Root which is hard and white, and a little spreading, but dying before Winter, from the head of which rises up a reasonable great, hairy, square Stalk, not very strong, nor upright, but as it are leaning down, with several Joints bouching out like Knees, and two Leaves at every one of them, somewhat long, hairy, and pointed, of a frether green color than the Leaves of the Alumered Kind, and dented about the edges, at the Joints also come forth Several Branches, joined and let with Leaves in like manner, whereabout, towards the tops, grow several hooded and gaping Flowers, like those of the Dead Nettle, but larger and greater, of a pale purplish red, standing in small, green, prickly Huds, in which, after the Flowers are past, grows the Seed, which is small and round, three or four growing together.

IV. The second, or Second Ballard Hemp, differs not much in Root or Stalk from the former, but the Leaves are shorter and rounder, the Flowers hereof are of the same fashion, but not so great as they, the uppermost part or hood whereof is of a pale color, tending to yellow, and the lower part of a deeper red, or Purple Color, the Huds of the Flowers are somewhat more prickly also than the other.

V. The Third, or Third Ballard Hemp, is in its growing much like the last, but its Root is a bulk of fibre and strings, from whose head comes forth one short body of a Stalk, which quickly divides itself into two, three, or four others, which growing up with several Joints, spread themselves out into many Arms or Branches, two and two at every joint, but

Of H E M P Bastard or Wild.

T H E Names. It is called in Greek Κάνναβις, in Latin Cannabis Spuria, vulg. in English Cannabis Spuria, or Spuria, and Cannabis Sylvestris, in English Bastard Hemp, and Wild Hemp.

II. The Kinds. Authors make there several sortes hereof, thus. 1. Cannabis Spuria primus, Cannabis Syl-
vestris Tragos & Lugdunensis, & Spuria altera Lobe-
lij, Cannabis sylvestis Tabernamontani, Urtica aculeata
Folliis ferrutii Bastiani, The first Ballard Hemp, or
White Ballard Hemp. 2. Cannabis Spuria secunda,
Cannabis Sylvestris Spuria tertia Lobelf, Altham
Arvense album Tabernamontani, Urtica aculeata Foel-

Hemp Bastard
but the leaves at the joints are somewhat long and narrow, a little slender, and not dented about the edges in most of them, the flowers hereof are hooded and gaping, but they are wholly of a pale yellowish color, with little or no shadow of spot in them, and hand thicker about the joints, whose husks have longer and slimmer points than the reft. killed and done no good, 'tis very possible that they may be of extraordinary use in curing the Kings-Fold, if prudently prepared and applied, and by a Wise and Skilful Hand.

HEMP Water. See AGRIMONY Water.

CHAP. CCLXX.

Of HENBANE Common or Black.

I. The Name. It is called in Arabick Alter-

Bastard

Hemp

common, and Altereccrement, and by the Arabi-

can Physicians: Benga, which differs but little from the In- 

dian and Persian Name Benga, as Gerard at Or- 

to, and Christopher As�a declare, in Greek: Yenak. 

#define

'Ab, or quoh Yohna Psorina, in Latine alle Hyoscyamus, 

and corruptly Jaffajamus, alle Apollonius, alle Apo-

drano Medicinae inventores, alle apollinis crebetum 

tunicum & satoh habita, comme Academiae parcellis, quoh 

and Apollinis infant Scirbonius says that the Latines

II. The Kinds. There are several sorts of this 

plant, but the principal kinds are, 1. Fusa, pas- 

Hysocyamus niger, called alle Hyoscyamus con-

guinn, and by Iaffars Hyoscyamus Benga. One Com-

mon Herbae, which is the Black Henbane, and a

singular plant, of which in this Chapter. 2. Prin-

nulauin, Hyoscyamus albus, so called by all Au-

thors, White Henbane, of which in Chyp. 561 fol-

lowing.

HEMBane.
Chap. 360. English Herbs.

...V. The Plants. The first is commonly found growing by the way sides, and under Hedges sides, and old Walls, about the borders of Fields, on old Dunghills which have lain long, and in other rude and unwholesome places, the other is an Exotic, common to be had in Egypt, as the first is with us, but by transportation of the Seed to us, it is now to be found in several of our Gardens.

VI. The Times. They spitting out of the Ground all April, and in May, and do both Flower in July, and in August, the Seed being perficled in October, when growing ripe, if it is sheltered to fled or fall, it ftings up again, and the Heads fprout.

VII. The Seed fizes. They are cold in the fourth degree, and dry in the fecond or third, they are Abo- dyne, Afftrigent, Emphatick, Repafcurive, Art- hitick, and Venenick.

VIII. The Specification. They are good against inflammations of the Eyes, Sciaticks, Gout, Rheuma- tifm, Kings-Evil, hot Tumors of the Cods, and of Womens Breasts, noife, defeafnefs, and pains in the Ears, it prevalts against Coughs, and Fits of the Mother.

The Virtues.

X. The green Leaves in fulphate. Applied they cool all inflammations, either in the Eyes, or in any other part of the Body, and are good to affuage all manner of swellings, whether of the Cods, or of the Womens Breasts, or in any other part, if any thing ap- plied to the Joints give rise in pains of the Gout, and Sciaticks, and to the foreheads and Temples they eafe a vehement Headach, proceeding from a hot Fever in Sleeps, and are very good against simple Coniums entire.

XI. The Liquid Juice of the Leaves. It has all the former Virtues, being bathed warm or fomented upon the parts afflicted, and seems to me to be the more powerful of the two, but after long use it will be neceffary to lay Linen Cloths four, fix, or eight times doubled dipped in the Juice upon the dif- ficulties, dropped into the Ears it takes away any noife therein, deafnefs, thicknefs of hearing, or pain there, held often in the Mouth of one who has the Toothach it gives relief and cafe, and if there is Worms in the Teeth or Gums it kills them.

XII. The Essence of the Roots and Leaves. It has all the Virtues of the green Leaves and Juice afore- going, and for the excellent use which may be made herof it ought always to be kept in a readiness in the House, if it is mixed with Wine, or Wine and Water in equal quantities, and a good Head bathed therewith, it will kill Nits and Lice, and this it will do in Man and Bealt; the fame thing the Li- quid Juice will do also.

XIII. The Juice or Emulsion of the Seed. An Ounce of the Seed will make twenty or twenty four Doses for a Man or Woman, it is an excellent thing against hot, falt, and sharp defiurations of Rheum fal- ling upon the Lungs, cafes Coughs, their never to ex- trem, and is good against pains of the Spleen, and Womb, and Hysterick Fits, or Fits of the Mother, it roots all sorts of Flices of the Bowels, as Diar- rhea's, Dillenteria, Lithenteria, and Hysteric Fits, as well as the Overflowing of the Terms, and the Whites in Women.

XIV. The Oil of the Seed by Infufion or Expre- fion. Dropped into the Ears it is good against noife and pain there, as also against thicknefs of hearings, and kills Worms in the Ears, anointed on the Joints of Gouty People, it giveth cafe to the pain and eafe- ages the swelling of the parts: The Oil by Infufion is good for all the above mentioned things, but the ex- preffed Oil is five times more powerful and efficacious, and therefore the rather to be choft.

XV. The Seed in fulphate. It has all the Vir- tues of the Juice or Emulsion of the Seed at tech. XIII. above, besides which it is a most excellent thing to be given about ten or fifteen Grains at a time (ac- cording to the Age of the Partia) to such as fits a Bed, or cannot hold their Water, being continued for some time, and by this remedy alone I have 11 u u cured.
cured several Young Persons, (even Women kind, which are most difficult) who had been troubled with the same many years, the Cura succeeding beyond expectation: The Emulsion of the Seed will also do the same thing, but whether it be so powerful as the Fruit I will not determine, because a great Virtue may reside in the Hulls or Husks of the Seed, which in the Emulsion are all call away, but if the Emulsion be made with all the Husks of the Seed in it, I know not but then it may do as well as the Seed in fulness it self, if the Seed is given in fulness, it ought still to be all broiled in a Stone or Glass Mortar, and then mixed with the pulp of a roasted Apple, or other proper Vehicle, and so given (for some time) every Night going to Bed.

XVI. The Decoction of Roots, Herb, or Seed. If the Feet are swollen, hot and esteem Sleep, and given in a Clyster it does the same, so also bathed upon the Temples and Forehead, and a little filtered up the Nostrils also, it has all the Virtues of the green Leaves, Liquid Juice and Efficiency at Salt. X. XII. if in like manner applied, but the Decoction is much the weaker Preparation, and ought therefore to be the other used. The Decoction of the green Hovels of the Flowers has also the same Virtues.

XVII. The Vinegar of the Root, green Herb, or green Hooks. It is made by Infusion in warm White Wine Vinegar, either by Infusion, Digestion in a Sand heat, or gentle boiling, or digesting in a boiling Balneoy, if it is held in the Mouth it eases the pains of the Teeth, given inwardly in a small Dose, as from half a Dram to a Dram, or more, in some fit Vehicle, it causes Red and Sleep, more especially if it is also bathed upon the Nostrils, Forehead, and Temples, and a Rôle Cake dipped in the same is applied to the Temples, bathed upon places insensible, tumefied, or painful, or affected with the Gout, it eases them, it also alluvates the swelling of the Spleen, and eases its pain.

XVIII. The Extract of the Juice of the Roots and Leaves. The Juice being produced by expression it is to be infused in a gentle Sand heat, or in the Sun, till it comes to perfec dyreness of a Ganmchon, done to it is to be reduced, by heating to a Mortar to a gentle Powder, and then it is fit for extraction, this is done two ways, viz. either with Water, or with Spirit of Wine, you must dissolve it in either the one or the other Mails of Spirit in a gentle Balneo, or in a gentle Sand heat and keep it in that digestion forty eight Hours, flowing in three, or three times a day, then being filtered still it is perfectly fine, decant off the clear Tincture, which reference, put more, either Water, or Spirit of Wine, and extract again as before, till no more Tincture will argue, duant this clear Tincture, which put to the furnace referred Tincture, casting the face away, this Tincture, whether Aquous or Vomous, put into a proper Vessel, if it is an Aquous Tincture, you may put it into a Glass Bottle, or well glazed Corken Bottle, and in a gentle Sand heat evaporate to dyreness, and then is done, but if it is a Spirituous Tincture, put into a Glass Body or Vessel, which fits a Glass Head, and in a gentle Sand heat, or in Balneo, drain off the Spirit, till the Mague remaining is of the thickness of new Honey, or something thicker, the Spirit you may keep for the other Dram, otherwise, the Extret you may take out, (by breaking the Glass Body) and keep it in a Pot or Box close covered from the Air, It is Sophisticous and Narcotice, diffused in Water or Vinegar, and used soothingly, it will do all that the green Leaves, Liquid Juice, Efficiency, or Decoction can do; if it is diffused in Cantry, or other Wine, it is good a

pright Delights, or indure of heating, noise and pains in the Ears, and held in the Mouth it gives ease in the Tootshole, and to diffused in Wine, or otherwise in Spirit of Wine, it must be given from twenty to thirty, or forty to sixty Drops, or more, in any convenient Vehicle, to cause Red and Sleep, and to ease the pains of the Spleen and Bowels, or pains in other parts of the Body, it operating more much different from an Opium, and this Extremity is that Juice of Henbane which you ought to part into the Composition when you Contend the Lusitanae Opium.

XIX. The Oil or Ointments of the Roots, or green Leaves, or of their Juice. It is made by a treble addition of the Vegetable matter to the Oil Ossor, or Hogs Lord, or mixture of Oil and Sheep Suet, every time infilling and boiling till the opaque substances are all confumed. It is good to cool inflammations, and cauf pain proceeding from a hot cause, if it is made (inseed of the Hogs Lord, or mixture, &c) with Lign anxious Folium, it will give admirable cafe in the Gout, alluvates the pain and swelling of the Tefeles, and the inflammations and Tumors in the Venous Breffers, it eases all pains of the Heart, and in any other part, and will perform what the Leaves, Juice or Fl issue can do.

XX. The Compounds of the Roots or Leaves. If applied to simple recent Contusions it dissipates the Tumor, or prevents its rising, and quickly cures it, if made by boiling them foil in Red Per Perine, and applied to Women Breeches, or to the Tefeles, or other like painful Tumors, it eases the pain and alluvates the swelling, applied to the Temples and Forehead it eases the Headache, gives Red, and induces Sleep, that made without Wine is good to be applied to pains in the Ribs, and to the heavy parts of the Arms and Legs, but it ought to be applied hot, that made with Wine is an excellent thing against the Scurfes, and the Gout in Hands or Feet.

XXI. The Emulsion. It is made in the Wine in the former Catapult was boiled, adding to every Pint thereof a Dram or two of Glutam Tars period little, it alluvates Inflammations, diffuses Tumors or Swellings proceeding from heat, and eases any pain proceeding from a hot cause, or hot and hard Humors, it is good also to bath them with the Hands and Feet which are apt to be hot and dry, and it is also good to hold in the Mouth for the Tootshole, and to torment that Sake of the Cheek and Jaw therewith, it giving pleasant eafe to the pains.

XXII. The Fumes of the dried Root, Herb, or seed. The Fume of dried Root, Herb, Stalks, or seed, being burned, and the Hands held over the Fumes thereof, will quickly ease such as are troubled with Swellings or Chillflins in the Winter, the same done to such as have Kibles in their Heals it will quickly heal them, tho' inveterate and very bad, it also cures the Toothache.

XXIII. The Distilled Water of the Root, Herb, Flowers. It is effectual to all the purposes for which the green Leaves, Juice, Efficiency, Infusion, Decoction, &c are used, but it is much thinner than they, it clears the mind, being wafted with it, of heat, Pimple, hot eruptions, or breakings out, Herb, Scent, Matoph, Yellowwines, and other Deformities, &c.
Chap. 361. **English Herbs.**

Infusions, alleviates pain, and gives ease in the Gout, the parts affected being often bathed there-where.

XXV. The Cure of such as are Poisoned with Henbane. If it is recent, the first and only thing which is to be done is, to give an Emesis, which may be Tartar Emetic, Latin Ammoniacate, Vomum Benedictum, or some such Antimonial Vitriol, which, when it has almost done working, its force down-wards ought to be encouraged, by giving this Cly-

**Motum Drach or Peyer-Drink a Pint**

from those Occasions, mix, melt, and exhale it warm; by this means all the Viscera of Bodies will be effectually cleared of the. Poxyon, then give to the Patient Goats Milk, or Milk, or Honied Water, or Pine kernels with sweet Wine, or if these be not at hand, give Verres, or Dilk, or Curare Seed in Poudre, private Seed, or Seed of Mulled or Reddish Wine, also Onion or Garlic taken in Wine do all help to free them from the danger, and restore them to their due Temer again, light, being put to Bed give two or three Drums of Aristata of Venice Treacle in a Grains of Canary, cover them down warm, and let them take it up.

XXVI. A History. Parkinson gives a Relation of one who digging up some Parfing Rots in a Garden, by chance also dug up some Henbane Rots which grew among them, they being both very like one another, as is before related, these Henbane Rots were boiled with the Parfing, and dealt with, and they were eaten at Suppers the Persyn who gave the relation hereof felt that he eat of them, and was presently after very day, and the drought was so great, that nothing he could take would quench it, his Taste was deprav'd, and his refiith of things was taken away, suddenly also his Sight was recou'd, so that he could not discern things as they were, but as if they were three or four fold, his Urine was also quite changed, so that notwithstanding he had a great desire to make Water, yet it was wholly cold, in this bold Condition he continued the most part of the Night, neith-

**comic he off of being in Bed; but his Urine, by the Hopage thereof, grew hot within him,** that it added much to his Grief, at length he thought himself a Medicine, which was good against the Stone, it was a Pouder, he premitly took it, and it caused him to make Water, and thereby he felt incredible ease in his whole Body, for all things which he had taken before did him no good, but by this means he quickly recovered his Sight, and the other Symptoms vanished, and by Morning he was very well! The Servants who did eat of this Meal were Deftirous, some more, some less, ac-

ting to their Feeling, and the strength of their habit of Body, or Constitution, operating together.

XXVII. An Observation. Moutbanks and Quack-Surgeons pretend to cure the Toothach with the Furnes of the bared Seed, and to bring many Worms out of the Teeth and Gums therewith. It is true that the Furnes of the Seed will give caitle in that pain, but the presence of Worms pulling out of the Teeth is a Truth which they put upon the hy-

**blinders, for these Vile Fellowes, to deceive those from whom they would get Money, caical the Pati-

teos to hold their Mouths over a Baffon or Bowl of fair warm Water, they receive the Furnes of the burning Seeds up a Funnel; the Seeds are stuck fast upon a stick, with a great many small bits of very hot Ash and Sulphur, fixed with the Robin, and fixed on the stick, with the Seeds afterwards, while the Robin is hot, as the Robin is then kindled and burns, melting the Robin, and as

the Robin turns the Furnes up the Funnel into the Mouth, and the Seeds burn'd, and the very small bits of the Lute String fall into the Water, which them to move or fill themselves, whereby the lookers on think to be live Worms come out from the Teeth and Gums, whereas in truth they are nothing but their bits of Lute String mixed and blended with the Robin just fallen down in means of the Fire, for it is the property of those Lute Strings, that feeling the heat of the Fire, and also filling into warm Wa-

ter, to bloom to fill and to move about in the Water as if they were alive.

### CHAP. CCCLXI.

**Of Henbane White.**

1. T HE Name. It is called in Greek, Ηφυσάμων; in Latin, Hyoscyamus albus; and in

**English, White Henbane.**

**Henbane White.**

II. The Kinds. There are several sorts, as 1. Hy-

**oscyamus albus**, (so called by all Authors) White Henbane, and this is major, the greater kind, for

**Bauhinia** makes two of them. 2. *Hyoscyamus albus minor*, The lefer white Henbane: whether they be one and the same Plant (as Parkinson says they are) is hard to determine, since difference in Soil may make a very sensible difference both in Growth and

**Magnitude** however with *Bauhina* we shall here admit them to be two, and so Parkinson upon Ger-

**lard allows them. 3. Hyoscyamus Creticae, Hyos-

cytamus albus Creticae, White Henbane of Candy; and this Cufan makes to be twofold, as it does

**Bauhinia**, which is a greater and a lefer, the Par-

**kinson will have them to be but one, and this larger sort is that which he thinks to be the Hyoscyamus

**Luteus Dafoeiriis:** but thefe in their figure and

**U n i t :** Decription
Salmon's Herbal. Lib. I.

Description are much different. 4. *Hepatica albus*. 5. *Hepatica albo-crinita*. 6. *Hepatica albo-punctata*. The other white *Habenula of Candy*; and this is that which is described by Johnson in his Gerard.

III. The Descriptions. The first, or White Habenula, (which is the greater kind,) has a Root which is not much unlike to that of the Common Habenula, but purer, and perfumes every Year after it has grown. The Seed this has divers large Leaves, but not so large as the Common, yet more flat and woolly, and the very much torn in or jagged on the edges, yet not to much as the former, somewhatRounder also, and of a paler green color: the Stalks grow higher, and with lower Branches on them. The Flowers are in Form like to the *Taget*, but smaller, and of a pale color, excelling to a whith a yellow: the Seed likewise grows in thich like hard Husks, but left prickly, and is white; but the Small of the whole Plant is nothing to soporifics, offensive and heady as the first kind in the former chapter.

IV. The second, or *Lettuce* white Habenula. This differs not much in the Root, Stalk, Branches, or manner of Growing from the former White Habenula, but that it forms to be every Year in Leat, as they are smaller, so they are much rounder, having indented Scaflaps upon them, and hanging upon a prettz long Foot-Balks. The Flowers and Seed-leafs are very like to those last described in the former Section.

V. The third, or White Habenula of Candy, has a Root which is somewhat thick and round, like a Nar- veve Root, along with as every Year. It has leaves and thinner Leaves than the first White, more white and woolly, and much more curf on the edges, denser also, and standing upon longer Foot-Balks. The Stalks are more tender and flint, having thick- like Flowers, ending in full round Leaves, standing higher above the Husks, of a fair yellow, and sometimes of a pale yellow color, and purple at the bottom. After which (if eaten away) there comes forth Heads of Seed much like the Common kind, but somewhat yellower, or of a lighter color, and in rounder Heads or Husks.

VI. The fourth, or Other white Habenula of Candy. It has a Root which is sufficiently thick and large, with many Fibres or Strings adhering to it. This is a littler harder Plant than the second or third before described; the Leaves also hang upon long Foot-Balks, and are covered over with a soft Dow- nines, and they are somewhat broader than the fo- cuss above, and more pinched, and somewhat re- semble the Form of a *Vine Leaf*, being also fibbed or notched about the edges. The Stalks are also covered with a white color. The Flowers are of a Gold yellow, with a Velvet kind of Circle in their middle. This is the Description of that which *Cul- su*, had from his Friend *James Plates*, who had the Plant in his Garden, growing from the Seed which he received from Candy.

VII. The Places. The first of these grow in Nar- bone in France, near the Sea side. The second grows also in her Climes, and where the first of these grows. The third and fourth are NATIVES of Candy, and grow also in Spain; but all thes kinds grow with us here in England only in Gardens.

VIII. The Times. They all flower towards the latter part of *July*, and also in *August*, and their Seed is ripe in *October*; but it does not often come to Ferkition with us, by reason of the Coldness of our Climate.

IX. The Qualities, Specification, Preparations and Virtue of these are exactly the same with those of the Black Habenula, lying that these are not so cold as those, as not exceeding the third Degree.

X. Note. The Black Habenulae are both accounted to be more dangerous than the White, and therefore to be avoided as much in inward Medicines as may be, unless administrated by a skilful Hand, or except in the case of Nocrece, when the White is not to be had. The White is chiefly to be used in inter- nal Phylls, and is very available for all the good Intentions which the Black are said to be useful for, and therefore to be chosen.

CHAP. CCCXII.

OF HENBIT, OR.

CHICKWEED Ivy-leaved.

I. T H E Names. It has no known Greek Names, but it is called in Latin, *Hederacea*, *Alfine Habenula*, *Morbus Gallinae*, and in English, *Henbit*, or *Ivy-leaved Chickweed*.

II. The Kinds. There are two Kinds hereof, viz.

2. *Hederacea minor*, *Alfine folio Haberula minor*, *E- laine prior* *Thalii* *Or* *Lagunculae*, *Alfine* *Folium*, *Folium* *Dobonii*, *Alfine* *Hirjuta* *Camariae*, *Centuncu- lus birificant* *Cæfalpi*, *Alfine Haberula minor*, *Morbus Gallinae minor*, and *Morbus Gallinae heder- lae folio Lobellii*, The Lesser Henbit.

III. The Descriptions. The first, or Great Henbit. It has a broad flat Root, which is tough, and fishi

V. The Places. These Plants grow upon Hills and Mountains in several parts of Italy, Spain, France, and England, and I have found them growing also in the Hills and Mountainous parts of Flanders; they grow in Fields also after the Corn is off, and in some Gardens.

VII. The Qualities, Specification, Preparations and Virtues of these are probably the same with the other Chickweeds in Chap. 137. allogroing, but otherwise Authors have said nothing of them from Experience of what they may possibly perform, but it is very likely, that being in taste very much agreeing, unto the common sorts of Chickweed, their Qualities and Virtues may not be much differing.

of HERB CHRISTOPHER.

II. Name. It has no known Greek Name, nor leaves any good Latin Name, but it is called by most Authors Christopher, and Hieron Christopher, and Saints Christopher, but for what cause or respect is not known, and in English Herb Christopher.

III. The Kinds. Gerard says, that tho' this Plant be none of the Bindwheels, or of those which have need of Supporters, so as it might climb upon any thing; yet because it bears Grapes, or clusters of Berries, it might have been numbered among the Arum, or Vine like Plants; There are two Kinds of this Herb, viz. 1. Christophoriana vulgaris, Our Common Herb Christopher. Lugdunensis calls it Nepellus Leuctanthemus, some Acrontium Barterianus, others Nepellus Racemofor, some call it Hollis nigar, but that is a vain Name, Penn and Label almost make it Atlas Plini. Lib. 7. Cap. 7. because this Atlas bears black Berries, but doubtfully Pitty's Atlas is Edulius, which has a rough Stalk, whereas this has a smooth, but Paulus Regius interprets the Root of Atlas to be the Root of Sambucus Bebrius calls it Acrontium Racemosum; some call it Serphritis Christopher, Gertruses calls it Lupinus, which is a kind of Wolfbane, but Parkinson not finding therein by the taste any pernicious quality, could not judge it to be any of these dangerous and pernicious Herbs. 2. Christophoriana Americana, Christophoriana Canadensis, Christophoriana Americana et Floridian Bacca minoris & fabris. Jacobus Cormarotus in his Canadenfium Plantarum Historia calls it the Name Pallanes vulgaris, five Racemifum Coorlanden.
of Salmon's Herbal. Lib. I.

CHAP. CCLXIV.

OF HERB FRANKINCENSE.

Narrow Leav'd,

O R,

A L L L E A L  Fennel Leav'd.

I. THE NAMES. It is called in Greek Aromatikos or Aromata, in Latin Libanum, Angiifolia, or English Herb Frankincense narrow Leav'd, or Fennel Leav'd officinal, The Arabian call it Faer Libanuris, Alfern, Aftphlamitis, Libanit, or Cachet.

II. THE KINDS. There are many Kinds of Herb Frankincense in Author, we shall only describe the following principal Kinds, viz. 1. Libanum Angiifolia, Narrow Leav'd Herb Frankincense, of which in this present Chapter. 2. Libanum Lanifolius, Broad Leav'd Herb Frankincense, or Frankincense Allleal, of which in the next Chapter.

III. The Kinds of the Narrow Leav'd Herb Frankincense, or Fennel Leav'd Frankincense officinal, Authors make several varieties of this Plant, we shall only treat of the following seven Kinds, as being chief, viz. 1. Libanum Folio Folio Difcoridis, Thujopsis, Galena, (whole Seed is called Calyxa, or Canaeis, as it is in some Copas, because of its fiery tinct.) It is the Libanum Carneum, Gaiacum, Calavas of the Adon Luciades, Libanum, Libanum Candna, Ciscopus, Fennel Leav'd Herb Frankincense. As for 2. Cibis, and 3. Galena, it is said by Dioscorides Lib. 5, Cap. 87, to be Fruitful with Semen Libaniti, and so we take it, see Themelides Lib. p. 252. 2. Libanum Canadna, or Semine Batishan, Panax Aftophyllum, or Aftopyllum, Panaceae Aftophyllum, Panaceae Aftophyllum, of which the seeds are said to be very pleasant in the taste, and the plants very aromatic and useful. 3. Panax Aftophyllum, Panaceae Aftophyllum, also in the American Parts of the World, is said to be useful.
Herb Frankincencis.  
Fennel Leaved.

IV. The Description. The first, or Fennel Leaved Frankincencis. It has a Root which grows deep, and spreads much, and with many Branches, it is self in the Ground, larger than a great Part of the top, and white both on the outside and on the inside, with a Pith in the middle, but it is so brittle, that you must handle it very tenderly if you desire not to break it, and when cut or broken it sends forth a clammy pale Juice, of an odoriferous, sharp, piercing smell, not much unlike to that of Limes, and endures in the Earth many Years, from the head of this Root shoot several bushy, great, reddish Stalks of Leaves, of a fresh green color, being something thicker and longer than those of the Ferula, and thorny than those of Peucedanum, or Hog-Fennel, yet often and in many places for three together, of a quick aromatic, thick smell, coming somewhat near to that of a Lemon, from among these Leaves rises up (sometimes, but not every Year) so as in England a good large Stalk, but rather to good not half to high as that of the Ferula, not much exceeding a Yard in height, nor much higher than the Stalks with Leaves, spreading it as far out into very many Ramifications of Branches, which at their tops bear Umbles of yellow Flowers, which being past away are followed by a good large fort of whitish yellow Seed, round, and a little long withal, somewhat covered on the outside, being join-
Salmon's Herbal. Lib. I.

X. The faith, or Small feem'd Salmon's Herb Frankincense, or Balsamum. It has a great and white Root, divided into four Branches, and with a bough of hairs above, it is a small Herb, and has sliver Leaves lying upon the Ground, much cut and divided into longer parts than Fenecianum, in Bogardus, and narrower than our green English Saxifrage; the Stalk has but few Joints, and Leaves on them, having small Umbles of white Flowers, like Moon, or Speckel, which being put away Leave small Seed after them, it grows like the Seed of Amsi, or Biflopsa-\n
X. The fafeenth, or Common Fennel Salmon's Herb Frankincense. It has a blackish long Root, as thick as a pea, but not as before, with a leaf at the top, from whence spring Stalks of the fーム like Leaves, but shorter than they, the Stalks rise to be a Foot and half high, on the tops of which fand bowing white sweet smelling Flowers. There is of this a letter fort afo, differing nothing in it but in its universal finifhke.

XI. The Places. The firt fix Kinds have been found growing in many Countries, as Italy, and Germany, 

The Actions. They are all fad to be hot and dry in theLeaved degree, Apertures, Atchlike, Difgustive, Difcutive, Diuretic, Traumatic, Cephal-

Chap. 136. English Herbs.

XXVII. The Balsam of Root and Herb.

It is a most admirable Vulgarary, not inferior to any made of Porrina, or Self-hed, Allheal, or any of the Woundworts; it digests contented or otherwise complicated green Wounds and Plaguevicious or eating Ulcers; and cleanseth them, and if there is a want of Effluvium it admirably incanates, dries, and heals them; it is good also against fretting and running Cancers, Warts, Pustules, and the like breakings out of the Skin.

XXIX. The Cataplasm of the Seed. Take Powder of the Seed, Darnel Flower, of each a like quantity, Vinagar a sufficient quantity, to make it into a Cataplasm. Being applied it dilutes simple Convulsions, and prevails against Scabs, Pimples, Warts, Herpes, Scut, Mumps, Evaporation, dilatations of the Skin, and other defections.

XXX. The Infused Water. It has the Virtues of the Juice, Effluvium, or Infusion of the Herb and Root, but much less efficacious; and is chiefly used as a Vehicle to convey some of the aforegoing or following internal Preparations down into the Body.

XXXI. The Acid Tincture of Root and Herb. It refiiles Poison, and the Plague, and all sorts of Magicks and Peltential Diseas, it prevails against the blights of Spiders, as the Tarantulae, of Mad Dogs, Vipers, Rattle-Nakes, and other Serpents, and all the bitings or flinging of any venomous Creature; it is prevalent also against all hot and burning Fevers, it quenches Thirst, extinguishes the heart, and destroys the Febric. Dose from ten drops to forty, fifty, or sixty, in any proper Vehicle, and according to the quantity of the Liquor it is taken in.

XXXII. The Acid Tincture of the Seed Concoction. It is Somnecky, caustic good Appertain and Digitation, refiiles Plague and Poison, opens obstructions of Stomach and Lungs, takes away Hoarfness and Wheezing, and thereby cauls free respiraction or breathing; it has all the Virtues of the Tincture in the former Section, and is to be taken in the same Dose and manner.

XXXIII. The Spirituous Tincture of Root and Herb. It is prevalent against Poison, expels Wind, and gives present cure in the Colic and Gripings of the Guts from cold, crude, and sharp Humors, it provokes Sweat, and is good against the Plague or Pelteliness, expelling the malignity through the Forces of the Skin, being taken in Wine it is good against the blights of poxous Serpents, provokes Urine, and facilitates the Birth of Women in Labor. Dose from one Dram to three Drams in Wine.

XXXIV. The Oily Tincture of Root and Herb. Outwardly applied it easeth the Gout, and all exterior pains proceeding from cold, straining of the parts, Bows, Falls, or the like, it gives ease in Cramps and Convulsions, and very much strengthens the parts weakened by those Diseases; it is also prevalent against the Pfalcic, being anointed upon the Vertebra of the Back, and also upon the part afflicted.

XXXV. The Saline Tincture. It is of great use against Freckles, Lentils, Sunburnings, Tanning of the Skin, black and blue Marks, Scut, Morphea, and other like defections thereof.

CHAP. CCLXV.

Of HERB FRANKINCENSE.

Broad-Leaf'd, O R.

Frankincense All Heail.

I. The Names. It is called in Greek, Monocrion, in Latin Libanotis Labanot, and in English Broad-Leaved Herb Frankincense, or Broad-Leaved Frankincence Allheal.

III. The Descriptions. The first, or Greater White Herb Frankincence, has a Root which grows great and long, which on the outside, with a Tast of hair at the top, a little long, and having a strong smell and taste, like the Roots of many other Umbelliferous Plants, from this Root spring forth many great long Stalks, with wings of large broad Leaves, some eight inches long spaces, and almost four inches broad, five being set together, two and two, one against another, and one at the end, three or four inches broad below, and smaller to the end, being somewhat hard in handling, of an overworn greenish color, and a little denser about the edges, among which rises up a round strong Stalk, from whence foot or five Feet high, having fuch like Leaves on the Joints, but fewer, and Jeller than grow below, and a few Branches rising from the upper Joints, bearing great spread Limites of whithch Flowers, after which comes Somewhat flat and round light Scrolled, two of them joined together, white on that side where it is joined, and striked with rough cramped stripes on the back or round side, and of a pale brown color when it is ripe, but a little purplish below.

IV. The second, or Lesser White Herb Frankincence, has a Root not much unlike the former, white, but more bitter than it, this agrees with the former in the shape or form of the leaves, Flowers, Seeds, and shape of the Root, but that they are all leaf, and the number of the Leaves are more, set together on every Stalk, being also more deeply denined about the edges: There is another Sort of this Plant, which Balsinon calls Libanotis luefida minor Sumini Christie, which differs only in having fewer Leaves on the Stalks, also as small, and but one or two deep cuts on the edges.

V. The third, or Truef Herb Frankincence of Theophrastus, has a Root which is covered with a thin brown Bark, and very white underneath, flowering, strong, like Frankincence, from which springs up a Stalk about a Foot and half high, divided into some Branches, with Leaves for puncturing both below and above, something resembling Smallage for the large-roots of the Leaves, and denoted about the edges, bearing
Salmon's Herbal of the Plants, Lib. I.

MORON, or MARUM.

THe Name. It is called in Greek, */Marum*, from *Marum*, a certain King of Thrace, who is said to have found it by a sea, and by the Greeks, *Moron*, as the name of a city of Africa, anciently called the seat of Cyrene. It is also called *Mentaleace*, from the word *Mentale*, meaning a plant that produces many kinds of seeds, and is therefore called *Marum*, from the word *Marum*, meaning a plant that produces many kinds of seeds.

The Parts. The first two *Fruits* are found in many places in *Georgian* and Persia; and the seeds are gathered from the *Stems* and *Leaves* of the plant, which is a hard, tough, rough, brown, and hollow plant, with several purple and hollow *Stems* running through it, and all of them divided, like unto *Columbine* leaves, being covered with five *Leaves*, with five divisions, and two others, with three *Leaves*, each divided into two *Stems*, thickened with purple, shining above, or, at a little distance, with five *Leaves*, which are wanting, and covered with a little dirt, and dripping Water into the Mouth, if it is a little covered therein, being also somewhat bitter of taste.

The Places. The second *Fruit* is found in many places in *Georgian* and Persia; and the seeds are gathered from the *Stems* and *Leaves* of the plant, which is a hard, tough, rough, brown, and hollow plant, with several purple and hollow *Stems* running through it, and all of them divided, like unto *Columbine* leaves, being covered with five *Leaves*, with five divisions, and two others, with three *Leaves*, each divided into two *Stems*, thickened with purple, shining above, or, at a little distance, with five *Leaves*, which are wanting, and covered with a little dirt, and dripping Water into the Mouth, if it is a little covered therein, being also somewhat bitter of taste.

The Times. The second *Fruit* is found in many places in *Georgian* and Persia; and the seeds are gathered from the *Stems* and *Leaves* of the plant, which is a hard, tough, rough, brown, and hollow plant, with several purple and hollow *Stems* running through it, and all of them divided, like unto *Columbine* leaves, being covered with five *Leaves*, with five divisions, and two others, with three *Leaves*, each divided into two *Stems*, thickened with purple, shining above, or, at a little distance, with five *Leaves*, which are wanting, and covered with a little dirt, and dripping Water into the Mouth, if it is a little covered therein, being also somewhat bitter of taste.

The Qualities, Specifation, Preparations, and Virtues of these are the same with those of the *Argyrius*, or *Narrows* *Lentis* in the former Chapter, to which we refer you, yet these being extra ordinary in their virtues, and of an extremely modifying and digesting power, we shall make the following Observation concerning them.

The Liquid Fruit, or Essence. They are good against *Chronic* Diseases of the Breast and Lungs, and prevent against the *Epilepsy* and *Jade*, more effectually if a little Pepper in hot *Water* is added, and so given in Wine; given in *Poison* *Drinking* they increase *Milk* in *Mares* *Brazils*, and cause pains in the *Soreness* and *Belly* from *Fever* in *Humors*, or *Winds*; they are also good against *Fever*, and the bleedings of *Mad Dogs*, *Venomous* *Beasts*, and *Scorpions*, or the bleeding of *Scorpions*, they provide *Mildness* of *Wounds*, and the *Cure* of *Rusts*, the *Fleshes* of the *Leaves* and *Roots* cures the *Eye* and *Eye* and 5.

XI. The Divine in Wine. It has all the Virtues of the Juice and Essence, but much weaker, and therefore may be given in a greater *Dose*, as from four to six *Ounces*; if it is dry *Vinegar* or *Vermouth*, and may be used Diurnally, as well as outwardly to wash any *Sores*, *Wound*, or *Ulcers* therein.

XII. The Balm, or Ointment. The *Fruit* is very useful as an ointment, and if a little *Potato* be added to it, they do wonders in these kinds of *Cures*, being useful in the following:

XIII. The Caputplum of the bristled Leaves. Being applied to *Flies* breaking in any part, and cut the *Hemorrhoids* or *Piles*, removes the heat, and cures the tumor or swelling of the *Fundament*, bringing the urine (if Nature intends it) to a speedy maturity, or speedily, the Caputplum being made with *Dame* Meal and a little *Vinegar*, and applied, gives ease in the *Gout*, *Cramps*, and *Convolutions*, and takes away *Scufi* of *Rheumatism*, *Lumbago*, and any inflaming *Pains* of the *Skin*.

XIV. The Powder of the Root. Used either alone or in *Water*, or mixed with *Vinegar* and applied, it thoroughly discharges *Fistulas* and *Ulcers*, and heals them with extraordinary fire in curing *Fistulas*, more especially if Powder of *Tobacco* about a third part be added thereto.

XV. The Powder of the Tops, or *Flowers*. It is a powerful *Pulver* for *Aviary* business, and is used in all kinds of Plants to make *Fruit*.
Mastic, but more tender and slender, on which grow many small whitish green leaves, very like to the Small Sane Scent Marjoram, but somewhat rougher up to the very tops, which bear smaller Heads or Knots than those of Scent Marjoram, and white Flowers out of them; all the Herb is of a most fragrant sweet smell, which endures a long time after it has been dried; it is very tender to keep, and will not endure our cold Nights, which come in August, or September, but is quickly destroyed by them.

VI. The Places. They all grow Wild on the Mountains of Spain, Crete, and Syria, but with us they are all most up in Gardens, the last indeed with some difficulty.

VII. The Times. They Flower about August, with us, and sometimes later, if the Summer Weather proves cold, and the Seed is perfected not long after.

VIII. The Qualities. Herb Mastic is hot and dry in the beginning of the fourth degree, it attenuates, opens, is Abstifive, Altiringent, Amody, Carmine, Digestive, Diuretive, and Stomachick; it is Cephalick, Neurotick, Stomatick, Hysterick, Arthritic, Emmenagogick, and Alexipharmick.

IX. The Specification. It is good against Poxions, the Bitings of Wild Dogs, Serpents, and other Venemous Beasts, Convolutions, Cramps, Lycanities, Palies, Epilepsies, Hysterick Fits, Vapors, and other Distempers of the Womb.

X. The Preparations. You may have them from three有一种 to two in a Glass of Wine, or other proper Vehicles, it prevails against Convolutions, Epilepsies, Lethargies, Headailes, Palies, and distempers of the Womb, it attenuates rough Flegm, opens obstructions of the Womb and Reins, provokes Urine and the Terms, and digests crude Humors.

XI. The Liquid Juice. Given from one Spoonful to two in a Glass of Wine, or other proper Vehicles, it prevails against Convolutions, Epilepsies, Lethargies, Headaches, Palies, and distempers of the Womb; it opens obstructions of the Liver and Spleen, and frees them from the morbid matter with which they are filled, it has indeed all the Virtues of the Liquid Juice aforesaid, besides which it opens, cleanses, strengthens, and corrects the Weakness thereof, or of any other part, which are commonly called Vapors; and is beneficial for such as are falling into a Dropsey, and helps the loss of Speech, by the resolution of the Tongue, it provokes Urine, and eases the Colic.

XII. The Infusion or Decoction in Wine. It has all the Virtues of the Liquid Juice and Infusion; it is very Stomachick, powerfully provokes Urine, eases the Straungury, and all pains and torments of the Belly, Doht to its Owners.

XIII. The Old by Infusion or Decoction. It warms and comforts the outward parts, being Morning and Evening mixed upon the same, it is good against the Gout, and Pain of the Joints, Nerves, Tender, and Masts, distempera Tumors, is good against Convolutions, Cramps, Lymenches, Numbness, and the Pallies, and anointed upon the lower Region of the Belly, it helps cold gales of the Womb, and gives ease to pains of those parts.
XV. The Diluted Water. It has the Virtues of the Juice and Efficace, but very much weaker in all respects, but it may be used as a Vehicle, to convey some of the other Preparations in, sweated with Sugar and given to Children troubled with Consti-

cations it cures them.

XVI. The Spirit. It is Cephalick, Neurontick,

Hydriotic, and Cordial, and therefore is good against:

Apoplexies, Epilepsies, Lassages, Convulsions, Pal-

ies, Vapors, Fits of the Mother, palpitation of the

Heart, Painting and Swooning Fits, fickness at Stom-

ach, Colick, and other like disfigurations of the

parts. Do of one Dram to Four Drams, either

in the Diluted Water, or in Wine, or some Ne-

rotick, Cordial, or Hydriotic Syrup, it may be gi-

ven in the Morning taking, and half at Night going
to Bed, and also two or three times before the

day time if need requires.

XVII. The Chymical Oil. It has all the Virtues

of the Juice, Efficace, and Spirit foregoing, but

operates in a more ample and powerful manner, in-

wardly it may be given from five drops to ten or
twelve, and that Morning and Evening, you shall
drop it into White Sugar, or into Honey, or

from the proper Syrup, and mix them well together,

then mix it with the Vehicle you intend to take it

in, for all cold and mild Diastes, as Pallies, Cramps,

Gout, Numbness, Trembling, weaks of the

Nerves, &c. it is ought to be taken in a Glass of Ge-

nerous Wine, in Vapors, Fits of the Mother, &c. It

may be given in the Diluted Water, or by Water

or Black Cherry Waters in the Colick it may be

given in Juniper Water, outwardly for the Pallie

it is to be anointed on the Back Bone, as also the

parts affected, so also for Convulsions, Cramps, de-

formations of Humors, &c.

XVIII. The Acid Tincture. It is a powerful Me-

dicament against the Plague, and all sorts of Mal-

sign and Pustuliferous Fevers, it destroys the paro-

chial ferment in the Blood and Jucnes, always Vapors,

and filling up of the Mother, cools preturmal

heats, and refills malignity in its Root, &c. Do of

from fifteen drops to thirty, forty, or more, accord-

ing to the quantity of the Internation in which it is
taken.

XIX. The Spirituous Tincture. It is a kind of

Heavenly Medicament, and a Noble Cordial, it clear-

the head, revives the Spirits, strengthens Nature,

refills Vapors, Paintings, Sweating, fickness at

Heart, and other Diastes of like kind, it takes a-

way fickness at Stomach, pains there, refills its

Vessels being hur by or deprived, and admirably stren-

ghens it. Do of one Dram to two, or three

Drams, in the Morning taking, an Hour before

Noon, and at Bed time, in a Glass of Generous

Wine, or in Syrup, or other proper Vehicle, it ent-

istes a good Appetite and a strong Digestion.

XX. The Oily Tincture. Inwardly given from
ten drops to twenty, or more, in some proper Ve-

hicle, it prevails against the Pallie, Convulsions,
pains and weakneds of the Back, the Stone, Sand,

Gravel, and Turtuous matter in the Reins, Urines,

and Bladder, &c. for Pallies it ought alfo to be an-

ointed on the Back Bone and parts affected twice a

day, and to be applied upon the part and well rub-

bed in with Convulsions, Cramps, &c.

XXI. The Powder of the Herb. If it is mixed
up the Node it provokes sweating, and thereby pur-

ges the Head and Brain of cold putious Humors,

the Herb being chewed in the Mouth it drives

forth much Phlegm and Flegm, causing pains and

flicks in the Head, Jaws, Throat, &c. given inward-

ly from half a Dram to a Dram in any proper Ve-

hicle it strengthens the Stomach, expels Wind, ca-

tes the Colick, and stimulates the Birth of Women

in Labor, bringing away also the Afterbirth.

XXII. The Compound Cordial. Take Herb Aca-

frick two Ounces, Oregano, Pellitory of Spain, of

each for Drums, Acorus, Long Pepper, of each four

Drums, White Porto Wine twenty Ounces, part all in-
to a kind Copper Vefca, or Glass Body, which con-

ver with a Blind Head, and let it simmer over a gen-

tle Fire for an Hour, then let it cool, and strain the

clear for use. Do of two or three Ounces at a time

for the Pallie, Pallies, Lethargy, &c. two or three

times a day, it is good alfo to gargle the Mouth

for a Pallie of the Tongue, when it is taken inward-

ly it may be dulcified with Syrup of Clovegillflow-

ers, or other proper Syrup.

CHAP. CCLXVII.

OF HERB ROBERT C. RUB.

Robins CRANESBILL.

II. The Name. We cannot learn that it has

any Greek Name, the Latine call it Herba

Robert, and Geranium Robertianum, and we in En-

ghland, Herb Robert, and Robin's cranesbill.
Leaf, one with a Fowl Leaf, and one with a Cherse or Coarse Leaf, which is this lives: it is also called Herba Roberti, vel Ruperti minor, Geranium Robertianum minor, The Vulgar, Common, or Lesser Herb Robert. 2. Geranium Robertianum major, Herba Roberti, vel Ruperti altera, Herba Roberti major, Gerani Robertianus alterus, Species Lobata, Geranium Gravimum Dahuriae, Geranium Violaceum Tatarum, Sanguinaria Radix Germani, The Greater Herb Robert.

The Descriptions. The first, Common, or Small Herb Robert, has a small and thready Root, which runs as the whole plant does, very strong, and almost sinking, which sends up a reddish stalk, commonly two feet high, having several leaves thereon, upon very long and reddish footstalks, divided at the ends into three or five divisions, and each of them cut in on the edges, some with deeper cuts than others, and all destined likewise about the edges, which oftentimes turn reddish; at the tops of the stalks come forth several flowers made of five leaves, much less than those of Althaea Chorel, or Doreveis, these flowers Label fays are larger in some than in others, and of a more reddish color, which being cut off, there come in their places Beakheads, as in other Chorelites, which are not very small nor very great; the stalks are slender, weak, and brittle, somewhat hairy, and reddish, the leaves are also jagged, reddish, talked, and deeply cut, like tothose of Chorel, and the flowers are many times of a bright purple color.

The Place. They both grow almost everywhere, by way of fields, upon Ditch Banks, and on the Ground, whereof ever one goes, but the second is not to be found as the other, yet often seen and found, the first grows also upon old Walls, as well made of Brick and Stone, as those made of Mud or Earth, it grows too among Rubbishes, and in the bodies of Trees sometimess which are cut down, and other like rutted places.

The Time. They flower all May, June, July, and August, and the Seed is ripe soon after, they are hardy Plants, being green generally all Winter, nor are newly cut by cold.

The Qualities, Specification, Preparations and Virtues are the same with Field Chorel in Chap. 169, aforothing, and to that you are referred.

Note. Herb Robert is not only commended against the Stone, but also to the Scurvy, when it is from Blood, when or howsoever flowing, as also specifiyly to heal all green Wounds, it curseth likewise Wounds and Ulcers of the Dog, or Women's Breasts, and in the Venerable parts.

CHAP. CCLXXVIII.

OF HERB TERRIBLE.

OR, GUTWORT.

The Name. It is called in Greek Αἰβών, or a, pteros, and Ροτρίνιον, pteros rothnion, i.e., a Remedy for Inflamations, but this is not to be spoken of, as is apparent, per contrariam, some think it may be derived from Ιβος, Saussum, vel Maritimum, because it grows near the Sea, in Latin it is called Althaea, and Herb Terrible, also Althaea by Altharion, the Root hereof is called by the name Altharion Turpentine album, as the Root of Eufa minor is called Turpentine angram, and in English Herb Terrible, or Gutwort, because Disfigures Eyes it gently excalates the Guts.

The Kind. Some Authors have this Plant to be of the Kind of Tript brothers, because of its most violent purging and griping evacuating qualities, but without doubt it is rather a Plant of its own Kind, there are three several sorts hereof, viz. 1. Althaea, Althaea Alba, Alboflavum, Althaea Hothis, Althaea Flava acuta, Carthamus Spatha, Herb Terrible of Momperde. 2. Tortolata, Herb Terrible Molliflorum Lobely et Ludumaher, Gutwort, or Herb Terrible of Marcillac, Alphonsus Pontus of Ferrara took it to be Carthamus Phero, the Root of which, as Pena fays, is like unto the Terrible Alexandri, not having so much heat and bitterness therein, nor other evil siltes, as the others have, Bernhau calls it Thyzaeus hothis carthusianus Serice inflato mollitudinis. 3. Althaea Maxis Citri, which the People of Valencia call Hippoglossum, and is Hippoglossum Valencianum Cliff, Herb Terrible, or Gutwort of Valencia.

The Description. The first, or Herb Terrible of Momperde, has a Root which is wholly red, both within and without, not swelling so strong as the former, and it sends up several slender hairy stalks, three feet high, at the Joins of which stand Leaves upon shorter yer redder Footstalks, divided at the ends most commonly but into three parts, as large or rather larger than the former, and turning red likewise, the Flowers are purplish red, and of the same magnitude, and so also are the Beakheads and Seed.
Salmon's Herbal. Lib. I.

526

from this Root rises up many woody Stalks, two or three Feet high, dividing themselves into smaller Branches, covered with a thin Bark, the older Branches being of a dark purplish color, and the younger more red, thickly beset with small, hard, dry Leaves, without order from the bottom to the top, which are somewhat long, and small at the fettling on, broader in the middle, and sharp pointed, some what like unto Small Myrrh Leaves, of a greenish color on the upper side, and whitish underneath, at the top of every Branch stands a round Flower in a fealy Head, consisting of many purplish Thorns or Threads, pater in the middle than round about, something like unto the Head of a Scabious, or rather Knitted.

VI. The second, or Gunwert, or Herb Terrible of Mariellès, has a Root which is also small, long, and woody, with many Fibers at it, it is yellowish on the outside and white within, nothing so hot, bitter, or unpleasant at the Leaves or Seed, yet leaving a small hot taste at the end, without any swell, and not giving any Mith, it is, as Penn says, very like unto the Thistle of Alexandria, or of the Shops, and in the form thereof, from this Root springing forth very many hoary, or Silver white, slender, and very tough Branches, two Feet high, divided into many other smaller, on which grow many small, white, hoary Leaves round about them, smaller than those of the former, the Flowers are white and small, set close together in a long Tuff, but so covered with the white woodiness, that they can scarcely be perceived, which being past away, small black Seed come in their places, bitter and unpleasant, and so hot, that if any one should chew the Cirs, or the Leaves of the Plant in their Mouth, they will ho heat the Mouth, Lips, and Jaws, that no washing will for a long time remove it or take it away.

VII. The third, or Herb Terrible of Valenti, is a small Shrub, three or four Feet or more high, its Root is too Fingers thick, brown of color, and of a woody substance, from this Root springs forth one or more Stalks, which spread themselves forth into many other small Branches, having a thin Rind, which is first brown, then purple, with many little and thin Leaves thereon, not much unlike to the Rind of the Rhubarb, the Flowers grow at the tops of the Stalk and Branches, and are as it were fcarlet and rough, like Scabious Flowers, of a blew purple color, the whole Plant is very bitter, and of an impure tart flavor, like Chamelaux, but somewhat stronger.

VI. The Places. The first grows on the Mountain or Hill Cluftus, called Cap de Cefe, and on other Rocky and Stony places in France, the second grows near Mariellès, by the Sea side, on a small Hill near therunto called Almonvard, as Penn says, and all along the Coast of Liguria, and the Isles of Cefere and Sardegna, the third grows about Valenti in Spain, as Clusius declares, they all grow on Mountains and Hills, as also in other places which are Gravely Grounds, with us they are only needful in Gardens.

VII. The Times. They Flower not until it is late with us, as in August and September, Clusius found some of them in Spain flowering in the Months of February and March.

VIII. The Qualities. They are all of them hot and dry in the fourth degree, Attractive, almind Pyratick, and vehement Carakrick, its purging faculty being much like the T.githubusercontenta, but the second of these is far more powerful or violent than the others, and comes nearly to the quality of Aperientes, so that by reason of its great heat and violence it is very dangerous.

IX. The Specification. They expat Watey, Hgiarnatrick, and Cholerick Humors in abundance, and Clusius says that the Landkippers in Spain do exhibit it with good success for the Cure of the French Pox.

X. The Preparations. You may hereafter, 1. A Powder of the dried Leaves or Root. 2. A Decoction of Leaves or Root. 3. A Powder of the Seed.

The Virtues.

XI. The Powder of the dried Leaves or Root. It is given in Beth for to purge Choler and Flagon, also Carakrick Humors in Drippings, which it evacuates in abundance, and procures also against the French Diffens, as Penn says that Empericks, the see that it to purge with such violence, do often give it with Wine or Baptop. Many fays the small quantity to be taken at a time in Chicken Broth is two Drains, a mean quantity is four Drains, and the greatest Dose to be given at once in its Drums; but to proportioning the Dose the Physicians ought to see visibly, and to begin with a smaller Dose at first, as half a Dram, to see the operation, and then to increase it to larger proportion as he shall be needed, to perfect its operation.

XII. The Decoction. Clusius fays the Sparrow give the Decoction of the Root, Leaves, Flowers and Seed, to those who are troubled with the French Diffens, and that with great success.

XIII. The Powder of the Seed. It purges downwards black Choler or Melancholy if taken with a little Salt and Vinegar, and in like quantity with Acidum, but it is said a little to evacuate the Bowels; it prevails against the Dripping, Pox, Ringewulff, and Giant. These Preparations of this Plant, is slightly cordelied, and given in a fit Dose, agreeing with the Strength of the Patient and violence of the Disease, (the Body being before hand prepared) may be admitted of, where better and finer things are not at hand to be had.

C H A P.
Chap. 369. English Herbs.

of Hollihock, or Tree Mallow.

I. The Names. It is called in Greek Antennae, a species in Latin Malva Arbores, Malva Rofa, Malva Hortentiflora major, in English Hollihock, or Garden Mallow, also Tree Mallow; this is the species. Africantans Plun. Lib. 2. Cap. 5. It is called I suppose a fuccadate odoris, or from ignorant, quod annulus furculis plantaeur.

II. The Kinds. There are two principal kinds hereof, viz. 1. Malva Hortentiflora vulgaris, the Common Hollihock. 2. Malva Rofa communis, Malva Rofa magna, Malva Rofa Arborae, the Great or Tree Hollihock.

III. Of the Common Garden Kind there are two Species, viz. 1. Malva Hortentiflora vulgaris, Malva Rofa Hortentiflora simplex, Single Flowered Hollihock. 2. Malva Rofa communis, Malva Rofa communis multiplex, The Double Flowered Hollihock. Of the Great or Tree Hollihock there are likewise two Species, viz. 3. Malva Arborae, Malva Rofa magna Arborae, Malva Arborae magna peregrina, The Outlandish Tree Hollihock. 4. Malva Arborae varia, Malva Rofa Arborae Arborae varia minoris, Our English Sea Tree Hollihock.

IV. The Description. The first, or Common single Flowered Hollihock. It has a long, white, tough Root, easily benzed, and grows deep into the Ground, not much unlike to the Root of the Common Mallow, but greater, and generally obviates all the Winter, rising up again the next Spring; the Stalk grows up straight, almost like a Tree, of five, six, seven, or eight feet high, according as the Ground is in good

hews, the lower Leaves growing upon which are almost round, and somewhat large, with many corners, but not cut in or divided, and few in number, the whole which grow up higher are much more profused into corners, from the middle of this Stalk, towards the top grow the Flowers upon slender pedicels, where they stand and make as if they were a long Spike of small Leaves and Buds for Flowers together, the Flowers are single, and consist of five leafs and round Leaves, and into single Roses, with a middle' long Stile, and some Chives about them, these Flowers are of diverse Colors, as pure White, or reddish, some one of a pale Blue, almost like a White, some with a tincture of Blue, fresh and lively, of a Rose Color, some are Scarlet, and of a deeper Red, like Crimson, some of a dark Red, like black Blood, some of a dark Purple, varying in their Colors, as Nature is pleased to play with them; after the Flowers are past, there grows up round Knees or Heads, but flatish and with round about the bottoms, and compact or made up with a multitude of round, flat, whitifh Seed, in form of a Cheek.

V. The second, or Double Flowered Hollihock, in its Roots, Stalks, Leaves, magnitude, manner and form of growing, and Seed, is exactly like the former, so that those parts need no further description. But that we have already just now given the difference between the former and this is only in the Flower, for whereas the former are single, these are manifoldly double, and are like unto double Roses, let very thick with Leaves, so that no Slide or Point or stem in the middle, the outwardmost row of Leaves in the Flowers are largest, the innermost being smaller, and thick for together, the Colors are manifold and various, according as we have described them in the former Section.

VI. The third, or Outlandish Tree Hollihock. It has a pretty large long Root, with four or five branches growing to it, which, the Stalk perishes every Year, yet endures with us for about two Winters, and then decays. This Tree Hollihock grows with us to be a great tall Tree, more likely than an Herb, having its Stalk or Body something woody, and oftentimes so great in compass, that no Man can grasp it round with both his Hands; the Leaves are twice as large as any Common Mallow, and as fuit and woolly in handling as the Malve Malvus, but not hollow, but downy, and many times crumbled about the edges, if Flowers not in the first Year of its springing up with us, but in the second Summer, if a preceding sharp Winter has not killed its Stalk in the first Year, (not then being grown to its full strength) being then more tender than afterwards; this main Stalk spreads it self out into several Branches, with Leaves on them, but smaller, among which stand few, great, and large deep purple Flowers, with Stripes and Veins in them, like to the Common Malve, after which come forth such like round Caffes, with blackish Seed in them, but larger, according to the proportion of the Plant, which seldom comes to maturity in our Country.

VII. The fourth, or English Sea Tree Hollihock. It has a Root which is white, great, and composed of many long Vines or Strings attached to it, and in its Stem, Leaves, and manner of growing, is very like to the last described: its Stalk is woolly, and as great as a Man's Arm, of a madder or hoary Color, upon which grow few, whithish, woolly Leaves, almost as large, as the other, and as soft and smooth as Velvet: the Flowers hereof are large, and of a whitish or dilated purple color, like in form to the Flower of a Held Malvus, but much larger; yet not so large as the last.

VIII. The
The Places. The first two grow only in Gardens, and are almost everywhere to be met with; the third grows near Venice, all along the Tiber and Shores, as also on the African Shore, where the Root lives many Years, tho' with us it scarcely ever outlives two Years, the fourth and fifth grow in an Island called Dinnis', three Miles from Kings-Road, and five Miles from Bristol, as also about the Cottages near Hurst Castle, over against the Life of Hiift.

IX. The Times. The two first Flower thro' all the Summer Months, even till the approach of Winter, but the Tree Hollows begin to Flower later, so that the first of them does not often perish its Seed with us, but the last of them brings forth its ripe Seed in a little time after its Flowering.

X. The Qualities, Specification, Preparations and Vectors of Hollows are the same with those of Common Mallow, Marsh Mallow, and Versoval Mallow, hereafter in their proper places to be declared, and to which we refer you.

CHAP. CCCXLV.

OF HOLLOW ROOT, OR, CAVOUS FUMITERRY.

THE Names. It is called in Greek Hermae, in Ptolemy, in Latin Radix eavae, Fumiterry, and in English Hollow Root, Cavous Fumiterry, and Hollow Rooted Fumiterry.

Fumitory, hollow-rooted

II. The Kinds. It is the third general Species of Fumitory Cep. 304. Sect. 2. of which we have three special Kinds, viz. 1. Radix eava major blate alba, 2. Radix eava major lutea, 3. Radix eava major flore Cornuse, Great Yellow Flowered Hollow Root. 4. Radix eava minor, Caprae Radice Ferulae, Small Hollow Root, Bean Infested Hollow Root.

III. The Descriptions. The first, or Great White Flowered Hollow Root, has a Root which is round and grese, of a yellowish brown color on the outside, and more yellow within, and hollow underneath, so that it is seen but a Shell, yet being broken every part of it tells green, this Root sends forth Leaves, but they break not out of the Ground until the end of March, very seldom before, and are, both for proportion and color, somewhat like unto the Leaves of Carians, divided into five parts, indentured about the edges, standing on small long footstalks of a whitish green color, among which rise up the Stalks, without any Leaves from the bottom to the middle, where the Flowers throw forth one above another, with every one a small short leaf at the foot thereof, which are long and hollow, with a frith behind it, somewhat like unto the Flowers of Larkspur, but having their bellies somewhat bigger, and the mouth not so open, being all of a pure white color, when the Flowers are pale, long, and round Cods spring forth, containing round blackish Seed.

IV. The second, or Great Bluish Flowered Hollow Root. The Root is told to be hoarse, or rather tuberous, and hollow within, or underneath, on the upper part prettily desen somewhat flat, covered over with a dark yellow Skin or Bark, with several stings adjoining thereto, and of a bitter and astringent taste, the Leaves hereof are jagged, and cut angular, almost like those of Cotmander, of a light greenish color, like the gyn color of Cumbine Leaves, to which they are also something like in form, but lesser, the Stalks are smooth, round, and slender, about which on the upper part stand little Flowers, orderly placed, long, with a little Plum at the end, like the Flowers of Tulll-Flax, of a light red, tending to a purple color, the Seed lies in flat Cods, very soft and greenish when it is ready to yield forth its ripe blackening Seed, this Plant is very much like to the former almost in all respects, saving that the Flowers are of a light red, tending to a purplish color, both these Plants abide above Ground but a very small time.

V. The third, or Small Hollow Root. It has a Root which is field or firm, round, and a little long twisted, two being usually joined together, after the manner of a Bean, being yellowish both within and without, the Leaves are of a bluish green color, yet greener and smaller than any of the former, and growing more thick together, the Flowers and Seed in proportion to the rising in all respects, but lesser, having purplish backs, and white bellies, standing closer and thicker together upon short Footstalks. But Gerard describes his Small Purple Hollow Root, that it has Roots, Stalks, Leaves, Flowers, and Seed, altogether like the first detached, the especial difference being, that this Plant is every way somewhat less.

VI. To the former three Kinds add a Fourth, which is in a Small Hollow Root with a green Caster, called Radix Cava minima Florae vividae, described by John-son upon Gerard, the Root hereof is foliage bran-ched, made of little bulbs, refreshing Teeth, and end-ing in white hairy Fibres, it sends up several little Branches, about three Inches high, and the Leaves are somewhat like those of the Triteio Fumiterry, or of the Radix Cava, but much lesser, the Flowers grow fluttering on the top of the Stalks, commonly five or seven together, each of them comprised of
Chap. 371. English Herbs.

four yellowish green Leaves, with some Threads in them.

VII. The Places. These Plants grow about Hedges among Brambles and Briers, and in the borders of Fields and Vineyards in low and fertile Grounds in Germany and the Low Countries, but the three first of them grow with us only in Gardens; the fourth is found in its times of flourishing among Bushes in several parts of England, as about Goldenhurst in Kent, especially in a Wood formerly belonging to one Pitts, and at the farther end of Gray Mouth on the Left Hand under a Hedge among Briers and Brambles, which is its proper seat.

VIII. The Times. The three first, as also the fourth, may be accounted Vernal Plants, for they rise not out of the Ground till the Spring comes in, and are gone likewise before it is platt, remaining under Ground all the rest of the Year, yet the latter abides longer above Ground than the gracer; the fourth Flowers in April, the other three in April, and the Leaves and Stalks are gone in May, nothing remaining save only the Roots, to stand a time do they continue.

IX. The Qualities. Hollow Root is hot in the second degree and dry in the third, Aperitif, Alberfive, Astringent, and Diuretic, Pedicel, Hepatic, Antirritic, and Alexipharmic.

X. Their Specification, Preparations and Virtues are the same with those of Pamiery in Chap. 304. Sect. 7; ad 24, to which for the particulars you are referred, there being little or no difference in their operations and effects, but with them you may take the following Notes.

XI. Nota. 1. The Powder of the Roots. Given to a Dram or more in Wine, or any Alexipharmic Vehicle, it is very effectual against Poyon, the birlings of Mad Dogs, and of venomous Serpents, as also against the Plague or Pelleance, the Patient being laid down to sweat upon the same, it also provokes Urine, and helps against the Jaundice, and being thrown upon a paper and running Ulcers it cleanses, dries up, and heals the same.

XII. Nota. 2. The Powder of the Seed. Drunk from one to two Drains in Red Port Wine, or in our Apus Beazantia, it stops Vomiting, stops all forts of Lacks or Fluxes of the Belly, and strengthens all the Vices.

XIII. Nota. 3. The Decollation of the Roots in Wine. It is good against Tumors in the Throat, and the long continued swellings of the Almonds, it prevals against furious prodromes, and the pain of the Jaws with an afflict of Hums.

XIV. Nota. 4. The Oil or Ointment of the Roots. Anointed on the Fundament it is good against the swelling and pain of the Hemorrhoids, or Piles, dis- cutting the one and eating the other, it is usefull also to expresse Tumors of the Throat.

CHAP. CCLXXI.

Of HONEWORT, or,

Corn PARSLY.

I. THE Names. It is an English Plant, and has no known Greek Name belonging to it, but is called in Latinum Scolium Sesticola, Goodier called it first Sium Terrestris, afterwards it was called Ape Erin Sij Colitis, and from the composition of the Leaves Sium edulorum Trogi; Gerard called it Sinum Segrénum, and Sium Agrestium, but at length the first Latin Name Scolium Sesticola obtained above the rest, from whence it is Named in English Corn Parly, but the Country People call it Honeworts.

II. The Kinds. It is accounted among the Unbelliferous Plants, for each it is, and is certainly one of the Stock of Seling, or Apis, for which reason it was called Apisum Sij Volts, but with us Corn Parly, as aforesaid.

Honewort
change, that is to say, every winged leaf has about eight or nine small, smooth, green leaves, finely
fringed or indented about the edges, growing on each
side of a small mum, or Loosewort,); the leaf, one opposite to another, and
one growing by it, flat at the top or end, in form
resembling that of Statum abTRACTum, but not
to large or long, or at all brownish, when among
which rise up many small, round, fluted stalks or
branches, about two feet in height. Sometimes
above twenty stalks from one root, sometimes
growing upright, sometimes creeping not far from
the ground, pointed or acrid, and dividing them-
selves into many branches, at every joint grows
one leaf, smaller than the former, which, together
with the lowermost, forms the root, so that seldom
one green leaf is to be seen on this plant when the
seed is ripe; the flowers are white, and grow most
commonly at the tops of the stalks and branches,
sometimes at most of the joints, even from the
ground, in uneven or sudden umbles, every
flower having five exceeding small leaves, flat and
broad at the top, and in the middle very small.
Chives with purple tops, the whole flower not
much exceeding the bigness of a small Pins head.
which being put away, there comes up in the place
of each flower two small, gray, crooked, fluted
seeds, like Early seed, but larger, in cute hot and
aromatic.

V. The Places. It grows in Corn Fields among
Corn, or where Corn has been Sown, in several places
of England, it grows in Clay Grounds, and has been
found in Wheat Lands about Maple Durham in
Hampshire, and several other places.

VI. The Times. It begins to flower about the
beginning of July, and to continues flowering a long
time, Porchins says it flowers not sooner than
August, and that the seed ripened about a Morn-
after, but part of the Seed is many times ripe in
August, and some other parts of it flantly in the
beginning of October, in the mean season some of it
fails, whereby it spoils its fall, and grows with both
Flowering green leaves all the Winter.

VII. As to the Qualitites, Specification, Prepara-
tions and Virtues, they come very neat, or are the
same with those of our Common Parsley, but the Seed
is in form and taste almost like Early seed, and
therefore to that you are referred.

VIII. Note. The Liquor Juice. Gerard relates
that the juice of a handful of the Leaves being
drunk in a draught of Ale or Beer every Morning
Eating for a fortnight, did cure one that had a fluid
in her Choch, Vomity there arising, but its or-
iginal cause was unknown, yet it was attended with
great heat, redness, and itching; by the use of this
Herb it was perfectly cured, and rid of no more, it
is possible it may be an excellent thing against fumarous
Tumors, or the Kings-Evil in any part of the Body.

C H A P. CCLXXII.

OF HONEYWORT, O R, WAX-FLOWER.

T H E Names. It is called in Greek Κυαμωθος
by Theophrastus Lib. 6. Cap. 7, in Latin Cin-
rinthe, and in English Honey-Wort, and Wax-Flower.

II. The Kinds. Some will have it to be Telephi-
um vulgarissimum, or Telephium Triflorum; and as
such they raise it up in their Gardens in Parks, Do-
numns and Closets by that name, or by Telephi-
un, or Telephium, in Cap. 465, of which he
makes five sorts, but that gives Ascovm to mean
either our Borage or Bugleflax, and that this Plant is
rather the Leucograpbus, because of the white spots of the Leaves, C/wcy
faks it was called by some Calyndron Montana, and
Bugleflax thereupon calls it Calyndron Montana,
Dalechamp took Calyndra to be Cinrinthe, a Cero-
bolus Florum to be anitips, but that refers it earlier
to the Kinds of Borage or Bugleflax, to which in
temperature it fits nearest. Authors make as little
as this, and yet, but we shall describ more than
grow in our Gardens, which are the following, one.
1. Cinrinthe major Florum latius et rubro Lobefi

Camelaris, Cinrinthe major Florum vero veref-
color Cloys, Cinrinthe, few Calyndron Montana
major Baudin. The Greater Yellow and Red
Honeywort. 2. Cinrinthe major Florum latius et
rubro, Cinrinthe quarta Cloys, Cinrinthe fima et
macerata viridi Baudin, the Greater Yellow and
Honeywort 3. Cinrinthe major flavo florae, Cinrinthe
flavo inferior Baudin, Cinrinthe quarundam major
Florae Cloys, The Greater Yellow Honeywort.
4. Cinrinthe minor flavo florae, Cinrinthe quarundam
minor flavo florae, Botany Cloys, Camerarii,
& Taterniorum, Cinrinthe Pinnay, The Lher Yel-
low Honeywort. 5. Cinrinthe major florae perturba-
tere, Cinrinthe tertia Cloys, Cinrinthe Florae rubro
purpurascens Baudin, Purple Honeywort.

III. The Description. The first, or Greater Yel-
low and Red Honeywort, has a Root which is some-
what grev and thick, sending therefrom many Fibres
within the Earth, but periphery every Year after Seed
Time, this party colored Plant rises up with divers
thick hairy Stalks, almost two Feet high, on which
are fir large Leaves, of a bluish green color, split
with great white spots, round at their further
ends, and so much encompassing the Stalk at the
lower ends, that it seems to go through them, set
with some small Pricks or Thorns thereon, and a little
hairy within, the Stalks are branched toward the
tops in another smaller order, but all of Leaves,
and much tetter, and some of them turn outward, like the
Targale Head, at every Leaf whereunder comes forth
a long hollow Flower, like unto a Clofrew Flower,
and as large, which in some are all yellow, with a
colored circle about the middle thereof, but in others
from the middle forwards is of a yellow color, the
other part next the Stalk being of a purplish red
color, with some Threads in the middle, taller than
the brown, wherefe other, which are much delight-
ed, each Flower standing in a green Husk, divided
into five parts at the tops, in which, after they are
pult, grow the Seed, which is blackish, a little cor-
tored, and flat at bottom, where it is joined to the
Husk.

IV. Gerard describes it thus. The Root perivus
at the first appearance of Winter, it rises forth of the
Ground after the falling of its Seed, with two small
Leaves, like those of Basil, between which the
Leaves comes forth a thick, flat, smooth, tender,
and brittle Stalk, full of Juice, dividing it fall into
many other Arms, which are also divided into many
other Branches, bowing or leaning towards the
Ground, being not able without props to pull it
up, by reason of the great weight of Leaves,
Branches, and much Juice, with which the whole
Plant is surcharged, upon while Arms or Branches
are placed many thick rough Leaves, let with very
sharp prickles, like the rough Skin of a Thorn. of
of a bleefth green color, spotted very notably with white flakes and spots, like the Leaves of the True Parmenaria, or Cordifia of Jufcaline, and in flakes like thole of the Coddled Thorns, which Leaves do embrace or encompass the Stalk round about, from the bottom whereas corn forth small clusters of whitish Flowers, with a circle or band of bright Purple round about the midst of the yellow Flowers; the Flower is hollow filamented, like a little Box, and of a sweet or Honey taste if it is fack’d, in the finifhing whereof are many little Chives or Threads, which being puff round, round black Seed does come in place, contained in folt skinny Hacks; the Flowers are very various in color, which are of yellow or purple, and sometimes of both mixed together.

V. The fecond, or Geffer Red and Yellow Honeywort, has a long Root, full of fibres, perforing every Tear, its Branches are both shorter and leaving downward, not fanding upright, on which grow long green Leaves, without any spots on them, and leffier than the former, the tops of the Branches are as full of Leaves and Flowers as the foregoing, but turn not in the fame manner, the Stalks which furnish the Flowers, and fo likewise the finall Leaves at the foot of every Stalk, are somewhat purplifer, but the Hank in which the Flower grows is green, and cut into five divifions, the Flower is long and hollow like the former, and almoft as great, of a Gold yellow color, dented at the ends, and with a Red or deep Crimson circle about the middle thereof, and the Seed which follows is like the other, but fome what leffer.

VI. The third or Greater Yellow Honeywort. It has a Root like the others, which perfories after Seed time, the Flower is much finer, and of a remarkable great Stalk, Branched on all fides from the bot tom to the top, many of the lowerwood lying upon the Ground, and the other banding more upright, on which grow long and large bleefth green Leaves, spotted as the leaf is, but not fo large at bottom, where they compafs the Stalks, and having fome prickles thereon in the middle, as the leaf has, and a little hony about the brink or edges, the tops of the Branches do bend downward, set with small Leaves, and Flowers at them, as the third, and as large as they, but without any circle or bottom of Purple, being wholly of a fair yellow color, with fuch little Green, and the former is fome what much the fame, the Leafe of this fpecies to be rougher than the Leaves of the third, but narrower at their faying on, as afofored.

VII. The fourth, or Unfer Red Yellow Honeywort. It has a Root which is white alfo, and long, and abides in more Southern Climes all the Year long, but with no perfories in Winter, it has a slenderer Stalk than the former, near two feet high, fit with smaller, narrower, and spotted Leaves thereon, without order, one above another, on both fides the Stalks, which spreads it felf out into many finall but longer Branches, from the middle thereof, thick fit with Leaves and Flowers, which are like the leaf alfo, all yellow, but fmalier, and dented about their brims after which come fuch like Seed as the leaf, but finaller.

VIII. The fifth, or Purple Honeywort, has a white long Root, which perfories evert Ear, and therefore must be new found every Spring; it grows very like the Great Yellow Kind, with low building Branches, and enormous large bleefth green spotted Leaves like as the leaf felf, the Flowers grow in the fame manner as the others do, and as large, wholly of a dark purplifer color, on the fuperficies whereof a little whitener is percieved, the Seed which follows is like the others, but greater than any of them, and two for the moft part banding together in a Husk.

IX. The Places. The fifth, third, and fifth, grow wild in Spaine, the fifth in Batica and Portugal, the third in Palaftines, altb. in Monte Palaftine at Rome, and in Germany in Angria, Saffa, Balcania, and Hungary: the Difcovery of the fourth and fourth are unknown, they none of them grow wild in England, but are only nurtured in Gardens.

X. The Times. They Flower all June, July, and Auguft, and sometimes to late, that we do not gather good Seed from any of them, but from the Red, if the Year proves not warm enough, and yet without to ripen them, or if they be not well watered when it is a dry Summer, to bring them the better forward, they perish at the first approach of Winter, and must be fown the next Spring.

XI. The Qualities. They are temperate in refpect to heat or cold, and dry in the firft degree, Altring-ant and Valerian.

XII. The Speciation. They are peculiar to stop Bleeding of all forts, the overflowing of the Terms, Bloody Flux, Hepatic Flux, &c.

XIII. The Preparations. You may have therefrom, 1. A Liquid Juice or Effence of the Herb. 2. A Decotion thereof in Wine. 3. A Pouder.

The Virtues.

XIV. The Juice or Effence of the Herb. Taken inwardly from one Ounce to two, or three, it is good to stop inward bleeding, whether of any Vejfel broken in the Lungs, or Pilling Blood, or the Bloody Flux, it stops alfo bleeding at Mouth and Nafe, the overflowing of the Terms in Women, and other Fluxes of the Bowels; if it is mingled with a little Saffron, it is good for blest and watering Eyes, and being used in foul Ulcers after they are cleansed, it helps to incultuate them, especially such as are in the more nice and tender parts of the Body.

XV. The Decotion in Wine. It has all the Virtues of the Juice or effence before related, and does the fame things, but not fo effectually, nor fo speedily, and therefore is to be given or ufed other, and in a greater quantity or Dole.

XVI. The Pouder. It stops inward Bleedings and Fluxes, as the Juice, &c. does, and being applied outwardly to any flux of Blood, it precipitously stops or resolving upon moft and running Sores, and purulent Ulcers, it cleanses and dries them, and difpolles them to healing.

XVII. Note. Pliny and Virgil affirm, that Bees are much delighted with the Flowers of these Plants, being sweet, or abounding with Honey, and that they gather from them more Honey and Wax than from many other Flowers, and from thence doubtfullly it obtained the Name of Ceriths.

CHA. CCLXXIII.

Of HOPS Garden and Wild.

I. T H E Names. Dispermis, Galena, nor any of the Ancient Greek Writers make any mention of this Plant, nor yet any of the Ancient Latin Authors, except Pliny only, who Lib. 21. Cap. 15. does but only name it, and number it among those Herbs which grow of themselves, and are used for Meat with divers Nations. The Arabians have not Y U Y 2 only
only remembered it, but commended it highly for
many Difficultes. The Greeks at this day call it Be- 
\textit{Brosia, Bryon and Bryonia}, it is likely for the
form of the Leaves and running of the Branches. The
Lanters call it \textit{Lupulus, Lupus Salutaris, Lupulus
Salutaris} (\textit{qui ad Salices affigis, vol qui Saludam
curat, vol quas falsi & repetit per Arbores, etc quis
fictit Salices.}) Mether makes it his third Kind of
\textit{Volubilis, Label calls it Vitis Septentrionalis, (The
Northern Vine)} and \textit{Tragan Silius offeras, which it
is not, we in English call it Hop, or Hops.}

II. The Kinds. It is twofold, viz. 1. \textit{Lupulus
Hericeti, The Garden or Manured Hop.} 2. \textit{Lupa-
tus Sylvifris, Lupulus Eamana, The Wild Hop.}

III. The Descriptions. The first, or Garden Hop,
has a Root which is great at the head, shooting forth
many blackish Branches, taking root both of the Ground,
it rizes up at first with several great brown heads,
like unto \textit{Asparagus}, but longer, which afterwards
freeding it left our into rough Branches, climb up
upon great, long, or high Poles, which are fit on
purpose for them to run upon, it has many hand
and rough dark green Leaves, cut into three or five
divisions, somewhat like unto bramble Leaves, and
dented also about the edges, at the tops of the
Branches, which hang down again for the most part,
come forth many scaly heads, being as it were a
number of small yellowish green Leaves growing
thick together, from among which come forth the
Flowers, of a whitish yellow color, which being
pulled, and the heads changing their color to a more
brownish yellow, they are then fit to be gathered to
keep, in this Flower at the bottom thereof is con-
tained the Seed, which is brown, or of a reddish
brown color, small and round.

IV. Gerard describes the Hop thus, The Root
are slender, and diversely folded one within another
it lives and flourisheth by embracing and taking hold of
Poles, Branches, and other things upon which it may
climb, it brings forth very long Stalks, rough and
hairy, also rugged Leaves, like those of the \textit{Pine},
or rather of \textit{Broom}, but yet blacker, and with fewer
dented divisions, the Flowers hang down by clusters
from the tops of the Branches, put up, and set
as it were with Scales, like little Canes, or \textit{Scaled
Pine Apples}, of a whitish color, tending to yellow-
ness, and of a strong smell.

V. The second, Wild, or Female Hop, has a Root
like the former, and grows up in the same manner,
form, or fashion, climbing upon Trees or Hedges, or
what lands meet unto it, with rough Branches and
Leaves like the former, but this bears much smaller
Heads, and in fact lots plenty or number than the
Manured does, and sometimes in some years there
are but few Heads to be seen upon some Plants, and
herin confints the especial difference.

VI. The Plants. These Plants grow more fre-
quently in our colder Climates, than in the hotter or
more Southern, they delight to grow in low moist
Grounds, where they may have moisture enough,
and yet not too much, for which cause they are
planted on Hills and as they were, and Terraces are
made to receive or carry off any great quantity of
Water, that the Plants may not stand drowned, by
which it appears they delight to grow in a flat and
fruitful Soil. The \textit{Wild Hop} grows among Briers
and Thorns about the borders of Fields, these by
being transplanted into Gardens, and being manured
as the \textit{Garden Hop is}, much athers is left, and be-
comes little inferior to that of the \textit{Garden}, and in
process of time comes to the same goodness and per-
fusion.

VII. The Times. They ripen not up till April,
when from the old Roots, which remain all the
Winter, new Shoots or Buds come forth, they grow
not till the latter end of June, and the Hop them-
selves are not gathered till the middle of August
and the beginning and middle of September, when they
are dried, and so kept all the year for use.

VIII. The Qualities. They are hot and dry in the
third degree, including, Aperitive, Alloactive, Sub-
affurantem, Digestive, Diffusive, and Diuretic.

Neurotick.
Neotricol, Stomatrik, Hepatick, Nephritick, Hy-
tterick, and Arithrick, Emmenogogick, Sodontrick, Alexipharmick, and Lithomiptick.

The Virtues. XI. The Sallet. The first Buds of the Hops being laid a while in Sand will make them renderer, and being boiled are used to be eaten after the same man-
er as the Bread, and with as great delight to the taste, they open the obstructions of Liver and Spleen, cleanse the Blood, bood the Belly, expel Gravel and Sand from the Reins, and give safe in the Suötry.

XII. The Liquid Juice of the tops of Hops. It has all the former Virtues, but much more powerful, it effectively cleanses the Blood, and is a good expel-
ler of Stones, and all the evil effects of French Diphtherie, and all kinds of Scabs, Itch, Pimples, Herpes, Tumors, Tartarous, Morphew, Scurv, spreading Sores, and all sorts of discolorations of the Skin, being taken daily Morning and Night, from two Ounces to Four, in any fit Vehicle, it is found by experience to expel Pofyom.

XIII. The Essence. It has all the Virtues of the Liquid Juice, but much more powerful to the inter-
tions, besides which, being taken two or three Hours before the coming of the Fit of an Ague, it is found to cure it at some few times taking; it kills Worms in the Body, provokes the Terms, and powerfully expels urine, drops into feet and elevated Ears, cleanses them from their Corruption, takes away their flaming small, and heals their put's; it purges Cho-
ler, but more effectually if given in Whey of Goats Milk; if the fit of it is continued for some time, Spring and Fall, it has been found to cure the Kings-
Evil, and the Scurvry.

XIV. The Infusion of Hops in Water or Wine. It cures the Strangury, or such as make their Water with beat and difficulty, and brings away Stones, Sand, Gravel, or Tartarous Mucilage, obliterating the paffages of the Reins, Uterets, and Bladder; If Desolation of Hops is used in making of Bread, it is in-
ford to make the Dough to rise better, and the Bread to be the lighter, it has all the Virtues of the Juice and Essence, but not full out so powerful, and there fore may be given to six or eight Ounces Morning and Night.

XV. The Decoction of the Roots. Cures Sores, that the Women in Spain use it to cure the falling of the Hair, caused by the French Diphtherie. Take fair Wat-
er a Glass, and Boil it for half an Hour, strain it, and make it as hot as you like, and drink it in small Por-ions, or more, boil them together to the conftipa-
tion of a third part, or better, strain out, and give half a Pint of it to drink every Morning fasting, let-
ting the Patient fasten upon it. Come add to the De-
coction Roots of Parsley and Lettuce-leaves, with a few Radions of the Sun.

XVI. The Syrup of the Juice. It has all the Virc-
tues of Juice, Essence, and inficion, but must be given in three times a larger quantity, hence the
Medicament is so much digested with Sugars, it cures such as have the Yellow Jaundice, eases the Heartburn which comes of heat, tempers the affiduity of Stomach and Liver, and is very potently used in long and hot Agues, arising from inflamed Blood and Choler, it looses the Belly, and effectually pro-
vides the Scoury, Diophs, and Stones.

XVII. The Powder of the Seed. Being given to the quantity of a Drum in the Morning fasting, and
left at Night going to Bed, it kills Worms in Children, or elder People, provokes Urine powerfully, and brings down Women's Complains.

XVIII. The Spirituous Tincture of Hops. It is not inferior to any Diet-Drink which can be given to
such as labour under the Scoury, Gout, Dropsy, Pox, and Kings-Fell, it uniformly purifies the Blood after a Salivation, but it is kept to be given to such as are of a cold and molot habit of Body, fat and corpulent, and not to such as are thin, hollow, and lean to be 
emaciated or confirmed; it may be given from a Drum to two Drums, or more, in Ale, Beer, Wine, or other proper Vehicle.

XIX. The Acid Tincture of Hops. It has the Virtues of the Spirituous Tincture, but much more in-
creased to be given to such as are of too habitable Blood. Con-
ce it cools and refreshes; it exterminates all mal-
inguity of the Pox, Plague, or Poyson, and is fig-
urally good against the Biting of Mad Dogs, Vipers, and other venomous Serpents, &c. it causes the
Scoury, Gout, and Kings-Fell, and after an admirable manner cures Agues and Fevers, and kills Worms in
Old or Young.

XX. The Only Tincture of Hops. As a Tonick it gives safe in the Gout and Sciatica, and cures all pain-
s of the Joints and Limbs coming of cold and mifur-
ity, it is an excellent thing against the Paffie, being anointed upon the Back Bone, and upon the parts afflicted, giving it inwardly also at the same time, you may give from ten to twenty, or thirty drops for a dose, being dropped into White Sugar, and then mixed with a Grace of White Wine; and so taken it gives safe in the Strangury, provokes Urine and the Terms, and effectually cures the Colic, and cleanses the Reins, Uterets and Bladder from small Stones, Gravel, Sand, and Tartarous Matter lodging therein, if the Dose be doubled or redoubled, and given two hours before the Fit of an Ague, it commonly
cures it at three or four times taking.

XXI. The Saline Tincture of Hops. It cures by
bathing therewith Scurv, Morphew, Lepracie, Tum-
ors, Ringworms, Herpes, and other like fungitious
out, and clears the Skin of Itching, Stabbing, black and blew Spots, Yellowfeats, and other like
discolorations thereof.

XXII. The Spirit of Hops. It is truly Cordial,
cherishes the Heart, and refreshes the Animal and Vital
Spirit, it is good in Sinking and Sweating Fits,
repels Vapors, and other Hydrostick Distemper, and
after a singular manner prevails against Contamination,
whether in Old or Young, and is helpful against Pal-
Pitick Ditempers.

XXIII. The Anod. It is made of the Hops, by
boiling in hot Water, if Women be in, and co-
tinue the use of it for some time, it brings down the
Terms, the long Hops, provokes Urine, cures pains of
the Joints and Limbs, purifies the expulsive virtues of the Strangury, and takes away the feeling and
hurdles of the Womb.

XXIV. Note. Hops are now very much used to
put into Ale, for thereby it not only makes it keeps
longer, and makes it finer, but also more wholesome,
and grateful to the Stomach and Palates; but this
Salmon’s Herbal.

Lib. I.

534

Chapter CCLXXIV.

of Horehound White.

I. Tit. & Name. This kind of Plant is called in Greek Thymus, in Latin Profanum, and Marrubium in English Horehound.

II. The Kinds. There are four genetical Kinds hereof, viz. 1. Profanum vulgar, Profanum, call Marrubium Album, White Horehound. 2. Profanum Nigrum, Black Horehound. 3. Profanum Aquaticum, Water Horehound. 4. Profanum Sylvestre, Profanum Silvifae, Wild Horehound, or Stachys.

III. The kind of the White. Of this there are five species, viz. 1. Marrubium Album Vulgar, Profanum Album Commun, Profanum Angustafae, Our Common White Horehound. 2. Marrubium Candidum alterum, Marrubium Candidum Hisscum, vel Parthenium Lactifl & Chiffi, Marrubium Candidum Gerardii, Marrubium Curticium Camaeffii, Marrubium Album Lentifolium Perigrinum Badian, White Spanish Horehound. 3. Marrubium Curticium Angustafae vel Lactifl, Marrubium Curticium Camaeffii, Dedon, Lagunefl, & albovir, Marrubium Album Angustafae Lentifolium Badian, Sweet Candy Horehound. There is another Species of this, which is unbranched, or without stem, called Marrubium Curticium Angustafae Herumor, Marrubium Album Perigrinum Badian, with a short Wood Badian. 4. Marrubium Album Velutin Badian, thought to be Profanum Vulpiforme, White Hairy Horehound, call’d by some French Horehound. 5. Marrubium Crispsa, and Marrubium Album Crispsa, and Marrubium Album Crispsa, White Curled Horehound.

IV. The Descriptions. The first, or Common White Horehound, has a Root which is blackish, hard, and woody, with many Fibres or Strings therefrom, which do not carry Winter, but show many Years, from this Root spring up several small white Stalks, half a Yard or two Feet high, set at the Joints with two or more, or as it were rough Leaves, of a dull, hoary, green color, and of an agreeable good small, but of a very bitter taste, the Flowers are small, white, and spic’d, set in rough, hard, prickly Huds round about the Joints with the Leaves, from the middle of the Stalks upwards, in which afterwards is made small, round, back’d Seeds.

V. The second, or White Spanish Horehound, has Roots like the former Common Kind, which sends forth several square Stalks, more white and hoary than it, on which Stalks are set by couples Leaves somewhat longer, thicker, whiter, and more woolly than it, and somewhat bent about the edges, the Flowers grow at the tops of the Stalks in clusters, at the several Joints with the Leaves, which are of a pale purpulish color, like the Common sort, and bending in the like rough Huds. Gerard calls this Snow white Horehound.

VI. The third, or Sweet Candy Horehound. It has a long Tender Root, furnisht with a great bulk of Fibres, from which springing up several crooked, or not very straight Stalks, which are round, and not figure, and thicker than the last, on these Stalks grow sometimes broader, and at some times and in some places smaller, longer, and narrower Leaves than those of the second Kind, (of which in my opinion this is a Species) these Leaves are set by couples at the Joints, more dent’d about the edges, and more white or hoary than the former Horehounds, as the Stalks also are, which branch forth into many Tender Branches, having Flowers at the Joints like the former, but smaller, and purpulish, and in smaller and sharper Huds, the Seed being also like it. The Unforti or small leaf Kind has only these differences, that the Leaves are shorter, narrower, and rounder point’d, and in a manner without any finell.

VII. The fourth, or White Hairy Horehound, call’d by some Tender Horehound, it has a woody frownd Root, which springs forth Stalks, rising up not above a foot high, round, and of a hard woody subfiansce, white and hoary, spreading into divers Branches, on which grow thick Leaves, in the same manner as the former, but smaller and rounder, and a little dented at the edges, and to white, hoary, and woody underneath, as no Curticium is more, but somewhat blackish and rugged on the upper side, the Flowers stand at distances at the tops of the Branches, of a pale purpulish color, and in the like rough Huds.
III. The Places. The first, being the Common Kind, grows plentifully in all places of England, in dry Grounds, and waste Greens, also near unto old Walls, Bins, Ditch Sides, High Ways, and beaten Paths; in unthilt places; it grows in all other Countries also, where it alters something, according to the situation and nature of the Countries, for commonly that which grows in Candida and Hungary is much whiter, and of a sweeter smell, and the Leaves oftentimes narrower and leffer than that which grows in England, and other Northern Countries, the second grows naturally in Spain, the third in Candida, the fourth about Paris in France, the fifth in Germany; and all four latter grow with as only in Gardens, being first raised of Seed brought from those places.

X. The Times. They all Flower in July and August, (as may be seen in the Second Year after the Sowing of them) and their Seed is ripe not long after.

XI. The Qualities. White Horehound is hot in the second degree, and dry in the third, bitter in taste, Acrid, Digestive, Althea, Fernal, Heart, Spiken, Splenetic, HYfteric, Sataliferous, Emmensagogic, Alethepramin, and Analogistic.

XII. The Specification. It is good against Coughs and Throats, and all other sorts of Colds, eases Ulcers of the Lungs, escares pains of Liver and spleen, expels Poyfon, and heals old filthy Ulcers.

XIII. The Preparations. You may have them from, 1. A Liquor Juice. 2. An Elixir. 3. A Powder. 4. A Decoction. 3. A Syrup. 6. A Wine.

The Virtues.

XIV. The Liquor Juice. Being given to two or three Spoonfuls, and repeated twice a day, in a Glass of White Port Wine, to Women whole Coursies are obstrued, it brings them down, being dropped into the Ears it cures their pain, and taken in a Glass of Wine it helps Stitches and Pains in the Sides, fits up the Nostrils it is a good Earthe to purge the Head and Brain of mucous Humors and infammer obstruing that Verticle; it opens obstructions of Liver and Spleen, as Goutt Erys: Mustardleaf Eyes is available forsuch as have had Livers, and have an Itch, or running Tettars upon them.

XV. The Elixier. It has all the Virtues of the Liquid Juice, besides within it is good for such as are pulse and wheezes, or are short winded, for such as are weakned by long Sicknes, and are waffled and fallen into a Consumption; it brings forth both Blood and Urine, and the Birth of such who have long and hard Labor; it expels Poyfon of any Vegetable, and cures such as are bitten by mad Dogs, Serpents, or other venomous Beasts, it kills Worms in Children, and provokes and galls against the Yellow Jaunke. Dole' two or three Spoonfuls Morning and Night in a Glass of Wine.

XVI. The Cataplasme, or Honey of Horehound. It is made by mixing a Quarter of the Juice with a Pint of Honey, and soothing it, applying it to the White of Eggs. It is good for Coughs, Colds, Consumptions, or Ulcers of the Lungs, Heart's hos, Wheezing, Thromnes of Breath, it expostures good Flaym out of the Thoax, but all this it does more effectually if it is mixed with a proportionable quantity of the Powder of Florzente Orise Root, Hail, town, and running Ulcers be shrivell with it, it cleanses and heals them; dropped into the Eyes it mighty clears the Eyesight, and dropped into the Ears kills Worms, and heals Ulcers therein, fit up the Nostrils it purges the Head admirably, taken ordinarily Morning and Night, it is excellent good for Old Men, and others, whose Lungs are afflicted with thin, Rift, cold Rheum, curing it to be exceptualled, for which reason it is irregularly good against Alhuma's.

XVII. The Decotion. It has all the Virtues of the Liquid Juice, Elixier, and Cataplasme, but nothing near so powerful, for which reason it may be given in double or treble quantity, Morning, Noon, and Night: it is an excellent Lotion to wash old Sores withal, and to make an Injection of to cleanse the Womb.

XVIII. The Syrup. It is an extraordinary Pelbrat, very good for old Coughs, and to ripen tough Flaym; it is also good for such as are Allethmatic, or short Winded, and breath difficulty, it has all the Virtues of the Cataplasme, and nearly as good as it has to all those Intemperat. Dole one or two Spoonfuls Morning and Night, to be given alone by it self.

XIX. The Wine. It has the Virtues of all the former Preparations, but not so powerful as the Elixier, it is good against the Plague or Pestifence, as also for Old People, and cold Contusions.

XX. The Vinegar. It is good against the Plague, given a Spoonful or two at a time in any proper Vegetable, and prevails against any Vegetable or Animal Poison, outwardly is it clear, the Skin of Mopew, Swett, Pimples, Redness, Tettars, Ringworms, Frieze, and other like skin eruptions.

XXI. The Powder. Given to a Dram in the Morning fasting, and left at Night going to Bed, it kills Worms in Children, strengthens the Stomach, and provokes Sweet in elder People, refuits Poyfon, provokes the Terms, and educeth the Birth; used as an Elixier it purges the Head and Brain of cold, moist, vitious and pruritous Humors, it is firendly thicke upon old, rotten, putrid, and filthy Ulcers, it cleanseth them, dries and purges their heat.

XXII. The Ointment or Balsam. It is a singular Vulnerary, curing green Wounds in a short time, it is good also for running Sores, old Ulcers, and the like; for it need be it digests, cleanseth, inwardly and out, and makes them dry, and heals; it is good against Pusles, Pimples, Boils, Scabs, and other like breakings out, being applied.

XXIII. The Cataplasm. The Leaves when being made into a Cataplasm with Honey do cleanse foul Ulcers, and put a stop to running and spreading Sores, which are curing and rebellious; if the Cataplasm is made of the green Leaves boiled with Hog's Land, and applied to the bittings of mad Dogs, it is drawn forth from the Venom or Poyson, it difficultly the swellings of Womens Breast, eases pains, and draws forth Thorns, or any other thing out of the Heale; it heals also any Fort of Scab, whether dry or milky.

XXIV. The Acid Tincture. It is a singular Antidote against the Plague or Pestifence, and all sorts of pestilential and malign Diseases, it opens all sorts of obstructions of the Lungs, cures all sorts of running, strengthens and fortifies the Stomach, cures a good Apetite, and a strong Digestion, and positively it may be one of the best things against the Rickets in Children in the World; let it be given in all that the Faience drinks, to many drops at a time, to make the Vehicle pleasantly thrup.
Salmon's Herbal. Lab. I.

XXV. The Spirituous Tincture. It is Cordial and efficacious. It provokes the Terms, relieves Poynting, anguish and constricts the Stomach, stops Fluxes, and gives ease in the Colics, and gripings of the Guts, as it expels Wind, so it relieves Vapors, and being frileusewell mixed with Honey, is an extraordinary celebrative in Consumptions. Do a half a Spoonful Morning, Noon, and Night, in any convenient Vehicle.

XXVI. The Only Tincture. It provokes the Terms as powerfully as any of the former Preparations, gives ease to pains in the Back, and opens obstructions of the Kidneys and Bladders; it is good against pain in the Head; and keeps it off for a Season. Root of Horehound, a singular thing against the Paffie, being inwardly taken, and outwardly applied to the parts affected, being also brought along down the Back Bone in the Morning and Evenings, quitted uponhours or punctures of the Nerves in any part of the Body, it is a singular thing against the Paffie, being inwardly taken, and outwardly applied to the parts affected, being also brought along down the Back Bone in the Morning and Evenings, quitted upon hours or punctures of the Nerves, it eases the pain and cures them; it gives ease also in stitches and pains of the Side, and in the Colic, as also in pains of the Gout, proceeding from what cause ever. Dose from ten drops to twenty, or more, dropping them first into Sugar, and then mixing the Sugar with a Glass of White Port Wine, and so drinking it Morning and Night as long as need requires.

XXVII. The Saline Tincture. It is good against the Ick, and all sorts of itching of the Body, prevails against Ringworms, Tasters, Herpes, Scarf, Morpheus, Pimples, Scabs, and all other breakings out of the Body, it is also laid to clear the Skin of Yellowness, Redness, Tanning, Sunburning, Freckles, Lentils, and the like, in what place soever they happen in, by washing the parts affected therewith Morning and Evening, and letting it dry in.

XXVIII. The Decollin Compound. Take six Ozons, Roots of Agrimony, of Bugle, and of Elecampane, of each half an Ounce, Liquor Aetere, Rhubarb, of each three Drums, Choice White Wine three Pints, or two Quarts, half covered till half be conformed, then strain out, and dilute it with White Sugar. It is an excellent Medicine to open obturations of the Lungs, Liver, Spheen, Gall, and Worms. Dose two Ozons every Morning fasting, as much at Two or Three Afternoon, and the like at Bed time, for fourteen or twenty days together, for the Cure of the Yellow Jaundice.

CHAP. CCLXXV.

Of HOREHOUND Black.

I. THE NAMES. It is called in Greek μαρουθον, Marathum Nigrum, and in English Black Horehound.

II. THE KINDS. It is the second of the Generick Kinds, and comprehends their following Species, &c. 1. Marruham Nigrum Largifolium Bambini, Marruhum Hispianicum Tuberamontiani et Gerard, Marruhum Nigrum Hispianicum Partheni, Marruhum Hispianicum odor Stachidis Lobelii, Osima frondosis Latifolium Cuffe, (because it is called at Valen
tia in Spain) Black Horehound, and Spanish Horehound. 2. Marruhum Nigrum Longifolium Bambini, Sikirrius Monspilletum, &c Viciae Monspilet
tum, Fendeti & Lagenarii, Herba Veneti & Hon
delisior alium, Long Leaved Black Horehound, and Black French Horehound. This Label questions whether it be not the Ogullos Deforindus, rather than the Vici Africani, which wears that Title.

III. The Description. It bears a Root which is small, and without anything Fibres or Strings, and sends up square hairy Stalks, about a Foot high, the Leaves grow on the Stalks by pairs or couples at the Joins, which are somewhat long, and round pointed, thinner, and fuller of Veins than the Horehound. Black Horehound, like unto the middle part of Balf, as Chufurs says, but longer, and of no scent at all, as Chufurs says, but Label says it has the smell of Starch, or Cyathum; the Flowers grow at the tops of the Stalks in prickly Husks, in Whirls or Bundles, of a white color, as Chufur says, but of a purplish color according to Label's, after which comes black Seed, like the other kinds, and growing in like prickly Husks.

IV. The second, or Long Leaved Black Horehound. It bears a thick Root, which spreads it self with many blackish Strings, by which it takes hold and fixes it self in the Earth, and keeps it self alive from Year to Year, shooting out fresh Stalks every Spring, these Stalks are square, and rough, rising up a Foot and half, or two Feet, and spreading themselves into di
ers Branches, set with two long and somewhat broad Leaves at every Joint, longer and broader than Sage Leaves, and longer pointed, dented about the edges, and of a lid overgrown green color, which in the Winter time remaining withered on the Branches, without falling off, are to be seen full of holes, as if they had been eaten with Worms, all the ribs and Veins abiding as they grew, till Frond comes and caustics their Stalks to fall away, the Flowers are of a purplish color, greater than any of the Horehounds, and more gaping, after which, (being past away) comes the Seed in hard prickly Husks, like unto Horehound: This Plant has no smell, good or bad, to be found in it, but as it were mild-lees.

V. NOTE. These two Plants some Authors will have to be no Horehounds, but yet for their likenesses like they are referred by others to this Stock, not can
can I tell to what other Family they can be so well joined, for as much as they have the very same Virtues with the former White Horehounds.

VI. The Places. The Foot of them is a native of Spain, the second of France, and grows about Almeria in Fert Grounds, and sometimes in Wheat Fields, with us they grow in Gardens, being produced from Seed brought to us from thence.

VII. The Times. They both flower in July and August, and their Seed is ripe within a Month after.

VIII. The Qualities, Specifications, Preparations, and Virtues, are the same with those of the White Horehound, declared in the former Chapter, so that no more need be said of them in this place.

IX. A Cato. Dioscorides says, that the Leaves being steeped with Salt and applied, it cures the biting of a mad Dog, against which it is of great efficacy; a Cato phrasing made also of the Leaves roasted in hot Embers, and applied, does waft or confume away hard lumps or knots (Vices) in the Fundaments, it also cleanses foul and filthy Ulcers, as the same Author affirms.

CHAP. CCCLXXVI.

OF HORSEHOUND Water.

I. THE Names. It is called in Greek Ναπροιον, in Latin Prostrum Aquaticum, Marrubium Aquaticum, in English Water Horehound, and Marth Horehound.

Horehound Water.

II. The Kinds. There are several sorts hereof, viz. 1. Marrubium Aquaticum Vulgare Lobeli, Lucdentifl, Dodonae, & Trogi, Label and Lonicera.

III. The Descriptions. The first, or Common Water Horehound, has a Root which consists of a bulk of blackish Pieces or Strings, which feeds forth Stalks which are something great and high, square and strong, having two somewhat large and long Leaves for at every Joint, deeply dented or cut in about the edges, not hairy or rough at all, but smooth and green; at the joints with the Leaves, towards the tops, grow small whiteth Flowers in rough green Hanks, encompassing the Stalk about; which being put away the Seed follows, which is round, and of a blackish color, four usually fast together in the Husk.

Black Water Horehound.

IV. The second, or Black Water Horehound, has a black thready Root, from whence rise up several square, blackish, hairy, green Stalks, which grow upon long footstalks somewhat roundish dark green Leaves, full of veins, a little hairy, and inclosed about the edges, two always at a Joint, and of a strong smell, the Flowers are gaping, and of a purplish
The fourth, or Candy Black Horehound, but a thornes or springy Root, which feeds forth its fift Leaves somewhat like to thofe of a Primrose, being many, long and longer then thofe of the White Horehound, dented about the edges, and thorn pointed, as large as thofe of Baman, and of fo black a color, as it may feem to be so colored or dyed by Art, from among their flocks brings up a fquare Stalk, or Stalks, upon which, as it were at Joints, grow many futhes like Leaves together, but lefter, up to the tops, where the Flowers land encloofing thofe, being in form like to thofe of Horehound, but blaccliff all, the Plant being wholly without fmall or taffe.

VII. The Places. They all grow in moifit and wet Grounds, the two firft in feveral places of England, the feenth has been found in the way to Rochester, about half a Mile from Greatfen, the third grows in Anclcris, the fourth in Candy, but the two laft not with us, unlefs planted in Gardens.

VIII. The Tower. They all flower in the Summer Mofs, as in the latter end of June, in July, and August, and give their Seed foon after.

IX. The Qualities, Specification, Preparations and Virtues of the three laft are the fame with thofe of White Horehound in Chap. 372, atropeging, and the fcond of thofe are faid to have the Virtues of the Black Horehounds in Chap. 375, Sect. 5, being used and applied in the fame manner.

X. As to the Qualities and Virtues of the firft of thofe in this Chapter Authors have faid nothing, but this I have found by experience, that it is an excellent Vomitive, whatever inwardly taken in Juice, Powder, Decoction, Wine, or Tincture, or outwardly applied in Oil, Bath, Ominent, Cerate, or Cataplasm, &c.

CHAP. CCCLXXVII.

Of HOREHOUND WILD, OR, STACHYS.

H. The Name. It is called in Greek Σταχύς, in Latin astachys, and in English Wild Horehound, Wild Horehound, and Stachys.

II. The Kinds. Authors make about seven Kinds, but by reafon the mollt of them are not to be had in England, we shall only treat of the three following, viz.: 1. Stachys Gerardi, Dodonaeus, Lagardener, Tet- herannean, Matthioli, Stachys minor Camerari, Stachys Hetera iris et odoris Geffneri, Stachys Lyciendaris, Stachys Spurca Flandremonti Lelijui, Stachys Italice minor Balsam, Sabina Sylvestris terrae Cepaliph, Wild Horehound, Safe Horehound, Litter Horehound, and Italian Horehound. 2. Stachys Fuch- fji, Stachys Germanica Geffneri, Stachys Germanica major Camerarii, Eufaudolys Matthioli, &c. Lagard- erne, Stachys minor Germanica Balsam, Morrallum Clement Antheum Thalij, Sidentis Herculis Co- mane, Rubi, Sabina Sylvestris Cepaliph, Great Wild Horehound, or Great Balf Horehound. 3. Stachys Palzifris Geffneri & Camerarii, Morrallum Aquiti- curn Gerardi, Botanica festiva Geffneri, in Collatione Stirpium, Sidentis prima Graia odoris De- cchampi et Thalij, Gymnem minus Lagenaph, Terza Plums, (because it cures Tertiam Agues) Lyfmacuc Galericulata Aubletarii Befleri in his Hertan Epilofco, Manih Wild Horehound, or Balf Horehound.

III. The Definitions. The firft, or Wild Hore- hound, which is thought to be the Stachys vera De- cchampi, but a Root which is weak and durable, made of divers blackish Strings, which periouls not after it has given Seed; from this Root rise up fcvral fott, woolly, green Leaves, lying upon the Ground, and aliding all the Winter, somewhat broad and long, of about two Inches in breadth, and three in length, fmoth, and not dented at all, or very little about the edges, from the middle of thofe Leaves arise fometimes but one Stalk, and fometimes othe- vers Stalks, bearing divers fuch as Leaves thereon, but lefter, and fet by pairs or couples one oppofite to another at the Joints, fomewhat hard, and a lit- tle longer and whiter than thofe of Common Hore- hound, (to which the whole Plant is very like) the Stalks are high and jointed, and fet with fott hairs; from the middle of the Stalks, and fo wards, come forth fcvral Flowers, of a yellow color, as Lobet, Camerarius, and Gerhard lay, but of a purpulh color as Parkinson lays, (he having never seen...

Stalks, like unto Betony, after which comes small, roundish, blackish, or brown Seet.

VI. The Places. The first grows plentifully in Italy, in the Fields about Rome, as Matthiolus and Caftor Durante fis, and also in Germany, as others affirm, with us it grows only in Gardens; the second is a native of Germany, as Campanarius, Lonicera, Plantago, and Gifever in down, it is also a native of England, and has been found growing wild in Ox

fordshire; in the Field adjoining to Whitney Park, about a Mile from the Town; the third grows in many places in low Grounds in several Countries, and in divers places in England.

VII. The Times. They all of them flower in the Month of July, from the beginning to the end, and the Seed is ripe in Auguft, or not more than Weeks after the flowering.

VIII. The Qualities. The two first are hot and dry in the third degree, a little bitter, opening, digesting, and cleansing, Peritcal, Hepatic, Splenick, Hydrel

ich, Nervick, Eenemyng the tide, Alchamickick, and Anemelick.

IX. The Specification, Preparations, and Virtues, are the same with those of the White Horsefoot in Chap. 374, Sef. 12, as 28, afgterfaying, do that no more need be fay thereof.

X. Noto. But thofe things in particular has been observed of thofe Wild Flowers, that their Juice, Ef

tere and Vomit, have been powerful in provoking Women's Croules, and to expel both Birth and Afterbirth, for which reafon they are dangerous to be given to Women with Child, becaufe they are apt to caufe Abortion, or Mischirrages; they also provoke Ulme being flopped, given inwardly,

and the parts alfo being fomented with the Decoction in Water, and the Patient fuffering over the warm flames of the fame.

XI. The third, or Maffh Wild Horsefoot, is a finging good Wound Herb, being both to heal green Wounds, running Sores, and old filthy Ulcers, the Jule, Elference, Decoction, or Wine thereof being given inwardly, and an Oill, Unmatt, Baldin, Cataplauin, or Ponder thereof being alfo outwardly applied.

CHAP. CCLXXVIII. OF HORSEFOOT.

OR,

COLTSFOOT Strange.

I. The Names. It is called in Greek ὑπολογεννή, in Latin Cicilia, and Cacumin, (not Cannabis, as some write) in English Horsefoot, and Strange Coltsfoot.

III. The Descriptions. The fift, or Horny Horfe

foot, has a long white Root, divided into many heads, with many long Strings and fibers thereof, of a gla

cious or clammy fزيد, like unto Gun Trancaschip, energizing thereby very much; from thence Hands float up tripped reddifh Stalks, with large round Leaves on them, larger and thicker than Coltsfoot, and more woolly alfo on the upper fide, yet with a greener to be feen in them, but very woolly and white underneath, with some Ribs and Vains in them, of a little bitterish unequalt fides, from among which Leaves rise up tripped, woolly, and reddifh Stalks, two or three Feet high, having several leafer Leaves in them, and all of them denoted about the edges, branching forth at the top into fmall Springs of pale puruleffent Flowers, made of four fmall Leaves apiece, with fome Threads in the middle, after which they have been a white blown do turn into Down, which is carried away with the Wind: Decemfamp-

as fays, that in the middle of the Flowers are hanging down fmall white Grains like Pearls, to make it anwer Pliny's Description.

IV. The fefond, or Smooth Horsefoot, has a Root like the former, and has Leaves as large, but thicker, harder, smoother, and greener, not hoary or woolly at all, but denser or waved about the edges, and pointed alfo with the roundness; but not open at the Stalks, as the others; the Stalks are in like manner tripped, but smooth, bearing the like Flowers at the tops, but somewhat paler.

V. The third, or Horsefoot of Virginia, has a Root conflagrifying of a half of blackish Vines or Threads, which obliterates the extremity of Winter, the Stalks and Leaves both perfewing yearly, but growing brownwards towards the end; it rises up with many round Stalks, about a yard high, and two fortnight high, but pointed Leaves, a little denoted about the edges, at each joint of them, the upper Leaves being smaller, and little or nothing denoted; at the tops of the Stalks come forth fveral Branches, with white
Flowers, divers small ones growing almost together, and consisting of five Leaves apiece, each Flower rising out of a small Hult, which being past, small Seed follows, each sticking to a little Down, which are carried away together with the Wind, this Plant has no small likeness in its Roout, Leaf, nor Flower, the Corinnet forms to affirm it.

The Places. The first and second Kinds grow in the Valleys of Mountains, by Roads, and places abounding with moisture, in many Countries of Europe, but very rarely in England, unless planted in Gardens, the third grows in America, as in Canada, Virginia, New-England, Maryland, and Carolina, in which last place I have found much of it.

VIII. The Qualities, Specification, Preparations, and Virtues, are the same with Celosia as aloe, to which you are referred; I have had experience of that which grows in America, and I found it to have the same Qualities and Virtues with our English Celosia, and to be fully as effectual.

Note 1. Authors say, that the Root steeped in Vine and eaten prevails against Coughs and Hoarsesth, but that it is a Plant without any Harmfull, and the same things Galen affirms of his Gicemon, the Root moderately dries, is without any biting quality, and is of a goods and emetickial flux, being beaten raw, and applied as a Cataplasm to the Gout, it easeth the pain thereof, stops the afflux of Humors, and strengthens the parts.

Note 2. Dioscorides says, that the Pearl like Grains which are found in his Calea, being made into a Powder, and mixed with some proper Ointment or Confit, will make the Skin smooth, and as Pliny says, will stay the falling of the Hair.

of HORSE TAIL Meadow, or, SHAVE GRASS.

The Names. It is called in Arabic Tharam Alad, Rhamb Alad, and Dhand Alad, in Greek Terwaz, &c. in Latin Equifetum, Celosia Equina, Equina, (from the name of a Horse Tail) and by Pliny Equifera, by some Salix Equina, and Sanguinis, from its effects of stopping Blood, in English Horsetail.

The Kinds. Authors have made several sorts heretofore, and very much multiplied the Species, we shall in this Work divide them into three principal Kinds, and under each give you the chief of those sorts which are useful in Physick, and commonly grow with us in England, you shall have then, 1. Equifeta Palatina, Marsh or Water Horsetail, of which in this Chapter. 2. Equifeta Pratensis, Meadow Horsetail, of which in Chap. 380. 3. Equifeta Nudum, Naked Horsetail, of which in Chap. 381. following.

Greater Marsh Horsetail

The Kinds of the Marsh or Water Horsetail. It is fivefold, 1. Equifeta major Palatina Latifoliis, Hipectys major Johanni, which Anguillara thought to be Canum Platifolius, The Greater Marsh Horsetail. 2. Equifeta Palatina Linearis Scoparia Folia, Broad Leaved Marsh Horsetail. 3. Equifeta Palatina lineata, Equifeta Palatina Lodij, The Lesser Marsh Horsetail. 4. Equifeta Palatina altera, Equifeta palatina brevifolia Folia, Canva Equina Varia Gerardi, which is taken by many to be the Polygonum Glume Dioscoridis, and Polygonum tertianum
tertium Plini (from the many joints it has) of Mau-
tholus, Glycer, and others, Polygonum Foemina Se-
mine Vidae Lobelij, Sanguinarii Rotunda Cordi, Bar-
ren Marth Hortefail, Marth Hortefail with shorter
Leaves. 7. Equifetum arnus transflumum, which is
the smallest and featt Hortefail, and is very
like to Equifetum transflumum & longifimae Folii Bar-
bian. 6. Equifetum Fasadum, Stinking Hortefail.

IV. The Decriptions. The first, or Greater Marth
Hortefail. It has a pretty thick Root, which creep-
der Ground, having Knotts at several places, and
Fibres springing therefrom, at its root springing up
it has Heads, something like to those of Affaragus,
which afterwards grow to be hard, rough, hollow,
Stalks, jointed at several places up to the top, grow-
ing to be a foot high, so made as if the lower part
were put into the upper, at which grows on each side
a bunch of small, long, hard, Ruth-like Leaves, each
part reminding a Horfe Tail, (from which it came
to be so called,) as is above hinted at the tops of
the Stalks come forth small Catkins, like to those
of Trees.

V. The second, or Broad Leaved Marth Hortefail.
It has a Root which is creeping, and jointed, like the
former, the Stalks are about a foot and half high
hollow, and jointed in the same manner, set with
Leaves after the same fhape, but they are
broadter than those of Toad-blite, green, rough, long,
and easily to break, what Julie or Carfin it bears has
not been observed.

VI. The third, or Leffer Marth Hortefail. It has
a very long Root, according to the depth of the Water,
very thick, and jointed, with some few Fibres or
Thread adjourn thefe, from the heads of this
Root rise up great, thick, jointed Stalks, on which
grow long, rough, Ruthy Leaves, Pyramid or Steep-
lie Fathion, the whole Plant is also rough, hard,
and fit to rub, flave or smooth wooden things, as
some of the others, it diffits not much in the maner
of growing from the former, the chiefd differ-
ence is, in that it is fmalter, and the Leaves or Bri-
ries, (as some call them) which are at the Knotts,
are lower and thither.

VII. The fourth, or Bassor Marth Hortefail. It
has a long Root, like that of Cunche, or Quitch-Crafts,
from which, as from a kind of Points, come forth many
Fibres or Threads, and from which Root at certain
diffences rise up several hollow Stalks, which
at several places are fitted with small Leaves in bundles,
like to those of Broodwoof, altogether laken of Flow-
er and Seed, for which reason Label called it Poly-
fonan Fomina-Sesima Vidae, but Johnfou Eys, that
it is sometimes found with ten or more Stalks at each
Root, for which reason Bading called it Equifetum
Fafadure brevifolius Folii Polyfomum, this differs
little from the falt, having that it is often found to
bear no Seed, as the others do.

VIII. The fifth, or Small and fmall Leaved
Hortefail. It has a kind of joined and fmall Root,
from whence rises up one pretty thick Sftalk, and very
hollow of Points, spreading in it fall out into many long
Branches; and making of this the whole a kind of Fane,
every of which Branches are replent with very fmall
and fine Leaves, and growing much after the same
manner as the others do.

IX. The fouth, or Stinking Hortefail. It has a
long jointed Root, set with Fibres, and the Sftalk grow-
s to be many times about a yard long, growing sometimes
nearly under Water, and sometimes hain in and out of
the Water, the Stalks are replentified with sever-
al Branches, but friped about, and for with horte
Leaves at every joint, as in the other Hortefails, but
they are somewhat jagged or divided to the tops, and
at the joints under Water come forth sever-
all small Fibres or Thatchs; the Plant is green
whilt it is in the Water, but taken forth and dried
it becomes grey and brittle, early to be rubbed into
pouder with one Fingers, and falling also into pou-
der of its fall by lyings, it feemeth somewhat like to
Bringlowe, whence came the Epithet fesifium.

X. The Places. They all grow in wet and moist
places, and some of them in standing Waters, in
many parts of this Kingdom, the fit and second in
moft or wet Grounds, the third and fourth in standing
Waters, the fifth in low wet Grounds in Woods,
as near Hackney, not far from London, for the fit
Gerard Eys may be found towards the latter end of
the Year in several Ditches on the back Side of South-
wall, near St. George's Fields, covered over with
Water, as also in the standing Waters of St. Jomer's
Park, and this is that which is taken to be Bandi-
mer's Equifetum fesifium sub Aquae repon.

XI. The Times. They fpringing up with their
blackfth Heads in April, their blooming Catskins ap-
pear in July, and their Seedings time is for the most
part in August, after which they perish and fall to
the Earth, springing up afhine again the next
Spring.

XII. The Qualities. It is temperate in reffect to
heat or coldness, and dry in the third degree, it has
some bitters, and mildly dry and without bitters, it is
Officinal, Diuretic, and Traumatick, New-
phritic, Aristarchia, and Palatia.

XIII. The Specification. It stops all Sorts of Flue-
res, and fluxes of Blood, whether inward or outward,
heals Ulcers and Excoriations, and cures Catarhus,
Coughs, and Cold, and provokes against the Stran-
gury.

XIV. The Preparation. You may prepare there
from 1. A Liquid Juice. 2. An Eflence. 3. A
Decotion
Chap. CCLXXX.

OF HORSE-TAIL Meadow, or, Meadow SHAVE GRASS.

I. The Names. It is called in Greek "Equisetum," in Latin, "Equi-Setum," and in English, "Horse-tail, or, Shave Grass.

II. The Kinds. It is twofold, viz. 1. Equi-Setum Majus, or, greater, Hippurius altera Tragia. Equi-Setum minus, or, younger, Hippurius Ventralis Lobularis. Equi-Setum sive longif-fruitus Bastiani, the Greater Meadow Horse-tail, or, Equi-Setum Pratense minus, the Lesser Meadow Horse-tail.

Greater

Meadow

Horse-tail.

III. The Preparations. The first, or Greater Meadow Horse-tail, has a small Root, and Fruits, with some few fibres or strings adhering to it, from which rise up a rough channelled-Stalk, joined at certain spaces, having at each joint two halves of rough, bristly Leaves, set one against another, in the form and manner of growing it differs but little from some of the former, save that it grows greater, and bushy, with more and longer Leaves than any at the joints, each leaf for the most part being jointed also with little, but scarcely inappreciable joints.

The second, or Lesser Meadow Horse-tail, has a Root not much unlike to the Greater Marsh Horse-tail, but with several Fibres or Strings adhering to it, growing under Ground, with joints at it were, from which root, if cut, spring up small heads, like the head of a Poker.
V. The Places. They both grow in Meadows, near Hedges, and Groves, and by Wood hills in moff Grounds, in many places of this Land; they are also oftentimes to be found in dry Lands, and by the borders of Land Ground where it adjoins to Fennery Ground.

VI. The Times. Their Heads spring up early in the Spring, and grow up in the Summer Months, the Carkins blooming in July, and Seeding for the most part in August.

VII. The Qualities, Specification, Preparations, and Virtues, are the same with those in Chap. 379. last foregoing, so that we shall lay no more of them in this place.

C H A P. CCCLXXXI.

Of HORSETAIL Naked, or, Naked SHAVEGRASS.

T HE Names. It is called in Greek Termino, 
Hippuris Nuda, Equifetum Nudum, and in English Naked Horsetail, or Naked Shavegrass.

II. The Kinds. There are three Kinds hereof, viz. 1. Hippuris Tragi, Equifetum Tragei, Lagenæntis, Saugeedfus jumnum familia Cord., 
2. Equifetum Pileus Nudum non 
Hippuris, 5. Equifetum Bambus, Equifetum Nudum, Naked Horsetail. 2. Equifetum Tragei, 
3. Equifetum Matthewi & Lagenæntis, Hippuris min 
fus Lappet & Dodo, Branched Horsetail, and Branched Naked Horsetail. 3. Equifetum Nudum 
variegatum Lappet, Small Naked Horsetail 
variegated or prey colored.

III. The Descriptions. The first, or Naked Horsetail, has a Root which is jointed, and excepts, like the others, from whence rise up many straight naked Stalks, jointed, but without any Leaves at the joints; sometimes the Stalks are single, and sometimes with one or two other like Stalks springing out of their Stalks, which are likewise jointed, naked, and growing straight upright; these Stalks are of a rough and 
RufC like suffrance, growing to be a Foot or more high, sometimes to two or three Feet high, according to the goodness of the Ground, by its nakedness of Leaves it is known from all the other Kinds of Horsetail, and is more used by several Workmen to smooth and polish their Works of Wood, Bone, Var 
is, and Japan, than any of the others.

IV. The Second, or Branched Naked Horsetail, has Roots like the former, and differs only from it in its 
growing with many Stalks from the top of one that 
top rise out of the Ground, and that many of the 
Mark, do branch themselves forth into others, all of then full of joints, and without Leaves, so that the whole seem to be a kind of Bulb.

V. The third, or Small Naked Horsetail variegated. It has a small, blackish, creeping Root, from which spring up several small, below, and green 
Stalks, of a Foot high, and sometimes so much, and full of joints, the lower joints of which are blackish, and the upper whitish, without Leaves, (which is probable to be the same which Mr. Bulke 

found on Gerard's he found with small Leaves, and called 
Horsetail Coraline, tho' this may sometimes seem to 
differ both from his and that of Gifford) at the tops of
of HORSETONGUE, or Doubletongue.

I. The Names. It is called in Greek Όρυχος, in Latin Hippocrepis, i.e. Lingua Equina, Lingua magnus, also Hippocrater, i.e. Bifhinga, Tongue upon Tongues, Vulturina, Apateri, Lingua Equina alterans, Horsetus, Angiata, Ovarius Bracteus, Lannecur, Tepochontempta, aliorumque, in English Horsetongue, and Doubletongue, also Tongue upon Tongue.

III. The Descriptions. The first, or Lesser Horsetongue, has a Root which is white and tough, and of a sweet and pleasant smell, which consists of many long, hard, thickish strings, growing from a Head. The Plant is very like unto the Chamaedaphne verum, Bufceraulis for the manner of its growing, for this is from the head of the Root aforementioned rosettes forth several hard Stalks, with Leaves upon them, one above another, as the Plant does, and much about the same length: the Leaves are long, narrow at the lower part next the Stalk, broad in the middle, like a Belly, and very sharp, pointed; having ribs running thro' their whole length, sometimes three or four, and sometimes five ribs, upon each Leaf grows another, smaller Leaf or Tongue, which grows out of the greater Leaf from the middle Rib, on the upper side, and about the middle of the Leaf, which makes it to differ from all other Plants which grow upon the Earth, from which double Leaf came the Name of Doubletongue, under the smaller Leaf, at the bottom where it ples unto the greater, comes forth one small, white, great Flower, and sometimes two, standing upon short footstalks, where afterwards hang the Berries, which when they are ripe are very red, very like unto the Yew Tree Be- ries, and in which is contained a white hard Seed.

IV. The second, or Greater Horsetongue. It is in all respects very like to the former, living that the Stalks are somewhat higher, the Leaves longer, and having longer Tongues upon them than the former, but this Equis Elisus, Galiius is much more rare to find.

V. The Plants. They both grow upon Hills and in Woods in several parts of Italy and Germany, the first more common to be met withal, and with us is only nurs'd up in Gardens.

VI. The Flowers. They flower in June in natural places where they grow, viz. in warm Countries, and the Berries are ripe in September, or fall of the Leaf.

VII. The Qualities. Horsetongue is hot and dry in the second degree, it is Appetitive, Hypertic, Empyemic, and Traumatic.

VIII. The Specification. It is an abstinence thing against the suffocation of the Womb, provokes the
Terms, caueth a speedy delivery to Women in Labor, drives forth the Afterbirth, helps the Strangury, and expels Stones, Sand, Gravel, and Tarryour Matter out of the Reins and Bladders, and opens all obstructions of the Viscera.

IX. The Preparations. You may have therofen,

The Virtues.
X. The Liquid Juice. It is one of the most powerful things against Hyperick Fits, or the suffocation of the Womb, and other Diaphragms of that Bowel; it suppresseth Vapors, repelleth the Fits, and gives a sudden eafe; it provoketh Urine, opens the obstructions of the Reins, Uterus, and Bladders, gives eafe in the Strangury, provoketh the Terms, facilieth the delivery of Women in Labor, and forcarre away the Afterbirth. Doe two or three Spoonfuls at a time in a Glass of Wine, or other soft Vehicle, in the Morning fasting, and Litt at Night going to Bed, as also at the time of a Paroxysm, or when the Patient is in extremity.

XI. The Effece. It has all the former Virtues of the Liquid Juice, and is very good to expel the Stone, Gravel, Sand, or Tarryour Mucrall, out of the Urinary parts, being given two or three Spoonfuls at a time in any proper Vehicle for several days together; it is said also to be good for such as have a Rupture, for which It is thought that there is no better Remedy, for that by the continuance of its ufe it will heir and heal the parts, provided also that the Patient be accommodated with a convenient Truth for a good while after as well as during the whole time of the Cure.

XII. The Decollation in Wine. It has all the Virtues of the Juice and Effece, but much less powerful in its operation or effects, for which reason it is the other to be given, and that from Four to Six Ounces at a time; it is good for such as have an impertinency in their Speech, it not being natural, or from the conformation of the parts, it is profitable also against Stones and Ulcers in the Mouth and Throat, and strengthens the Utrum, as to confirm and fix it in its natural state, drying up the humidities, which many times reliefs it, and harts its Tone.

XIII. The Powder of the Leaves or Roots. It has all the Virtues of the Liquid Juice, Effece, and Decollation, and may be given from a Dram to two Drams, repeating a Dram at a time till three or four Drums are given; it need not be more, being given to a Woman in Labor, it may be given in Cunary, Malaga, or Tent, or any other proper Vine or Vehicle, as the Physician shall think most fit, or it cures old and filthy Ulcers in any part of the Body.

XIV. The Acid Tincture. It opens obstructions powerfully, suppresseth Vapors, cures Fits of the Mother, and is one of the best things in the World to cure the Rickets in Children, Kill Worms in their Stomach and Bowels, caueth them a good Appetite, and reforfe them in Contumencies. Doe so many drops (in any Ale, Beer, or Wine) as to make it pleasant and gratefull thirsty.

XV. The Spirituall Tincture. It has the Virtues of the Juice, Effece, and Powder, but is much more Cordial and refreshing; it is good against Convallions, Piles, Fainting and Swooning Fits, strengthens the Stomach, cures pains and gripines in the Bowels, as also after pains of Women in Childbed, and is a good thing to be given with a continuance to Chylful Women, to cause a compleat cleansing,
Salmon's Herbal. Lib. I.

II. The Kent. Authors make many Kinds of this Herb, but we shall in this Discourse take notice of none but the six following Kinds, viz. 1. Cynoglotum. 2. Cynoglotum. 3. Cynoglotum. 4. Cynoglotum. 5. Cynoglotum. 6. Cynoglotum. The Great Houndtongue is Cynoglotum maximum, an annual Plant, which has sometimes been found with a white Flowers, after the Flowers are fall, but rough Seed come in their places, which has a small Thicker or Boiled in the middle, and by reason of its roughness easily cleaves to any Garment which it touches, not being readily pulled off again.

W. The second, or Great Houndtongue. This differs not color in its Root, Stalk, branches, Leaves, Flowers, Seed, fust, or manner of growing, from the first Cynoglotum, but now described, but only in its magnitude, this being twice as large, which is indeed the only difference.

III. The Descriptions. The first, or Common Houndtongue. It has a black, thick, and long Root, which is tough, or difficult to break, and full of a viscid, or slimy Juice, swelling of a strong ill smell, much like to Digitalis, at the Leaves also, which soon call a proper sour smell, from this Root springing up many long and something narrowler, fott, and as it were hairy, darkish green Leaves, lying on the Ground, somewhat like unto the Leaves of Digitalis, but not altogether it lies in feeling to, from among which rise up a rough hairy Stalk, about two Feet high, with some smaller Leaves thereon than those which grow below, and branched at the top into several parts, with a small Leaf at the top of every Branch, which is branching long, with many Flowers set along those Branches, which are crooked, or turn inwards, before it flowers, and gradually opens as the Flowers grow, whilst Flowers consist of four small, purplish, red Leaves, something of a red or dead color, fercely rising or flower themselves out of the rough green Huds in which they stand, with some Thickets in the middle, this Plant has been sometimes been found with a white Flowers, after the Flowers are fall, but rough Seed come in their places, which has a small Thicker or Boiled in the middle, and by reason of its roughness easily cleaves to any Garment which it touches, not being readily pulled off again.

The third, or Great Mountain Houndtongue. This differs not color in its Root, Stalk, branches, Leaves, Flowers, Seed, fust, or manner of growing, from the first Cynoglotum. This being twice as large, which is indeed the only difference.

V. The third, or Great Mountain Houndtongue. The Root is blackish on the outside, and which within, being something like the former, it has also springing from the Root many large, but hairy and soft Leaves, lying on the Ground, above a Foot long, and an Hand breadth broad, of a whithish green color, having in every one of them the middle Rib reddish, with many green Veins running into them, and reddish Footstalks to fulfill them, those which are in the middle of them standing more upright, from among which rises up a thick, hollow, crooked, reddish, woolly, or hairy Stalk, two Feet or more high, replenished on all sides with flesh like Leaves, but either and either up to the top, where it spreads it fall into four or five branches of Flowers, standing all on one side, yet forming at first a round Head, very pleasant to behold for the variety of colored there is in it, the hairy flaches of the Flowers being green, and ending in five points, the Flowers being all hollow and long, and consisting of five purplish
red Leaves, somewhat fower, standing above the Huds and green Leaves which grow among them, with red fiddles in them, which in the fllow, where it delights to grow, is the more conpicious and beautiful, after which in the fild Huds come longer or Seed than in the Common Kind, four ufually together, which on the upper fide are flat, and circled about with a few fhort prickles, whereby it commonly cleaves falt to Peoples Garments if it touches them.

Ever green Houndftongue the leffer.

VI. The fourth, or Ever green Houndftongue. It has a Root which is thick, and blackish on the out- fide, like the others going before, but does it much differ from the Common or Ordinary fort of Houndftongue first defcribed, but that the Leaves are always fresh and green, somewhat long and narrow, with a great whitifh green Rib in the middle, smooth on the upper fide, and more hoary underneath, the Stalk at firft is but low, with many narrow long Leaves compofing it about, but more thinly than in fome other Kinds, the Flowers are red, but some what larger than the Ordinary, standing in like man ner upon fmall Branches, which are vithed or turned ed like the Heliotropium, or the firft Kind, the Seed which follows stands all on the one fide, and is fmal ler, and lefs rough, but the Stalk will then be grown much higher, this has no manner of hearted, nor has it to ftong or rank a fmall as the former have, it does alfo spring forth with freh Leaves, before the old Stalk with its Seed is quite dry and withdaw away.

VII. The fift, or Small Houndftongue. It has a fmall black Root, not much differing from Our Common Kind, but it is every ways smaller in all its par- trics, having fuch like Leaves, but smaller and fhorter, yet greener, and more thinfing, the Flowers being fmall, are alfo of a pale red color, the whole Plant has not to ftong or rank a fmall as have fome of the former, but this fmallnes may be thought by

Come to be from the barrenfes of the Soil in which it grows, which is not fit, because it is oftentimes found in the fame Ground where the greater grows, and helkeys, being either transplantd from the Seed fown in Gardens, it will continue much fmalller than the other.

VIII. The fourth, or Small Houndftongue with blew Flowers. It has a fmall long Root, but annual, which feeds forth one round, fmall, hairy Stalk, fometimes but a foot, and fometimes two feet high, brownifh below, and green above, on which are let on both fides without order feveral fmall, and fomething long, but narrow Leaves, of a whitifh green color, covered with a long fairy down, which is tough and ftekking, the middle Rib is fonewhat hard and eminent, and the whole Plant of a hot fitter fhape, from the bottom of thefe Leaves, efpecially upwards, come forth fometimes other Smaller Leaves in a Tuft together, and is parted into divers Branches, the tops of which are bended, as in feveral other Korts, bringing forth very fmall Flowers, of a fmall blew color, with a yellow Star in the bottom, standing in fuch like Huds, in which after they are paft is contained very fmall roundifh Seed, without any prick in the middle, as fome others have, but very rough or prickly, and ready to fick upon Garments or Cloaths, as the others will.

IX. An Observation. There has been a great Con troverfie amongst Botanifts whether the Cyngellifum here firft defcribed, which is our Ordinary and Com mon, and is the most common in all Countries, be the Cyngellifum coronam Dioscoridis, because he fays it bears neither Stalk nor Flowers, which this does, which Plant, wanting Stalks and Flowers, Matthias fays he found in fome fandy Grounds in Rome, behind or beyond Mount Adrianus, but both Peria and Label tax him with want of proof, becaufe they it will in the fame and other places bear both Stalk and Flowers, altho' in divers Years and places it does not bear, yet will after fome refpite of time in any place, as not only here, but feveral others.

Good Authors have acknowledged, as well in this as in other Plants, I confefs I my felf have oftentimes found the firft defcribed Plant, viz. Our Common Houndftongue, in feveral parts of England without either Flowers or Stalk, and that at the fame time, and near the fame places, where other Plants of the fame Species have had both, and therefore without all doubt Our Common Kind is the true Plant which Dioscoridis has defcribed under thofe Names to defecribly.

X. The Places. The firft grows in moft places of England, in falle and unifufted Grounds, alfo by high Ways, Lanes, and Hedges fides, the fcond grows in the Low Countries, but chiefly in their and our Gardens, the third grows on Mountains near Naples, with us only as it is mantined in Gar- dens, the fourth in falkow Wood in Germany, &c. the fifth grows in many places of England, as also in Germany, discurfed of by Cordy upon Dios- coridis, and politely is that fame Kind, which in the Adverfario is faid to grow about Mumpeter, and called Puffulum Narboniense, the fifth grows in Au- ftria, as Clifton fays, and in other parts of Germany, as Trajvan fays, and at Naples, as Columns fays, alfo very plentifully in England, by high Way fides, as you go from London towards Cudgehury, between Elfesfard and Wifton in Eiffe, as Gerard fays.

XI. The Times. They all flow about May and June, and in the ift de-
The Virtues.

XV. The green Leaves. Being tied and applied they cure the falling away of the Hair, which comes of hot and sharp Humors, they are good also to be applied to any place fealded, or bair'd with Fire, and to any green Wound they heal in quickly, for the same is powerful also against Antimony fires, and other Infammations.

XVI. The Root. Being roasted under Embers, wrapped up either in Feife, or double wet Pappers, and thus a Suppository made thereof, and applied to, or put up the Fundament, it is effectually good against the Harmorrhoids, or Pilis, and as a Castpillar to the Gout it cures the same.

XVII. The Juice of Roots or Leaves. Made into a Syrup with Honey it is good against vehement fire and ulcers, old Coups, Colds, Asthma, and all sharp and dry defections of Rheum which fall upon the Eyes, Nee, Ears, Stomach, or Lungs, caus'd by wheezing, hoots, or Breath, etc. Doe one or two Spoonfulls, (according to Age, Sex,) Morning and Night.

XVIII. The Essence. It has all the Virtues of the Juice, and more powerful, and may the given in the same dose in a Glass of generous Wine; it is good also (usually taken and outwardly applied) against the bitings of mad Dogs.

XIX. The Powder of Roots or Leaves. It has all the Virtues of the Juice, Essence, and Pouder, but is much more efficacious in larger quantities, as from an Ounce to two, or three, as the Patient is in Age and Condition; it cleanses, dries, and heals Wounds and Ulcers, if the Patient is of a hot constitution, the Decoction ought to be made in Water, after which, if you think it, a little Wine may be added.

XX. Pils of the Capsule, or Seeds of Houndburne. Take the dried fruit of Houndburne Roots; White Henbane Seed, Optim prepared, (i.e. extreelted with Fair Water, and reduced to pouder) of each one Ounce. Mix them, and after the pouder of each, a little Syrup of Steevia, or a Draught of Wine, and mix them well, and let the mixture stand in a dry place, then dampen a little Syrup of Steevia, or any other proper Syrup, and make a Malt for Pills. They were designed to stop Catarrhs, or defusions of Rheum upon the Lungs, Stomach, or other parts, to alleviate Coughs, rheums, and Pneumonias, which they perform beyond other Medicines; they stop Loose stools, all sorts of fluxes of the Bowels, and fluxes of Blood or Humors in what part of the Body they be.
Chap. 384. English Herbs.

major, & minor vulgare, Umbilici, Verneris Species altera Angulata, Our Common or Valpar Houleleek. 2. Sedum major leguminous Caffi, Aizoon magnum varus Pervestrius, Sempervivum major, Sempervivum Arborvitae, Sempervivum Arborvitae, Sempervivum Arborvitae, Sempervivum Arborvitae, Sempervivum Arborvitae, The True Great Houleleek, or Tree Houleleek. 3. Sedum major Maximun Anguli- cam, Sedum Portalentum Lobed, Great English Sea Houleleek. This Leaf makes to be a Foot or Kind of the second abovemented, or Tree Houleleek.

Common Greater Houleleek

IV. The Descriptions. The first, or Our Common Houleleek, has a small fibrous Root, creeping all about, and from small strings multiplies into many heads of Leaves, round the original Root, rising up thereby a cluster of Shoots, and in this Root finds Torch on all sides several heads of pale, green, thick, fat, broad Leaves, pointed at the ends, lying circular one unto, and as it were upon another, and upon the Ground, from the middle of each head of Leaves rises up a straight Shoot, two Feet high, all covered with smaller and longer green, thick, fat Leaves, (than those below) which often dry and fall away before the top thereof has produced its Flowers, which grow on long Branches, bending their ends or tops downwards, with a single Leaf at the foot of every one of them, which confit of many Leaves, Star fashion, of a dark reddish color, after which comes Heads, with small blackish Seed in them.

V. The second, or True Great Houleleek. It has a Root consisting of strings, like the former, which divides it into several off-shoots, and which grows great, to the form of a Shrub, or woody Plant, of two or three Feet, or more high, in its native places, which are warm, and its Stem or Trunk below is of the signification of Four Fingers, and the other Branches are the thickest of one Thumb, of a greyish color on the outside, and spotted as it were round about, but they are the marks of the old Leaves which are fallen, the like of which may be seen in Wood Spurge, and some other Plants, it spreads it felt out into several limber smaller Branches on all sides, and Leaves at the ends of them, standing in a compass, like the Heads of the former Common Houleleek, but nothing to close, every Leaf being formed somewhat like a Tongue, small at the bottom, and broader towards the end, wherein is broadened, touching at each side of the end, and a little denied in about the middle of the foot end, so much unlike the form of a Heart, they are also finely denied about the edges, and as it were a little hollow, like a Spoon, and full of juice, and of a pale green color, from the tops of some of the Branches thrid forth a long Stalk, divided into many leafy Branches or Twigs, with some few small Leaves on them, and at the ends of them several Star like Flowers, consisting of many small Leaves, of a pale yellowish color, with sundry small Thrusts in the middle, the greater Stalk becomes dry and smooth, as the Heads, which have small black Seed in them, which being ripe they usually part after Seed time, but the other Heads of green Leaves abide and fall all the Year, which send forth Flowers the next Year after, and may be taken before hand from the main Stock to be planted, and will take root being put into the Ground, in the warmer Countries it spreads it Eft much more into Branches than in the colder Countries.

VI. Ground describes it thus. It rises up with a Stalk a Foot and half, and sometimes three Feet high, which is thick, hard, woody, and so tough, that it can hardly be broken, parted into divers Branches, and covered with a thick grofs Bark, which in the lower part resembles certain princes, or imperfect marks of the Leaves which are fallen away, the Leaves are fat, well hollowed, full of juice, in rich form, and somewhat more, almost like little Tatoes, very finely divided or parted on the edges, standing upon the tops of the Branches, having in them the shape of an Eye, the Flowers grow out of the Branches, which are divided into many Springs, which Flowers are slender, yellow, and spread like a Star, which being put away, there comes up in their places very fine Seed, the Sprigs withering away, the Root is parted into many off-springs, and the Plant is always green, nor in its native Soil is it hurt by the cold of Winter, for which reason it obtained the Name of Sempervivum.

VII. The third, or Great English Sea Houleleek. It has a long slender Root, or Roots, with some few Fibres adhering, from whence spring up one or more Heads, which at length become Leaves and Stalks, the Leaves imitate Laureate, growing among the Tithymal, but thicker, flower more fat, and tender, the Stalk is of a woody flesh, the Leaves are of the Kind of Sempervivum, Crassifolium, and Tithymal, of which last some Authors have thought it to be a Kind, others have thought it to be a Shrub, degenerating from all those Plants, Pena and Label, who first discovered it and it forth, knew not what to think of it, others since then have been as uncertain, however, its something, like to our second Kind, or True Houleleek, above described, its Stem is woody, but it grows neither so high, nor with so many Branches, the Leaves also, although something like to them, yet are not so thick or flippy. In its other parts it differs not much from the last Tree Houleleek.

VIII. The Places. The first grows naturally both in England and Germany, as also in the Low Countries, France, etc., it grows upon Stones or Mountains, upon walls and ancient Buildings, as also upon the tops of Houles, and more especially being planted in Clay, or in Clay Ground, its form does sometimes differ, according to the nature of the Soil, for in some places the Leaves are narrower and longer, and in more in number, and have one or two circle, in some places they are fewer, thicker,
and broader, they are green, and of a deeper green in some places than in others, in some places of a lighter green. In Syria, the raccels grow in Greece, Bra- by, Portugal, Spain, France, Turkey, Servia, Sici- ny, Sicardia, Corsica, England, Etc. In divers places of Italy, Spain, and Portugal, it is kept in Pots, as Confidentially and carefully preferred in Winter, and in Lisbon it grows on the tops of Houses, as our Common Kind does with us, but it does not very well endure the cold of the more Northern Countries of Europe, with all the care that can be, unless kept in a Room with a Stone in it's yer Label Days he found it growing in the Island of Holness near Bridled, it grows in the Islands of the Mediterrenean Sea, as aforesaid, as also in Zant, Rhodes, Candia, and in many Provinces of the East, and of Greece, &c. the third grows by the Sea side in many places of England, and in the Island of Holness, not far from Bridled, it grows also in the Isle of Portland, for which reason it has obtained the Name of Sedum Portlandiicum.

X. The Times. The first Flowers in the Summer Season, which is in June, about the eleventh day, and generally Flowers from that time thro' all June and July, and now and then in the Month of August, it sends it full into Heat from several Springs of the Root in April, which Sprigs or Strings of the Root are the Ground Work of the great Circles, and of other Circles, by which it multiplies in fall, and by which, being at length fully grown, it forms itself into many other Circles; the second Flowers, as Chalus Days, in the warmest Climes, as Spain, Portugal, &c. in November and December, but scantily over with us; the third, or Sedum For- lootium, which grows by the Sea side, Flowers in July and August, whilft the Weather is warm.

XI. The Qualities. Hufleek is cold in the third degree, and dry in the dry, it is Anodyne, Affini- gur, Repercive, and Antiphatic.

XII. The Speculation. It cures an Erysipelas, or Anthony's Pox, so called, and allays the heat of all Inflammations, Blisters, Scaldings, &c.

XIII. The Prepartions. You may have therefrom,

The Virtues.

XIII. The green Leaves. Applied twice a day upon Corms and Warts in the Hands and Feet, it dissolves or confumns them, and takes them away; the Leaves bruised and laid upon the Crown or fore part of the Head, stops the bleeding at Nodc very quickly, and being applied to the Temples and Fronthead it eases the Headache, and allays the heat and dittem- per of the Brain thro' FEVERS, Frenzies, or want of Sleep.

XIV. The Liquid Juice. It is good against all heats and inflamations, as well inward as outward, dropped into the Eyes or Ears, stops all hot defections of the Eyes, it neutralizes these parts, and being taken internally it is good to stop all fluxes of Humors upon the Vitseas, and the Immoderate flux of the Terms in Women, it kills also Worms in Young or Old, and is profitable against the bitting of the Pha- lobium, being often bathed upon Warts and Corms, it is fit to take them away, the more especially if the green Leaves be applied also over the same, the more warmly it abates and allays all sorts of inflamations in any part of the Body, as in an Erysipelas, or An- thony's Fire, and all other hot Eruptions of the Flesh and Skin, Shingles, Pimpls, Ringworms, Furrures, Pins, Etc. in Pots, it allays Ulcers, Burning, Scald- ing, Morpheus, Scorf, and other the like defecti- ons of the Flesh and Skin; and bathed upon the part it eases the pain, and is very profitable against the Goat.

XV. The Poffit. It is made with the Juice, and has all the Virtues of the Juice, being inwardly gi- ven, it is also frequently good against the hot Pits of Agues, for it cools and tempers the Blood and Spirits, quenches thirst, and stops Catarhhs; it may be given in a Boupful quantity to the Juice, for as the Juice may be given from a Spoonful to two Spoonfuls in a Glass of Wine, or other fit Vehicle, to the Poffit may be given from four Spoonfuls to eight, a little sweetened with Sugar, for all the a- fordable Infections.

XVI. The Oil. It is thus made. Take juice of Hufleek, choice thick Cream, of each a Quart, but them over a gentle Fire till a Separation is made, and the Oil leaves on the top, of a yellow or greenish co- lor, which when cold take off, and keep it for use. In all external Cakes, (excepting an Erysipelas) it has the Virtues of the Juice, and is good to apply Pim- ples, Shingles, Tetter, Ringworms, Scarf, Mor- phew, Etc. with, as also places pained with the Gout, given inwardly from half an Ounce to one Ounce in any convenient Vehicle it gives eafe in the Strangury, Stone, Gravel, heat and scalding of U- tine, and cleanses the Urinary pathes from tatur- nious musclage. .

XVII. The Cataplasme. Being made with Hogs and Barley Flower it is good against all the Disfailes the Liquid Juice is used against, except an Erysipelas, because experience has taught us that all grizzle or olyy bodies rather exacerbate than abate that Disfaile, applied in the Gout it gives sudden eafe and cure.

XVIII. The Diluted Water. It is profitable for all the purposes aforesaid, being in outward Diftuf- bars bathed upon the parts affected, and in inward Difcaies given from two to four Ounces, sweetened with Syrup of Clovegillflowers, if it is bathed upon any place Bung with Nettles or Bogs it presently takes away the pain, to also the Juice, being used in like manner, as also the green Leaves, being rubbed upon the parts wounded or affected.

XIX. Note. If the Cataplasm of the Leaves is made with Vinegar and Barley Flower (instead of Hogs and Barley) it may profusely be applied to an Ery- sipelas, or Anthony's Pox.
Chap. 386. English Herbs.

on all sides with many small heads of Leaves from small Strings, as is usual with the Hoofbeaks, each Leaf whereof is long and narrow, cut in deeply into three divisions, one on each side, and the end longest, something like to the Leaves of the Sweet Groundpine, but smaller and greener, not having any hoarfeifs on them, affiegent and drying also in talk, as much as any of the others, the Stalks are redlich, very fender, and not above two Inches high, as Clasius says, but they grow three Inches or more high with us, which is spread out at top into some few Branches, bearing every one of them one small Flower, (but with us it is large, with reflect to the bignefs of the Plant) which consists of five Leaves apiece, of a pale green color, says Clasius, but with us as on that Plant which came from one Mr. Hacket out of Lancaster, of a pale whitifh color, with some yellow threads encompassing a middle round Head.

IV. The Places. Clasius says it grows on the Mountains called Suysberg, or Snowbery, among the Stones, with us it grows on Mountains in Lancas-
shire, as the aforementioned Hacket reported.

V. The Times. Clasius says that it Flowers in thofe Months which are prefently after the Snow is diffeifsed, but with us towards the latter end of April, or in May, but yet somewhat later on thofe Mountains before named.

VI. As for the Qualities, Specification, Preparations, and Virtues, they are much the fame with thofe of Our Common Hoofbeak in the former Chapter, fo that no more need be faid of them in this place.

HYACINTH English, See Hares-Bells, Ch. 335.

CHAP. CCCLXXXVI.

OF HYSSOP Common.

I. THE Names. It is called in Arabic Herb, 
Taste, Gaf, in Greek Hyfopus, in Latin Hyfopus, in English Hyfop.

II. The Kinds. There are two principal Kinds hereof, viz. 1. Hyfopus rubris, or Rubrous, Hyfopus vulgaris, Our Common Hyfop. 2. Hyfopus ramosus, Hyfopus infrequentus, Hyfopus inclebrus, vel infi-
tus, Hyfop Strange, and not Vulgar or Common, of which in the next Chapter.

III. The Kinds. Of Our Common Garden Hyfop there are only two Kinds, viz. 1. Hyfopus vulgaris, Hyfopus Arabum, Our Vulgar or Ordinary Hyfop. This Hyfop is not the Hyfop of Disfeifers and other Greek Authors, as all our modern Botanifs do acknowledge, except Matthioli, who erroneously contends that Our Garden Hyfop is it again all rea-
fon, nor do any of our Herbists know (as far as I can find) what the true Hyfop of the Greeks was. As for our Common Garden Hyfop, It is certainly the true Hyfop of the Arabian, and fo we take it. 2. Hyfopus Arabum floribus rubris vel albis, White or Red Flowaerd Hyfop.

IV. The Descriptions. The Hyfop, or Our Vulgar Ordinary Hyfop, has a Root which is somewhat woody, with many threadly ftrings thereof, it is a small bufly Plant, which fprings up with many woody but tender Branches, Something more than a Foot high, on the Stalks and Branches whereof are fat at certain distances fome small, narrow, and long green Leaves, not dent'd at all on the edges; at the tops of the Stalks and Branches grow blowifh purple gaping Flowers in fpiked Heads, one row above another, after which follows the Seed, which is small and blackifh, the whole Plant is of a vigor-
ous or strong, sweet, pleafant fmall.

V. The second, or White or Red Flowered Hyfop: They have a Root like the former, but are fearfs
to be diftinguifh'd in their form, and manner of growing from the Common Garden Kind, (of which this
is a fot) the chief difference is, that they do both ufually bear white or red Flowers, all on one side of the Spike, yet continue not conftant in that form, but change into the form of the former Common kind, and fo become (as it were) the fame Plant, and af-
ter that change not to be diftinguifh'd therefrom.

VI. The Places. They grow with us only in Gar-
dens, and that thro' the whole Kingdoms of Eng-
l and Ireland, but they grow wild in Arabia, and other hot Countries, as also on the Hills of Ro-
mans, about Ferona, and near unto Mount Bulldus.

VII. The Times. They Flower in the Summer Months, viz. in June and July, and their Seed is ripe in the beginning or middle of August.

VIII. The Qualities. It is hot and dry in the third degree, Anfeive, Alterative, Attracting, Anody
, Cautionative, Digestive, Diuretic, it clears, puri-
fies, and makes thin, it is Sieurmac, Pethan, Cor-
dif, Scenepick, Nepthric, and Arthurick, Em-
menagogick, Alphameric, and Analepick.

IX. The Specification. It is pecuflar against 
Alhum's, Coughs, Colds, Cataras, Wheezing,
Hoarfens, thorned of Breath, difpofity of breath-
ing, cures Contufions, Strangury, Falling-Sick-
ness, and green Wounds.

X. The Preparations. You may prepare there-
from, 1. A Liquid Juice. 2. An Effence. 3. A De-
coration in Wine or Water. 4. A Lobech, or Syrup.
5. A Pouder. 6. Pills. 7. A Lotion or Garfargyn.
8. A Oil by Decotion. 9. A Balfam or Vintiment.
XL. The Liquor Juvace. Mixed with Honey and taken it kills Worms in the Belly, and helps Afflictions, Coughs, Colds, Wheezing, shortness of Breaths, and other Diftempers of the Lungs, cured by a plentitude of Honeys. Dote from one Spoonful to three Morning and Night.

XL. The Etherce. It has all the Virtues of the Juvace, besides which it is excellent against the Falling-Sicknes, Aches, Cataracts, or Dilatations of the Brain upon the Lungs, and other parts; it amends and cures the native Heat, and color of the Body; and is a powerful Remedy against the Colic, Swelling, obstructions of the Terms in Women, Poison, the bites of mad Dogs, Serpents, and other venomous Creatures; it cuts tough Hegen, and cures expellation. Dote two or three Spoonfuls to the Diluted Water, or some other proper Vehicle.

XLII. The Decotion in Wine or Water. It has all the Virtues of the Juvace and Etherce, but nothing pain to powerful, and therefore may be given Morning, Noon, and Night to fix or eight Ounces, sweetened with new Honey. If in very cold it is boiled with it, and to drink, it Cures Cataracts upon the Lungs, and has the other Virtues of the Juvace and Etherce, if the Decotion, Etherce, or Juvace, is mixed with Oxen is purges great Humors by Stool, and kills Worms in Children, if any of these three Preparations are mixed with pulp of Figs and Sail Nitro it loosens the Belly, and works downwards afo, if either of them are mixed with juice of Garden-Grass and Dew Donender Roes, or powder of the Filo Petruccius Roots, in a fit proportion, this mixture will purge the Bowels yet more forcibly, carry off the cysts of the Colic, cure the Yellow Jumakes, Dropsie, obstructions of Liver, Spleene, and Womb, and restore the true color of the Skin, this more effectually if it is given twice or thrice a Week, as the Body can bear it.

XLIII. The Lobeb or Syrup. Take of the clarified Juvace two Pounds, of choice Honey four Pounds, mix, and boil to the consistence of a Rob or Guimsey, it has the Virtues of the Juvace, Etherce, and Decotion, and may be taken three, four, five, or six times a day, or more, as the nature and reason of the Dis- eafe requires, it causes an admirable expellation of the mucus matter out of the branches of the Lungs, take a little of it at a time with a small lit- tle Spoon, and let it dilute down the Throat gradually.

XLIV. The Ponder. It is made of the Leaves, Honeys, and Flowers, boiled upon new Wound is preferably heals them, upon old running Ulcers it cleans, dries, and heals them also, applied with plain Honey or Stool, and Salt, and Honey, it is good against the bitings of Vipers, Rattle-Snakes, mad Dogs, and other venomous Creatures, given inwardly to one Dram, or Dram and half, it gives ease in the Colic, provokes the Terms, and opens the ob- structions of the Urinary parts, it causes to break Wind, and prevails against the cold fits of Agues.

XLV. The Pills. Take Hyppop in powder, Male Hyppop in powder, of each two Drams, Catechu- man in powder one Dram, Horse-Hound in powder, Affes -fiddle, of each half a Dram, Crystal of Looz in powder, a Scrap of, with a Peck of Horse-Hyppop (made per fce with- out Honey) 1 oz, mix, and make a mass of Pills, for senn Viter, to be given every Night at Bed time; this is laid to be a socckich and excholical Remedy against the Falling-Sicknes, to be repeated every New and Full Moon so long till the Cure is complected: These Pills cure also a vehement Headach, thro' of very long standing, and are prevalent against a Verigo.

XLVI. The Lotion or Gargorym. Take Hyppop four good handfulls, White or Red Port Wine three Pints, Sal Nitre or Ozone, wine, and boil for a quarter of an hour, then strain off the clear. It is a very good thing against the Quincke, or any other of Throat or Mouth, it abates the inflamation of the Throat, and dissolves the swellings thereof, being often gangrened therewith; it takes away inflammations in other parts of the Body, as also black and blood spots and marks, which are occasioned by Falls, Blows, or Bruises, if Wine Hyppop is used to make the Lotion with instead of the Wine, it will ease the Toothach, and the fumes thereof being received thro' a Funnel into the Ears eases their pains, and abates an inflamation if any is present, and also takes away their ringing noise.

XLVII. The Oil by Decotion or Infusion. Being anointed upon the Head it is said to kill Lice and Nits therein, and take away the itching, taken inwardly to one or two Ounces mixed with Water it opens obstructions of Stomach and Lungs, and cures the putrid matter to pass off thro' the Guts, anointed upon any part convulsed and painted thro' Cold, it eases the pain and dissolves the swelling.

XLVIII. The Balsam or Ointment. Being applied they quickly heal any simple green Wound in the Hand, or other parts of the Body; applied all over running Sores and foul Ulcers they cleanse, dry, and heal them quickly, more especially if the Pou- der of the Herb afore named be also thrown upon the same, the Balsam applied upon any part purin with the Gout gives ease in the pain, and by continu- ing the application in a short time cures it.

XXVIII. The Carpathon. Made of the Green Herb by bruising, adding also thence Sugar and Salt, with a few Crumbs of White Bread, and applied, it is admirable to diffuse any recent simples Contusion, or heal any simple green Wound, in what part of the Body soever.

XXIX. The Diluted Water. It has the Virtues of the Juvace, Etherce, and Decotion, sweetened with Sugar and Honey, and to taken from two Ounces to Four Ounces, but it is mostly used as a Vehicle to convey the other Preparations down in, outwardly used sweetened with Honey it is good of vis to cure sore and running Eyes.

XXX. The Spurious Tincture. It is Cephalick, Neurolat, Stomatick, and Pehonik, it is good against Wind in the Stomach, gives eafe in the Col- lick and grittings of the Guts, and sweetened with Honey it cures thevenemy of the Countrey, and causes expectoration, it is good against Vapors from the Womb, Fits of the Mother, and the Falling- Sicknes. Dote one Spoonful in the Morning falling, another an Hour before Dinner, and the like at Night going to Bed, in the Diluted Water.

XXXI. The Acid Tincture. It is good against the Pega, all sorts of malign and pestiferous Diseases, by reding Poyon, and is efficacions against the bitings of mad Dogs, Vipers, and all other kinds of venomous Creatures: it cleanses the Stomachs, strengthens it, and cures a good Appetite and Digestion, top- ples Vapors, and reds Hyplick Fire, it power- fully opens obstrictions, and amates thick and grous Honeys which clot and clare the Viscera, cau- sing the same to be carried off by Stool and Urine. Dote to make drops as to make the Vehicle plea- santly sharp.

XXXII. The Oyl Tincture. It opens the obstrictions of the Urinary parts, as also of the Womb, provokes Urine and the Terms, expels Wind pow- erfully,
of all the Vixera, but more particularly of the Spleen, Reins, and Womb; they inspired Vapors, prevail against Hyterick Fits, conquer Hypochou- 
trick Melancholy, doubtless, dry the Urinary palfages, 
and give proucte cures in the Strangury, curing the 
Patient to pits plentifully and cally, and being con-

XXV. The Saline Tinctures. Inwardly taken in a 
Glass of White Port Wine from half a Dram to a 
Drain, or Darn and half, it is prevalent against the 
Strangury, and caueth a Pissing freely, outwardly 
used it is good against Scabs, Pimples, breakings 
et, Tettars, Ringworms, Scarf, Morphea, Tanning 
ning of old Scars, Sunburninge, Venome of other 
deformities thereof, the Skin (after being first wath'd 
clean with warm Water) being well bathed there-
with Morning, Noon, and Night.

XXVI. The Spirits. Being distilled with double 
refined Sugar it is a most excellent Stomack and 
Cardial, it expels Wind, gives cife in the Colic and 
grijings of the Guts, it prevails against fainting 
and other weaknes the Heart, and other Di-

clements of the Stomach and Pericardia. Dose from 
half to one Spoonful in Canary, or some other Wine 
or proper Vehicle.

XXVII. The Distilled Oil. It is a Specifick against 
an old irritent Couagh, Catten, and Althom, it cures the Colic to a Miracle, expells Wind power-
fully, and cures Convulsions, Lethargies, Vertigo, 
and the Palse after a sanguinary manner, it admirably 
flows the Nerves and Brain, and is good against 
all cold and moist Diffaetes afflicting those parts, let 
them come from what cause ever, it caketh the 
Headach coming by rotation of cold, and is a sanguinary 
Agent against the Cough, being both inwardly taken 
and outwardly applied, it is powerful against 
Agues, as also against the Headach, Magrim, Verti-
go, Carus, Lethanagy, and other Diffaetes proceed-
ing of a cold. Sunburninge, Venome of other 
diffaetes; it is also of a particular Remedy for the Falling-Sick-
nesses, that in Persions put their Minority, and who 
are advancing towards their middle Age; in the Pal-
sie the Blood being to be animole therein with Morning 
and Night, rubbing it well in, and inwardly it is 
to be given from four drops to ten, fifteen, or 
twenty, according as the Patient is in Age and 
Strength, and the Dose to be repeated Morning and 
Evening, and in case thereof, let them drop'd into 
White Sugar, with which it is to be well mixed, 
then add to it the Vehicle you design to give it in, 
and let the Patient drink it.

XXVIII. The Tinctures or Powders. They have 
all the Virtues of the Distilled Oil, and are much 
more thin and penetrating, inclining into the Flesh as 
fast as they are put on, they are to be outwardly 
used in the fame manner as the Oil, and to the same 
parts in the same cases, and likewise to be inwardly 
given Morning, Noon, and Night, from thirty to 
eighty, or an hundred drops, in a Glass of Wine, or 
other proper Vehicle.

XXIX. The Elixir. The Virtues hereof are just 
the same with the Distilled Oil and Powders, and 
are to be used also outwardly and inwardly in the same 
manner, saving that the Dose of the Elixir is only 
from three to six drops to the Wine, in case it 
Vehicle, given in Sherry or Modern Wine to fixy 
drops or more in a Pint of it it gives proucte cife, 
and in a little time after a perfect cure, in particu-
lar also it is a very excellent thing to kill Worms in 
Children.

XXX. The Salt Fixed and Viscid. They are 
both Alcalis, and do absorb Acids, infallibly cure 
the pain of the Stomach, tho' one of them more 
and never to vehement, they have been given with good 
success in all sorts of Colicks, they open obstructions

C H A P. CCCCLXXXVII.

O F H Y S S O P Rare or Strange.

PREFACE. It is called in Greek Ἱύσσωπος, 
"Hyssopus," in Latin Hyssopus In-
ferius, Hyssopus Incrberus, vel Infinitus, 
Hyssopus Libya, or Hyssopus Lybiae, 
Engl. Strange, or Rare, or Uncommon Hyssop.

I. The Name. There are no less than Thirteen 
Kinds of this Hyssop: viz. 1. Hyssopus folis 
Nivis, White Leaved Hyssop. 2. Hyssopus folis 
Aureus, Yellow Hyssop. 3. Hyssopus folis Ceratinis, 
Rufier Leaved Hyssop. 4. Hyssopus Saturea, Dehis, 
Death Leaved Hyssop. 5. Hyssopus Luteolis, Broad Leaved 
Hyssop. 6. Hyssopus foliis Carinatis, jagged 
Leaved Hyssop. 7. Hyssopus foliis inulatis, vill de Cif-
fas, Masked Hyssop. 8. Hyssopus Coronata, vel Ca-
ronata Crenata, Spitted Hyssop. 9. Hyssopus folis Cri-
pinis, Curled Hyssop. 10. Hyssopus Angustifollos Spica-
cata, Narrow Leaved Spitted Hyssop. 11. Hyssopus 
foliis Ordinariis, Round Leaved Hyssop. 12. Hyssopus 
minor, foliis Hypomera, Dwarf Spanish Hyssop. 13. 
Hyssopus montana, Mountain Wild Hyssop.

II. The Kinds. There are no less than Thirteen 
Kinds of this Hyssop: viz. 1. "Hyssopus folis 
Nivos, White Leaved Hyssop. 2. Hyssopus folis 
Aureus, Yellow Hyssop. 3. Hyssopus folis Ceratinis, 
Rufier Leaved Hyssop. 4. Hyssopus Saturea, Dehis, 
Death Leaved Hyssop. 5. Hyssopus Luteolis, Broad Leaved 
Hyssop. 6. Hyssopus foliis Carinatis, jagged 
Leaved Hyssop. 7. Hyssopus foliis inulatis, vill de Cif-
fas, Masked Hyssop. 8. Hyssopus Coronata, vel Ca-
ronata Crenata, Spitted Hyssop. 9. Hyssopus folis Cri-
pinis, Curled Hyssop. 10. Hyssopus Angustifollos Spica-
cata, Narrow Leaved Spitted Hyssop. 11. Hyssopus 
foliis Ordinariis, Round Leaved Hyssop. 12. Hyssopus 
minor, foliis Hypomera, Dwarf Spanish Hyssop. 13. 
Hyssopus montana, Mountain Wild Hyssop.

III. The Description. The first, or White Leaved 
Hyssop, seems to me to be one of the sorts of the 
first Common Kind in the former Chapter, and to 
differ only in the party coloring of the Leaves, this 
having several Leaves parted white and green in the 
midst, and some or all of the most part white, and 
some wholly green, or with some stripes in the 
green.

IV. The second, or Yellow Hyssop, is without 
doubt one of the sorts all of the first Kind in the 
former Chapter, it has several Leaves parted yellow 
and green in the midst, and come all or most part yel-
low, the uppermost Leaves are usually wholly yel-
low in the Summer time, parted with green, but 
the lower Leaves often abide without discoloring.

V. The third, or Ruffet Leaved Hyssop, This 
differs from the former scarcely in any thing else 
but in the color of the Leaves, which are of a grey-
ish or Ash color, called by some Ruffet; and this 
seems to be that very sort which Bothonius says 
was sent him from England, it growing very freely 
in some of our Gardens.

B b b

V L Tn.
The forth, or Double Hyssop. This Hyssop grows lower and thicker than the former Kind, being thicker far with flender and not so woody Branches, bending their Heads somewhat downwards, and much more thick fit with Leaves of a dark green color, in the Flower and other particular it differs not from the first Kind described in the former Chapters.

XII. The ninth, or Curled Hyssop. In its Roots, Stalks, Branches, and manner of growing, it differs not much from the Common Garden Hyssop, or Office in the Germania has decayed, but in the small, which is so fragrant, grateful and pleasant, that it comes very near to the small of Musk.

XIII. The eleventh, or Spiked Hyssop. Its Root is small, woody, and with many fibres or stringes, in its manner of growing it is very like unto the Common Garden Sort, but the Leaves are not so many at a joint, and are somewhat harder and rougher, and a little hairy, and something narrower within.

XIV. The twelfth, or Dwarf Spanish Hyssop, which Lobel calls Hyppus Parva Anguillis Folia. This has a small, woody fibrous Root, which sends forth Stalks smaller and lower than the Common Kind, nor do its Branches rise so high as the former Garden Sort, but bend a little downwards, the Leaves also being smaller and thicker, and of a fader green color, and the Heads or Spikes shorter, but the Flowers are purple, like the Garden Kind.

XV. The thirteenth, or Mountain Wild Hyssop.
Branches are stiffer, bending, and four-square, having several small Leaves for the same, very like to those of the Ordinary Garden Hyssop, but a little shorter and broader, and of a pale green color, of a very bitter subtile but rife, from about the middle of these branches, at the joints of the leaves, up to the tops of them, come forth the Flowers every one at a place, hanging upon very short foliage which are somewhat long and hollow, ending in four leaves, two of the lowest standing out, as it were, lips, and the other two above, shorter by the half, of a whitish yellow color, tending to a black bloom, and sometimes more brown or purple; after which come small round heads, in which is contained small seed.

**X. The Liquid Juice.** It works very strongly and charitably both upwards and downwards, expelling much vitious and groaty Flegm, all Choler, and watry Humors, for which reason it is profitable for such as are troubled with a Scurvy, or Dropick Anamorsa; as also the After or Symptoms in beginning, and for such as are afflicted with the Gout or Scutica, it cures both Tertian and Quartan Agues, and kills Worms in the Belly, whether in Old or Young, by reason of its Churlnts it ought to be corrected with Aniseeds, Carawayes, Cloves, Cinnamon, &c. Dose half a Spoonfull, increasing it according to Age and Strength gradually to two, three, or four Spoonfulls, it may be given mixed with Poffe-drink, Sack-Whey, or Mutton Broth, &c.

**XI. The Effeue.** It has all the Virtues of the former, but nothing near so charitable, but ought to be corrected with Flowers of Angelica, Pennyroyal, Aniseeds, Carawayes, &c. It cures Quaftion and Tertian Agues, opens obftructions of Liver and Spleen, refills purification, kills Worms, and evacuates peccant Humors, the Dose is the fame with the Liquid Juice, and to be given in the fame manner.

**XII. The Decotion or Infusion in Water or Wine.** It has all the Virtues of the Juices and Effeue, but is to be given in a greater quantity, it cleanses the Stomach and other Villums, opening their obftructions, it also induces old running Sores and filthy Ulcers to a speedy healing, it works both upwards and downwards, but much more gently than either Juice or Effeue.

**XIII. The Powder.** It has all the Virtues of Liquid Juice, Effeue, or Decotion, but operates not so speedily, it kills Worms efficaciously in Old or Young, and prevails wonderfully against the Scurvy and Jaundice, as also obftructions of the Womb, but it ought to be corrected with Camphir, Powder of Aniseeds, &c. Dose from a Scrupule to a Dram, or more, according to the Age of the Patient, Strength, and other Circumstances, outwardly fried upon old running Sores, or putrid Ulcers, it cleanses and dries them, and induces their speedy healing, it also admirably confolates green Wounds, &c.

**XIV. The Extract.** It may be made into Pills with Pouders of Aniseeds, or Common Camomiles and commend it not only to be available against the Droptic, but against all sorts of Agues, and so much the more if a little of the Infipid Juice of Calamint be added, it has all the Virtues of Juice, Effeue, Decotion, and Powder, but works with much more efficacy and gentleness. Dose from a Scrupule to a Dram in any vehicle.

**XV. The Baffom or Ointment.** It is excellent good against the Gout or Scutica being applied to the parts afflicted, it alsodigests green Wounds, or malign Ulcers, cleanses, dries, and heals them in a very short time, but this more especially if the powder of Tobacco, be mixed with the same.

---

**Chapter CCCLXXXIX.**

**Of Hyssop Hedge Baffard.**

1. The Names. This can have no Greek Name, any more than the former, in Latin it is called

---

**Hedge Hyssop com**

---
Salmon's Herbal. Lib. I.

356. **Salmon's Herbal.**

**Hedge Hyssop.**

**Hedge Hyssop narrow leaved.**

- It has a Root which is white, and bears forth many fibres, whereby it takes good rooting and hold in the Earth, from this Root shoot forth sometimes many, and sometimes but one or two round reddish Stalks, half a Yard high, which are branched towards the tops, on which are for one above another, and sometimes one against another, divers small and somewhat long Leaves, somewhat smaller than those in the former Chapter, and newly refounding *Hyssop* Leaves, of a pale green color, and joining close to the Stalks and Branches, without any Footstalk at all at the Joints with the Leaves come forth Flowers, every one by it standing in a long Husk, and consisting of four Leaves, of an excellent blue color, after which comes in their places small brown Seed, contained in long round Pods; the Herb and every part thereof is without any the least small, and almost without any tails, the same will have it to be of a little nitrous, others of a little feathery; sometimes in the moister Grounds this is found with larger Leaves, and growing higher, and sometimes in dry places with smaller and longer Leaves, scarcely growing a Span high.

**V. The third, or Greater Broad Leaved Hedge Hyssop.**

- It has a Root which spreads much, and with many Branches under Ground, quickly protruding a large circuit or compass, it is a strong low Plant, rilling about a Foot high, with many square Stalks variously branched from the bottom to the top, having therein several Joints, and two small Leaves at every one, which stand upon the Footstalks, being broad at the bottom, and smaller towards the end, a little dented about the edges, and full of Veins, of a flicker green color than the former, longer also, and broader, the Flowers are gaping, something like unto those of *Dead Nettle*, of a fair bluish purple color, with some white spots in them, every one standing at the Joints with the Leaves, up to the tops, after which come forth small Seed Vessels, formed something like unto the top of the Thigh Bone of a Man or Beast, in which the small Nut or Husk Bone is placed, the upper part of which does lift open when the Seed is ripe, and falls away when it is touched, thereby throwing within itself small yellow Seed. There is a lefter Root hereof, differing only in the finallness of the Plant, which I am apt to believe arises only from the different goodness of the Soil; this Herb is referred to *Gratiola*, not only from its place and manner of growing, but especially for its bitterness, in which it is said like to it.

**V. The third, or Greater Broad Leaved Hedge Hyssop.**

- It has a Root which is small, long, and white, spreading it felt under Ground several ways, which produces in Winter, no roots like the last, but spreads forth new Branches every Year, from this Root finipings up one or more small Stalks, about a Foot high, round, but cutted as it were all the length, which spread forth other smaller Branches, on which do grow many small Leaves, fit by couples one against another, being something broad, but very short forth, forming almost round, and ending in a sharp point, a little dented about the edges, at the Joints with the Leaves come forth the Flowers, every one by it itself, on a small Footstalk, being in form somewhat like unto the left, a gaping Flower, but shorter, of a pale reddish color, spotted in the middle of the lower Leaf with many small white Spots, after the Flowers are fallen come in their places Seed Vessels, in those following like unto the Nut in a Creak-Bone, in which is contained small yellowish Seed, the taste of this Plant is as extramly bitter as the last; this Herb is also referred to the *Gratiola*, as well for the resemblance of the Flower to the last before described, as for the bitterness thereof.

**VI. The Places.**

- The first has been found growing naturally in several places of England in moist and wet Grounds, as at Dorchester in Oxfordshire, at the back side of the enclosed Grounds, on the Left Hand of the Town, as you go from thence to Oxford, in the Grotto places of the Charming Corn Fields, the second grows likewise in severall places of this Land, in wet low Grounds, and by Water Edges, the third is not known to grow in any other Country but in England, so far as we can yet hear or learn, and it was first found out by Gerard, who called it simply *Gratiola*, in wet lowr Grounds among the Grubs, it is found growing on the Bog or Marsh Ground at the further end of Hampstead Heath, and upon the farm Heath towards London, near unto the Head of the Springs that were digged anno 1590, for Water to be conveyed to that City.

**VII. The Times.**

- The first flower in June and July, the third in July and August, their Seeds ripening in a short time after their Flowers are ripe.
the first of these has never yet been applied to any Medicinal Use by any Author that I could ever yet see, nor yet the second or third Kind, but their bitterness coming near to that of the Gouty Vetch, or True Hedge-Hysop, induces me to think that they must have some of the Virtues of the True Hedge-Hysop, and if they be not full out for officinal to Purge, yet by their bitterness they may be Aperitive, and have a virtue to open the obstructions of the Vitae, and clear them from their putrid and vitious Excrements; they may also by the bane bitterness be Aperitive, and to strengthen the Stomach, and other Bowels, reforming their depraved Tone, etc.

CHAP. CCCXC.

OF JACK-BY-HEDGE, OR, SAWCE-ALONE.

I. The Name. This seems to be a Novell Plant, not known to the Greeks, and therefore has no Greek Name, the Latinus call it Alliaria, Cyn-

II. The Kind. Some would have it to be Scor-

dium, but that it is not, others Scorbia Species, a

III. The Description. The first, or Common

Jack-by-Hedge. It has a long slender Root, which is

fibrinous or stringy, and threadily, perishing every Year

after it has grown Seed, from this Root rise up se-

veral slender Stalks, about a Foot and half high.

the Leaves are broad, of a light green color, nicked

round about, and sharp pointed; the lower Leaves

are rounder than those which grow upward towards

to the tops of the Stalks, and are for longest one at a

Joint, being length round the higher they grow, and

also pointed at the ends, and dented about the

ground, the somewhat less demted than those grow-
ing below, they somewhat resemble Nettle Leaves

for the Form, but are of a finger green color, and

not rough or prickly, upon the Branches of the Stalks

near the tops grow very small white Flowers

one above another, like Rocket, which being pell

come small, slender, and round long Pods, not very

much unlike to those of Excruciation, having that

are rougher, and grow somewhat closer to the Stalk,
in their Pods are contained small, round, and some-
what blackish Seed, this Plant rises again in every

Year again of its own swaying, and it has affinity to

Gardilch in its Name, yet not in Name only, but in

its Kind, for any part of it being bruised emits of

Gardilch, but more pleasantly, and refines something

hot, sharp, and biting, almost like unto Rocket, for

which reason it becomes an admirable Sauce, so

fit for love that title.

W. The second, or Greater Kind of Jack-by-Hedge, has like Roots, Stalks, Leaves, Branches, Flowers, and Seed, and the same manner of growing, and dif-

fers only in that, the Leaves grow larger and

V. The Places. It grows of it self by Garden

Hedges, by old Walls, by high Way sides, and

sometimes in the borders of Fields, in most places

of this Kingdom.

VI. The Times. It Flowers chiefly in June and

July, and the Seed grows ripe in the mean season,

or not long after the Flowers are gone; the Leaves

are used for Sauce in March and April.

VII. The Qualities. It is hot and dry in the third
degree, and is reputed with much Salt, Sulphur, and

Mercury, it is Incline, Aperitive, Attractive, Ab-

bassive, Carminative, Digestive, DiRovitive, and

Diuretic, Nervous, Stomatick, Pectoral, Nephar-

ick, and Hypertick, Permeating, Emmenagogyck, and

Alexipharmick.

VIII. The Specification. It is peculiar against the

Scabby, Coughs, Colds, Wheezing, Throatick of

Breath, Stone, Strangury, Colick, and Fiss of the

Mother.

The Virtues.

X. The Liquor Juices. Taken from a Spoonful to two or three Spoonfuls in a Glass of White Port, Madera,
Salmon's Herbal. Lib. I.

Modern, or Canary Wines, it provokes Urine, helps the Stomach, expels gravel, Sand, Tartarous Matter, eases the Colic, and expresseth Vapors and Eats of the Mother.

XI. The Efficacy. It has all the former Virtues, besides which it potently refists the Scoury, Drope, Swel, Catarrh, and Gout, refists Vomiting, strengthens the Stomach, causes a good Appetite and a Strong Digestion, it admirably corretts Crudeities, warms the Stomach, and refors the Tone thereof being hurt or weakened. Doe one, two, or three Spoonfuls Morning and Night, and sometimes at Noon in a Glass of generous Wine.

XII. The Infufion or Decoffion. It has all the Virtues of the Juice and Efficacy, but has much weaker, and therefore may be given to fix or eight Ounces Morning and Night, but the Infufion is better than the Decoffion, because condititious mus of volatile parts, throttle by boiling will evaporate away in a great measure, whereby, et a clothe infufion they may all be preferred.

XIII. The Syrup. It ought to be made with clarified Honey, and then it will be as good as Erythrum, or Hecate-Malvador, to warm the Stomach, and cafe Cougias, Cold, help Wheezings, shortness of Breath, and Difficulty of breathing, et a help to Cysts, and to cause expectoration of thick tough Flagg and puritk Humours out of the Breast and Lungs.

XIV. The Ro. It takes thump, like unto Reddish Roos, and therefore may be used in the same manner, and to the same purposes, as if it were thump thin, and the feedings are put into Wine Vynar, with a little Salt, it makes a very good Sauce for Meat.

XV. The Juice of the Root given in White Wine is excellent against the Colic, Stomachy, Stone, &c. it gives eafe alio in all those Caifes if exhibited in a Glafs, &c.

XVI. The Seed bruised, or infufed in Wine. It is a preuent Remedy for a vehement pain in the Stomach, as also for the Colic, Strangury, Stone, Groat, or any Tartarous Matter obstructing the Urinary passages; it expresseth Vapors, abates Mcheologly, and cures Hyphyrick Ficts. Doe of the Seed from half a dram to a dram and half, either infufed (mixed with Honey) or in infufion in Wine.

XVII. The Capulis. Made of the green Leaves, or of Leaves and Root, and applied to old running Sores and crooked Ulcers, whether in the Legs, Arms, or other parts, it alates the pain (if any) cleemst the Sore or Ulcer, dries them, and induces a speedy healing.

XVIII. The Acid Tincture. It is possibly one of the greatest Medicines in the World against the Scoury, it refists the Tone of the Stomach, strengthens it, caueth a good Appetite and Digestion, expresseth Vapors, and has all the Virtues of the Liquor Juice and Efficacy above declared, it is also Antiphlaebtrick, and Alexipharmick, it cures all sorts of hot, burning, and putrid Fevers, and all such as are phlegmatical, and is powerful even against the Plague itself; it refists Poylon internally taken, or otherwise given by the bittings of mad Dogs, Vipers, or other Serpents, or other venomous Creatures, being inwardly taken, and outwardly applied to the parts wounded, by bathing. Doe of many Drops may make a Glafs of generous Wine, or other proper Vehicle, plamly, acid or sharp, and to be repeated three or four times a day, or as oft as need requires.

XIX. The Spiritus Tincture. It is Cephalick, Neurontick, Scrocinick, Cardiack, and Hyphyrick; it warms and comforts the Head, Brain, Nerves, and Stomach, cleans the Heart, revives the Spirits, and is powerful againstainting and sowing Ficts, Convolutions, Palsies, Vertigo, Leucopeny, Caro, Cuna, Epilepsie, Hyphyrick, and other Difficulties of the kind affecting any of those parts; it caueth a good Appetite and Digestion, gives present eafe in the Colic, and alleviates pains of the Stomach and gittings of the Guts arising from cold, cramp, and undigested Humors. Doe from half a Spoonful to a Spoonful, or more, two or three times a day, in a Glass of generous Wine.

XII. The Oily Tincture. It has all the Virtues of the Juice, Efficacy, Infusion, and Tinctures, and may be given by eight drops to twenty drops, or more, being first dropped into and mixed with White Sugar, and then mixed with a Glass of Wine, or other proper Vehicle; it is a potent thing against the Stone, Gravel, Sand, or Tartarous Matter obstructing the Reins or Urinary passages, it gives eafe in the Colic and Strangury, and is a present Remedy against the Pleurisy, Stitches in the Side, and other like pains of the Throat and Stomach, it cures Crams by anointing therewith, and is of excellent use against Convoltions Ficts in Elder Persons, as also against Vapors, and objections of the Wombs, it provokes the Terms, and facilitates the Birth of Women in Labor, bringing away the Afterbirth or dead Child, it gives present eafe in after pains anointed upon the lower parts of the Belly, and taken inwardly in a Glafs of Canary, it prevails against the Palies taken daily in Wine, bathing the Body therewith, together with the parts afflicted, and continuing the use thereof for some considerable time; it also gives eafe in the Gout.

XII. The Saline Tincture. It seems to be a Specific against Arthritis pains, proceeding either from a hot or cold cause, it is good against Spots, Marks, Tanning, Sunburning, black and bloomed, and other discolourings of the Skin, it removes yellowness of the Scar Skin, Fleckles, Lentils, Scarf, Murphow, and other like deformities of the Cutis, but it must be made pretty strong, and applied two or three times a day, and fluttered to dry, for by that means the fulminating matter will be drawn forth, and the Skin will peel off in manner of Scarf, leaving a fine, young, tender, pure, clear Skin elsewhere.

XIII. The Spirits. It is truly Cordial, Neurontick, Cephalick, and Hyphyrick, it revives the Spirits, clears the Heart, and refences the whole Universal Man, it is good against Convoltions in Children and Elder People, prevails against Palsies, Apoplexies, Lethargies, Epilpesies, and Pleurisy, giving in those Difficulties preuent relief, it is singular against Vapors, and Ficts of the Mother, and wonderfully refists and reforses out of Fainting and Swooning Ficts, it is strongly Apertive, and removes the obstructions of the Lungs, Liver, Spreny, Reins, and Womb, difficulting the conglagation of Humors caufing the Fims.

Doe from one Dram to two or three Drums in Wine, or any other fi Vehicle.

XIV. The Same. It is made of the Leaves dried small, or of theRoots scraped, or of their Juice expressed, adding a proportionate quantity of White Sugar, White Vinegar, and Salt. Being thus compounded, it is eaten in the Spring Time with Meas, Mutton, Lamb, Beet, Veal, &c. either boiled or roasted; it corrects Crudeities, expels Wind, strengthens the Stomach, creates a good Appetite, and caueth a good Digestion.

JACINTH English, See Harlebeke English Ch. 372.
The Names. This Plant its general Name is called in Greek Ἰγκίνθιον, in Latin Hyacinthus, in English Jacinth, and Hyacinth, the Spaniards call it Alba Floras.

II. The Kinds. There are various Species of this Plant, and several sorts of each genera: these are,

Rooted in Spain, growing in England, and are commonly called Harebell, and of which we have already treated in the foregoing part of this Book, viz. in Chap. 335. and therefore shall now overskip them in this present Chapter. 2. Hyacinthus Philodromus Minor, of which there are six Species, and are Treated of in Chap. 392. 3. Hyacinthus Borreoides, Grape Flowered Jacinth, of which there are four Species, which are Treated of in Chap. 394. 4. Hyacinthus Orientalis, The Oriental Jacinth, of which there are eight Species, which are Treated of in Chap. 395. 5. Hyacinthus Compositus, The Haided Jacinth, of which there are four Species, which are Treated of in Chap. 396. 6. Hyacinthus Albus, The Winter Jacinth, of which there are three Species, and are Treated of in Chap. 396. 7. Hyacinthus Albus, The Brown or Dark Colored Jacinth, of which there are three Species, and are Treated of in Chap. 396. 8. Hyacinthus Albus, The Summer Jacinth, of which there are four Species, and are Treated of in Chap. 397. 9. Hyacinthus Albus, The Brown or Dark Colored Jacinth, of which there are three Species, and are Treated of in Chap. 397. 10. Hyacinthus Albus, The Winter Indian Starry Jacinth, of which there are four Species, and are Treated of in Chap. 397. 11. Hyacinthus Albus, The Common Starry Jacinth, of which there are five Species, and are Treated of in Chap. 397. 12. Hyacinthus Albus, The Common Starry Jacinth, of which there are five Species, and are Treated of in Chap. 397. 13. Hyacinthus Albus, The Autumn Jacinth, of which there are four Species, and are Treated of in Chap. 397. 14. Hyacinthus Albus, The Autumn Jacinth, of which there are four Species, and are Treated of in Chap. 397.

III. The Kinds of the American Jacynth. There are only two Species of this, viz. 1. Hyacinthus Indicus vel Americani, and Hyacinthus major Radice Tuberosea, The Greater American Tuberose Rooted or Knobbed Jacinth. 2. Hyacinthus Indicus vel Americani minor Radice Tuberosea, The Lesser American Tuberose Rooted or Knobbed Jacinth. Clitans leaves out the Word minor in the Name of the second, because, as it is there, it may have been from the Indian Floras, and some would have the Hyacinths to be called Hyacinthus on Iridi, The Indian Woolly Jacinth, because when they are broken they have much Wool in them, which I think to be a mistake, and some think that these two Plants are not two severals, as greater and lesser, but that the greatness of the one is caused by the goodness of the Soil where it grows, but wholly call correct the particular Description of each, and compare them, will soon become of another Mind.

IV. The Descriptions. The Snow, or Greater American Tuberose Rooted Jacinth. It has a thick knobbed Root, (set formed into several Heads, somewhat like unto bulbous Roots) with many thick Fibres at the bottoms of them; from the divers Heads of which Root rise several flowering stalks, thick with divers fair, long, and broad Leaves, joined at the bottom close unto the Stalk, where they are greatest, and grow smaller to the very end, and those which grow higher to the top being smaller and smaller, which being broken many fine Threads appear like Wool in them; the tops of the Stalks are beautified with many Fair, large, white Flowers, each of which consists of six Leaves, lyning open, as the Flowers of the White Daffofil, with few short Threads in the middle, and of a very sweet smell, so sweet as from some account it though and heady; this is the greatest and tallest of all the Hyacinths, and the Flowers are something near in resemblance unto those of the Daffofil, but its Root is tuberose, as aforesaid, and not bulbous, as all the rest are.

V. The Second, or Lesser American Tuberose Rooted Jacinth. The Root of this Jacinth is knobbed, like the Root of Arum, or Wake Robin, or like the Root of the Carolina Lilly, from whence many Fibres spring forth, from this Root come forth many Leaves, lying upon the Ground, and encompassing one another at bottom, being long and narrow, and much narrower to the ends, which are small and pointed, and no left woolly and full of Threads, but the former, from the middle of these Leaves rises up a Stalk, which is very long, and tender, three or four Feet in height, which, unless it is propped up, will bend down, and lie upon the Ground, and some are set at certain distances many Foot Leaves, being broad at the bottom, where they do almost encompass the Stalk, and are smaller towards the end, where it is thin pointed, at the top of which are thick many Flowers, with a small piece of a green Leaf at the bottom of every footstalk, which seem to be for many White Oriental Jacinthis, being composed of fix Leaves, which are much thicker than the former, with six Chives or Threads in the middle, tip with pale yellow Pendents.

VI. The Places. They both grow naturally in the West Indies, from whence they were first brought into Spain, and from thence have been brought to us, and into several other parts of Europe.

VII. The Times. They flourish not in England and other like cold Countries till the middle of April, and sometimes not at all, unless they be carefully preserved from the injuries of our cold Weather, and then if the preceding Summer has been hot they may flower a Month sooner.

VIII. The Qualities. They are cold and drying in the first degree, or beginning of the second, Attringent and Diuretick.

IX. The Specification. They fluxe fluxures of the Bowels, give cause and relief in the Stomach, and are profitable against the Jaundice and Kingi-Evil, the Roots are only of use in Medicine, but being often used are thought to cause barrenness, but they certainly, that being taken inwardly by Young Perfons it keeps them from growing riper too soon.
Salmon's Herbal. Lib. I.

C H A P. CCCXCI.

Of JACINTH Grape Flowered.

I. THE Name. It is called in Greek τριφύλετον, in Latinus Hyacinthus Botroides, and in English Grape flowered Jacinth.

II. The Kinds. The Grape flowered Jacinth has two principal or generic Kinds, viz. 1. Hyacinthus Botroides vel Racematus non Muskatari, The Grape flowered Jacinth not Musked, of which in this Chapter. 2. Hyacinthus Botroides vel Racematus Muskatari, The Musked Grape flowered Jacinth, of which in the Chapter following.

IV. The Descriptions. The fris, or Leffer dark Blew Coloured Grape flowered Jacinth. It has a Root which is round, and blackish without, being encompassed with a number of small Roots or Offsets, round about it, so that it will quickly choke a Ground if it is suffered long in it, for which cause many do cast it out some time by course, if they intend to preserve it, or else cast it out of the Garden quite, it has many small and flat weak Leaves, lying upon the Ground, which are somewhat brownish at their first coming.

X. The Preparations. There are but few Preparations from these Plants, viz. about five. 1. A Linient Jacinth. 2. An Infusion. 3. A Decotion or Infusion. 4. A Powder. 5. An Ointment.

The Virtues.

XL The Liquid Juice. It cools and abates Fevers, and given in Red Florence or Port Winerops, fluxes of the Bowels, given in White Port Wine, or Parfitly, or Ardent Water, it cleanses all the Urinary passages, provokes Urine, and cures the Strangury; given in Milk of Hempsseed made with Pafly Water it prevails against the Jaundice, and daily taken in Mutton Broth, or a gentle Infusion of Sarsaparilla it eradicates the Kings-Evil. Dose from one Spoonful to two, or more, increasing the Dose gradually, as you find the Patient's Body does agree with it.

XII. The Infusion. It has all the Virtues of the Juice, and is something more prevalent than it, for which reason it is to be given in a lefther Dose, but in the Same manner, and in the Same Vehicles, and may be given twice a day, as you see fit requires, or the Constitution of Body will bear it.

XIII. The Decotion or Infusion. It may be made in Arfihust Water, or Parfitly Water, in which a Scaple or half a Dram of Salt of Tartar is diffolved, or in White or Red Port Wine, (according to the Intention) or in a mixture of the former Waters with thefe Wines, as the Physician in Practice shall direct; they have all the Virtues of the Juice and Infusion, but must be given in a much larger Dose, viz. from three Ounces to eight Ounces, according to Age, &c.

XIV. The Powder. It may be given for all the Purposes that any of the foregoing Preparations are given for. Dose from half a Dram or a Drum, or Drum and Half, once or twice a day in any proper Vehicle. It does not so speedily pass off as thefe Liquid things do, but commonly lies longer in the Stomach, and if the Stomach is weak, or foul, will be apt sometimes to make it feck, contrary applied to old running Sores, or purrid Ulcers, also Ulcers of the Kings-Evil, it cleanses them and dries up their Humidities, and induces them to a speedy healing.

XV. The Ointments. It is good to heal old Sores and Ulcers, but is chiefly good against Tumors and Ulcers of the Kings-Evil, for by anointing them first therewith Morning and Evening, chasing the Ointment well in, it infallibly cures them, or Swellings, and in time perfectly diffolves them; and if you mix therewith Powders of Scammony and Tobacco, &c, and apply it to Incurable Ulcers, it cleanses, takes away dead or proud Flesh, dries them up, and quickly heals them.

XVI. Note. What we have said of the Qualities, Specification, Preparations and Virtues of these Typhoys Jacinthi, the same is to be understood of all the Bulbsus Jacinthi hereafter following, (excepting only JACINTH flowered Jacinth in Chap. 397, which is said to be the Bulbus Vomitorius Disper- dis, and the LILY Lored Starry Jacinth in Chap. 402,) and this I thought good to give notice of here once for all, that in the following Chapters of this Plant we might not often repeat the same in vain.
Chap. 392. English Herbs.

coming up, and of a kind green afterwards, hollow on the upper side and round underneath, from among which rise up round, smooth, weak Stalks, bearing at the top many small, heavy, Bottle-like Flowers, in shape like to the Muscari (in the following Chapter) but very thick thrifty together, smaller, of a very dark or blackish blew color, of a very strong smell, like unto Starch when it is new made and hot.

Jacinth Grape =flowered great.

V. The second, or Greater dark Blew Colored Grape Flowered Jacinth. This Plant in its Roots, Leaves, Stalk, Flowers, Color, and manner of growing, is in all respects like unto the Lepper before described, and differs nothing from it but in the magnitude, this in its Stalk, Leaves, and Flowers, being greater than theirs.

VI. The third, or Sky Colored Grape Flowered Jacinth. The Root of this is whiter than the former, but does not increase so much as it, yet produces plenty enough of Plants; it brings up with fewer Leaves than the first, and not reddish, but green at its first appearing, the Leaves when they are full grown are long and hollow, like the first, but greener, shorter, and broader, standing upright, and not lying along upon the Ground as they do; the Flowers grow at the top of the Stalk, more perfectly set thereon, and not so thick together, but like a thin Bunch of Grapes, and Bottle like, as the former, of a perfect Blew, or Sky Color, every Flower having some white spots about their bases, this has a very fine smell, yet nothing like the foregoing.

VII. The fourth, or Branched Grape Flowered Jacinth. This is a true Species of the former Kinds, and is found to grow with many Branches of Flowers, breaking out from the sides of the greater Stalks of Branches; the Leaves, as is all the rest of this Plant, are greater than the former.

VIII. The fifth, or White Grape Flowered Jacinth. It has a bulbous Root, as the others, its Leaves are green, but a little whiter than the Blew or Sky Colored Jacinth; its Flowers are purely white, and alike sparsely set on the Stalks, but a little lower and finer than it; in all other things there is no difference.

IX. The sixth, or Blew Grape Flowered Jacinth. The bulbous Root of this Grape Flower is greater than either of the Roots of the Sky or White foregoing, and has seldom any small Roots or Offsets at the others have; its Leaves also are larger, and somewhat broader, the Flowers are of a pale, or blew blew Color out of a white, and are a little larger, and grow a little higher, and fill of Flowers than the White.

X. The Places. They are Natives of many places of Germany and Hungary, and grow also in Spain, and on Mount Balduc in Italy, and near Narbon in France, about the borders of Fields, with us they grow only in Gardens.

XI. The Times. They Flower from the beginning of March, and sometimes sooner if the Weather is mild, and continue Flowering till the beginning of May.

C H A P. CCCXCIU.

Of JACINTH Grape Flower Musked.

I. The Names. It is called in Arabic Zir, in the Turkish Language Dependi, and Moschatus, by which Names they were sent to us from Turkey, in Greek Ἡμαςτσακελ, and in Latin Hymenias Botroideus Moschatus, and in English The Musked Grape Flowered Jacinth.

III. The Descriptions. The first, or Greater Yellow Musked Grape Flowered Jacinth. It has a Root which is long, round, and very thick, and white on the outside, with a little whitish thorn when broken, and fall of a smyce juice, to which are added a thick, fat, and long fibers, which persist not, as in most of the other Jacinths, and therefore need not to be often renewed, as some of the other sorts are; This Musked Jacinth, or Grape Flower, has five or six Leaves spread upon the Ground in two or three Heads, which at the first budding or flowering forth out of the Ground are of a reddish purple color, and afterwards become long, thick, hollow, or guttered on the upper side, of a whitish green color, and round, and dark colored underneath; in the middle of the Heads of Leaves rise up one or two hollow, weak, brownish Stalks, sometimes lying on the Ground with the weight of the Flowers, (but particularly the Seed) yet for the most part standing upright when they are laden towards the top, and when the Flowers begin to blow open, are of a brown red color, and when they are blown of a

Cec
fair yellow, flowering first below, and so upwards by degrees, every one of these Flowers is made like unto a little Pitcher or Bottle, being big in the belly and small at the mouth, which is round, and a little turned up, very fierce to smell, like unto Musk, from whence it took the Name 

Salomon's Herbal.

of Jacinith Haired.

I. The Name. It is called in Greek Τυθροχιόνα, in Latin Hyacinthus Comus, in English The Haired Jacinith.

C H A P. CCCXIV.

of Jacinith Haired.

I. The Name. It is called in Greek Τυθροχιόνα, in Latin Hyacinthus Comos, in English The Haired Jacinith.

II. The Kinds. There are five several sorts of the Haired kind, viz. Τυθροχιόνα Commos albus, The White Haired Jacinith. 2. Hyacinthus Comosus Bicolor, The Turkey Fair Haired Jacinith. 3. Hyacinthus Comosus major purpureus, of some it is called only Hyacinthus major, and of others Hyacinthus Commodus major, but these are English call it The Purple, or Great Purple Fair Haired Jacinith, because of its Tutsis or Taffels of purple Threads like Hairs at the top. 4. Hyacinthus Comosus Ramous purpureus, some call it only Hyacinthus Comosus Ramous, others Hyacinthus Calomisratus, others Hyacinthus Comosus Parnissi, The Fair Haired Brachied Jacinith. 5. Hyacinthus Comosus Elagentis, Hyacinthus Pannus, and Hyacinthus Comosus Parnissi, Fair Curled Haired Jacinith, some will have it to be called also Hyacinthus Calomisratus, others think it originatur more fit and proper, for that the curled Threading which seem like Hairs are better expreessed by the Word Currant, which signifies the curled both of Hair it self, than by the Word Calomisratus, which signifies only the Criping, Pin or Instrument, where with of old they used to tricier or curl the hair.
The fourth, or Fair Hairy Branched Jacinth. Its Root is greater and flower than that of the next, and covers more of the Leaves hereof; the Leaves hereof are broader, shorter, and greater than of the last, not lying so weakly on the Ground, but standing something more upright; the Stalk rises up as high as the former, but branches out on every side into many Tuffs or Threads, with Knops, as it were Heads of Flowers, at the ends of them, like unto the Head of Threads at the top of the former Jacinth, but of a little darker, and not so fair a blew with purple color; this Jacinth does sometimes resemble the next Card'd Hair'd Jacinth, but that the Branches are not so Early composed altogether of curled Threads, nor of so excellent a Fair Purple, or Dove Color, but of a much more dusky hue.

VII. The fifth, or Fair Card'd Hair'd Jacinth. It has a bulbous Root, not so great as the last, but white on the outside, it is an admirable Jacinth, and rises up with three or four Leavessomething like unto the Leaves of the Masked Grape flowered Jacinth, but longer, from between which Leaves springs the Stalk, about a Foot high, or somewhat more, bearing at the top a Bush or Tuft of Flowers, which at the first appearing is like unto a Cone, or Pine-Apple, and afterwards opening it will spread in many Branches, yet still retaining the Form of a Pyramis, being broad spread below and narrow above; each of these Branches are again divided into many Tuffs of Threads or Strings, twisted or curled at the ends, and of an excellent Purple or Dove Color, both Stalks and Hairs; this continues a great while in its beauty, but afterwards all these Flowers (if you will so call them) do fall away without any Seed at all, spending it itself as it were in its abundance of Flowers.

VIII. The Places. The two first have been first to us from Constantinople, the third is found wild in many places of Europe, as well in Germany as in Italy; the native places of the two last are as yet unknown, they all grow and are nurfed up with us in Gardens only.

IX. The Times. The three last Species do Flower in April, the two last Kinds in May.

C H A P. CCCXCV.

Of JACINTH Oriental Single.

I. THE NAME. It is called in Greek Ἰακίνθος, in Latin Hyacinthus Orientalis, in English The Oriental Jacinth.

6. Hyacinthus Orientalis Floribus antennem repicientibus, The Oriental Jacinth whole Flow-

Jacinth Hairy Fair White, or Turkish.

IV. The second, or Turkish Fast Hairy Jacinth. It has a bulbous Root, like the former, but it is bigger, and larger also in its Leaf and Flowers, and bears greater Bore of Flowers on the head of the Stalk, the lower Flowers, altho' they have short Stalks at their first flowering, yet afterwards the Stalks grow longer, and those which are lower stand out further than those which are highest; these Footstalks are short, and almost close to the Stem, and of a more perfect Purple than any below, which are of a dusky, granith, Purple Color, the whole Stalk of Flowers does sometimes from like a Pyramis, broad below and small above, yet neither of these Jacinthee have any Threads at the tops of the Stalks, as the others following have, this Jacinth came from Constantinople, and is something like so that before described, laying that it is every way bigger.

V. The third, or Great Purple Fair Hairy Jacinth. It has a great bulindrical white Root, with some redness on the outside, it is a Fair Hairy Jacinth, whose Leaves are longer, longer, broader, and left hollow than the former, lying for the most part upon the ground, the Stalk rises up amidst the Leaves, being stronger, higher, and bearing a greater and longer Head of Flowers alo than tho' they, the Flowers of this stand not upon such very long Footstalks, but are shorter below, and close almost to the Stalk above, having many bright, purple, blow Threads, growing higher above the Flowers, as it were in a bush together, every one of these Threads having a little Head at its end, somewhat like unto one of the Flowers, but much smaller, the rest of the Flowers below this Bush are of a fadder or dusky Purple, and nor of so bright a Color, and the lowest withal of all, rather inclining to a green, like unto the last Turkish Kind; the whole Stalk with the Flowers up

on it does somewhat resemble a long Pufli Taffel, and therefore several Persons have fome Named it; the Heads and Seeds are like to that just foregoing, but greater.

C C C C 2
Salmon's Herbal. Lib. I.

VIII. The fifth, or Oriental Jacinth whole Flowers open all one way. This in its Root, Stalk, and Leaves, is like the fourth Species foregoing, but in this it differs, viz. that its Flowers fluid and open all one way, and not on all sides; as several other Jacobin do, and are therefore hereof like to the Great Zumbul Bed before described.

IX. The seventh, or Late Flowering Oriental Jacinth. This, which seems to be a Species off the fourth Kind, Flowers later than all the rest of them, and

Jacinth Oriental Winter White.

Jacinth Oriental Winter Purple or Blew.

Jacinth Oriental Blew.

III. The Description. The first, or White Winter Oriental Jacinth. It has a hollow Root, which

fonds forth green Leaves, (which are in all respects like to the Ordinary Oriental Jacobins, but something narrower) before Winter, and sometimes is in its Flower also in the middle or beginning of Winter, and is in form and color a plain White Oriental Jacinth, but somewhat leffer, differing in no other particulars, but in the time of its flowering, which is always certain to be long before the other Jacobin.

IV. The second, or Purple Winter Oriental Jacinth. In its Root, Stalk, Leaf, and Flower, it is like to, and serves it self to be of the Stock or Kind of Oriental Jacobins, the difference of color in this Flower makes it to be distinguished chiefly, and it is, as the former, more early than the rest which follow, this seems to be the very first Kind with the former, giving that this has fine blushed purple Flowers, whereas that has white.

V. The third, or Greatest Oriental Jacobins. The Root of this Jacobin is curiously greater than any other of its Kind, and most commonly white on the outside, from which rise up one or two great round Stalks, spotted from within the Ground, with the lower part of the Leaves also upward to the middle of the Stalks, or rather higher, like unto the Stalks of Dragons, but, darker, being fat among a number of Round, long, and somewhat hollow green Leaves, almost as large as the Leaves of the White Lilie, at the tips of the Stalks, and more round than Flowers than in any other of this Kind, every Flower being as great as the greatest of Oriental Jacobins, ending in fix Leaves, which turn at the points, of a fair blushed purple color, and all flowering many times on one side of the Stalks, and many times on both sides.

VI. The fourth, or Ordinary Oriental Jacobins. It has a Root which is greater, and white on the outside, and sometimes purplish also, flat at the bottom and small at the head, it has many green Leaves, long, somewhat broad, and hollow, from which rise up a long, green, round Stalk, bifo from the middle thereof almost with several Flowers, standing on both sides of the Stalks one above another unto the top, each of which next unto the Footstalk is long, hollow, round, and close, ending in fix small Leaves, laid open, and a little turning at the points, of a very sweet smell; the Colors of these Flowers are divers, for some are pure white, without a show of any other color in them, another in blackish white, having a show of blackness, especially at the brims and bottoms of the Flowers, others are again of a very faint blush, tending towards a white, some are of as deep a purple as a Violet, others of a purple, tending to redness, and some so pale a bluse, as it were more white than bluse, after the Flowers are fall thereupon Heads appear, bearing round black Seed, green and thinning; this is called the Common Oriental Jacobins, because it is now so plentifully to be found in all Gardens, that it is not very much esteem'd; of this Species are the three next following sorts.

VII. The fifth, or Purple Violet Oriental Jacobins. It is very much like the fourth Kind, but its Flowers are of a deep purplish Violet color, having whitish lines down the back of every Leaf of the Flower, which turn themselves a little backwards at the points.

VIII. The sixth, or Oriental Jacobins whole Flowers open all one way. This in its Root, Stalk, and Leaves, is like the fourth Species foregoing, but in this it differs, viz. that its Flowers fluid and open all one way, and not on all sides; as several other Jacobin do, and are therefore hereof like to the Great Zumbul Bed before described.
and the flowers are smaller, and stand more upright, and they are either white or blow, or mixed with white and purple.

X. The eighth, or Bulby or Leafy Stalked Oriental Jacinth. This Strange Jacinth has its Roots, Leaves, and Flowers, like the middle former Oriental Jacinths, but the chief difference is in this, that its Stalk is not bare or naked, but has very narrow long Leaves, growing upon it partially and without order, with the Flowers therein, which are blow, and having for the most part one Leaf, and sometimes two at the foot, or sitting on of every Flower, yet sometimes it chances some Flowers to be without any Leaf at the bottom, as it pleases Nature, which in this Plant is very variable, the Heads and Seed are black and round, like to those of the other Jacinths.

XI. The Places. All these Plants have been brought to us out of Turky, and from Constantinople, but the place of their true original is fearely known, with us they grow only in Gardens.

XII. The Times. The two first Flowers the earliest, sometimes before Christmas, but more usually after, and thro’ the whole Month of January, and later sometimes, they abide a great while in Flower, and in great beauty, more especially if the Weather is mild, when few or scarcely any other Flowers are able to appear; the third Kind Flowers also earlier than any of those which follow; the other Ordinary Kinds Flower long from the middle to the end of February, some in March, and some in April.

CHAP. CCCXVII.

Of JACINTH Summer.

I. The Names. It is called in Greek 'τυκ-ντις, in Latinus Hyacinthus Afrorum, and in English Summer Jacinth.

III. The Defcriptions. The first, or One Double Oriental Jacinth, has a bulbous Root, like the former Single Kinds, it has several long Leaves, like unto the other Oriental Jacinths almost, standing upright, amongst which rides up a Stalk, brownish at first, but growing green afterwards, bearing many Flowers at the top, made like the Flowers of the former Jacinths, and ending in fix Leaves, green at the fifth, and of a bluish white when they are open, very unlike the flower of the, the Stalks, as well as the Stems of the Leaves being white, from the midst of each Flower stands forth another small Flower, constituting of three Leaves, of the same color with the other Flower, but with a green line, on the back of each of these inner Leaves, in the midst of this little Flower some Threads stand, which are tint with black, the fanci of this Flower is not so sweet as most of the other Flowers, the Stalks are flowerer and smaller, bearing but three or four Flowers on the Heads of them for the most part, which are not composed like the lat, but are more fair, full, and double of Leaves, where they have all their full beauties, and of a fair blew color in face, and purple in others, smelling pretty sweet, but these do seldom hear out their Flowers fair, and besides have several other Flowers, which will be either single or very little double upon the same time Stalk.

IV. The second, or Fair Double Blew or Purple Oriental Jacinth. This Double White Flower or Plant has its Leaves like unto the Single White Oriental Jacinth in the former Chapter. Its Stalk is likewise long, slender, and green, bearing at the top two or three Flowers at most, very double, and full of Leaves, of a pure white color, without any other color therein, hanging down their Heads a little, and of a reasonable sweet smell.

V. The third, or Pure White Double Oriental Jacinth. This Double White Flower or Plant has its Leaves like unto the Single White Oriental Jacinth in the former Chapter. Its Stalk is likewise long, slender, and green, bearing at the top two or three Flowers at most, very double, and full of Leaves, of a pure white color, without any other color therein, hanging down their Heads a little, and of a reasonable sweet smell.

VI. The Places. They came hither from Constantinople, but which is their native place of growth is uncertain, with us they are only nurfed up in Gardens.

VII. The Times. Some of them Flower in March; and some in April, and some sooner, like as some of the latter Single Kinds do.
V. The third, or Small reddish Colored Oriental Jacinth. It is another of the same kind, whose Flowers are of a fine delayed color, with some deeper colored Vils running among the three outward Leaves of the Flower, and differing in no other particulars from the first of thefe Summer Jacinths.

VI. The fourth, or Greater Summer Starry Jacinth. It has a Root which is round and white, having some long thick Roots under it, besides the Vibs, as is usual in many other Jacinths; from this Root rise up several narrow green Leaves, lying upon the Ground, somewhat like the Leaves of the English Jacinth, or Harrelths, but blunter and stronger, among which rises up a round fliff Stalk, bearing many Flowers at the top thereof, and at every foot-stall of the Flowers a small short Leaf, of a purplish color, the Flowers are Star-like, of a fine delayed purplish color, tending to a pale Blov, or 4th Color, rising on the back of every Leaf, and having a pointed Umbole in the middle, with some whirlifh purple Threads about it tipp with blew; the Seed is black, round, and thinning, like unto the Seed of the English Jacinth, or Harrelths, but not full orange to brown.

VII. The fifth, or Lesser Summer Starry Jacinth. It has a small bulbous Root, and white, covered with a brown Coat, and having some few thick Roots among the Vibes as are among the others; this Lesser Jacinth has several very long, narrow, and thinning green Leaves, spread upon the ground round about the Root, from among which rises a very thorn round stalk, not above two or three Inches high, bearing fix or seven small Flowers thereon on each side of the Stalk, like both in form and color unto the Greater Summer Jacinth before described, but blunter by far, the Seed is black, and contained in three cornered Heads or Huds.

VIII. The Places. The fift three have been gathered on the Pyrennean Mountains, on thofe sides next to Spain, from whence they have been brought to us; the fourth and fifth grow naturally in Portu- gal, and from thence have been transplanted into our Gardens.

IX. The Times. The fift three Flower very late in refpeft to the Early Summer, or Autumnal, viz. in May or June, for the mod part; the two latter Flower nif in May, towards the latter end of it, and sometimes also in June, and their Seed is ripe in July.

C H A P. CCCXCIII.

Of JACINTH Dun or Brown.

I. T H E Names. It is called in Greek ακτένθ, in Latin Hyacinthus fucatus vel obf©ICEUS, in English The Dun or Brown Colored Jacinth.

III. The Descriptions. The first, or Spanish Dun or Brown Colored Jacinth, has a bulbous Root, which is reasonable great, and white on the outside, with many strong white Vibs at it, which perish not yearly as the Vibes of many other Jacinths do, it springs up out of the Ground, bearing four or five Starry, round, hollow, and soft, whithrifh green Leaves, with a white line in the middle of every one of them, from among which rise up one or more Stalks, bearing feveral Flowers at their tops, all looking one way, or standing on one fide, hanging down their heads, confifing of fix Leaves, three of which, being the outwardmoft, lay open their Leaves and turn back their ends a little, the other three Leaves, which are inwardmoft, do as if they were clofe together in the middle of the Flower, without laying themselves open at all, being a little whithrifh on the edges, the whole Flower is of a purplifh yellow color, with some white and green as it were mixed amongst it, of no smell at all, after the Flowers are past great three cornered and bunched our Heads or Huds come in their places, which contain black and flat Seed; this Plant as it springs up late, fo it keeps its green Leaves almost until Winter.

IV. The second, or Derby Brown Colored Jacinth. This Plant in its Root, Leaves, Stalks, Flowers, Seed, and manner of its growing, and in all other refpefts (except its magnitude) is very like the former, nor does it differ at all from it, but that this is every ways much greater.

V. The third, or Ethiopian Dun or Dusky Colored Jacinth. Its Root is bulbous, and like the former, its Leaves are broader and greener than it, and the Stalks also thicker, bearing divers Flowers, confiftently hanging upon longer footstalks, yet made after the fame fashion, but that the three inner Leaves are whithrifh, and dented about the edges, a- therwife the Flowers are greenish on the inside.

VI. The Places. The native Country of the first of these is Spain, the fcond is a native of Derby, growing about Fsa and Marocco, the third is a native of Ethiopia, and was brought hither from the Cape of Goodhope, with us they are only nurfed up in Gardens.

VII. The Times. The firft Flowers not until late, because it springs late out of the Ground, as afore- faid, holding its Flowers all September, the Seed ripening in the mean fiahon, and much about the fame times the other two Flower and Seed.

C H A P. CCCXCIX.

Of JACINTH Starry Common.

I. T H E Names. It is called in Greek Ακτένθ, in Latin Hyacinthus Asteraceus, in English The Starry Jacinth.

II. The Kinds. There are fix generic Species of the Starry Jacinth, viz. 1. Hyacinthus Asteraceus, three Species of which we have already Treated of among the Summer Jacinths in Chap. 357. referring to, 2. Hyacinthus Asteraceus, The Common Starry Jacinth, of which in this Chapter.

III. The third, or Bluff Colored Starry Jacinth. This in its Root, Leaves, and Stalk, is exactly like the former, and differs nothing herefrom but in the Flowers, which are of a dark bluish color, much more eminent than in the others, in all other particulars it is exactly alike.

II. The fourth, or Early Blow Starry Jacinth. Its Root is bulbous, and a little white with the Fleshes, its Leaves are also a little broader, of a fitcher green, and not brown at all, as the fifth Blew Jacinth botering is; the Buds of the Flowers while they are inclosed within the Leaves, and after when the Stalk is grown up, do remain more blower than the Buds of the former, the Flowers when they are blown open are like the former, but something larger, and of a more lively blow color, this Kind of Jacinth does more seldom bear Seed than the others botering.

III. The fifth, or White Early Starry Jacinth. This is also one order of the forth kind, the green Leaves whereof are a little narrower than the former, and its Flowers are purely white, in any other respect there is no difference from it at all.

IV. The sixth, or Purely White Starry Jacinth. This seems to be a Species of the second kind going, its Leaves are of a pale fresh green, and a little narrower than thefe, and its Flowers are smaller than them, and of a pure Snow white color.

V. The seventh, or Early Bluff Colored Starry Jacinth. The Root is bulbous, and like to the other Starry Jacinths, the Leaves differ not from the fifth Kind, or White Early Starry Jacinth, and its Flowers are bluish colored, and as large as those of the fifth Kind, and somewhat larger than the Flowers of the fourth Kind, this Bluff Colored Jacinth is very rare, but it is very pleasant.

V. The Place. All these Jacinths have been found in the Woods and Mountains of Austria, Bohemia, Germany, &c., as Fuchsius and Gaffier affirm, and in Italy, near Naples, as Imperati and others say, but with us they are all of them rooted up in Gardens, more especially the White and Bluff Kinds, for that they are more tender, and therefore require the more care to keep them blithely possing.

VI. The Period. The first, second, and sixth Kinds Flower much about the middle of February, if the Weather is mild and gentle, the other Kinds about fourteen or twenty days after, viz. in March, but many times as early as the twelfth three.

CHAP. CCC.

Of Starry Peruvian.

T HE Name. It is called in Greek Τάστελλα, or Τάστελλον, in Latin Hyacinthus Eriophorus, vel Hyacinthus Lanternus, Eriophorus Vernalis, Hyacinthus Stellatus Peruvianus vel Americanus, Hyacinthus Peruvianus, Hyacinthus Stellatus Batatus, in English The American or Peruvian Starry Jacinth, and The Spanish Starry Jacinth.

Great Blown Starry Jacinth of Peru.

III. The Descriptions. The first, or Greatest Blown Starry American or Peruian or Spanish Jacinth. It has a great bulbous Root, and sometimes yellowish on the outside, with a knob or bunch at the lower end of the Root, (which is called the foot of the Root) like unto that of the Mofkari, or Scylla, and many other bulbous Roots, from which hang down several white, thick, and long Fibres, by which it is fastened into the Ground, which push not every Year, but while continually, and therefore does not lose much removing, from this Root springing up two or fou more or very broad and very long green Leaves, spread upon the Ground round about the Root, which being broken are woolly, or full of very fine Fibres, (wherefore came part of the Greek Name) from the middle of these Leaves rises up a round short Stalk, (in comparison of the greatness of the Plant, for the Stalk of the Oriental Jacinth is sometimes twice as high, whole Root is not (as great) bearing at the top a great Head or Bulb of Flowers, fashioned in the beginning, before they are blown or separated, very like to a Cone, or Pine-Apple, they begin to flower below, and so upwards by degrees, every Flower standing upon a long blackish blew Footstalk, which when they are blown open are of a perfect blew color, tending to a Violet, and made of two small Leaves laid open like a Star, the Threads likewise are blew, like with yellow Pendents, standing about the middle Head, which is of a deep blew, not having any pleasant smell to be perceived in it, but commendable only for the beauty of the Flowers, after the Flowers are past threequarter or corner Heads come in their places, containing round black Seed, this Jacinth is the greatest of those whose Flowers are spread like a Star, except the two first American ones described in Chap. 391. afollowing.

IV. The second, or Great White Peruian Jacinth. The Roots and Seed of this are like unto the former, so it is also in most of its other parts, but that the Leaves are not so large, nor of so deep a green, the Stalks of Flowers likewise have not thick rich Heads or Bulbs on it, but the Flowers are fewer and thinner, yet having a small dath of blew in them, and the Threads are whitish, tips with yellow Pendents, these are the chief particulars in which it differs from the former.

V. The third, or Great Blown Colored Starry American or Peruian Jacinth. This is found growing among the other, and also near the road from the two former, but only in the color of the Flowers, for this has its Head of Flowers as great and large as the fifth, but the Buds of its Flowers before they are open are of a deep blew, color, which being completely opened are more delayed, and of a pleasant pile purple or blew color, standing upon purplish Footstalks, the Heads in the middle are whitish, and so are the Threads encompassing it, tips with yellow.

VI. The fourth, or Woolly Jacinth. Its Root is bulbous and white, somewhat like to the Root of a Mufkari, which is in full of Wool, or fine white or Yellow Leaves, or rather more than they, or any other part of it, this Wooly Jacinth has many broad, long, and fair green Leaves, very like unto some of the Jacinths, but finer, or thinner, more appropriated which being broken do yield a multitude of small fine, soft Fibres, as if a little fine Cotton Wool was drawn out, from among those Leaves rise up a long, round, green Stalk, a Root and half high, or more, on which is set a long great Bush of Flowers, which blowing open by degrees, forth below, and so upwards, are very long in flowering, the top of the Stalk with the Flowers, and their little small Footstalls, are all blew, every Flower standing upright with its Stalk, and spreading like a Star, divided into six Leaves, having many small woolly Threads, standing about the middle Head, which, as far as it yet discovered, never yet gave ripe Seed.

VII. The Places. The fifth has been formerly Named Erinias Pernann and Hysiacinus Stellatus Peruannus. The Starry Jacinth of Peru, and the three first are generally known and received by the Name of Hyacinthus Pernannus, for which reason we have retained it, but all the first three grow naturally in Spain, in the Meadows not far from the Sea, as also in the Island of Gades, commonly called Cadiz, as likewise in other parts along the Sea side going thence to Porto S. Martin, which when they are in Flower grow to thick together, that they seem to cover the Ground, as Gaul, Bud affirms, who says that himself gathered these and many others in the places named with his own Hands, but saying withal that the White and Blyth Colored are far more rare than the Blown, or first Kind, yet notwithstanding all that has been hither to said, it is very probable that they have been found growing also in Peru, otherwise they would never have to generally obtained that Name, with us they are only meted up in Gardens, the fourth has many times been sent out of Turkey into England, where in our Gardens it has flourished for a long time, as well as several others, it is probable that that in Thomalsus Lib. 7. Cap. 11. is this very Plant, where he declares that Germans were made of the woolly fulidence of a bulbous Root taken from between the Core or Heart of the Root and the outermost Coats or Feltings, but Coursin will have this Eriochirus
CHAP. CCCCI.

Of JACINTH Starry Turky.

I. THE NAMES. It is called in Greek Ἰακίνθος, in Latin Hyacinthus Byzantinus, and in English The Turky Starry Jacinth, The Starry Jacinth of Constantinople.

III. The Descriptions. The first, or Turky Starry Jacinth with a black Root. It has a Root which for the most part runs downwards, something deep into the Ground, from which rife up several fhrubs, green, thin, and long Leaves, of the biggest of the English Jacinth, but not so long, between which rife up a flender low Stalk, being five or fix Flowers, differently thereto, spreading open like a Star, of a pale or blew blast color; the Leaves of the Flowers are somewhat long, and low as it were somewhat lowly, one off from another, and not so closely together as the Flowers of other Kinds; it seldom bears with us ripe Seed, because the Heads are fo heavy, that lying upon the Ground they rot with the Wet. or are bitten with the Fruits, or both, so that they seldom come to good; the Rose is small in some, and reasonable big in others, round and long, white within, but covered with deep red-dish or purplish feelings next unto it, and darker and blacker purple on the outside, with some white and thick white Fibers like Fingers hanging at the bottom of them, as is to be seen in many other Jacinths.

IV. The second, or Greater Starry Jacinth of Constantinople. The Root of this is like the former, growing that it is not black on the outside, as the other, but three times bigger, this Jacinth may truly be referred to the former Jacinth of Constantinople, and called the Greater, it is so very like thaterunto, that any one who knows that cannot but know or think that this is another of that fort, but greater, as it is in all its parts, bearing larger Leaves by much, and more Flowers, lying upon the Ground round about the Roots; it bears many low stalks of Flowers, as black and flower'd as loolly as the former.

V. The third, or Other Turky Starry Jacinth, or Starry Jacinth of Constantinople. Its Root is of a dark whitish color on the outside, and sometimes a little reddish within, it has for the most part only four Leaves, broader and greener than the first, but not so large or so long at the second, the Stalk has five or fix Flowers upon it, bigger and rounder fet, like other Starry Jacinth, of a more perfect or deeper blow than either of the former, having a whitish green Umbone or Head in the middle, lower with a long flat or blew Chives or Threads tip with black, to closely encompassing the Umbone or Head, that the Threads seem to be so many pricks stuck into a Club or Head, some have therefore liken'd it to a Barke Flower, and fo have called it, after the Flowers are put come up round white Heads, in which is contained round and white Seed.

VI. The fourth, or Turky Alth Colored Starry Jacinth, or Soror's Starry Jacinth. Its Root is like to that of the English Jacinth, or Harsells, being great, round, and small, fo like that it is hard to know the one from the other; its Leaves are also very like to the Leaves of the English Jacinth, and spread themselves upon the Ground in the same manner, from amongst which rife up one or two Stalks, rish or all at or with a number of smaller Star like Flowers, baffing out more below than above, of a very pale or blew Blew, tending to an Alth Color, and very sweet in tinct; the Seed is black and round, like unto the Seed of the English Jacinth, or Harsells.

VII. The Flowers. The Title of the three first thou their native places, the third or them, as Label says, was brought to England from Constantinople by the Lord Zeunth, the fourth Soror brought from Constantinople, or out of Italy, as Label says, into the Low Countries, from thence it has been brought to us, but they all flourished admirably well in our Gardens.

VIII. The Times. The first of these Flower earlier than the other three, and presently after the Early Starry Jacinth, the three last Flower all of them in April.
Salmon's Herbal.

Lib. I.

CHAP. CCCXIII.

Of JACINTH Starry Autumn.

I. The Names. It is called in Greek Ὀξύνθον, in Latin Hyacinthus Stellatus Autumnalis, and in English The Autumn Starry Jacinth.

III. An Observation. Dolechampus with many Words would have us to believe that these Plants can be no Flowers, because their Flowers appear before their Leaves in Autumn, contrary to the true Jacinth, as he says, and therefore will have it to be the Bulbus of Theophrastus Lib. I. Cap. 12, which he calls his Lýpios (these mentioned) as also Bulbus Addita Dolechampi, this may carry some probability with it, yet the likeness of both Roots, Leaves, and Flowers, have persuaded very Learned Botanists to believe them to be true Flowers, and so we take them in this Place.

IV. The Descriptions. The first, or Greater Autumn Starry Jacinth. It has a Root which is great, bulbarous, and white on the outside, from this Root sprang up five or fix or more very long and narrow green Leaves, lying upon the Ground; the Scales are furnished at top with many Star-like Flowers, of a pale blooming purple color, with some pale colored Threads tipp’d with blow flaming about the Head in the middle, which in time growing rise contain therein small, black, and roundish Seed.

V. The second, or Lesser Autumn Starry Jacinth. This Lesser Jacinth has a bulbus Root like others, which founds forth such like long and small Leaves as the former; but narrower, the Scales is not full out so high, but bears as many Flowers on it as the other, which are of a pale or blooming purple color, very like to it also, as is the Seed too, but that it is smaller, both thefe for the most part bear their Flowers and Seed before the green Leaves rise up much above the Ground.

VI. The third, or Lesser Autumn Starry Jacinth with white Flowers. This in its Roots, Scales, Flowers, and Seed, as also in its manner of growing, differs nothing from the former Lesser Purple Kind left described, excepting in the color of the Flowers, which in this Plant are always white.

VII. The Places. The native places of the first and third are as yet unknown to us, where possibly they may grow wild, here they are only nurfed up in Gardens, the second grows wild in many places of England, as on the foot of a high Bank by the Thames side at the hither end of Chelsea, before you come at the Burnt House, and other places, from whence Plants have been taken for Gardens.

VIII. The Time. The first or greatest Flowers in the end of July, and in August, the other two in August, and September, you shall rarely find any of their Plants with Flowers and green Leaves together at one time.

CHAP. CCCXIII.

Of JACINTH Starry Lilly Leaved.

I. The Names. It is called in Greek Ὀξύνθον, in Latin Hyacinthus Stellatus Liliifolius, and in English Lilly Leaved Starry Jacinth.

II. The Kinds. There are three several Species of this Plant, viz. 1. Hyacinthus Stellatus Liliifolius Super Ceruleus, Hyacinthus Stellatus Liliifolius Roseus & Radices, The Blew Flowered Lilly Leaved and Lilly-Rooded Starry Jacinth, (its Root being as like to a Lilly Root as its Leaves to Lilly Leaves). 2. Hyacinthus Stellatus Liliifolius album, vel Liliifolius Super albo, The White Flowered Lilly Leaved Starry Jacinth. 3. Hyacinthus Stellatus Liliifolius Cornus, The Blush Colored Lilly Leaved Starry Jacinth. Now because the Roots of these Plants as well as the Leaves are so very like to a Lilly, they have been called Hyacinthus Stellatus Liliifolius & Radices, but for brevity sake Hyacinthus Stellatus Liliifolius, The Lilly Leaved Starry Jacinth. Chaffus says that the People who Dwell near its native place of growth call it Cornelii.
and being close and round, before the stalk rises out from the middle of the leaf. Leaves there does appear a stunted hole, to be seen a good while, which at length is filled up with the stalk, rising up to a foot or more in height, bearing many star-like flowers at top, of a perfect blue color, bluish, or black, or black-brown color, having as it were a small cup in the middle, divided into six pieces, without any threads therein; the seed is black and round, but not thinking.

IV. The second, or White Flowered Lily Leaved Starry Jacinth. This Plant in its root, leaves, stalk, flower, seed, and manner of growing, is wholly like the former, (so that all the aforesaid description may here be avoided) that we may not fly the same thing over again, but there is something in which it varies, and that is in the color of the flowers, which in this is white, whereas the former is black, and that is all the difference.

V. The third, or Bluff Colored Lily Leaved Starry Jacinth. This Plant is like also to the first and second before described in all the parts of the same, and in the magnitude and manner of its growing, varying only in the color of the flowers, whereas they are black in the first and white in the second, whereas are of a white color, which is the whole of the observed difference.

VI. The Places. Thefe Jachinthi have been found natives of the Pyrenean Hills, in that part of France called Aquitania, and in several other places; I have found them growing plentifully in many Plantations in Carolina, and other parts of the West Indies, but that with the white flower is most usual or common.

VII. The Times. They flower in April, and sometimes later, I have found them flowering in Carolina in March, and in April, as also in May, and sometimes later if the weather prove hard or cold.

VIII. The Virtues. Authors have assigned to them no Medical Virtues, but account them rather as Pavons, for that by Experience it has been found, that Carrot who have eaten of the Leaves heretofore have preciously fuddled and died; this I know, that in Carolina if their Caives, young Bullocks, or Cows eat thereof they are perfectly taken with a swelling, and in a short time turn round with a Vomito, and then in little time after it dies, and all this without remedy, this I have seen; nor could I find that they had any Cure for it, their Death being so sudden; An Ointment of Balm made of the Roots is an excellent thing against echolous Sores and Ulcers, and being duly applied cures them a Wonder.

JAMES WORT, See Regis Wort.

CHAP. CCCCV.

OF JEWSEARS.

THE Names. This Plant is called in Greek Musc Marvel, in Latin Muscaria, in Italian Muscaria, Sambuci, and Fungus Sambucinum, Gummone Sambuce, and of some Aurelica Fida, in English Jewsears, also Muscarion of the Elder Tree.

II. The Root shall be accounted of the Stock of Mushrooms, as is also Agarick, but this growing upon the Elder Tree is a singular Species.

III. The Description. It is an Excrecence, which is soft, blackish, covered with a Skin, or otherwise like a thick Skin, somewhere like won and thin to a Monk's Ear, which being plucked off and dried shrinks together and becomes hard.

IV. The Places. It is found growing only upon Elder Trees, and generally such as are old, in most places of this Kingdom.

V. The Times. They are to be gathered when they are come to their large, or perfection, in the fore part of the day, in a fair and dry Summer, and in the Months of August or September, when they have participated of the full attending Virtues and Juices of the Tree.

VI. The Qualities. They are temperate in respect of heat or cold, dry in the beginning of the second degree, they are Astringent, Affrangent, and Diffusive, a little Repulsive, and Valency.

VII. The Speciation. They are peculiar for curing the Quinsy, and the other Tumors of the Throat, Almonds, and Jaws.

VIII. The Preparations. You may have therefrom 1. A Decoction in Wine or Water. 2. A Compound Deocotion. 3. A Suppositio.

IX. The Deocotion in Wine or Water. It is used as a Gargle to heal all Tumors or Swellings, and Sores or Ulcers in the Mouth, Gums, Throat, Almonds, &c. whose parts being washed or garbled therewith these, four, five, or six times a day as may be endured, by this means exquisite Quinsies have been cured thereby, but in case of a Quinsy the Decoction will be best to be made in Vinegar, adding thence after it is boiled a mixing proportion of Wine.

X. The Compound Decoction in Wine or Water. Take Wine or Water three Pints, Treacle, Elm Bark bruised, of each four Drumps, Columbine Leaves half an Ounce, Magdler three Drumps, Cressor Tartar in powder five Drumps, Black Pepper in powder D d d z , half
Salmon's Herbal.

Lib. I.

Salmon, a bane, but to the consumption of three quarters of a Pint, strain out, and keep the Decotion for a Gargle, which you may dilute, or not, as the occasion requires. It is an excellent Remedy for the cure of a Quilfer, being used as hot as can be endur’d, as also for any other Tumor of the Almonds, or parts adjacent, and cures all forms of Sores and Ulcers of the Mouth, Jaws, Gums, Throat, or Almonds of the Face; it stanches the Florid, or Palate of the Mouth, that when it is down it refires to its proper tone and there, it also takes away vehement inflamations of those parts, they being often gargeted thereby.

XI. The Iatrophia. It is made by cutting the Auricles or Fungi into very small bits, and then boiling them in Wine, or in Vinegar, adding a little Barley Vinegar to bring it to a confluence. Applied outwardly to the Throat as hot as can be endur’d in a Quilfer, (whilst the Decotions are used inwardly as a Gargle,) it much contributes to the abating of the Inflammation and diffusing of the Tumor; applied to any other recent Inflammation or Tumor whilst in beginning, in what part of the Body forever, it cools, arrests the inflammation, alleviates the pain, and decreases the swelling.

CHAP. CCCCV.

OF JOHN’S WORT, GREAT COMMON, OR,

HYPERICON.

I. The Names. It is called in Greek Τομήν, in Latin Hypericon, in English Hypericon also, and Johnswort; the Arabs call it Resefiens, Resilicium, Nolficon, Neificon.

II. The Kinds. There are two generick Kinds of Hypericon, or Johnswort, viz. 1. Hypericon vulgar, which some have called Peganum, i.e. Drye Devil, and some Andromeda, because the Flowers yield a bloody color, and others Chamapsin, because of the reinous sinner of the Seed, but there are the proper Names of other Plants, thus this Hypericon clemente of this Chapter is the True Hypericon of Desertics, or Common Great Johnswort, as both the bloody color of the Flowers and reinous sinner of the Heads and Seed do declare, which are two principal Notes thereof.

III. The Description. Common Great Johnswort, or Common Hypericon, has a Root which is hard and woody, with divers Strings and Fibers at it, and of a brownish color, which abides in the Ground many Years, shooting forth abroad every Spring, from this Root shoots forth brownish, hard, upright, round Stalks, about two Feet high, spreading many Branches from the sides up to their tops, having two small Leaves for one against another at every place, which are of a deep green color, something like to the Leaves of the Lesser Currant, but narrower, and full of small holes in every Leaf, which can not be so well perceived as when they are held up to the light; as the tops of the Stalks and Branches stand yellow Flowers, consisting of five Leaves apiece, with many yellow Threads in the middle, which being bruised do yield a reddish Juice, like Blood, after which do come small round Heads, in which is contained small blackish Seed, smelling like Roofin.

Johnswort the Greater.

IV. The Place. It grows in Woods, Gr axes, and Copese, as well in shady places as in rich as are open to the Sun, in many parts of this Kingdom.

V. The Times. It Flowers about the latter end of June, as also in July, and the Seed is ripe towards the end of the June, Month, or the beginning of August.

VI. The Qualities. It is hot and dry in the first degree, thin, and of bitter parts. Acute, Digestive, Aperitive, Abstitive, Diuretice, Difurative, Traumatic, or Vulnerary, Neurotic, Stomachic, Nephritick, Hypurick, Arthritick, and Alexipharmick.

VII. The Specification. It is peculiar for curing Winds and Ulcers, Spitting, Vomiting, and Pissing Blood, Bittings of Venomous Creatures, Stones, and gravel in the Reins, Strangury, and heat of Urine, Stoppage of the Terms in Women, Terain and Quaran Apartments, the Sciatica, Pallie, Epilepsie, and other Difficulties of like Kind.

The Virtues.

IX. The Juice. It is a good Vulnerary, whether instant taken or outwardly applied, and given to two, three, or four Spoonfuls at a time mixed with a Glass of Wine it heals inward Wounds, Hurts, or Bruises; it is of further parts, open obstructions of the Viscera, dissolves Tumors, softens the lips of
of Wounds, strengthening the parts which are weak and leech.

X. The Ieucine. This is yet more effectual to all the aforesaid Intumens, besides which it is good against the manner of Spriting and Vomiting. Blood occasioned by the rupture of any Vein, or by Bruises, Falls, or any other means whatsoever, it is an Antidote against Poylon, and prevails against the Rings or biting of any Venomous Creatures, it has been found effectual by experience to give cafe in the Stungurgy, to expel Sand, Gravel, and small Stones out of the Kehm and Bladder, and to provoke the Terms in Women, taken to three or four Spoonfuls (according to Age) warm, mixed with a Glass of Wine, before the Fits of Agues, for some days, it helps them and alters the Fits, whether they be Terms or Quartans, and by continuing the use of it for some time perfectly cures them.

XI. The Infusion or Decoction in Wine of Herbs and Flowers, as ufe of the Seed. They have the Virtues of the Juice and Efficace, but much better to be made in a much larger proportion in Juice or Efficace of Kermopeplate it cures Spriting, Vomiting, and Pilling of Blood, as also Bloody Fluxes, and confidtures any Vein which is inwardly broken; if it is taken to the quantity of two Drams in form Broth it does gently purge Choler, cleanses the Vef- fels of the Mefentery, and expels congealed Blood out of the Stomach, it is also much commended, being drank for forty days together, for the Cure of the Empyema, Palls, Gout, and Scirrhous, as alfo to remove and cafe Rhummatism Pains in any part of the Body.

XII. The Simple Oil. Take Exprefsed Oil of the Seeds of Hypericum, or for want thereof Exprefsed Oil of Ben, or choice Oil of Olive, a Pint, Red Port or Lisbon Wine a Pint and half, Flowers of Hyperi- cum, eight Ounces, or of any other Flowers, in a qua- rter Pint Sand heat for fourteen days, then boil in Bal- neo to the conflagration of the Wine, strain out by Ex- pression, and repeat the Infusion with like quantity of Water, Boiling and Expressing, as aforefith, ad- ding alfo more fresh Wine, repeating the fame Work the third time with fresh Flowers, then straining out, keep it for ufe, add one to the afterd Oil Venice, Stranghinge, or other Seso Tarmarine, one Pound, diffufine therein, and do keep it for ufe. Or thus, Take Oil Olive eight Pounds, Letar, Flowers, and Seeds of Hypericum bruised, of each four Ounces, infu- rate, or digeft in an expofite Sand heat fourteene days, then boil in Balneo, and in fraue heat, which Work repeat the second and thiret three times with fresh Herbs, Flowers, sc. till the Oil becomes of a Blood red color. Gerard makes it thus. Take Oil Olive for Pounds, two Pints, Water Wine, of each three Pounds, Letar, Flowers, and Seeds of Hypericum bruised, of each twenty four Ounces, infu- rate, or digeft in a Sand heat ten days, boil in Balneo, and fraue heat, and with fresh Herbs, Flowers, sc. re- peat that Work the second and thiret three times, which al- loth being hot draw out, and keep it for ufe. This Oil being alfo hot draws Cures of the Nerves, and Contusions of the fame, as alfo Burning, Scald-

ings, all Wounds and Ulcers, tho' made with po- tived Weapons, Gout, Scirrhous, and Rheumatick Pains, it is faid to heal green and deep Wounds which run into the Body, it strengthens and refifits to the Joins, comforts the Nerves and Tender, helps Tremblings, Cramps, Convulsions, and Foci, and is third time, and then strongly pren out by Driving, to every Pound thereof add of pure Flaxen Oil four Pounds, of choice Venice or Seso Tarantipine for Qunce, Oil of Wormwood three Ounces, Diturgy, Ovend, Cardcur, Turmerce, Calamus, Carnation, Cardine, or Cardine Maris, all of them in powder, of each two Drums, Earth Worns nine and eighen, sandly, in White Wine two Ounces, let them tor infinate the five or six Weeks, or eft digeft, and then moderate Sand heat, and keep the Oil for ufe. Or thus, Take of either of the Simple Oils in the former Seotion four Pounds, Oil of Tanifer Berries refolven half a Pound, Crunchial Oil of Nutmegs a quarter of a Pound, Balfam Cupreus two Ounces and half, Compere and Ounce, mix, diffufe, and keep it for ufe. This has all the Virtues of the Simple Oil with advantage, being more conformable to the Nerves, drawing and cleansing than it, is a most excellent Vulnare, dif- cuiseus Tumors, efters Pain, heals Contusions, Pant- ones, or other Hurts and Wounds of the Nerves and Tender, and is admirable for old Aches, Rheu- matisms, Bruises, Strains, Pains, Numbnefs, Comfts, Convulsions, Headach, Megunit, Lathing, Burn- hings, Scaldings, &c.

XVI. The Aegrogated Oil. Take of the Simple Oil of Hypericn made with Oil of Ben at Sew. 14, after- going four Pounds, Balfam of Peru a Pound and half, Balfam of Tolu, Storaex Calaminis fratured, Tinture of Soffron and Calamen afforciated to the thickness of two Money, of each half a Pound, or Oil of Angelica, Lavender, Limons, Alvat, Nutmegs, Oran- ges, and Sungofra, of each three Ounces, mix, digeft, in a warm Balneo or Sand heat for a Week, shaking ittogether once a day, and then for ufe. This has all the Virtues of the Simple and Compound Oils aforegoing, but for any extrem or invacriate Pain in any part of the Body, or for any Contusion, Phan- ore, or any other Wound or Hur of the Nerves or Tender, there is nothing superior to it in the World, eftiem it as a Jewel.

XVII. The Diffilled Water. Take the Flowers, Leans, and Seeds of Hypericum twice good handfulls, White Port Wine three Quarts, mix, digeft two days in a warm Balneo, then in Balneo drain off the Water to dryness. It may serve as a Vehicle to convey the Juice or Efficace in, being good for all the fame purpofes, if it be united with White Sugar and drank, it is thought to be as effectual as the Infu- sion or Decoction, befits it is said to kill Worns in the Stomach, and Belly.

XVIII. The Acid Tinture. It is good agains Poylon violently or outwardly received, being given from twenty to fifty drops at a time in any proper Vehicle, as the Diffilled Water, &c. it is good alfo to diffuse, and Stomatichal, comforts and fortifies the Ventrice, and refores its Tone being hurt or depraved; it caufes a good Appetite and Strong Di- ginion, and allays the fermentation of the Humors.
of Juices in the Body, it prevents also against the Plague or Pestilence, and all sorts of malign and pestilential Diseases.

XIX. The Spirituous Tincture. It warms and comforts the Stomach, is good against Crudities, and expels Wind; a gout Wound wathed with it it cleanses it, comforts it, restores its heat, and presently consolidates or heals it, and is profitable for such as are affected with a Vertigo, Lethargy, Epilepsies, Palpi, Convulsions, or other like Disorders of the Head, Brain, and Nerves. Dose from one to two Drains in any fit Vehicle.

XX. The Oily Tincture. It opens obstructions of the Knees, Gleeters, and Bladders, expels Sand, gravel, Small Stones, or other Tarraous Mincage out of those parts, and gives present ease in the Stomach; it gives instant relief in the Colic, and givings of the Guts, alleviates the pain in the Back, the never so extreme, and restores and strengthens the Tone of any or all the Viscera, the very much hurt and deplaged, outwardly it eases Aches and Pains in the Limbs, proceeding from a cold Caufe, and givens pertinent help to Consultans and Punctions of the Neves and Tendons, the extremity is so great as to cause Consultans, performing the Cure in a short time after. Dose of this Oily Tincture is from eight to twenty drops, according to Age and Strength, first dropped into Sugar, and then mixed with the Vehicle you intend to give it in.

CHAP. CCCCVI.

OF JOHNSTWORT SMALL, OR, LEAFER HYPERICON.

I. The Name. It is called in Greek "Hyperikon," in Latin Hypericum minor, and in English the Smaller Johnswort, or Leafier Hypericon.

II. The Kinds. We shall take notice but of five Species of this Plant, being all that are yet known to grow in our Countries, viz. 1. Hypericum minor crenatun Benth. Hypericum pulchrum Trag., (as it is thought) Hypericum minor Tholli, Hypericum Syricum L. Small Upright Hypericon, or Johnswort. 2. Hypericum minun Supinum, vel Supinum glabrum Benth, Hypericum Exigua Trag., Hypericum minum Dudonii & Gefnaires, Hypericum minutum Supinum Septemtrionale L. Small Creeping Hypericon, or Johnswort. 3. Hypericum Numburose Folin, Hypericum tertium Trag., Hypericum minun secundu Budow, Round Leaved Hypericon, or Johnswort. 4. Hypericum minum Supinum Tomentosum Benth., Hypericum alterum Tomentosum L. Hypericum minor Supinum Monspeliacinum, Androsaeman album D'cclsbergi, The Small Creeping Woolly Hypericon, or Johnswort. 5. Hypericum Americanum, Hypericum Frutescens Americanum Boher, American Hypericon, or Johnswort, White Flowered American Johnswort.

III. An Observation. Altho' what I have to say here ought to have been put in the former Chapter, yet it is better to have a place out of his order than no where, it is the Opinion of some Authors concerning the Generick Kinds of Hypericon that they are fourfold, viz. 1. Hypericon vulgare, Hypericon, or Johnswort, properly so called, of which we discourse in the former and this present Chapter. 2. Hypericon Numburose Folin, Hypericon tertium Trag. and 3. Hypericon Americanum, Hypericum Frutescens Americanum Boher, American Hypericon, or Johnswort.

IV. The Descriptions. The first, or Small Upright Hypericon, or Johnswort. It has a small and long Root, and fibrous without, enduring all the Winter in the Ground, this Plant is very rare to meet with, but it is very like that in the former Chapter, living that it is smaller, yet the Leaves do not fully answer the form of the other, but are a little broader, and not so sharply pointed; the Stalks are reedish, and the Flowers least, not fully so yellow, nor do they give full out so bloody a Color when they are bruised between the Fingers, and sometimes they lack in the Centre, at the bottoms of the Stalks as well as at the tops; the Seed is also reedish, as the former.

V. The
V. The second, or Small Creeping Hypericton, or Johnswort. Its Root is very like the former, nor does the whole Plant differ much from it, its Stalks are reddish, and not much above an inch breadth high, yet stand not fully upright, but leaning downwards; the Leaves are small, narrow, and smooth, and the final Flowers are yellow.

VI. The third, or Round Headed Hypericton, or Johnswort. Its Root is small and long, and slender, as the others foregoing, this Plant is as small as the Luff, and its small, red, little Square Branches rise to a higher than that, having two Leaves for one against another at every joint up to the tops, and are almost round, like unto Moneywort, or Herb Teespoon, of a dark of fold green on the upper side, and whitish underneath, spotted times with red, on the face, and blonde, the Flowers are of a yellow color than the former, but somewhat large in comparison to the smallness of the Plant, with several yellow Threads in the middle.

VII. The fourth, or Small Creeping Woolly Hypericton, or Johnswort. It has a small, slender, long, woody, and loose Root, from which spring up several hairy, whitish, small, woolly Branches, lying upon the Ground and flooding forth Filastic, set with woolly Leaves, but not very close together, much like to those of the Common Hypericton in the former Chapter, but hony and white, and a little rounder, at the joints towards the tops of the Plants, which are smaller than those of the Common Hypericton, and of a paler yellow, the Seed Vellis are like unto the other Kinds, as is also the Seed it self.

VIII. The fifth, or Flowered American Hypericton, or Johnswort. It has a long, slender, woolly, frorous Root, which divides all the Winter, from this Root arise yearly several woolly Stalks, semi tall to a Man height, covered with a whitish Bark, from whence are thrust up all over the whole Plant various Branches for thick green Leaves, narrow below, broad about the middle, and round at ends, sometimes two or three at a place, from which joints also arise other white Flowers, consisting of four Leaves apiece, the Leaves fall away every Year, and appear again in the Spring.

IX. The Place. The three first Kinds grow in Woods and Copics as well in those which are sharp as those which are open to the Sun; the fourth grows in Moorish and Wet Fields, as also on dry barren Ground, the fifth kind grows in Gardens, and is brought hither from the North West parts of America.

X. The Times. They all Flower about the middle or latter end of June, and in July, and the Seed is ripe in the end of July, or in the beginning of Aug.

XI. The Qualities, Specification, Preparations, and Virtues of the first four are the same with those of the Common Hypericton in the former Chapter, but scarcely or not altogether so powerful and effectual to all those Intentions: The Qualities and Virtues of the American are not yet well known, or but only guessed.

CHAP. CCCCVII.

Of IRONWORT, or,

SOLDIERS HERB.

I. The Name. It is called in Arabic Siderics, in Greek Σιδερίτης, "Vas, in Latin Sideritis, in Germanic, Spuria, Vicia, Anglica Sanguiforba, or Woolly Smelly, and Green, or Common Ironwort.

II. The Kinds. Authors make many Species of this Plant, viz. 1. Sideritis vulgaris Chufi, Sideritis prime Chufi, this is without doubt Sideritis endemic, or Sideritis Sideritis a la in Vitruvius Catalpina, Abhumin Oedmara, Sideritis Arvenfis Lasfolia glabra Badian, Meadow Ironwort with red Flowers. 3. Sideritis frons vell Herculis, Herba fulcata, Terebrata, Sideritis procumbens non Rumpa, Small Creeping Ironwort not Branched, Small Ironwort. 5. Sideritis sanguiforba, a Sideritis africana Chufi, Another Smaller Ironwort. 6. Sideritis Montana parvo Etor negro purpureo Columbae, Sideritis Montana Apula serpifera, Mountain Ironwort with a small black purple Flower, or Mountain Ironwort of Naples. 7. Sideritis Pulchra Abhumin Virginitia Badiani, Ironwort with German Childs Head Leaves. 8. Sideritis Greek Carpathia, Sideritis secta Chufi, Small Germany Ironwort, this days Chufi is common at Vienna in Austria. 9. Sideritis Herbculata Eto, Sideritis Anglica, English Ironwort, or Ironwort with Alcedo Leaves. 10. Sideritis Sanguiforba Etor sphenuntis oblonga glabra, Ironwort with smooth long Leaves. 11. Sideritis Arvenfis Lasfolia glabra Badiani, Sideritis Hectoris a la Catalpina, Sideritis Arvenfis Etor palus Calendulae, Sideritis Arvenfis Species a la Thalii, Abhumin Germanicum alterum, Broad Leafed Meadow Ironwort, this Badiani must have to be Sideritis Spuri, which it is not, and Label would have it to be a Species of Cannabis Spuris, others that it is Marrubium Pennanum Chufi, all which are much to be doubted. To the former Eleven Kinds may be added the two Following, viz. 1. Sideritis Anglica Radicis Strumata, Venos Oedemi Gerardi, Sideritis promi Thalii, Betonica fastida Gerso- rini, Clows Woundwort, or English Ironwort with burned Roots, of which we have Treatises at large in Chap. 9. afterwarying. 13. Sideritis Arvenfis grandi odoris, Prospettina Sanguiforba, Ironwort having a pleasant smell, or Our Common Burnet, whether greater or lesser, and this we have here added to the number.
number, because several Authors will have it to be a Species of the Sideritis, or Ironworts, of which we have Treated alfo at LARGE in Chap. 101. foregoing this Work.

Ironwort

III. The Description. The first, or vulgar or Common Ironwort. It has a Root which is white and woody, containing all Winter, and shooting forth new Stalks every Year; it grows greater and higher than the other Ironworts, as Claficays says, with larger hairy rough pointed Leaves at the top by couples one agaift another at the joints of the square hairy Stalks, dented about the edges, but flat at somewhat farther distances, which branching themselves forth are set from the middle upwards, as many Whorls of gaping white Flowers at the joints with the Leaves, spotted with blood red spots in the upper parts of them, ending in a long Spike, the Seed which follows is small, uneven and black, contained in fine square Heads.

IV. Note. This our first Sideritis I take to be truly the Sideritis facunda Matth. which very much appears from his description of it, tho' it is very short, in his Epitome, and is in these Words, Root in the Crude quadrato, detrantali, aut majori, Ramo-joum, Folii Marrubii longiores, ad Salve, fequit accedentibus, cutris, abiacuntibus, & per ambianti Incommis specie hanc ingratam, Flus us verticillatam in Crude, & Rons pedunculatis Marrubii modo.

V. The second, or Meadow Ironwort with red Flowers. The Root of this Herb is very fibrous, or full of Threads, from whence rife up a square brown Stalk, full of branches, and thence several narrow, long, and pointed, rough Leaves, somewhat dented about the edges, for by pairs or couples at the tops of which stand the Flowers, encompassing them, as the others do, of a dark red color, and sometimes of a white color; the whole Plant is of an auricul

VI. The third, or Creeping Branched Ironwort, called also Jews Ironwort. It has a Root which is small and woody, yet living all Winter, and shooting forth after every Spring, it is a small low Herb, neither wholly standing upright, nor wholly leaning down to the Ground, but his several weak, rough, hoary, square Stalks, not much above a Foot high, full of joints, at the several distances whereof grow two small Leaves, somewhat long, rough, or as it were cramp'd, hard and hairy, not half so broad as Horchound Leaves, dented about the edges, fibrous and tufting somewhat strong, which spread abroad into divers Branches, the upper parts whereof are replenish'd with many rough small Whorls of pale purplish gaping Flowers, with hoary Leaves at the joints under them also, where after they are pale come small blackish Seed, contained in thick Huds wherein the Flowers fowld before.

VII. The fourth, or Small Creeping Ironwort not Branched, or Small Jews Ironwort. The Root of this Plant is small, and perifhes every Year, the Herb is also small, and somewhat like the former in the hairy branches, but more trailing or leaning, the Leaves also are hairy, somewhat larger, and less fmall about the edges, that is, they are dented only from the middle to their ends, the Flowers grow in the bosoms of these Leaves, and encompass the Stalks or Branches of the Plant in Randles at certain distances, as the others do, from their bottoms to their very tops, being of a white color, and shaped like the other Kinds.

VIII. The fith, or Other Small Jews Ironwort. The Root is much like the beforegoing, and perifhes every Year, it is a small Ironwort, and has the middle Stalk upright, square, and something hairy, spreading it fall into many smaller Branches, even from...
from the bottom upwards, which in a manner lies upon the Ground, with two fork like Leaves at the Joints in the leaf, but little or nothing dented at all; the Flowers are white, without spots, but gaping in like manner.

X. The Flooht, or Mountain Ironwort with a small black-purple Flower. It has a Root which is small, bared, and yellowish, from which rises up a reddish, hoary, bared, hairy, square Stalk, about half a yard high, divided into two Branches, about the middle thereof, on which are set at the joints two small and long pale green Leaves one against another, covered with an hoary Dew, and having three dents or notches on each side at the ends of them, which at the lower end of the Stalks next the Ground stand upon long footstalks, but up higher towards the top are without any, the Flowers stand in small pointed Husks, and are gaping, or hooded, as the root are, very little, whole head and jaws are of a dark purplish color, the middle of the Flower is yellow, and the long neck of the Flower which rises out of the Husk is whithit; after the Flowers are grown, one blackish Colored Seed, are found, somewhat conicd, which are contained in the hairy or hoary Husks.

X. The seventh, or Ironwort with Germanium Character. The Root is small, but not so small as the preceding, which sends forth a Stalk a foot long, spread out into Branches from the bottom, and those again sending forth smaller ones, all of them having above the Germanium Chicks, but much greater, on which stand a few hairy Leaves by pairs or couples, in form like unto that of Chickweed, but larger, and dented about the edges, the Flowers grow at the joints with the Leaves towards the tops, and like unto the others in fashion, but somewhat longer, and of a bluish color, flanding in sharp and rough Husks, in which is contained small round Seed.

XI. The eighth, or Small German Ironwort. The Root is white and woody, and persifing every Year, it is a small Plant, and has fine square Stalks, about of a foot high, Branched out almost from the very Ground, being hoity and hoary, as the Leaves also; which stand at the joints by couples, being long, and somewhat narrow, without any dents at all; the edges are, yet larger at or near the bottom of the Seed, and broader towards their tops; the Branches have Flowers growing about them upwards as soon asplith they shot out, in these as the other forts are, but they are so small that they scarcely cause the Husk of the Flowers, of a dusky color, the jaws and lower parts on the inside being white, after which follows blackish Seed, smaller than in the others.

XII. The ninth, or English Ironwort, or Ironwort with Alchoot Leaves. It has a Root which is small and thready, persifing every Year, but abundantly rising up itself from its own root, in any Garden where it has once taken root, it is a small Herb, not much above an Hand breadth, or four or five Inches high, having small, broad, and roundish green Leaves, with round dents about the edges, like to Alchoot, or rather like to Red Arrowroot Leaves; the Flowers are hoouted, small, and purplish, and the Seed smal and blackish.

XIII. The tenth, or Ironwort with smooth long Leaves. Its Root is in height, hoary, glossy, and persifing every Year, from whence rises up square and pointed Stalks, from half below, but with some small kind of binate or hollow at their tops; the Leaves are smooth and thin, as in the last, but little or nothing dented at all; the lowermost three Inches long, and one broad, not dented at all about the edges; the Flowers are hoouted, like the Common for, but white, larger than they, and longer also, standing in rough Husks about the Stalks, even from the bottom almost, after which come small, blackish, uneven Seed, in Husks like those of Plantain, but shorter.

XIV. The eleventh, or Broad Leaved Meadow Ironwort. The Root of this is like the second kind persifing, and it has larger smooth green Leaves below than those above, a little dented about the edges; the Stalks are squire, about a Foot and half in height, and Branched out, the Flowers grow in Roundles at the tops of the Branches, being hoouted, and of a pale yellow color, and in some purplish, tending to white, without any smel at all.

XV. The Places. Some of these grow wild in England, in Meadows, and on Mountains, in many places, being more of them natural to our Country, the second of thefe Gerard says grows frequently in the Corn Fields in Kent, and by Nuttings in Essex, the seventh Gerard also found it in Flower and Seed among Corn in a Field joining to a Wood not far from Greenwich in Kent, the ninth Parkinson says he found growing Cold in the Fields, from whence he transplanted it into his Garden, where it continued to increase and flourish.

XVI. The Times. They all Flower in June and July, and their Seed is ripe soon after.

XVII. The Qualities. Ironwort is temperate in respect to heat or cold, and dry in the first degree, or beginning of the second; it is Anodyne, Affrillent, Incrcrante, and Vulnery.

XVIII. The Speciation. It is very powerful to stop all fluxes of Blood, Catarrhs, the Reds and Whites in Women, and speedily to heal all simple green Wounds, and that, (as Authors say) without suppuration, it dries up all fluxes of Humors in old fretting Ulcers, cleanses the Ulcer, incarnees, and quickly heals it.

XIX. The Preparations. You may prepare therefrom,

1. A Liquid Juice.

2. An Essence.

3. A Syrup.

4. A Decotion.

5. A Powder of the Herb.

6. A Balsam or Ointment.

The Virtues.

XX. The Liquid Juice. Given inwards two, three, four, or five Spoonfuls at a time, either alone or mixed with some cold Water, it will restore all fluxes of Blood, and is powerfull against all internal fluxes of Blood, as Splint or Vomiting Blood, Pitting Blood, the Bloody or Hepatic Flux, and the overflowing of the Terms in Women.

XXI. The Essence. It has all the Virtues of the Liquid Juice, besides which it is powerfull against Catarrhs, or fluxes of Rheum falling down the Throat upon the Lungs, it prevals against four and Cholerick Balthings of the Stomach, is fald to cure Ruptures or Bartelets, and the Whites in Women, as well a simple Gonorrhoea in Men, being taken inwardly, and outwardly injected into those parts with a Syringe, for being very drying and binding, and strengthening whereby; it not only restrains those parts, but promotes their done unites; it is admirably good also to wash all green Wounds and old running Sores or Ulcers, healing the first, (if simple) without suppuration, and cleansing, stopping the defluxion of Humors, and drying the other, in order to its speedy healing; and if there be any inflammation, or beginning of a Gaugreem about the parts, it prevents it, and soon cures it against any dangerous Accident. Dose two, three, or four Spoonfuls in any convenient Vehicle Morning and Night.

XXII. The Syrup. It helps Coughs, Colds, Catarrhs, and Affirms, prevails against obstructions.
Salmon's Herbal. Lib. I.

of the Lungs, thickens the putridous matter, and
causes expectoration, mixed with Gargantria it
heals Sore and Ulcers of the Mouth and Throat.

XXIII. The Decoction in Wine, or Wine and Wa-
ter. It has all the Virtues of the Liquid Juice and
Effence, but ought to be given in a greater quantity,
and that Morning, Noon, and Night: Gerard lays
it is not only available in the stopping a flux of Blood,
or flux of Humors, than the Herb or Juice.

XXIV. The Pouder of the Herb. Given inwardly
by a Dram, or more, it stops inward fluxes of
Blood, whether by the Mouth, Anus, or Bladder,
it cures fluxes of the Bowels, and is good against
Catarhms; outwardly applied to any green or fresh
simple Wound it quickly conglutinates the lips
thereof, and heals it, and applied to any irritative
running Sore, or old Ulcer, it (in a little time)
stops the fluxion, cleanses it from its fordes, increas-
ates where Flesh is wanting, dries, and in a little
time heals it.

XXV. The Boffon or Pomatum. If to Every Pound
of the Ointment or Balfm three or four Ounces of
the Pouder or Tobacco be added, it will become
most admirable Medicaments or Topicks for the cur-
ing of old running Sore, irritative and pastoral Ul-
cers, and malign Fihula's, being first wall'd by in-
jection or otherwise with the Juice, Effence, or De-
cocition, and then (twice a day) draped up with one
of these Preparations, they are all profitable against
the Gout, or other Aches and Pains in any part of
the Body.

XXVI. The Cataplagon. It may be made of the
Herb alone, or of the Juice mixed with the Pouder
of the Herb, or with Barley Flower, &c. applied to
flusses of Blood in Wounds it stops the bleeding, it
strengthens parts weakened by any Disease, as the
Joins by the Gout, the Nerves by Palfies, &c. and
hinders the flux of any Humor to the weakened
parts, applied also to a simple recent Contusion it
difficultes the Tumes, and restores the part hurt.

CHAP. CCCCVIII.

Of I V Y Tree or Wall.

I. The Names. It is called in Arabick Coffas,
in Greek Hederis. &c. in Latinine Cotone,
and Citton, and Hedera, the first of these Names
some have thought to be derived from Hermin Pat-
more, five Lopes porros, quas at the Apyon, at the
Vicem texuras poros, & sperancia innumerio pas-
vas Viam transitur, unde Catoni & Varrom Gif-
sangis Poeculum Hederaecum aff. And probably
might it be that from this Collas might lay, That a
Capunda of Ivy Wood will not hold any Wine therein.
The latter Name, Hederam were Pompeius didum
creatis, quos haece, vel patrius edas petuit, vel quas
secan dolentis edit & censebat, and in English it is
called Ivy.

II. The Kinds. There are five several sorts of
Ivy, viz. 1. Hedera Arboris, five Sceudeus, Hedera
Corymbo-Agro, Orbechdia, Hedera ardis, Hedera
regna Planta, Common Ivy, Tree Ivy, or Wall Ivy,
and this is that which all Authors call Hedera sim-
ply, which is Our Iddar Tove Ivy, called also He-
dera nigra, Black Ivy, because it bears black Berries.
2. Hedera Corymbo-ahis, Hedera Corymb, White
Berry bearing Ivy. 3. Hedera Helix, Hedera Steri-
ita, Hedera Helle prunivoca, which is thought to be
the Helle Difurtale, Theophrasii & Pliny, which
they make to be the third Species of their Climbing
Kinds, yet it is seldom seen to climb up in the man-
ner of the former, but lies for the most part on the
Ground; but Johannes Thuvell in his Historia Sylva
says he found it climbing as well upon Trees as crep-
ing upon old Walls and Stones; this some lay is
latter, as not bringing forth any Fruit, yet others
lay this is rather for want of Age, for that in time
it would bear, and change into the other kind, as
Theophrasus and Pliny lay, this is that we call Bar-
ren Ivy. 4. Hedera Virginiam, Hedera Tripila
Virginianæ, Three Leaved Virginian Ivy. 5. He-
dra Quingue foliata Virginianæ, five Virginianæ, Five
Leaved Virginian Ivy.

III. Hedera Thysia, Bushmilk makes it to be a
differing sort from Hedera Helix, et Sterilis, Our third
Ivy, or Barren Ivy above mentioned, and calls it
Hedera Harti reportus, which yet Tho. himself di-
riguiteris not, but says, that it which whilst
it is young brings forth no Fruit, when it is grown
old, and that there is no difference in his two
Kinds of Hedera and Hedera but in the Age; this
Barren Kind, lays Prickshoon, which creeps upon the
Ground, will yet with its climbing Branches take
hold of whatever is next unto it.

Ivy Tree or Wall.
Leaves, Flowers, Berries, and manner of growing, differs very little from the former, and is chiefly distinguished in these things, viz. that the Leaves are thinner and finer, and of a little longer duration only; and that the Berries are of a whitish or greyish color when they are ripe, and not black, as the Berries of the Common Sort are.

VI. The third, or Barren Ivy. From a woody springy Root, as the former, it sends forth several slender and tendy Branches, trailing upon the Ground, and for the most part lying thereon, but sometimes it is found to wind it fell and climb up the Trees, B bushes and Hedges under which it grows; with the small Tendrils or Claws it shoots forth at the several joints of the Branches, where the Leaves come forth, being somewhat lefter than the stiff Common Kind, and of a dark thinning green color. These Leaves formcd into three corners, and sometimes into five; at the Joints with the Leaves there thrufs forth under them small white Fibres, Claws, or Radicles, by which it taketh hold as it creeps; it very rarely has been seen to bear either Seed or Flowers.

VII. The fourth, or Three Leaved Virginian Ivy. The Roots of this Plant do shoot under Ground, and send forth young woody Stalks, from thence will stand upright, others lie down, and take root again as they spread, as also on any Wall they stand nigh unto, like unto our former Barren Ivy; the Leaves are broad and large, three always growing together, and a long footstalk; at the Joints with the Leaves come forth pale Flowers in a loose Tuft or Cluster, which turn into pale yellow Berries, with small hand, round, Aft Colored Seed in the bottom of them, and without any moisture at all in them, this Plant yields a white Milk, without any taffle in it, being broken in any part thereof, which Milk after it has lain a while will change to be as black as ink, and therefore is thought to be a good Material to color Hair or any other thing Black.

VIII. The fifth, or Five Leaf Virginian Ivy. This Scleroder, or Tall Climbing Virginian Ivy, has a Root which spreads bore and thereunder the Ground, but not very deep, from whence rife up several stems or Stalks, none much bigger than a Mice Thum, many les, from whence shoot forth several and many long with Branches not able to stand upright unless they be filthioned, yet being planted near unto a Wall or Pale, or House fide, the Branches at several distances of the Leaves will shoot forth small short Tendrils or Claws, not twining themselves about any thing, but ending in four, five, or six, or more, short and somewhat broad Claws, which will fallen like a Hand with Fingers to clofe therunto, that it will bring part of the Wall, Mortar, Board, Glass, Brick, or Stone, away with it if it is pulled from it; and by these Claws it lays it flat, and climbs up to the top of the highst Tree, Wall, House, or Chimney, being planted by them: the Leaves are crumpled, or rather folded together, at their first coming forth, and very red, which afterwards growing forth are very fair, large, and green, divided into four, five, six, or seven Leaves, (not regular to a certain number) standing or growing together upon a small footstalk, and set without order on the branches, at the ends whereof, as also at other places sometimes, come forth several short TufTs of Buds for Flowers, which here in England never come to that perfection, as to open themselves and shew what kind of form they would be of, much less what Berries a Heed would follow the use of this is chiefly to furnish a Garden, and to be an Ornament to the place it is planted in.

IX. Or thus, according to Gerard. There is kept for Naveline false in doory Gardens a Virginian Vine, but which is indeed an Ivy, the Stalks hereof grow
Salmon's Herbal. Lib. I.

The Virtues.

The Virtues of the Leaves. The fresh Leaves are commonly used to be laid upon Illness of the Liver, in Arrows, Legs, &c. to keep them open, and to draw forth the Humors which fall upon the same parts.

The Virtue of the Leaves. The Virtue of the Leaves is of use to make little round Balls of, about the bigness of a High Swan Shot, or white or grey Pea, which are used for Holes instead of Pea, drawing forth the Humour exuded, and keeping the Sores open, and this they do by reason of their (Expediency, or power,) being much more porous than Pea, and so more apt to be filled with the Ferocities of the Illness, if the Wood is made into a Cup, and Ale, Beet, or Wine be put into it, to as to hard 'in it for some time, and then drunk off, and this continually done for some days, it is laid to help such as are troubled with the Spiles, and to give ease in the pains thereof. A Cup sayeth this to the Doctor of Villains, and that the Doctor of Villains may be found out by one of these Cups, if they mix any Water with their Wine, for the said mix'd Wine being put into one of these Cups of Ivy Wood, the Wine will soon find the Wood and leave the Water behind it for Cere and Parre both say it is the nature of Ivy Wood not to hold any Wine, so great an Anathomy there is between them.

The Virtue of the Fruit. That which is gathered in hot Countries from the Body and Branches of the Ivy, (either by a voluntary lifting therefrom, or by bruising thereof,) is exceeding sharp and hot, burning and exalating the Skin, yet is used, being dilu-ved, to take away Filthous Hairs in any place, and to destroy Nits and Lice, also Crab-Lice, in which parts Brerers, being diluved in Vinegar and put into a ballon Bag, both the pain, and being often used will cause it to fall out, some use this Gum with other things as a Bait to kill Fish, see more hereof in my Bephalan, or Druggists Shop. Lib. II. If you may find the Gum to use thereof, and also the Signa how to know it, and to distingush the true from the falk, that falk in the Druggists Shops being for the most part counterfeit, it is not the true form or shape of the Virtues of the true Gum, the falk being for the most part full of Sticks, dusts, and filth, blunte, and of an infipid taste, whereas the true is of a yellowish or red color, clean, of a strong smell, and of a sharp, biting, and exalating taste.

The Virtue of the Flowers. It is much taken inwardly it is apt to cause Blemishes in Man or Woman, it also causes a weakness and trouble in the Brain or Understanding, and afflicts the other Sense, for which reason Authors say used much inwardly it is an Enemy to the Nerves, but much strengtheneth them being outwardly applied; the juice of the Leaves or Brerers used as an Elinrise, by compelling it up the Node, purges the Head and Wind of thin Rheum, which causes Cataracts or Declinations into the Glandules of the Throat, Jaws, Eyes, Nose, or other parts adjacent, and cures linking Ulcers in the mouth, dropped into the Ears it cures old and running Sores and Ulcers in them. Dose one or two Spoonfuls inwardly in a Glafs of Wine, or other in Vehicle.

The Virtue of the Root, Leaves, or Berries. It has all the Virtus of the Liquid Juice, but is more powerful as being depurated, and so is to be given in lesser quantity, as from three quarters of a Spoonful to a Spoonful and half, increasing the Dose as the Age and Strength of the Patient will bear; it is very good against the Yellow Jaundice, provokes Urine, and is laid to be good to break the Stone, and expel Phlegm, Gravel, and Gallstones from the Urinary parts, taken also Morning, Noon, and Night in a Glafs of Wine it is a good preservative against the Plague, or any other infectious Diseafe, and is of singular use to cure the same after infection.

The Deception of Leaves or Berries. It has all the Virtus of the Juice and Efficacy, but nothing near it in power, and more than to three to fix Spoonfuls sweated with White Sugar, a Deception in Vinegar mixed with Danish Rose Water and Oyl of Roses, and applied to the Forehead.
Chap. 408. English Herbs.

Head and Temples gives ease in the Headache, tho' it be of long continuance, and applied warm to the Sides of such as are troubled with the Spleen, Aches, or Stitches in the Side, relieves the Colicommum if any be uttered given in the Belly, the Dejection of Levevines or Barries in Wine is of excellent use to cure old running Sores and Gibbous Ulcers, which are difficult to be healed, it admirably dries, and heals them, and it is also excellent for the speedy cure of green simple Wounds, by uniting the Jeath and con-solidating their Epis; the same is good to heal Scaldings with Water and Burnings with Fire, and the Excoriations which happen thereby, occasioned by the falls, heat, or Harpunts of Humors flowing thereto.

XXI. The Powder of the Flowers. A Diam of the Flowers (being dried carefully and reduced to powder) being given in the Evening, kills Worms in Old or Young, and prevails against the biting of the Pothanum; it is a singular Remedy both to prevent the Plague or Pestilence before infection, and to cure the same after it has flourished the Patient, by drinking the Powder from half a Diam to a Diam, (according to Age and Strength) in any fit Phosphatitl Vehicle, or proper Inamotadus Liquor, Morning, Noon, and Night, for three, or four days together, and being taken in White Port Wine for some certain time it opens the obstructions of the Reins, Urethra, and Bladder, gives ease in the Strangury, provokes Urine, and breaks the Stone, expelling Sand, Gravel, and Tartarous Mucilag from the Urinary parts and paf- afterwards Tragos says that it provokes the Terms in Women, and is so powerful in its operation on those parts, in driving forth the dead Child and Afterbirth, that it ought to be cautiously used, and not but upon necesity.

XXII. The Bath of the Leaves and Berries. It is a strong Decoction of them made in Water, if a Woman which has had a Child in it, is taken as hot as she can conveniently bear it, it forces away the Child and Afterbirth, and being once or twice re-peated causes a due cleansing; it is a Woman whole Course in this respect, and repeat it for Dropsipus, if some times, it effectually brings them down, but a Woman with Child ought cautiously to forbear the use thereof, because it will endanger Abortion.

XXIII. A Posy of Leaves and Berries. It has all the Virtues and Operations of the Bath in the former Section, but not altogether so powerful, yet it is very much prevail to bring down the Terms when Hop'd, and being often repeated forces away the dead Child, &c. as is before expressed.

XXV. The leaves made of the Branches being burnt. It expels all pestilential and infectious Vapors, cools a putrid Air, which causes malignity and putridation, and drives away Puts, Gouts, and other troublesome Insects of that kind.

XXVI. The Acid Tincture of the Berries. It opens all obstructions of the Urinary parts, breaks and expels the Stone, relieves Vomiting, strengthens the Stomach, and is a good Prophylactic and Cum-mative of the Plague of Pestilence, it destroys the malignity and putridative heat of all Fevers, cools, and allays Thirst. Dose so many drops as to give the Velliculum a pleasing acidity, which may be repeated two, three, or four times a day, or more, as need requires.

XXVII. The Spirituous Tincture of the Berries. It has the Virtues of the Juice, Emence, Decolation, and Powder, but a much more pleasing Medicament, because finer, purer, containing of more simple parts, and given in a much smaller Dose, and by reason of its preparation with Spirit of Wine is also more Cordial and Reoertick. Dose fifty or fifty drops Morning and Night in a Glass of Wine, but it is not long to be continued lest it induce Bumemes; outwardly bathed upon Nerves and Tenacions parts it comforts and strengthens them, and alleviates aches and pains coming from a cold and moist climate.

XXVIII. The oily Tincture. Immediately given it prevails against the Palsie and Leuthamy, gives ease in the Strangury, provokes Urine, breaks and expels the Stone and Gravel in Reins or Bladder, and alleviates the pains of the Colicick, currently, it is used in the Gout, (a little Camphir being dissolved therein) it gives ease in pails and stitches of the Side and Spleen, dissolves cold Tumors, and gives relief in a Gout proceeding from a cold cause. Dose inwardly from ten to twenty, or twenty five drops, dropped first into Sugar, and then the Sugar mixed with the Velerulum you design to give it in.

C H A P. CCCCIX.

Of IVY Water, or

Ivy Leaf'd CROWFOOT.

I. THE Name. I know not of any Greek Name it has, but it is called in Latin Hedera aquatica by Gerard and Ladder, also Ranunculus Hederaceus Dactylanum, &c. Lopcherruya, Aleyria Leaved in English Water Ivy, or Ivy Leaf'd Crowfood.

II. The Kinds. It is certain it is no Species of Ivy, properly so called, but a singular Plant of its Kind, obtaining the Name Hederae stately from the form of its Leaf, and froms the nature and qualities of the Herb to be more allied to the Stock of the Crowfeet than any other Plant.

[Image of Ivy]

III. The Description. This Hedera aquatica, or Water Ivy, has small thinly Strings instead of Roots.
Salmon’s Herbal. Lib. 1.

582

Roots or Stalks, which spread themselves very much under the Water, from this springy Root grow forth several slender trailing Stalks, rising from the bottom of the Water in the top, these Stalks grow forth at the lower ends and with the Leaves under the Water several other small Fibres, which serve as Roots also with the former. From the Stalkslikewise at the joints come forth divers triangular Leaves, in form of an Ivy Leaf, which Leaves, thole which grow near the tops of the Stalks, float upon the top of the Water, and are many, each of their three parts, turned alike in a triangular or three cornered manner, like thole of Barren Ivy, or Noble Liverwort, and are sometimes marked with a black spot, and with these Leaves from the joints come forth small knots of yellow Flowers, standing upon indifferent long footstalks, but Gerard says it is barren of Flowers or Seed.

IV. The Places. Gerard says it is very rare to find, and that he found it once in a Ditch by Bermondsey House, near London, and never elsewhere, but Parkinson says it is found plentifully enough in divers places of this Land, I have found it in Ditches, Pools of standing Water, and other like wet and plaited Grounds in several places of Cambridgehire, but it always grows in Waters.

V. The Times. It Flowers in May and June, and gives its Seed in some small time after.

VI. The Qualities, Specification, Preparations and Forms are exactly the same with thole of Common Creeping, and therefore I refer you thither, where they are handled at large in Chap. 175. Sect. 24. ad 34. so that no more need be told thereof in this place.

JUNIOE’S TEARS, see Vernonia Chap. (§ 1.) JUPITER’S BEARD, see Hottentot Great Ch. 384.
JUPITER’S DISTAFF, see Clery Chap. 137. Sect. 2. JUZ V, see Darenth Chap. 211.

C H A P. CCCCX.

OF KATHERINE-FLOWER, OR Roman NIGELLA.

I. THE Name. It is called in Aridick Xaneth Suza, Sanniz, in Greek Melanthion, and Nigella, in English Katherine-Flower, Vernal-Flowers, and Roman Nigella.

II. The Kinds. There are severall sorts of Nigella, or Fennel-Flower, viz. 1. Melanthion, or Nigella Roman, Roman Nigella, or Katherine-Flower, properly so called, of which in this Chapter. 2. Nigella Cretica, Fennel, Fennel-Flower, or Nigella of Candia. 3. Nigella Hispanica or De- Spanish Fennel-Flowers, or Multiplici, Spanish Fennel-Flower, or Nigella Single and Double, which we Treat under the Title of Nigella in some of the following Chapters of this Book.

III. The Kinds of Roman Nigella, or Katherine-Flower. Of these there are the three following sorts, 1. Nigella Roman, or Roman Nigella, Sweet smelling Nigella, or Sweet Scented Katherine-Flower. 2. Nigella Roman Aristophora, or Field Katherine-Flower.

Wild Fennel-Flower, or Katherine-Flower. 3. Nigella Romanus Arsenius, Field Fennel-Flower, or Field Katherine-Flower.

V. THE DESCRIPTIONS. The 5th, or Roman Fennel, smells Nigella, or Katherine-Flower, has a Root which is small, thready, yellow, and prettying every Year, this Fennel Plant grows up to be two Feet high, more or less, with several slender Branches, and many leafy cut and divided Leaves on them, nearly as fine or small as Fennel, (whereone of the Names) and very like unto thole of the Larkspur, at the top of every Branch stands one Flower, male of five leafy Leaves, laid abroad like a Star, without any green Leaves under the Flower, as in some Single, and another Double leafed, with a green Head in the middle, committed with some few Threads, which Head grows to be the Seed Veil, being a little long and round, with five small fiolet Tops, like Horns, standing at the tops of the Heads, in which they in several Cells small, black, and very sharp, fiver, fying smelling Seed.

V. The second, or Wild Fennel-Flower, or Katherine-Flower. This grows very like the former for its green Leaves, but a little smaller and shorter, the Flowers are blew, and like the former, but the Head with its Seed is larger, and the Horns longer, the Seed wherein is usually black, sometimes a little white, and sometimes yellow, without any Seed at all: there is another like this of this sort, differing in nothing from this, but only that its single Flowers are white, and its black Seed without fiver.

VI. The third, or Field Fennel-Flower, or Katherine-Flower. This Field Sort is very like the last, but it grows thinner of Branches and Leaves, and they also fiver, the Heads are smaller and longer, as the Flowers also are, but of a pale blue color, the Seed being black likewise, and without fiver: there is another of this sort, differing little from that now described, but in the Flowers, which being fiver and blew like it, have green Leaves under them, and the Seed being black is somewhat fiver.
Chap. 410. English Herbs.

VII. The Places. The first is usually Sown in Gardens, even in Italy, and other Countries, the others grow wild, and in Corn Fields of Italy, and other Southern Countries, with us all grow in Gardens only.

VIII. The Times. They are all Annually to be Sown in the Spring, if they do not Sow themselves, and they Flower in June and July, giving their ripe Seed in July and August.

IX. The Qualities. The Seed, (which is chiefly used) is hot and dry in the third degree, it is Aper- rent, Attrusive, Carminative, Digestive,利ptic, Pelletordial, Nephritick, Alexipharmic, and of thin and balsamic parts, where note, the first Kind is only used in Physick.

X. The Speciation. It wonderfully prevails against thin and evil Catarrhs, expels Wind, kills Worms, helps thirsts of Breath, provokes the Terms,-causes the Strangury, expels Stone and gravel, and in an Acrid Time against Poyson.

The Virtues.

XII. The Liquid Juice. It opens obstructions of the Vesica, chiefly of the Lungs, Reins, and Womb, mix'd with equal parts of Honey, and So taken, it helps against Asthmatic, causes free breathing, retards Aversion, expels Catarrh, Digestives, &c. Cures the Strangury, expels Sand, Gravel, and Tartarous Matter out of the Urinary parts, gives ease in the Colic, and forces down the Terms in Women, kills Worms, and dries up Caudars. Do one Spoonful to two Morning and Night for some considerable time; it may also be mix'd with White Port Wine, and so taken.

XIII. The Aperient of the Juice. It has all the Virtues of the Liquid Juice, is something more pleasant to be taken, and more powerful in its operation, and therefore ought to be given in some heat a letter quantity, taken with Honey is a Remedy against Poyson, the Stinging of Scorpions, and the Biting of the Spider, Spinulamum, given mix'd with a simple distill'd Water of Aeguilea, Amostra, or Ren- cord, it is said to increase Milk in Nurs'd breasts.

XIV. The Infusion of Herb or Seed in Wine. It has all the Virtues of the Juice and Aperient, but must be given in larger quantities, viz. from four to six, or eight Ounces, it helps thirsts of Breath, provokes Urine, and is good against the Biting of Venomous Creatures, &e.

XV. The whole Seed. It is said that it was eaten familiarly in former Times, being famed upon their Bread, or rather put into their Bread in making, and so put in as Poppy Seed was, tied in a Cloth and boiled to, being of hot, dry, and thin parts, it helps to dry up Rheums and Distillations from the Head, as Canker Lays, and being put into a Cup among other things for that purpose it does much good; being often boiled to it is said to reduce the Sult of Smelling to those who have it, it serves well to put into antidotal Powders and Balsams among other sweet things.

XVI. The Powder of the Seed. Being taken from half a Dram to a Dram in Wine it is a Remedy against thirsts of Breath, and difficulty of breathing, diffuses and expels Wind, provokes Urine and the Terms in Women, increases Milk in the Breast of Nurs't, not being too much taken, it kills and drives Earth Worms in the Stomach and Belly, whether taken in Wine or Water, and this it does the more effectually if it is applied White-wined, or in a Cataplasm, to Stomach and Navel, it is an excellent Remedy (as Galen says) where there is need of heating, cleansing, and drying.

XVII. The Oil of the Seed by Expressing. It has all the Fiive Virtues of the Seed, expressed in the former Section, and may be given from twenty to forty drops, first mixed with Honey, or Syrup of Clove-gillinflowers, or other proper Syrups and then taken in a Glass of Wine, Sack-Whisy, barley-Bread, or other proper Vegetable, Morning, Noon, and Night.

XVIII. The Acid Tincture. It is good against burning and malignant Fevers, the Plague or Pestilence, and other contagious Dities, it refits Poyson, it is good against the Stinging of Scorpions, the Biting of Mad Dogs, and other Venomous Creatures, and has all the Virtues of the Juice, Efficiency, Decoction, or Infusion and Powder of the Seed afterfoeing. Do so many drops as to give the Vehicle a pleasing ac- diroy, several times a day.

XIX. The Spirituous Tincture. It clears the Heart, revives the Spirits, refists Fainting and Swooning Fits, prevents against palpitation of the Heart, drives up Caudars and Rheums, diffuses and expels Wind, strengthens the Stomach, cures a good Di- gestion, provokes Urine, and is profitable against Gravel and Stone; given to a Woman in Labor from one to three Drams in a proper Vehicle it facilitates the Delivery, and brings away the Afterbirth.

XX. The Oily Tincture. It is good against the Colic and inward Convulsions of the Bowels, opens obstructions of the Womb, Reins, Uteruses, and Bladder, gives ease in the Surfprinting and Sand, Gravel, Stones, and other Calculous or Tar- tarous Mucilage out of the Urinary parts. Does from ten to twenty, or thirty drops, first dropped into White Sugar, and well mixed therewith, and then given in a Glass of White Port Wine, it gives ease in the Gout outwardly applied, is excellent against the Wounds or Funicature of Nerves and Ten- dons, and helps the Birth of Women.

XXI. The Decomposition of the Seed in Vinegar. If it be held in the Mouth of such as are troubled with the Toothach it eases the path, bathed upon hard it cleans the mouth, Swellings it diffuses and dissolves them, it is a good Cure of the Eyes of Sult, and being daily applied to the De- formities of the Skin, as Tatars, Kingworms, Scurf, Swollen, Yellowness, Spots, Freckles, &c. It is said to cure them.

XXII. The Tonic from the Herb or Seed being burnt. It drives away Flies, Gnats, Musketoes, &c. out of the Room in which it is used in Summer time.

XXIII. The Spirit from Herb or Seed. It is Cordial, expels Wind, cures the Colic, prevents against Convulsions in Children or Elder People, and cures Fainting and Swooning Fits.

Of KALI, or GLASSWORT, Called also SALTWORT.

T H E Names. It is called in Arabic Kal, it knows no Greek Name, but in Latin it is called
called Kali Allo, and Salticornia, Salticorium, and Salticorum genun, in English Kali, Glasswort, and Saltwort. The Alhes hereof are called Sals, and Rhus, and their Seeds, or Salt Alehs, the Salt of Kali, or Glasswort. Kali is an Arabick Word, and in that Language signifies Salt.

The Kinds. There are four Kinds of Kali, or Glasswort, viz. 1. Kali Gentilicium, Salticorum, Salticorum genun aut Cephalina, Salticorium, joined Glass- wort, or Saltwort. 2. Kali majus Cocleatum, Kali majus Saltri, Kali Cocleatum, and Cocleatum, the Small White Saltwort. 3. Kali microcum, Kali microcum Selvifolium, Kali Bini, Kali microcum Thalid, Small White Glasswort.

4. Kali Erythrorum, Cephalis vulgaris, very small, Kali Alpinus, Kali Alpinus, Kali Gentilicium, or Saltwort.

III. The Descriptions. The first, or jointed Kali, Glasswort, or Saltwort, has a Root which is small, long, and thready, it rises up whitish with but one Stalk, and is round and white, divided into three Pins, or straight thin, a Foot, or Foot and half thick, thick fat, and full of Joints, or Knots, without any Leaves at all on them, but shooting forth Joints one out of another, and one as the end of another, with short Cods, at the heads of them, and also such like smaller Branches on all sides, and they are also divided into another others, that is thought to bear neither Flower nor Seed: there are some other Kinds hereof, as Kali Gentilicium breve, differing a little in the form of the Joints one another, and Kali Gentilicium rubrum, one which is wholly reddish, not differing in any thing else from any of the other jointed ones.

IV. The second, or Great Glasswort, or Kali with Small like Seed. This has after which is somewhat long, with many fibres adjoining to it, and penetrates every Year for the most part after it has given Seed, it rises up with a big, round, reddish, fatty Stalk, very thick, into a Perforation, about two Feet high, divided into many Branches, on which do grow many thick, long, round, reddish Leaves, pointed at the ends, growing without order, sometimes one or two, the other branches more standing at a place, here and there dispersed upon the Branches come forth also green small Leaves, and after these small brownish Heads, turned round like Small, in which, after a small round Seed, this Plant has an all Dull, but Edible.

V. The third, or Small White Glasswort, or Kali. It has a Root like a Sedge which is small and round, and rises after it has given Seed, it springs up from the Root with several whitish green Stalks, or Branches, rising so high as the former, and bending or leaning down to the Ground, spreading in it Into other smaller Branches full of Joints, wherein grow more floure of smaller and thower, round and pointed Leaves, nothing to fatty as the former, and of the same green color with the Stalks, the Flowers are white, and stand singly on the tops of the Branches, after which come small Huds, in which lies the Seed, which is small, black, and thin-shelled, and dry, Sweeter Seeds.

VI. The fourth, or Egyptian Kali, Glasswort, or Saltwort. It has a Root like the others, and grows up with one slender Stalk, bending it self downwards, and branching forth at the Tines into other small ones, which for the most part stand more upright, and at every of the joints two very long and somewhat hairy Leaves, bowing themselves downwards because of their weight, though the last Branches are bare, without Leaves unto the tops or ends of them, where grow many small and long Leaves, hairy, like to the former, but nothing so large, from among which grow small, whitish, purple Flowers, with many small, white threads in their middle, of this sort there are some with shorter Leaves, differing in little else.

VII. The Places. The first as well as the fourth grows in Egypt, and it generally grows among other Sea Plants on the Sea Coasts in all Countries, I found it growing plentifully in the Salt Marshes in South Carolina, as up Wadmalaw River, and on the Islands and Marshes of Wando River, not far from the Sea face, and in other Salt Marshes of the same Country, it grows also on our Coasts of England, in many places, in Saxony, and other parts of Germany, where there are Lakes of Salt Water, the second grows by the Sea sides in several places of Syria, Africa, Italy, and Spain, as also in France and Flanders, where they grow large Fields thereof, for the Prophets they make of the Salt or Albania of the Plant in making Glafs and Soaps, the third grows not only in the aforementioned places, but in other cold or Chilly Countries, not by the Sea only, but by the Salt Ponds in England, and in other Countries, but I found also on the Sea Coasts of England and Ireland, the fourth, as Algeria Elys, is more peculiar to Egypt, and Solomon says it is frequent on the Western Acliptum Shore.

VIII. The Times. They all four thrive in the Summer, and which they partake give their Seed in Autumn, or something later, the leaf of them abides all the Winter.

IX. An Observation. Out of this Herb is made the Alehs of the Arabs, Levesso, Egypt, Ely, or Pot Adhes, as we in England call them, called also by other Names, as Pterocera, Pterocera, Rhes, and Sals, which are all the same thing, made of the same Matter, but do each differ in goodness, according to the place the Matter comes from, and the Method or Order of making of it, the Matter is the Herb Kali, (Allo Ales, or Kelp) which is Sago, Sargassum, Sea-Weed, Sea-Hearts, or Sea-Lowers) the goodness of the Herb is taken from the places of its growth, that which grows on the Coasts and Banks of Syria, Egypt, the Season, is the best, that which grows on the Coasts of Spain, Italy, and France, is the next best, that which grows on the Coasts of France is worst, but that which grows on the mouth of the Thames, and other Maritime places of England, is the worst of all, as making Adhes, which yield the leaf Salt, or Salt Alehs, of any of them.

X. The Qualities. The Herb is hot and dry in the end of the first degree, the Adhes or Salt is hot and dry in the fourth degree, Aperitive, Altheative, Digestive, Diuretive, Fopotic, and Caffedick, Nuphaentic, Hypometric, Arthritic, Spumagogick, Sudorific, and Alexipharmacick.

XI. The Specification. Kali purges pituitous, watery, and melancholy Humors, provokes Urine, is good against the Dropsey, opens old Ulcers of Li- yer and Spleen, brings down the Terms, and expels the dead Child.

The Virtues.
Chap. 411. English Herbs.

Child, it open obstructions of the Liver and Spleen, and cures the hardneth thereof; it gives life in the Epilepsies, Gard’s Sciences, &c. XIV. The Powder of the Herb. It has all the former Virtues of the Juice, but not fall out so effectual as it, and may be given from half a Dram to a Dram daily, in Water, or in any other proper Vehicle, it is sometimes mixed with those things which are used as Corroboratives, to cure Superfluous, proud, or pious Fleshes, which grows in foul and violent Ulcers. If it is given too great a quantity it is mischievous and deadly, as Gerard says.

XV. Pot Aher. They have all the Virtues of the Juice and Powder, and are equivalent in operation to the Akes of Tartar; they are powerfully aperient, provoke Urine in the last degree, and carry off a Droppe by Urine, being made into a Liqui-

vium with Water, and given in Wine, they are very effectual and bring it like a Catechu, and the Lye which is made thereof is so strong, that it will fetch off the Skin from the Hands, or any other parts of the Body it is applied to, and therefore if any use it to destroy the Stone from Stones, Fears, Lentsils, Yeasts, Sunburning, Tanning, Soruf, or Mop-

phrase, or other like Dellemens, they ought to be cautious in using it, and apply it very sparingly, or else Bad Fleshes, and fear may do them much good. How these Akes are made for our Sepulchrum, or Dragges Shop, Lib. 2. Cap. 4. Sel'd 11. and 12. where, and in other Sections of the first hundred, you may find the authentic Satisfaction, and you may also go to what Mechanick Uses they are to be applied, as also in Sel'd. 22. of the fame the root of their Medical Uses, to also our Polygra-

XVI. The Salt, or Salt Alkali. This Salt is made out of the Pot Akes, and has all the Virtues of Salt of Tartar, and almost in the fame degree of good-

ness; how this Salt is made is in perfection in our Polygrap-

hie Lib. 10. Cap. 1. Sel’d. 12. 13. 14. 15. 16. These Akes which come from Spain and the Levant are good, where, by reason of the heat of the Climate, Fears grow in great quantities, and is green all the Summer, but these Akes which come from Egypt, where there is never any Rain, are the strongest, and make the strongest and sharpest Salt. The Akes coming from the Levant are called Pot Akes, because they are in Powder, and have no such Preparation as Soda and Rochele have, for the Herb is but hard on Iron Grates, and afterwards when cold the Akes are gathered up and kept in Rocks for use; these Akes have indeed less Salt than Rochele and Soda, but for the quantity it is nothing inferior in virtue and goodnesh. Our Dutch Pot Akes, which are pure white, and in great hard lumps, are the best in the World, yield most and purest Salt, and of the strongest kind, and therefore of excellent use in making Soap, Glais, &c. This Salt prevails against the Jaunices, Droppe, Scourvy, and Gout. Dole a Scruple or half a Dram in a Glass of White Port Wine.

XVII. The Soap. If it be spread upon a piece of coarse thick brown Paper and applied to the Soles of a foot, and those who have Back Speechles, it brings them to their Speech again in a little time, if there be any hopes of restitution, anointed over the Face of one who has Lentsils or Frailles theron it obliterates them away, but it is by a gentle taking away of the Skin, after the manner of a Scurf as it were, spread upon Leather and applied to the Hips in a Scutian it cures it, being removed as it doth require, the Emollients does not being applied to places painted with the Gout, and repeated accord-

ingly.

XVIII. The Sandexer, or Glis-Salt. It is what often being made into Powder to be blown into the Face, makes the Eyes dry a Quill, or being diffilved in Water and squired into them, to take away the Skin which grows over the Sights; it takes away all Cakes and Mungels, if the parts afflicted be often bathed therewith, and serves to dry up almost all Sores and Scals, helps against the Herb, and ill Tastes, Ring-

wormes, and the like, being often wafted therewith, and soared to dry it, it serves to make Metals ruin, and a little thereof put into Antimony and Ni-

tre for making Green Alcloriferum, increaseth the quantity of the Ovenses, and it will therewith the better separate from the Sandex, Glais being made with Pot Akes and other Materials, as Sand, Cry-

tal, &c. this Sandexer is that Salt which is found-

ed off from the top of the Glis in the making thereof; that more of it in my Sepulchrum, or Drag-

gisc Shop, Lib. 2. Cap. 15. where you may have fur-

ther Satisfaction.

XIX. To find out the quantity of Salt Alkali which is contained in any quantity of Pot Akes. Take a Pound of Pot Akes, dissolve them, by boiling in eight or ten Pounds of hot Water, make the remaining clear well settled decoct off the clear Liquidum from the Faces, the Faces dry either in the Sun or before a fire, or in an Oven, or over a Sand heat, and then saw them, for so much as they want for the making of much Salt is contained in each Pound of Akes, and so many Ounces of Salt you have in your Liquidum. In some of your Oriental Pot Akes coming from Syria, Egypt, &c. you may have about ten Ounces in a Pound, and in some other not above nine, or eight Ounces, and some of the warfer forms of Akes do not contain above seven or fix Ounces in a Pound, so great a difference is there in the godnesh of the Akes, but out of a Pound of the best, strongest, and whitest Dutch Pot Akes we have obtained various times from thirteen and fourteen Ounces of pure Salt, very easily to Little as twelve Ounces, the strongest and best Akes are those which are in greatest lumpes, very hard, and white, as it were of a blemish white, (which color ariseth from the well burning) and such contain the greatest plenty of Salt.

C H A P. CCCCXII.

Of KELP, SEALACES, OR, SEA-THONGS.

1. THE Names. It is called in Greek φῦκιον, and φῦς φοινικόν, in Latin Alga, and Alga Maris, also Alga Maris, and Phycus, or Phycus, or Bonus Marinus,onr, being added thereto to differeth it from Fucus Herba, which Is Antocha, in English Kelp, and meaning.

2. The Kinds. Of Kelped, there are several Kinds, viz. 1. Alga Maris, Bonus Marinus, Kelp.

Salmon's Herbal. Lib. I.

2. Quercus Maritima minor, The Feather Sea-Oak, or Sea-Wrack. 3. Quercus Maritima Torris, The Third Kind of Sea-Oak, or Sea-Wrack. 4. Quercus Maritima quarta, Jagged Sea-Wrack. 5. Fucus, Alga in distinct Sea-Curled Endive. 6. Fucus from frafta nodosus, Sea Raggedturf. These two last generick Species fee in their proper places under the Tides Other green, and Sea-Wrack.

IV. The Definitions. The fift, or Kelp peculiarly so called, Sea-Girdles, Sea-Laces, or Sea-Thongs. It has roundish Roots, which are hairy and blackish on the outside, from whence it up small, round, long, white, hairy Heads, breaking out at the fides as it were into Branches, on the tops whereof only or grow three or four very long and narrow fold green Leaves, some being an Ell or more long, and about an inch broad, this has neither Seed nor Stalk, but lies on the Ground, until the Tide raise it to Root on the Water, being broken by the force of the Waves with a light. where it is gathered and kept for many ufe.

V. The second, or thick Broad Leaved Alga, Kelp, or Sea-Girdles. This differs from the former, in that the Root is wholly Stout, the Stalks eging from thence thick and round, two or three Inches high, and the Leaf, which is sometimes but one, and seldom two, of a very great length, and divers Feets, or rather Yards or Bills long, and above four Inches broad, equal from a little above the fattening on to the end, but somewhat waved and crowded on the edges, being thick, and of a deep green color, fo soft and molli while it is fift, that it is like unto moss Grin or Gulley, and will hardly dry, unless it lies long in the Sun, and will not be fit to be kept without being molli after it has been many days dried.

VI. The third, or Broad and Thin Leaved Alga, Kelp, or Sea-Thongs. This is in all respects like unto the fift, but that the Leaves are thinner, broader, and longer, yet crowded on the edges, and of a paler green color, and like unto thin Parchment.

VII. The fourth, or Winged Alga, Kelp, or Sea-Girdles. This grows fift upon Stones, and Sheets of Fith, both in the deeper and shallow places the Sea, having a round, dark, reddish Stalk, of the bigness of a Goose Quill, which being grown to the full length is very weak, lying on the Ground, unless the Wind bloweth it, and which are six Inches long, on one fide of which grows a Wing all the whole length of it, like unto a Skin or Parchment, with Veins therein, which being like the Feathers of an Arrow, is smaller and broader above, equally to the top, of two or three Inches breadth; the Leaves which grow next the Ground are many, (and some grow also on the Stalk) of a yellower greenish color, and of an Hand breadth, being four, or six, or eight Inches long, tough and pulpy, or of a skinny sublimity, like unto the other Girdlers, the Stalk does very well resemble a two edged Sword; this Kind of Alga or Kelp is used to be dethled and eaten by Kelp, also as one of the Rubbish of the Sea Coals where it grows, after it is cleared from the skinny Wings, and has a little sweet taste with its Bitterness, which makes it the more acceptable to the Palate.

VIII. The fifth, or Great Alga, or Kelp, or Sea-Girdlers with Labels or Hangers on. The manner of growing of this with its leaf is like the fift, but this is the greatest of all these Sea-Woods, bearing a Stalk as thick as that of Angelica, of a brown Chinitum Color on the outside, and so are the round Leaves thereof, which are sometimes four, five, or six Feet long, not being so thick as once little finger, and ending in several broad and thin labels, in like manner as the longer part of the Sword Hangers, which are of a yellowish color.

IX. These fourth and fifth Kindes Johnston upon Gerard has thus described. This Seaewood has a various Face, for sometimès from a flue Root, which commonly grows to a Pibble Stone, or is fallen to a Rock, and forms thence a round Stalk, and

*
Chap. 413. English Herbs.

III. The Description. It has Roots proceeding from one Head, which are many, long, and slender, smaller than those of the other Yellow foot, and by its long slender Stems spreading in the Ground, it does much increase: This Small Yellow Asphodil, or Kings-Spear, has many long, narrow, edged Leaves, which are chambered, or furrowed, which makes them from therefore, of a bluish or whithish green color, the Stalk is round, and rises up to be sometimes two or three Feet high, before with small long Leaves up unto the very Flowers, the Flowers which grow thereof from the middle to the top are very many, in shape like to the Flowers of the other Kinds, they grow thick together, and Spike fashion, one above another, for a great length, and wholly yellow, lid open like a Star, Somewhat smaller than the Great White Asphodil, and somewhat greater than the Lesser Asphodil, which when they are put small round Heads or Seed Vessils come in these places, in which is contained small, black, corroded Seed, almost three-pieces.

CHAP. CCCCXIII.

OF KINGSSPEAR, or R.

Small Yellow ASPHODIL.

I. The Names. It has no known Greek Name, the Latins call it Aphisodilus Lucius minor, Mattithias Regia, and Terrini Dinuiphi Dodonae, in English Kings-Spear, or Small Yellow Asphodil.

II. The Kinds. It is the Fourth Species of the Aphisodil Treated of in Chap. 35. Sect. 2. aforegoing, and a singular Plant of the Species.

V. The Places. It grows naturally in Italy, Spain, Southern parts of France, and other hot Countries from whence it has been brought to us, and is only nurfed up in our Gardens.

VI. The Times. It Flowers in the latter part of Summer, as in July, and August, and the Seed is ripe about a Month after.
Salmon's Herbal. Lib. I.

CHAP. CCCCXIV.

Of Knapweed Common, or Matfellown.

I. The Name. It has no Greek Name, nor any ancient Latin Name that I know of, but by the modern Latins it is called Jacea, and in English Knapweed, or Matfellown.

II. The Kinds. Knapweed is agreed upon by all Authors to be a kind of Scolymus, and therefore Trygon makes it to be Scolymus quadratic, Coifor in Homer takes it for a Kind of Great Century of the Medway, and thinks it to be that Plant which Sehanger calls Scolypis nigrae/ Thallos in Hortus calls it Cy.

III. The Kinds of the first or Common Knapweed. Authors make fifteen or eighteen Kinds or Varieties of which not above five or six grown in England, of which we shall only speak in this Chapter, leaving the others alone for a more general Work.

IV. The Descriptions. The first, or Our Common Knapweed, has a Root which is white, hard, and sandy, with several Fibres annexed thereto, which penetrates not, but shreds with Leaves throughout all the Winter, and shorts out fresh again every Spring, from this Root rise up many long and somewhat broad dark green Leaves, something deeply dented about the edges, and sometimes a little round or torn as it were on both sides in two or three places, and a little hairy within, from which rises up a strong round stalk, four or five Feet high, divided into many small Branches, at the tops whereof stand great scaly green Heads, from whose middle there is thrust forth a great number of dark, purplish, red Thumbs or Thumbels, (and sometimes, tho' bare and white) in which after they are withered and past away several black Seeds are round, lying in a great deal of Down, somewhat like unto Tussle Seed, but smaller.

Knapweed Black Common

Great Knapweed

III. The Kinds of the first or Common Knapweed. Authors make fifteen or eighteen Kinds or Varieties
like the former, blackish, and hard, with many Flowers, this Other Wild Knapweed grows with an among Corn very much, as well as in Meadows, and it grows with greater and taller Stalks than the former; the Leaves both below and above upon them are much divided on both sides, even to the middle Rib, almost like the Great Scabious of Matthiolus, but of a dark green color, and as rough, or rather than the former, or if Black Knapweed, the Icy Heads on the tops of the Branches are greater, and the Flowers larger, and of a deeper red color; the Seed is also like to the first allgoing.

**Knapweed white flowered**

Seeds, like the others of this sort also there is one whole Stalk and Leaves are longer, and smooth, all over hairy, felt, and woolly.

VIII. The fifth, or French Mountain Knapweed. It has a Root which is long, slender, with some feomewhat adjoining to it, and of a bitter taste, from which Root spring forth several long winged Leaves, very much divided on both sides into other small, long, and narrower ones, but they little or nothing again divided, of a light green color on the upper side, and hoary white underneath, and a little rough or hard withal, somewhat like unto the Yellow Knapweed with prickly Heads; from among these Leaves in one round Stalk, something rough also, and about a Foot high, without many Branches, but bearing three or four Icy Heads at the tops, with each of them a long, narrow, divided Leaf at the foot, and thrashing forth for a Flower many purple threads in the middle, swelling sweet, after which comes the Seed, not unlike the other Knapweeds, but lighter.

IX. The sixth, or Heavy White Mountain Knapweed. It has a thick and bulky Root, which sends forth divers winged Leaves, lying upon the Ground round about it, very much jagged, rent or torn on both sides into many small Leaves, which are each of them deep ly dentated on the edges, somewhat like unto the Leaves of the抚斯 Steaks in the next Chapter, all covered over with a hoary white Cotton or Wool, or as it were sprinkled with fine Wheat Flower, or Meal, from among which rises up a coarse, white, hoary Stalk, a Foot, or Foot and half high, scarcely rising any Leaves thence to the top, where it bears only two or three fealy Heads of Flowers, like the others, with purple Threads rising from the middle, which being put away leave Seed like the rest.

VI. The third, or White Jugged Knapweed. It has long creeping Roots, which are brown, or thready, and spread themselves fomewhat under Ground; from this Root rise up several Stalks, furnished with pret-ty large whithil green Leaves, very much jagged, divided or cut in on each side to the middle Rib; these Stalks rise up so sometimes about two Feet high, replenished with like Leaves from the bottom almost to their tops, and they likewise branch out almost from the Ground on all sides with slender Branches, which are also belter with like Leaves but lesser and leaves jagged as they appear near the tops; at the tops of the Stalks and Branches grow such like Icy Heads as on the former, and with the like pleasant Flowers, made of fine Threads, as the others are, rising out of them, saving that these are purely of a white color.

VII. The fourth, or Narrow Leaved Knapweed. Its Root is long, hard, and blackish, and replants with many small Fibres, from this rises up a round, rough green Stalk, about a Foot and half high, on each side of which are set narrow, rough, short, and somewhat hoary green Leaves, composing it at the bottom, and divided into some slender Fibres on the top of each of which lies a fairly, whitish, green Head, out of the middle of which rise many small long Thickets, like unto the former, but smaller, and of a pale reddish color, after which follows small dark red Flowers.

X. The Places. The fifth grows with us in most Fields and Meadows, and about the borders, and near Hedge sides, and in many waffe Grounds, almost everywhere; the second grows in many places of this Land, also among Corn, as well as in other Fields, and grows in an especial manner about Country, the third is also found growing wild in several places of England, Johnson says he found it growing wild in a Field near Martin Abdy in Surry, as also in the Isle of Tenes, the fourth grows about Paedis in Italy, and Mompelier in France, and other like warm Countries, the fifth upon the Hills of Cotswold nons, near Mompelier, the sixth about Capua in Italy, but with us three last grow only in Gardens.

XI. The Times. They all Flower in June and July, and their Seed is ripe in July, or August, or September, according as their flowering is, either early or late.

XII. The Qualities. Knapweed is temperate in respect of heat, and dry, in the beginning of the feconadal degrees, Allrigion, Collectif, Traumarck or Vulnerary, Antitemmangick, and Analpeick.

XIII. The Specification. It is a peculiar Cure for all fluxes of Blood, whether internal or external, whether in the Stomach or other Bowels, whether by ruptures of any Blood Veild or opening of their Mouths, it is good also to flop the flux of Humors to any Wound, Sore, Ulcer, or Pilule, to dry up the moisture, and gently to heal the same, without any harshness or bitting.

XIV. The Preparations. You may have these from 1. A Liquide Fiacre. 2. An Effisence. 3. A Decollation or Infusion in Wine or Water of Herb and Roots. 4. A Powder of Herb and Roots. 5. A Gar-
g资深. 6. A Beffan. 7. A Catoilism. The
Salmon’s Herbal.  

Lib. I.

Chapter CCCLXV.

Of Knotweed Silver, or Falle Stoebbe.

The Virtues.

XV. The Liquid Juice. It is a very good astringent, and helps to stay fluxes both of Blood and Murrer, as pilting or vomitting Blood, bleeding at Noses, and other outward parts, pulsing of Blood, also the violent overflowing of the Courts in Women, it heals inward Wounds, alfo those Veins which are inwardly broken, and cures fluxes of the Bowels, as Diarrhœa’s, Lenteria’s, and Dyenteria’s, or bloody Fluxes. Dose three, or four, or more Spoonfuls in Red Port Wine two or three times a day, or as oft as need requires.

XVI. The Essence. It has all the Virtues of the Juice, but is much more powerful for Fluxes of the Belly, it strengthens the Stomach, and stops Vomiting, it prevents against Catarhitis, or distillations of thin and sharp Humors falling upon the Lungs, and is good for such as are bruited by Falls, Blows, or other Accidents. Dose two or three Spoonfuls in a Glass of Wine Morning, Noon, and Night.

XVII. The Decocution of Herbs and Roots in Wine or Water. It has all the Virtues of Juice and Essence, but much less powerful. It is good to wash green Wounds, old running Sores, putrid Ulcers, Fiffula’s, and the like, for it washes off, and cleanses them of their putrid matter and toxiks, dries and heals them, without any harshness or bitings, it does the like in running Sores and Scabs of the Head and other parts. Dose inwardly is five, six, or eight Ounces, sweetened with a little Sugar.

XVIII. The Powder of Herbs and Roots. It is admirably drying and astringent, for being chewed thick upon any bleeding part it presently stops the aﬄux of Blood, and conglutinates the lips of a simple green Wound, aﬄew thick upon old and putrid running Sores and Ulcers it cleanses them, dries up the Humors Eruing, and dissipates them to healing, a Dram of the Powder given inwardly in Red Port Wine Morning and Evening stops all inward fluxes of the Bowels.

XIX. The Gum of the Flowers. Take of the Essence two Ounces, of the Decocution four Ounces, Alum two Drums, Honey an Ounce, mix and disjutte. It heals nores of Mouth, Gums, and Throat, and assigns the Blisters of the Uvula and Eaves, it is also good for green Wounds, to stop the bleeding, and conglutinates the lips of the Wound.

XX. The Balsam. It digests, cleanses, incarneates, dries, and heals all sorts of Wounds, Ulcers, and putrid running Sores in what part of the Body sover, and put railing hot into Fiffula’s it dissolves the cellulot, and causses them in a short time to be cured.

XXI. The Capulgin. Made of the Herb and Roots boiled soft, and brought to a thickness with Powder of Cowhour Roots, and applied, it is said to be available for the Cure of Rashes, the Decocution in Wine being also taken inwardly for some considerable time.

XXII. Lastly, it is to be noted, that the Qualities, Specifications, and Virtues of this Herb are in a manner the same with those of Scabious, this being a Species thereof, and therefore for a more full account thereof we shall refer you thither.
whiter at the bottoms of them, which to hand in the flowers near a Month before they fade, in the mean time having ripens in the Heads, which is small, not much bigger than the Quanto, but not so great as the Ordinary Knapped.

IV. The second, or Clusius his second Silver Knappedweed, which is neither so large and long, nor enduring after Seed time, it has many divided hairy and somewhat hoary Leaves, lying on the Ground, divided into several parts on both sides, but more fatigues one from above than the former, the Stalks are somewhat hairy or hoary also, but hand not so upright as the former, rather leaning downwards, by reason of their weakness, the Stalks are divided into many Branches, bearing at their tops fealy Heads, a little larger, from whence shoot forth larger Flowers also than the former, whose outward Leaves are made alike those of the Quanto, or Common, or of a purplish red color, with feveral very small green Heads or small Tops, in their middles as are in that part foregoing, with whitish and yellowish bottoms; the Seed ripens in the time of Flowersing, and is like the former.

V. The third, or Large, or deeper Headed Knappedweed, which is the third Kind of Clusius, The Root is something thick and long, and abides sometimes after Seed time, it has many Leaves rising from the Root, but the Flowers are more divided, and into smaller parts than either of the foregoing, being more hoary, or of a whiter green Color than they, the Stalks are in the same manner hoary, and rises up as high as the former, thin, or divided Leaves upon which sharp at the points, but smaller and finer up to the tops, where they are much divided into Branches, and bearing at their ends fealy green Heads, but more white edged Leaves, seating as if they were Silvweed, out of which come forth small purple Flowers, like the rest, but smaller, the Seed hereof lying in the Downy Heads, as the others do, but are something thicker, or than each, having a hairy top on them.

VI. The fourth, or Greater Silver Knappedweed of Austria. This does not much differ from the last neither in its manner of growing, nor in its form of the Leaves, nor the Seed ripens in the Heads, but only in its fealy Heads, which are not of such a shining white Silver like Color, and in this confides the subtle difference.

VII. The fifth, or Silver Knappedweed of Austria the latter. There is likewise but very little difference in any particular between this and the last, its chief variation is in the downes of its growing and flowerings of the Stalk, by which it is made a diminutive Plant of the kind.

VIII. The sixth, or Leffer Silver Knappedweed with a white Flower. Now is there much difference or variety between this and the last, but only in the Flower, which consists wholly of white Threads or Toppes, without having any other Color joined or mixed with it.

IX. The seventh, or Narrow Leaved Silver Knappedweed of Candy it, has a white Root, and of a Veter's thickness in magnitude, it is but a small Plant, and has desiers long, fift, fat, and narrow Leaves, lying near the Ground, a little pointed on the edges, but the which grow upon slender Stalks, of about a handfull long, are not dented at all, but resamble Rhyvord Plantane Leaves, and are of a yellowish green Color, the tops of the Stalks are repleatified with small Heads, Heads, out of which grow green yellow Flowers, and after them small Seed, like unto that of Scabious.

X. Note. Clusius says that the Spaniards call the Sib in the name of Cohefpuéts, id㠬 Capitolum, little Head, and they usually make Brooms or Bouts thereof to sweep their Houses, and that the Learned Physicians there do use the third Kind instead of Scabious for all the Purposes thereof.

XI. The Plants. The fifth three sorts do grow in several places of Spain, especially about Salamanca, as Clusibus says, the fourths, fift and eighth grow in Auflria, and the seventh, (as its Title testifies) in Candy, but by transplanted they are nurfed up in several Gardens of the Curious here in England.

XII. The Times. The first five do all Flower in the Summer Months of June and July, that of Candy Flowers something later, viz. in Augufl, if any early Frost takes them they immediately wither, also in their own natural places, which are the warm Countries, and where they continue many Years.

XIII. The Qualities, Specifafcations, Preparations and Virtues are the same with those of the Vulgar Common Knappedweed in the former Chapters, and to that I refer you. Authors say that all the sorts of Knappedweed come somewhat high unto the Qualities of Scabious, to which for their full Virtues you ought to be directed, and known that what Remede may be had from and what Difficulties Scabious may be applied to, the same the Knappedweed are produfice or of equally efficacious in.
III. The Description.  The first, or Common Knawell, or German Knottgrass. It hath a Root which is small, slender, and slender, the whole Plant very much resembling the former, both in its manner of growing and in its slender trailing Branches, which have small, long, hoary, grayish green Leaves, many set together at a joint, but that they are longer than they, some of these being two inches long, especially of those next the Root, the Flowers being broad and grow not at the joints with the Leaves, but at the tops of the Stalks and Branches, many clustering together, which are very small, and white on the inside, but of a brownish red Color on the outside, which afterwards turn into a plentiful Crop of very small Seed.

V. The third, or White Mountain Knottgrass, or Knawell. It hath a Root which is small, long, and white, not perishing in Winter in its native Clime or place of growth, so not so much as its Branches or Leaves, but it will not endure our cold Nights and piercing Blasts, and therefore dies with us, unless preserved with great Care and Circumpection. This Herb is a fine, white, and Silver like Plant, especially growing in the hotter Climates, and when it is grown old, To that it gives much delight to the beholders; it spreads many weak trailing Branches upon the Ground, in some places not a Hands breadth, in others a Foot long, as full or fuller of joints than any of the Kinds of Knottgrass in Chap. 418. Following, which are thick set also with smaller Branches, on which are placed very small long Leaves, lying almost like Scales upon the whitish hard Stalks, these Leaves are green at the first, and tender, but when they are grown old they will be of a thinning Silver Color, and hard, like Sticks or Parchment, the tops of the Stalks and Branches are thick set with small, white, Silver like Leaves, and at the joints come forth very small white Flowers, fiercely to be differenced, which being put away are followed by exceeding small Seed.

VI. The fourth, or Spanish Mountain Knottgrass, or Knawell. Its Root is small, long, and blackish on the Outside, is in a small Plant, and by some referred to the Anthyllides, but by others accounted a small kind of Knottgrass, or Knawell, it shoots forth many small, weak, reddish Branches, lying upon the Ground, and not able to stand upright, though a Foot long, parted into many other smaller Branches, on which grow several joints and spaces many small Leaves together, like unto those of Time Spurge, on which, as well as on the Stalk, there appears a thou of meateaf, as many Sea Plants have, with the Leaves come forth small, purplish, white Flowers, consisting of four Leaves apiece.

VII. The Places. The two first grow in retired places of England, the first of them about Chipping, in the West Country, and the second in dry, Sandy, and Rocky places, the third grown in Spain, and the Southern parts of France, and the fourth about the Cattle of Valletas in Spain, and other places, with as they are only used up in Gardens.

VIII. The Uses. They all exceed the first green and green in the Summer Months, and continue their verdure till cold Weather comes in, which causes them to wither and dry, in the mean Season they flower and perfect their Seed.

IX. The Qualities. They are Aperitive, Abbeverant, Venerous, Diuretis, Nephris, and Lithontriphals.

X. The Specification. They are powerful to break the Stone, and give ease in the Strangury, especially the first and second kinds.

XI. The Preparations. You may have thereon, 1. A Looped Juice. 2. An Essence. 3. A Decotion in Wine. 4. A Powder. 5. A Mixture.

The Virtue.

XII. The Liquid Juice. Tragus says that Knawell has the same Properties which Knottgrass has, and may leave to all Intentions instead thereof, as well for inward as outward Remedies, it opens obstructions of the Reins, Uterus, and Bladder, gives ease in the Strangury, and is said to be very powerful to break the Stone. Dole three, four, or five Spoonfulls in some small Mixture of Wine, or in the Morning fafting an at Night, outwardly used upon Wounds and Ulcers it cleanses, dries, and heals them admirably, by only witholding thereunto, and applying Sypulls dipp'd therein, it congeatizes the lips of green Wounds in a very short time.

XIII. The Decotion in Wine. It has the Virtues of the Juice, but much more powerful to the Intentions. Dole three or four Spoonfuls or so in some small Mixture of Wine, or in the Morning fafting an at Night, outwardly used upon Wounds and Ulcers it cleanses, dries, and heals them admirably, by only witholding thereunto, and applying Sypulls dipp'd therein, it congeatizes the lips of green Wounds in a very short time.

XIV. The Mixture. It has the Virtues of the Juice and Essence, but not altogether so powerful, it cleanses the Reins, Bladder, and Womb very forcibly, and is a good Lotion for the cleansing and drying of foul and running Ulcers.

XV. The Powder. It provokes Urine, expels Swell, Gravel, and Vomit Researches from the Gastric parts, and dries up Ulcers and Wounds it congeatizes and heals them, it stops a flux of Blood in green Wounds, and a flux of Humors in Ulcers, being dipp'd thick thereof. Dole inwardly a Dram at a time, Morning and Night, in a Glass of White Porto Wine.

XVI. The Mixture. By washing a small green Wound with it congeatizes the lips thereof upon the spot, it cleanses Ulcers, repulses fluxions of Humors upon the face, the part and parts adjacent being fermented warm therewith, it dries up Ulcers, and dissolves them to a bloody healing. This Mixture is made by mixing the Liquid
chap. 417. english herbs.

gold juice or essence three parts, with choice brandy one part, and digesting them together twenty four hours.

chap. ccccxxvii. of kneeholm, or butchers-broom.

the names. it is called in greek olympinon, osmyryne, &c. myrtus acetica, morus aegina, myrtus sylvatica, but there is another myrtus syl-

toferis among the ancients, which is like the tame or manured kind, which pliny lib. 15. cap. 7. contains together) morranks, myracteaca, myrtus sphyrnic, waldsack, marina spina, and by theophras-

sus katarrhophilus, centaurmyrrhus, in luitive rufus, and rosam, and by the apothecaries braufus, and of home, as marcellus says, scopo regia, pliny says, it is called communyryne, and among, or rather ac-

cerun, which is one of their boiled names, in eng-

lish kneeholm, and butchers-broom.

the kinds. authors have not yet found out more than one singular species of this plant.

knee holm or butchers broome

with the roundsticks, which are tough, pliant, and

flexible, on which are set somewhat broad and al-

most round hard leaves, sharp, and prickly pointed

at their ends, of a dark green color, and somewhat

like unto myrtle leaves, two for the most part for

at a place, very close or near together, about the

middle of the leaf, on the back or lower side, from

the middle rib, comes forth a small white, green

flower, consisting of four small round pointed leaves,

landing upon a very short or no flower stalk, in whose

place, (being pulled away) comes forth a small round berry

green at the first, but when it is ripe red, much like

to an asparagus berry, but greater, in which are con-

tained two or three white, hard, round seeds.

iv. the places. it grows generally in most places

throughout england, in copses, and upon heaths,

and on rough, barren, and wilder grounds, and oft

times under or near holly bushes, it grows upon

hemped heaths, not far from london, and in many

places in scott, ellen, and berkshire, almost in every

copse and low wood.

v. the times. it shooths forth its young buds

in the beginning of the spring, which are eaten in

some places (as aforesaid) as our young asparagus,

the berries are ripe in august and september, the

branches and leaves abiding green all the winter.

vi. the qualities. the whole plant, roots,

leaves, and berries are powerful apertive, alter-

native, diuretic, and vulnerary, f ectoral, nep-

phritic, hydropic, and architopic.

vii. the specification. it is a peculiar thing ag

gainst the droppings, especially that called an a-

fiates, opens obstructions of the urinary passages, and con

solidates broken bones.

viii. the preparations. the root is chiefly

made use of to all the intentions for which the plant

is used, and the same is accounted one of the first

opening roots; therefore you may make, 1. a

juice or essence. 2. a decoction in wine. 3. of

the young spouts 4. salters. 4. of the branches,

brooms or infusions. 5. a decoction of leaves and

berries.

the virtues.

ix. the juice or essence. it powerfully opens

obstructions of liver, spleen, gall bladder, reins,

ureter, and bladder, provokes urine, and annulls

the ill fluid thereof, it helps to the navel and

the stone, gives ease in the strangury, and provokes

women monthly courses, it helps the yellow jaundice,

and the headach, and made into a loofch with honey it expelles

flegm, and cleanseth the thorax, or lungs, and stomach of flegm and clam

my humors gathered together therein. dose from

one spooutful to two, three, or four, in a glass of

white port wine twice a day.

x. the decoction in wine. it has all the former

virtues, tho' not altogether so powerful, and may

be given morning and evening from four to eight

ounces, or ten in dose, before which it is excellent

in knitting and consolidating of broken bones, and

strengthening parts out of joint, and other weak limbs,

for which it is not much inferior to confection, or sa-

form's salt, drinking this decoction, and applying

the fail roots publick-wise unto the parts affected.

rivierus in his observations says, that a beggar

man was affected with the droppings three months,

whereby his belly grew exceeding big, and because

his poverty would not afford him the choicer medi

caments, he used, by the advice of a country wo

man, a decoction of the roots of kneeholm, or butchers-broom, and was purged twice or thrice

with an infusio of salts, and with these remedies g g g

alone.
alone he was perfectly cured, a strong Decotion of
Infusion also of it in Water being had plentifully
used Night and Day by it fell, also boiled in
Wine or Broth, and eaten as Food with the Wine
or Broth for a Month or five Weeks space, has been
found by Experience to cure an Asthen, and it cured
this kind of Dropple in two Young Maidens, the one
of which lived in good Health many Years after it,
another Woman was cured of a Dropple of the
Woman, as was supposed, with this Medicament,from
whom it brought away with a kind of insanity or
violence about ten Gallons of Water, a Decotion
of this Root, Roots of the Blue Vincetulcus, and
Several Roots in Water or Wine being used for some
time has been found of admirable use for the cure of
their kind of Dropplies of the Belly, and Disenteries
is not varying in its Prepars for this purpose.
XI. The Scler or the young Sperma. It is
prepared as are those of Aristogiton, and eaten in the
same manner, and go eaten the said Sprouts open
Obstructions of Liver, Spleen, Reins, Thoater, and
Bladder, cleansing those parts of Falriculures, but
they are nothing near so effectual as are the Jukes.
Effence, or Decotion of the Roots in Sect. 9, and
9. afterwards.
XII. Growing or Blum. Formerly Huhuvies made
use of this Plant to make beds of to sweep
the House, from whence came the Name Scotia Regia,
as being used also in Kings Chambers, but now tho
the Revolution of Times they are changed to Broths,
for cleansing Browsers Stealls, from whence came the
Name of Batches-Brown.
XIII. The Decection of Leaves and Berries in
Wine. This, according to Dioscorides, has all the
same Effects with the Decotion of the Roots, but
in my Opinion the Preparation of the Roots is much
the more powerful.

CHAP. CCCCXVIII.

OF KNOTGRASS.

OR

SWINESGRASS.

THE Name, it is called in Great Britain
and north genetm creeps, in Arable Bote
or Trifolium, in Latine Polygonum, Sanguinaria, Sar-
gasina, Semalis, Proserpinaca, in English KNOT-
grass, Swinesgrass, and Birdstongue.

II. The Kinds. Authors make seven several Sorts
of this Plant, viz., 1. Barthum Anis, Polygonum Anis,
Polygumum vulgaris major, Polygonum Anclu, Our Greater or Common Knotgrass. 2. Polygonun
minor minus, The Lesser Common Knotgrass. 3.
Polygumum minum hirsutum, Small short Leaved
Knotgrass, this Bawham in his Plan takes to be
Polygumum Anisum, Pentriconds Thuly in his Ar-
cymus Spetas, also the Sodan minimum Arthrinum
Vermiculatum Lathii, 4. Polygumum Sausati, B наги
Store or Rock Knotgrass. 5. Polygumum Alti-
rinum major et minor, Polygonum Altimus
primum Langhans (with Deticamp), Polygonum
Maritimum Lathii Bawham, The Greater or Broad
Leaved Sea Knotgrass, 6. Polygumum Maritimum
minus, Polygonum Maritimum alitrum Deticampi,
Polygumum Maritimum Angulifolium Bawham, The
Lesser or Narrow Leaved Sea Knotgrass. 7. Poly-
gonum Germanicum Bawham, Knave, of which we
have already digested in Chap. 116, aotograph.
together, with Leaves thereon, something like to the Common Kind, but thicker, flouter, shorter, and broader, and of a dark green color above, and whiter underneath, the Flowers stand at the joints in the same manner, having small white Flowers, which crown several, each in some of a purple color, after which some small Seed, inclosed in whitish Shinny Shells, the taste of the Plant, and of every part thereof, is indifferent, but more or less withal bitter.

VIII. The Faith, or Lesser or Narrow Leaved Sea Knotgrass. It has a Root which is long, black, and woody, with a few Yolks adhering thereto. This Root, and the larger Stalks thereof, is flat, and covered with a reddish Bark, also more divided into smaller Branches, having fewer Joints on the greater Stalks, but the Branches are thick, and fit with each other in the manner of the former, which are something fat, and thick, long, and narrow, like the next Common Kind, the Flowers are small and whitish, and the Seed is much like that of the fifth Kind.

IX. Note. Whereas the fifth great sort is called before in this Chapter Atris, or the Male Kind, it seems to bepeak a Female Kind also, but there is indeed no Female Species of Knotgrass, for that which some Authors call Polygonum Femaee, or Feminae, is one of the Kinds of Equisetra, or Horse-tails, as being likened unto them, although not rough, but differing totally in form from Polygonum, or Knotgrass, for which reason we take no further notice of it in this Chapter.

X. The Places. The fifth, or great Kind, as also the second, or lesser, grow almost everywhere, and in every County in England, as well by the Foot Ways in Fields as on the sides of High Ways which are green, by the sides of old Walls, and on the side of Banks. It will also grow in places it ever spreads them, the third and fourth grow on higher Grounds, on Gravelly, Stony, and Rocky places, upon Hills and Mountains, the two last grow in Salt Marshy Grounds, and by the Sea side in many places.

XL The Timers. They come forth late in the Spring, and continue all the Summer, Flowering and seeding in the mean season, and to endure all Winter, in which Season all their Branches perish.

XII. The Qualities. They are cold in the first degree, and dry in the second, Astringent, Alterative, Diuretic, Diuretix, Traumatic, Nephritic, and Astringent.

XIII. The Specification. Knotgrass is a peculiar thing against catarrh of Blood, and all fluxes of Blood, either in Men or Women, and other fluxes of the Bowels, the Gonorrhœa in Men and Women, (Universalis being premiated) Heat and Sharpness of Urine, also the Strangury, or Hooping of the Bowels, cools inflammations, eases Worms, and cures and heals old and filthy Ulcers, &c.

XIV. The Preparations. You may have therefrom: 1. A Liquid Juice. 2. An Infusion. 3. A Decoction in Wine or Water. 4. A Pudder of the Herb. 5. A Distilled Water. 6. A Balsam.

The Virtues.

XV. The Liquid Juice. It is cooling, drying, and binding, and is very effectual to stay any bleeding at Mouth or Nose being drank in Stewed or Red Wine, and being applied to the Forehead or Temple as also exteriorly on the Nipples with a Syringe, it is no less effectual to cool and temper the heat of Blood, or of the Stomach, and to stop any flux of Blood, or of the Belly, as liquids, or Bloody Fluxes, fluxes of choleric and sharp Humors, or of the womb, as the overflowing of the Terms in Woman, and the Willets, or of the Sprenthick parts, as the running of the Reins, &c. Dose four Spoonsfull, it cures running Ulcers of any Kind, &c.

XVI. The Infusion. It has all the Virtues of the Liquid Juice, besides which, if it is given before the Fit of an Aque comes, whether Tertian or Quartain, it is laid to determine it, and cure the famine, it is also angular good to provoke Urine, when it is stop- ped, as also when it passes away by drops and with pain, which is called the Strangury, it allows away the heat and sharpness thereof, and is laid powerfully to expel the Stone, Gravel, Seed, Urine, &c. and other Tartarous Matter from the Reins, Ulcers, and bladder, it is a Sovereign Remedy to cool all manner of inflammations, to stop the progress of Aqueous and Putrid: or any other burning forth of heat, and gives a free action in hot Swellings and Aphtas, and prevents the future burning, burning and eating of dangerous, old, running and gorging Sores and Ulcers, you, tho' in the Privy Parts or Men or Women, refilling the Humours for falling into them, cooling them, and drying up the heat, sharp, and moist matter which causes them to be inflamed. Dose two or three Spoonfulls in some proper Vehicle Morning and Night.

XVII. The Decoction in Wine or Water. It has the Virtues of the Juice and Infusion, but not altogether for the Extinguishing or effectual, and therefore is to be given in larger Doses, as from a Quarter of a Pint to half a Pint, or more. The Vinous Decoction is good for those who are ragged or bitten by Scorpions, Serpents, or other Venomatic Creatures, and the same is very effectual to stop all defensions of Rheum falling upon the Stomach or Lungs, it kills also Worms in Stomach or Belly, and cures all inward parts of the Bowels arising from heat, sharp- ness, and corruption of Humors, as the Cobick, &c.

VIII. The Pouter of the Herb or Seed. It is good against the Stone, Gravel, Seed, and Tartarous Matter in the Urinary parts, being drank to a Dram or more Morning and Night in Wine for many days together, applied outwardly to bleeding Wounds, or other fluxes of Blood, it presently stops the bleeding, and when it is a simple Wound conduces to its speedy healing.

XIX. The Distilled Water. It has the Virtues of the Juice, Infusion, and Decoction, but nothing near so powerful as either of them, being taken by it. If it fall to four or five Ounces it is effectual to expel the Purposes afever, and is a very excellent thing to cool all sorts of inflammations, proceeding from worst causes, bloody Fluxes, and in what part of the Bodysoever.

XX. The Balsam. It, freelie, cures, all simple green Wounds, by reducing the flux of Blood, and confouding their lips, it strengthens weak Joints, comforts the Nerves and Tendons, and is prevalent against the Gout, being duly and rightly applied Morning and Evening.

XXI. Note. It has been observed that the Sea Kinds of Knotgrass have not been so cooling and operative in the above enumerated Difficulties as the Common Kinds, by reason of their abundant falling Substance, yet effectual in several Cases where there is need of greater penetration, and therefore a Catala- platin made thereof and applied has been found of much more effectual against the Gout.
of LADIES BEDSTRAW, or, CHEESE RENNENT.

THE Name. It is called in Greek Teloos, and Ladas, and, in Unis Fornix, a fop, of some witnes, and ao, and was so called from that Milk, from the effect, which was to make Milk turn into a Cord when they set it to make Cheesi, for which it leaves very well in Latin Gallium, and in English Ladies-Bedstraw, Cheese-Rennet, and so forth.

II. The Kinds. Authors make fix or even Kinds of this Plant, or more, but because several of them are not to be met withal in England or our Productions abroad, we shall only describe the five following, viz. 1. Gallium, & Gallium Inticum, Our Common Ladies-Bedstraw. 2. Gallium album, Eriiflfy & Pane, Molugo, Molugo vulgaris Lob., Gallium albulum, Thym. 3. Molugo Montanum, Lade. 4. Molugo, & Tiberiornn, Our Common White Flowered Ladies-Bedstraw. 5. Gallium Montanum Cruciatum, Gallium Americanum oder Floridae, Candia or American Ladies-Bedstraw.

III. The Description. The first, or Our Common Ladies-Bedstraw. It has a Root which is red, or more brown, square, upright Stalks, three feet or more high, furnished or branched forth into divers parts, full of Fruits, and with several very small Leaves at every one of them, little or nothing rough at all, at the tops of the Branches grow many long Tufts of yellow Flowers, very thick set together, and in other others, from the several joints, which consist of four small Leaves spices, and small somewhat strong or cecomet, but not unpleasant, the Seed in small and black, like Poppy Seed, red for the most part joined together, some of the Branches bending down to the Ground take root at their points, whereby it is much increase.

IV. Gerard thus describes it. It has a small and thready Root, from which come forth small, round, thin Stalks, weak and tender, creeping and thither upon the Ground, on which do grow very fine Leaves, cut into small parts, finer than those of Dill, yet of certain spices, as those of Woodward, among which come forth Flowers of a yellow color in clusters or bunches, thick thrust together, of a strong sires small, but not unpleasant.

V. Gerard, or Our Common white Flowerew Ladies-Bedstraw. It has a Root which is fibrous or thready, and abiding all Winters, and the whole Plant is in all things like to that next to be described, so that the Branches are so weak, that they may be pluckd with the Root, or with the Ground, and the Leaves are smaller and narrower, the Flowers more small as before, tho’ the Venues are also small and white, and not plentifully abounding; Some Authors make a smaller sort hereof, which is not a proper Species, for upon transplanta-ting it will grow as great as the other.

VI. Gerard describes this second sort thus. Ladies-Bedstraw with white Flowers is like unto Clea-

VII. The third, or White Flowered Mountain Ladies-Bedstraw. It has a Root which is black, and very fibrous or thready, from whence grow forth a number of slender and weak Stalks, which yet stand upright of themselves, directly branching forth into many parts, so that it seems to be a pretty well spread Bush, having many shorter and broader smooth white Leaves set at the joints than any of the former, or the next which follows, the Flowers are very small and white, glittering at the tops of the Branches, very thick or plentifully set than the following with red Flowers, which being puff away turn into small, black, round Seeds.

VIII. This Gerard says that it is called Molugo, and has Stalks which need not be pruned up, but of it itself stands upright, and is like unto our second Species, or Common White Flowered Ladies-Bedstraw, but that it has a smoother Leaves black, and

IX. The fourth, or Red Flowered Ladies-Bedstraw. Its Root is of a reddish color, but greater than the first Common Kind, creeps not, abiding many Years and not perishing. The Plant is small, and has slenderer and lower Stalks than the first Kind, yet divided into many Branches, at which Joints stand four, or six long Leaves, and not of so dark a green color as the last, the Flowers are of a red color, not so thick clustering or set together as those of the first Kind, and consist of four small pointed Leaves, with a yellow Point in the middle, but may grow or not growing together at the tops of the Branches, which afterwards turn into small

final, brown, square, upright Stalks, three feet or more high, furnished or branched forth into divers parts, full of Fruits, and with several very small Leaves at every one of them, little or nothing rough at all, at the tops of the Branches grow many long Tufts of yellow Flowers, very thick set together, one above another, from the several joints, which consist of four small Leaves spices, and small somewhat strong or cecomet, but not unpleasant, the Seed in small and black, like Poppy Seed, red for the most part joined together, some of the Branches bending down to the Ground take root at their points, whereby it is much increase.
small black Seed, like the first. **Columns** will have **Gallium album** or *Water-flowered Ladies-Bedstraw*, to be a differing Species from this now described, but they seem to be all one Kind, the Flower being in some places only a little darker, but in all other Parts alike.

X. Gerard says this fourth or Red Flowered Ladies-Bedstraw has been taken for a Kind of Wild Madder, but it is truly a Kind or Species of Ladies-Bedstraw, and much less bitter, yet with its Qualities of turning Milk into Curds, as able by its Form, being in each respect like unto the *Gallium Internum,* or Our Common Ladies-Bedstraw, and differs in the color of the Flowers, which are of a dark red cold with a yellow Pointed in the middle consisting of four small Leaves.

XI. The fifth, or Candy or American Ladies-Bedstraw. It grows like the first, or Common, or Yellow Ladies-Bedstraw, but much bigger, yet with greater Roots and Branches. It is a more effectual Remedy than any of the former, but and astringent, **Hopping Flower of Blood.**

XII. The Places. The first and second grow frequently in many places in this Land, in Meadows and Pastures both wet and dry, as also by Hedge Sides, and their Flowers give to the borders of Fields, in fruitful Soils almost every where; the second grows in Marsh Grounds, and other moist places, the third grows on Hills and Mountains, and Rough moorish places, the fourth grows on Mountains and Hill places in Germany, and was sent to us from Strasbourg, since which it is nourished up with us in Gardens, the fifth is known, as appears by several parts of *Americas* upon the Floridian Continents, in several places of which I have often found it.

XIII. The Times. They all Flower early, viz., in May, except the Red Flowered, which Flowers in June, July, and August; but Gerard says they Flower most of the Summer Months.

XIV. The Qualities. They are hot and dry in the first degree, Astringent, Abiliferous, and Tribrachous, or Vulneraceous, they are also Nephritick, Lithotriptick, and Arthritisick.

XV. The Specification. Ladies-Bedstraw is a peculiar thing to be bleaching inwardly, or at Nares, to heal inward or outward Wounds, to help burning with Fire and Scalding with Water, to strengthen the Nerves, Tendons, and Joints, give ease in the Gout, to help the Starangy, and to tire and break the Stone.

The Virtues.

XVII. The *Liquid Juice.* It is powerful to provoke Urine, to help the Strangury, to break the Stone, and to expel Gravel, Sand and Tartarous Matter from the Knees, Heelers and Bladder, being taken two or three Ounces at a time, two or three times a Day, in a Glafs of Pure White Port Wine. The same drink helps to stop inward Bleeding and the Subloration of the Terms in Women, as also to heal inward Wounds, by its heating and drying Qualities.

XVIII. The *Decotion of Herb and Flowers in Wine or Water.* It has all the Virtues of the Liquid Juice, but is much weaker. It is good to make the Feet of Travellers in, who are weared and tired with Travel, and whose Feet are swoln, or bruised, or galled thereby, and for such whole much and long, Burning Caules not only Weakening, but Parting in the Nerves and Joints, for all which thes this Decotion used as hot as it can be well endur'd, is very available. It is also good against Scurvy, Morphew, Dandriff, dry Scafo, Ichings, and other like Deformations of the Skin, Children and Infants.

XIX. The *Puder of the Root.* It may be taken to one Dram in choice Camry, Maders, or other like generous Wines and, as *De Frondes,* writes, it provokes Vomitory or Bodily Lye, it doth also Purify the Flowers of the Herbs, taken in the same Doce and Manner Morning and Night, or two or three times a Day.

XX. The *Nofe of the Herb and Flowers.* They being bruised, and put up the Nolidis, are laid to hop a vehement Harmorrhage in those Parts, and it may be so much the better, if some of their Juice be first Eaten up, or grnged in.

XXI. The *Ointment.* It is made by boiling the bruised Herb and Flowers in Oil Olive in Griffeys, and straining out, and so repeating this Work three or four times, then adding a little Bee-wax, bringing it to a Confitency: But some advise it to be made with Hog-Lard. Or you may make an Oil thus: Put the bruised Herb and Flowers into pure Oil Olive, and Infuse till the Oil becomes of the Colour of Olive, and, and repeat this Work three or four times, and strain out for Use: but it is sooner done by boiling the bruised Herbs and Flowers in the Oil to Griffeys, straining out by Profit, and anointing with the Work three times more; then straining out the clear Oil, keep it for Use. It is good against Burns with Fire, and Scalding with Water, and is good to be anointed upon Limbs and Joints, which are weak, and become stiff with Walking, for it strengthens the Nerves, Tendons and Joints. It prevails also against Scurvy, Morphew, Mange, dry Sores, and the Ichings and Collings of Children, and all other Deformities of the Skin. Applied also to the Parts affected, it gives Eafe in the Gout, and other like Pains; and by Continuation of the Application, cures the same.

XXII. The *Chefe Remedy.* It is made of the bruised Herb, by squeezing out its Juice, being first mufhoned with a little choice Camry or Sherry, to which a quarter part of Spirit of Wine is added, and by three times to be put in: Or this: Take the expir'd Juice, deliver'd to you by a Natyler, or Clarifier, or by Clarifying Milk with Eggs: to a quart of this prepared Juice, put Sherry Wine four ounces, nift mixt with Spirit of Wine two ounces, mix them, digest them one Day, then drink them, and keep it for Use. But many Country People make use of the simple Juice only. *Mathhts,* says, That the People of Tuscany do use to Turn their Milk with it, that the Chieve which they make of Sheep and Goats Milk, may be the sweeter, and the more pleasant in Taste, and also more wholesome, as to break the Stone, &c. And the Chefe, Wonen, especially those about N Forneux, that the self Cheve is made, do use it in their Remedy, (viz. by putting the bruised Herbs into their Remen-bag,) much more extreemly of that Cheve which is made with it, than of that which is made without it.

XXIII. Note. The Ancients thought the Gallium album or *Water-flowered Ladies-Bedstraw,* to have no Virtues, or to be of no Use. But *Clifton,* says, That in Austria, Hungary, and other places of Germany, the People have found it by Experience to be good to strengthen the Arteries, Nerves, Tendons and Joints, these Parts being bathed either with the Juice, Decotion or Remedy, and that it takes away Weakening and Weakness after Travelling, and eases Pains caused by Cold, Over-working, &c.
Salmon's Herbal.  Lib. I.

598

Blows, or Over-straining. Parts affected with the Gout, being well bathed with the Remett made thereof in the Morning and Night, as hot as it can be endured, cures the Pain, and in a short time eases the Difease; but it is much more effectual, if after Bathing, a Cataplasm be applied, made of the Juice of Remett, (of any of the Kinds of Ladies Red-Brain) by bringing it to a Confluent with fine Barley-flower, or Guums of White-bread, mixed with a little Oil of Poppy-seed, or Oil of Rennet, the Application being made as hot as the Patient can well endure.

CHAP. CCCXX.

OF LADIES-BOWER, OR CLIMERS.

I. H. E. Names. It is called in Greek, Κατάλονος; in Latin, Clematis; and in English, Ladies-Bower, Virgin's Bower, and Climer.

II. The kinds. Authors make many sorts here of, some of which grow not in England, nor in any of our English Plantations; those which are to be had with us, are the following.
1. Clematis arvensis, Clematis alcea filiis, Clematis albus, Clematis albo-violacea, Clematis peregrina, Clematis Bower, or Virginia-Bower, or Single red-flowered Clematis.
4. Clematis peregrina, and Clematis purpurea, Double purple-flowered Ladies-Bower, or Virgin's Bower, or Virginia-Bower, or Single purple-flowered Clematis.
5. Clematis varia, Clematis morifolia, Clematis triserialis, Clematis peregrina, and Clematis Bower, or Virginia-Bower, or Climer, which the Natives call Martens. Plantamit, fijis farfurea or crepta, Plantamit frutes, Clematis credis or farfurea, Upright Ladies-Bower, or Virginia-Bower. Here is to be noted, That the Sixth or Virginia Kind, is called by the Spaniards in the West Indies, Grandalsul, or Grandisul, because the Fruit is in some sort a small Pomegranate on the outside, yet the Seed within is black, round and blackish.

III. The Descriptions. The leaf, or Ladies-Bower, or Virginia-Bower, or Burning Climer, or Burning Bower. The Root is white and thick, stiffly and tender, or easily to be broken; inflames that one can scarcely handle it; the very tenderly, without danger of breaking it. This Cascaril or Burning Climer, has very long and tender climbing Branches, yet something woody below, which wind about those things which stand near it, covered with a brownish green Bark; from the Joints of which shoot forth many winged Leaves, consisting for the most part of five single Leaves, two, three and two together, and one at the end, which are a little cut in, or notched on the edges here and there, but every part of them is softer than the Leaves of the next following Climer, without any clapping Tendrels, to ride about any next adjacent thing. Towards the upper part of the Branches, with the said Leaves, come forth long Stalks, on which stand many white Flowers cloutether, opening the Bells into fix or eight small Leaves, spiralling like a Star, very finest of Smell, or rather of a strong heavy Scents, which after turn in blackish fililiary Seed; plumed, at the Head, which Plume or Feather flies away with the Wind, after it has lived long, and leaves the Seed naked or bare.

IV. The second, or Red Ladies or Virgin's Bower, or Single red-flowered Climer. Its Roots are a Bundle of strong brownish yellow Strings, running down deep into the Earth from a large Head above. This Climer has many Limber and weak climbing Branches, like the former, covered with a brown thin outward Bark, and green underneath. The Leaves hard at the Joints, confiding but of three Leaves or Parts, whereby some are notched on one side, and some on both, without any clapping Tendrels, as the former, but winding with its Branches about any thing which stands near it. The Flowers in like manner come from the same Joints with the Leaves, but not so many together as the former, upon long Foot-stalks, confiding of four Leaves apiece, standing like a Croft, of a dark red Colour. The Seed is flat and round, and pointed at the end; three or four or more standing close together upon one Stalk, without any down upon them at all, as in the former.

V. The third, or Single purple Ladies-Bower, or Single purple-flowered Climer. This is like to the former in its Roots, Stalks, Branches, Leaves, Flowers and Seed, and differs from the Bower in this only, that the Colour hereof is of a dark bluish purple: So that the one is not possible to be known from the other, till they come to the Seafon of Flowering.

VI. The fourth, or Double purple-flowered Ladies or Virgin's Bower, or Double purple-flowered Climer. This in its Bower, Branches and Leaves, does so near resemble the Single Kinds, that no Difference can be known between them, but in those Particulars, viz. that this grows more bold and great
great, and yields both more Borne of Branches from the Ground, and more spreading above: also that the Flower in this is very thick and double, consisting of a number of smaller Leaves, set close together, in order, in the middle, the four outermost Leaves which compass them, being much broader and larger than any of the inward, but all of a dull or flat bluish purple Color; the Points or Ends of the Leaves forming a little darker than the middle of them. This bears no Seed, so far as has yet been seen or heard of from any Parish of Credit, notwithstanding the Affirmations of some false and Ignorant Gardeners, which affirm the contrary.

VII. The Fish, or Creeping fiery Sea Climber. It spreads abroad many creeping, pliant, and curled Branches, about the Foot long, set and into a very dark green Bark, from whence shoot forth many winged Leaves, a little dented about the edges, very like unto the Thomasia fexis crea in Sol. 9. following, consisting of five Leaves, but most commonly of three upon a Stem, being narrower, harder and longer pointed: at the ends whereas comes forth a small clasping Tentacle; but those which grow up higher than upon the Stalks, and nearest unto the tops, where the Flowers do stand, are much smaller and narrower. The Flowers come forth many together, as in the other, set upon long Foot-stalks, which are white and with many white Threads in their middle. After they are palled away, many round, flat, reddish Seed are produced, smaller than in others, three or four upon a Stalk together, plated with a white Feather at the Head of each of them. The whole Plant is hot end sharp, like unto the others.

VIII. The Sixth, or The Virginian Ladies-Bower or Climber. Its Root is composed of a number of exceeding long and round, yellowish brown Strings, spreading far abroad under the Ground, sometimes as long as any Roots of Sarthapilla, and a great deal bigger, which to be conveniently and clearly laid in the Ground, may be called up like a Cable; and those Roots, by shooting up in several places, a good distance from another, make a great Enclosure of the Places. This noble and much defined Plant rises out of the Ground very late in the Year, about the beginning of May, if it is a Plant which has sprung up from the Seed of our own Sowing; but if it is an old one, such as has been brought to us from Virginia, not till the end of May. It springs up with a round Stalk, not above a Yant and half high, or thereabouts with us, but in hotter Countries, as some Authors say, much higher; bearing one Leaf at every Joint, which from the Ground to the middle thereof, has no Claspers, but from thence upwards, has at its Joint with the Leaf, both a small, twining Chipher, like unto a Vine, and a Flower also. Every Leaf is broad at the Stalk thereof, and divided about the middle on both sides, making it somewhat resemble a Pig-Leaf, ending in three Points, of which the middlemost is longest. The Bud of the Flower, before it does open, is very like unto the Head or Seed-Velvet of the Ordinary Fiddle Nigella, having at the Head or Top five small crooked Horns, which when this Bud opens, are the Ends or Points of five Leaves, which are white on the inside, and lay themselves flat, like unto an At- nemeum or Windflower, and are a little hollow, like a Scoop, at the end, with five other smaller Leaves, and which were hid in the Bud before it opened; so that this Flower, being fully blown open, consists of ten white Leaves, laid in order, round, one by one: from the bottom of these Leaves on the inside, rise up several twisted Threads, which spread and lay themselves all over these white Leaves, reaching beyond the Points of them a little, and are of a reddish Peach Color; towards the bottoms likewise of these white Leaves, there are two red Circles, above the Breadth of an Oat Straw, one something distant from another, which add a great Grace to the Flower; but in some Flowers there is but one of these Circles seen. By their means the white Leaves fixer their Color thru the Peach-colored Threads; and the red Circles or Rings upon them being peripatetic, make a tripartite Show of Colors very delightful. The middle part of this Flower is hollow, and yellowish; in the bottom of which rises up an Umbo, or round Sile, somewhere big, of a whithish green Color, spotted with reddish Spots, like the Stalks of Dragons, with five round Threads or Chires, fixed in like manner, and tippd at the ends with yellow Pentiers, standing about the middle part of the said Umbo or Sile, and from thence rising higher, ends in three long crooked Horns most softly, (and sometimes in four, as Al- lston in his Natural Garden obviated) spotted like the rift, having three round Buttons at their ends. These Flowers are of a comorable, pleasant, sweet Smell, and very acceptable, but perish without yielding Fruit with us, because of the so late Flowering: but in the natural place, and in hot Countries, it bears a small round whithish Fruit, like a Crown at the top thereof, in which is contained (whil! is left, or not over-dried) a sweet Liquor, but when it is dry, the Seed within it is small, flat, black, and somewhat rough, and will make a redding Neste.
Salmon's Herbal.

Lib. I.

X. The Places. These Plants delight to grow in the Sun, and prosper better in a fruitful Soil than in a barren. The first four grow in our English Gardens, where they flourish much. The fifth, 

Borough, says, grows in many places of the Adriatic Sea Shore, and in Islands tharbelonging to the Peninsula. The sixth grows not wild in England, but flourishes well in our Gardens. The seventh, which is the surpassing Delight of all Flowers, came from Virginia, and now is become a free Denizen of England, by being planted in our Nurseries or Gardens.

XI. The Times. They all flower in the end of June or July, and sometimes in August, and perfect their Seed in September. The Virginia Chimer flowers in August, yet sometimes, tho' not often in July, but perfectly Seed here.

XII. The Qualities. They are all hot and dry in the fourth Degree, Caustick and Biting, or Blistering the Skin.

XIII. The Specification. Authors say they are peculiar against Scurf, Morphew, Scabs, Leprofy, and other Defections of the Skin, but are not said to be taken inwardly, unless to purge Water in Dropes.

XIV. The Preparations. All these Plants are never or very seldom used in Phythic, unless in outward Application, yet their following Preparations have been made of them, viz. 1. A Pouder of the Seed of the first or Burning Ladies-Bower, and of the seventh or Upright Ladies-bower. 2. An Oil by Infusion or Basting of the same Plants. 3. A Distilled Water of the same. 4. The Liquor of the Virginia Chimer. 5. A Cataplasme of the Chimers.

The Virtues.

XV. The Pouder of the Seed. Given to a Scruple or half a Dram, more or less, in Fair Water or in Milk, it is said to purge Choler, Hymen, and watery Humors.

XVI. The Oil by Infusion or Basting. It cures Aches and Cramps, Sciatica's, and other Pains coming of Cold; it is also good against the Stone, and provokes Urine, from small quantity of it being taken inwardly in any proper Vehicle. It also takes away Scurf, Morphew, Scabs, Leprofy, and other Defections of the Skin, by anointing therewith.

XVII. The Distilled Water of the Upright Ladies-Bower. It clears the Skins of Defections, and is effectual against any cold Gripe in any part of the Body.

XVIII. The Liquor of the Virginia Chimer. This Liquor within the Pains, is very pleasant to the Tongue, as if Musk or Ambergris were mixed with it: and having a little Acidity with it, it does not close the Stomach, tho' it be taken in large quantity, nor gives any bad Symptoms, but is said rather to move the Belly downwards, and make it soluble. Addison gives us many Virtues of it, which seem to me to be spoken Hypochondrially, for by Experience nothing has yet been observed thereof. But he says, that the Leaves of the Plant have aummurous Property, and small like to Nightshade, having (as he thinks) some deleterious or deadly Qualitie in them, because it kills Flies which feed thereon.

XIX. The Cataplasme of the Leaves of the other Burning Chimers. Being applied to the Sciatica or Gout, or any Pain in other Parts proceeding from Cold, it cures them, being cautiously used; for it quickly Blisters.

XX. Note. Matthioli says, that the Pouder of the Leaves of the Upright Ladies-Bower, being prepared and given, helps against a Quartzian Ague. However, all the other Chimer may serve very well to make Arrows in Gardens and Orpards, or other like places for Pleasures, for to those Purposes they are most fit, if any where to Plante them.

C H A P. CCCCCXI.

Of LADIES-MANTLE, O R, LIONS-FOOT.

Called also, Great SANICLE.

THE Name. It does not appear that this was known to the ancient Greeks: but Brunsellins says it is known to, Leontopodium, Lions-foot: yet others say it is not that which Dictyocallis, etc.
III. The Description. The first, or Common Ladies-Mantle, has a Root which is somewhat long and black, with many Fibers, and Springs thereof. It is something like to our Common Sanicle, having many Leaves arising from the Root, flanding upon long hairy Foot-stalks, being almost round, but a little cut in the edges into eight or ten parts, more or less; making it seem like a Star, (whence the Name Stellaria) with so many Corners and Points, and denoted round about, of a light green Color, something hard in handling, and as if it was folded or plaited at first, and then crumpled in divers places, and a little hairy, as the stalk is also, which rises up among them, which grows to the Height of two or three Feet, with a few stalks Leaves thereon, but smaller, and being weak, is not able to stand upright, but bends sometimes down to the Ground, divided at the top into two or three small Branches, with small yellowish green Heads, and Flowers of a whitish green Color, breaking out of them, which being pale, there comes small yellowish Seed, like unto Poppy Seed.

IV. The second, or Five-leaved Ladies-Mantle. It has a small black thorny Root, from which spring a few smaller and smoother green Leaves, set upon long Foot-stalks, but divided at the edges into five Corners or Points, and something more deeply dented about the Base than the former; from among which come forth two or three small weak bending Stalks, about six or seven Inches high. The Flowers which grow at tops, are smaller, but like to the other, according to the Rules of the Plant, and of the same Herby or green Color.

V. The Places. The first grows naturally in many Pastures and Wood-lands, both in Hertfordshire and Wiltsshire, as also in Kent, and in various other Places in this Land. Gerard says it grows of it left Wild in divers places, in the Pastures at Andover, and in other parts of Hampshire and Berkshire, in their Cloths and Copes, or low Woods, as also upon the Bank of a Meat which encloses a House in Essex, called Bourn-Hill, fourteen Miles from London; and in the Highway from thence to Welford, a small Mile distant from it. The second grows on Bernard's Hill in Switzerland, but is to be found with us only in Gardens.

VI. The Uses. The first Flowers in May and June. The second not till August: but they both abide after Seed-time, and flourish and keep green all Winter after, as well as in Summer.

VII. The Qualities. It is hot in the second Degree, Astringent, Astringent, Strengthening and Vulnerary.

VIII. The Specifion. It is peculiar to stop Bleeding, whether inward or outward, all Fluxes of the Bowels in Man or Woman, and the Whites, or Weakness of the Womb. It cures Wounds after a most singular manner, being one of the most reconcile Wound-herbs, being extolled by the Germans with exceeding great Prife, who never cure any Wound, whether inward or outward, but they give of the Decoction hereof to drink.

IX. The Preparations. You may make hereof.

The Virtues.

X. The Liquid Juice. It is not so hot as that of Sanicle, and therefore more fit for those Wounds, which are accompanied with inflammation, and so is more drying, affrighting, or binding and cleansing. It is effectual against all sorts of Catarrhs both inward and outward, stops the Over-flowing of the Terms in Women, and cures the Bloody-flux, as also all other fluxes of the Bowels. Dose from two to four or six Spoonsfuls Morning and Night in a Glaff of the distilled Water, or in Ale or Wine.

XI. The Essence. It has all the Virtues of the former, besides which, it cures Bruises by Falls or otherwise, whether inward or outward: it heals Ruptures of the Peritoneum, as also Ruptures of the Blood-veins, which cause Spitting or Pissing of Blood, and is a peculiar thing to stop the Whites in Women, being extolled and used in this Purport; than most other things; for which Intention it is not only to be given inwardly by the Mouth, but also outwardly to be applied as an Injection up the Womb, with a Wound-Syringe. Dose three or four Spoonsfuls in Red Port Wine, or some other proper Vehicle, two or three times a Day. Inwardly also taken, and outwardly applied to Women's Bruises, which are great and over-much big, it cures them to grow later and hard. This Essence being taken for twenty or thirty Days together, by such Women as are Batten, or have a Slippetiness of the Womb, it is said to cause them to Conceive, and to retain the Birth after Conception, so that it dries up the too great Humidity, and slows H h h
the Flux of Humors to the Matrix, and it strengthen-  
en the Womb, as to prevent Abortion, reducing  
it to a perfect State of Health; but the Patient  
ought as well as to take it inwardly by the Mouth,  
so in a strong Decoction thereof Bathwife.  
XII. The Decoction or Infusion. This has all the  
Virtues of the Liquid Juice and Effusion, but weak-  
er in its Effects: however, it may serve as a Vehi-  
cle to convey other Preparations of this Herb in,  
and may be given from Four Ounces to eight Ounces  
or half a Part. It makes a good Infusion for hol-  
low Wounds and Ulcers; cleansethem, makes them  
feared Hind, and brings them to a speedy Healing.  
XIII. The Powder of the Leaves or Root. It is  
an excellent Styptic, and stops Bleeding in any  
Part it is applied to. Inwardly given from half a  
Dram to a Dram and half, in the Decoction, Infu-  
tion, or distilled Water, or in Red Port Wine, it  
has all the Virtues of the Liquid Juice, Effusion, &c.  
provided it is given Morning and Night for some  
considerable time. Teeth may be dip't into the Juice  
or Infusion, and then rooted in this Powder, and so  
put into any hollow Stone or Ulcers, by which  
it removes it wonderfully dry all Ulcers of the  
Ulcer, incarminates it, and induces a speedy Healing,  
yes, also! it is efficacious, with a Flux of Humors  
applying it, and shares also Infammations, if any  
be present.  
XIV. The Salvia or Oatment. It is one of the  
best of Vulnereal, for it digests if need be, adhe-  
ges or cleanseth, incarminates, dries and heals, almost  
to a Miracle; and in simples green Wounds or Cuts,  
it has such an exquisite Faculty of speedy Healing,  
that it cures it at the first Intention, consolidating  
the Lips thereof, without the bleeding Matter, or  
any Drayer or breaking out again, by altering  
any Corruption to remain behind. Outwardly applied  
to the Gout, Sciatica, or other like Pains of the  
Joints, proceeding from Blows, Over-ruining, or  
the like, it gives Ease, and speedily cures them, ad-  
ing also Strength to the Part.  
XV. The Calypso. It is an excellent thing to  
be profitably applied to a simple green Wound; for  
it stops the Afflux of Blood, and consolidates  
the Lips thereof at the first Intention of Curing. It  
also attains Infammations coming upon the Joints in  
the Gout, and gives Ease in the Pain. Applied to  
a recent simple Contusion, it prevents the Afflux  
of Humors; difficults those which are present, if any  
be, and safely reduces the Part.  
XVI. The distilled Water. Authors say, that if  
it is taken continually for twenty Days together,  
that it cures Barrenness in Women, viz. such as  
cannot Conceive, or such as cannot retain the Con-  
ception. But doubtless the liquid Juice or Effusion  
is much better than this, and therefore either of  
them may be given in this as a Vehicle, for which  
it is very proper, and may be given Morning and  
Night, from half to eight Ounces.  
XVII. The Spirituous Infusion. Inwardly taken,  
it warms and comforts the Bowels, Strengthens the  
inner Parts, Repels Wind, and is an excellent  
Traumatick, is drying and astringent, and therefore  
good against all Fluxes of the Bowels, Over-flowing  
of the Terns, and other Weaknesses of the Genera-  
tive. It is good to be used Diaesthetically in the  
Cure of Wounds, old Sores, running Ulcers, and  
Fihful's accompanied with Fluxion of Humors: it  
has all the Virtues of the Juice and Effusion, and  
may be given Morning and Night, from two Drains  
to three or four, in the distilled Water, or in Red  
Wine.  
XVIII. The Acid Infusion. It has all the Virtues  
of the Spirituous Infusion, but is more Traumatick  
or Vulnereal, and more Stomastic, whereby it ef-
Larks-Spur Common.

III. The Descriptions. The first, or Ordinary or Common Larks Heel or Spur, has a Root which is hard after it is run up to Seed, spreading both abroad and deep, yet penetrates every Verte, running it self usually from its own Sowing, as well as from the Seed soon in the Spring time. From this Root rise many Branches, which spread much more Ground than the others, rather leaning or bending down to the Ground, than standing upright; on which are fix many long green Leaves, finely cut, almost like to branched Leaves. The Branches end in a long Spike of hollow Flowers, with a long Spur or Heel behind them, (whence the Name ) very like unto the Flowers of Iceland-Root, (before described) and are of several and various Colors, as of a yellowish purple Color, or white, or bith color, or red, paler or deeper, as also party-colored, or two Colors in a Flower. After the Flowers are puffed, (which in this Kind abide longer than in the other) long round Seeds come forth, containing very black Seed.

IV. The second, or Double Common Larks-Spur. Of this Common Kind, there is some Difference in the Flowers, also in nothing else: the Flowers grow many upon a Stalk, like the former, but every one of them are as if three or four small Flowers were joined together, with every one his Spur behind, the generall Flower being cernomph, and as it were containing the rest, which are of a pale red or deep blush Color. Another of the Kind will bear its Flowers with three or four Rows of Leaves in the middle, making a double Flower, with one Spur only behind: and of this Kind there is with purple, white, blue and white Flowers, as also partly-colored. And thefe all bear Seed like the Single, whereby they are increas’d every Year.

V. The third, or Wild Larks-Spur. In its Root is much like the former, whence rise up fvelier and lower Branches, with smaller and shorter Leaves, and more frefhly or thinly growing upon them, than upon any of the former. The Flowers likewise are neither so large as any of the aforesaid, nor fo many growing together; the Cods likewise have smaller Seed, and is harder to grow in Gardens than any of the others. The most useful Color hereof, is a pale reddish or blush Color, yet sometimes they are found both white and blew, and sometimes mixt of blew and blush, variably disposed, as Nature sometimes pleads; but there are much more rare.

VI. The fourth, or Sparsifh Wild Larks-Spur. It has a Root which is small and threads, suddenly pufhing with the first Cold which overthrows the Plant. It has several long and broad Leaves next the Ground, cut in on both sides, something like to a Stahnoa Leaf, but it is smooth on the edges, and not indented before the Cods: it is of a whitish green Color, and something smooth and soft in handling. From among the Leaves rises up a whitish green Stalk, having many smaller Leaves upon it, which grow below, and not divided, branching out into many small Stalks or Arms, bearing Flowers like unto the Wild Larks-Spur, but smaller, and of a blew with a Color, which being puffed, there comes forth two or three small Cods, joined together, in which is black Seed, and smaller and rounder than any of the former.

VII. The fifth, or Single upright bearing Larks-Spur of many Colors. The Difference between this and the third, or Wild Larks Spur aforesaid, is, that the Leaves of this are not fully so green, nor so large: the Stalks grow upright to the Height of a Man, and sometimes higher, having some Branches thence, but fewer than the former, and standing likewise upright, and not leaning down as the others. The tops of the Stalks are better flaved with Flowers than the other, being sometimes two Feet long, and above, of the same Fashion, but not altogether so large, and of several and more various Colors, as white, pale, blue, red, deeper and paler, all-colored, purple or violet, and of an over-worn blew white purple, or iron Color. For all these we have simple without any Mixture or Spur. We have all other sorts among the simple Colors, which rise from the same Seed, and will have

Flowers
Flowers which will be half white, and half bluish or purple, is one Leaf white, and another bluish or purple, or else very little mixed and spotted. The Seed and Seed-Veils are like those of the three last kinds, but larger and harder.

XXI. Double or Double upright Lark-Spurs of many Colors. These Double Lark-Spurs cannot be known from the Single of the same kind, both are described, until they come towards flowering; for those appear many Flowers upon the Stalks, to the same manner, and all as many Colors almost as the Single, except the purple-colored, which stand like little Double Lark-Spurs, and spread open, as the Roy Columbine, without any Spur(s). Here they have them very delightful to behold, consisting of many small Leaves growing together, which, after they are fallen, three or four small Seeds set together come up in their places, which are contained here and there, or all are not full of Seed as the Single kind. Black Seed, like unto all the rest, but smaller, which being borne, will bring Plants, which will bear both single and double flowers all open. And it often happens, that it variably alters in colors from its own Sowing, for none of them hold constantly its own Color, (so far as it has yet been observed) but change into others in many months.

XX. An Observation. This last Plant Mr. Rea, in his Core's Chap. 14, says, is only worth the preserving, and he describes it thus: Double upright Lark-Spurs, from a Root which produces a little branch, sends forth small-jagged Leaves, tall upright Stalks, branched at top, and bearing many double flowers, in form like to the Roy Columbine. In several Plants of as many several entire Colors, as Blue, Purple, Alth. White, pale Blush, Rose-color, these are the most usual Colors, yet sometimes some Roots will bring Flowers which are tipped, and variegated with blue and white, and often with some Leaves blue, and others, purple; after the Flowers are fallen, come forth small horned Fods, which contain Seed black and round, and which being blown, will bring some Plants with single, but most with double Flowers.

XXI. The Places. The first, or Greatest Wild Kinds, grow among Corn in many Countries beyond Sea, but for its Beauty, is brought to us, and cultivated in our Gardens. The third, or Lesser Wild Kind, grows in several Fields of our own Country. The latter Kind was brought to us in Seeds, and grow also in our Gardens. The first Double and Single have been common for many Years in all Countries of England, but the tall Upright, Single Kind, have been made Natives but of late Years; and of them all, the Double Kinds are the most rare.

XXII. The Times. The Spanish Kind flowers very late, so that many times in England the Winter takes it before it can give ripe Seed. The other Kinds flower in the Summer Months only. The Double Kinds, as well as the Upright, as the Wild or Common, are very choice and tender, many times not yielding good Seed. The first Kind flowers according to the time of sowing it, sooner or later, in July or August, and many times Plants come up of themselves from the Seeds fallen out of the Pots before Winter, which have continued and borne far double Flowers in January following, which have brought about much good Seed. The usual time to sow these Seeds is, in the beginning of April; but to get good Seed, (which is a chief Consideration in these Plants) you ought to sow them as soon as they are ripe, in some place where they may be defended from long Frosts in Winter; and one of these Winter Plants is worth ten of those raised in the Spring, and will yield more good Seed; yet in some kindly Summers some of the Spring will feed reasonably well.

XXII. Yellows Larks-Spurs, called Delphinium luteum, which is Nasturtium indicum, Mr. Rea, in his Core's, puts into the Cliffs of Larks-Spurs, and describes it in the following Words. The Root, which perishes in Winter, sends forth many spreading, long trailing Branches, four or five Feet long, which unless supported, by a tree or Ground, and take up much Room. The Leaves are smooth, Elliptical, round, and the Flowers of a yellow Color, with long something like to a Single Larks-Hoe, but the Leaves flat, plain, and some of them are touched with red. The Flower is so well known, that it is needless to be over-curious in describing it, for few Gardens of any Note are without it. The Seeds are rough and uneven, falling of themselves, which are gathered off the Ground and preserved.

XXIII. Place and Time. They were first brought by Mr. Norwood from the West Indies; now they grow in almost all our Gardens throughout England. It flowers in July, and the Plant continues flowering till it is check'd by Frosts. The Seed is sown in April, and it is ripe and good, will be apt enough to come up; and the trailing Branches, when they grow, may be laid upon a Patch-thread tied upon Silk-shapes, into which Form your seed-plots, or they may be bound upon Roots stuck in the Earth, that they may remain through Winter. But we shall say no more of this Indian Plant, because we have already discours'd of it in a Chapter by it self, viz. Chap. 14. above;

XXIV. To these Mr. Rea, in the place cited, adds another Larks-Spur, which is Balsamina japonica, and describes it in these Words. It has a Root which dies at the first approach of Winter. The Stalks are thick and reddish, the Paulone, branched, and set with Leaves, the tipes of the Pome-Tree. About the Stalk, from the middle upwards, come the Flowers on short Foot-Stalks, which are of two or three Shadows of Purples, with Spur(s) behind, like Single Larks-Spurs, but bending downwards. These Flowers are succeeded by round rough Heads, pointed at the end, in which are contained small round blackish Seeds. The Flowers come forth in July and August, but rarely yield any good Seed in England. The Plant is tender, and must be sown in a hot Bed, and be placed into good Ground, and carefully attended with Watering; in the Heat of Summer, else it will quickly perish. Of this we have also wrote before, in a Chapter by it self, viz. Chap. 76, where there is a Difficulity of it so large, that we shall say no more of it in this place.

XXV. As to the Qualities, Specifications, Preparations, and Virtues of Larks-Spurs, those fix last Plants which are properly so called, Authors have had nothing to say about them. But Gerard says, they are temperate and warm of Nature: and he says, that the Seed of Larks-Spurs drunk, (I suppose he means it to be in Ponder) is good against the Stinging of Scorpions; and that some made it to be one of the Kinds of Coughs and Coughs.

XXVI. It is also well noted, That the former given to Larks-Spur, the Name of Musk-Head; it yet is not that pungent Musk-Head or Musk-Head, of which we fully discours'd in its place, Chap. 72, foregoing.

XXVII. Flowers of Larks-Spurs. Germain says, that three or more of the Flowers, are good against Pains and Stitches of the Side, and Bruises. Others say, That the Flowers kill the Eyes, Hears, or Body, Coughs, Strangury, Stoppage of Urine, by Gravel and Sand, and give Ease in the Sciatica. CHAP.
Chap. 423. English Herbs.

CHAP. CCCXXXII.

Of Lavender, or Lavender Spike.

The Name. This is a Plant unknown (as far as I can learn) to the ancient Arabs and Greeks; the Latins call it Lavandula and Spikes, and we in English, Lavender, also Spike.  

II. The Kinds. There are three Kinds of this Plant, viz. 1. Lavandula major, or Greater Lavender. 2. Lavendula minor, or Lesser Lavender. 3. Lavendula officinalis, or Galia, which Gerard calls Stachus multi- 

Sed. There is also a third Kind, the Scented Lavender, which is more rare, and is found in the Gardens of Italy, for the Use of their Bees. This third Kind is our Common Garden Lavender. 2. Lavendula minor, Lesser Lavender, or Galia, Small Lavender, or the Lesser Spike. Of these Greater and Lesser Kinds, there are also two sorts, the one being a purplish blue Flower, the other a white one, which latter is the more rare. 3. Lavendula officinalis, or Galia, which Gerard calls Stachus multi-

Sed, but erroneously) Jugged Lavender. 

Common Garden Lavender.

V. The second, or Small Lavender, or the Lesser Spike. Its Root is woody and spreading, and the whole Plant is very like unto the former, but grows not so high, nor is the Spike or Head so long, but shorter and smaller, and the Flowers of a deeper purplish blue Color. The Leaves are a little hither, whiter and fatter than the former, and the Smell is likewise somewhat fliptier and stronger; this is not so frequent with us as the first Common is, but is nurfed up in Gardens in a warmer place. 

VI. The second, or Small Lavender, or Lesser Spike, with a white Flower, called lavender inhere 

there also. This Small Lavender differs nothing from the former Small Kind, but is in all things like it, seeing that the Flowers are white, and the whole Plant is yet a little smaller, and is generally planted in very warm places. 

VII. The third, or Jugged Lavender. Its Root is hard and woody, like unto the others, 2-is a small Plant, and rises up with figure, rough and hasty Branches, to a Foot and half high, heaving thirteen many heapy with his Leaves, very much haggled or torn on the edges, into many parts, even to the middle Rib, and each part cut or jugged; of a thirp Tall, part of a pleasant Smell, yet much weaker still, than the other Small Lavender. From among these Leaves rise up twofigure heavy Stalks, without any Leaves on them all, to the tops, where they bear small spikes of purple Flowers, like unto the first Lavender's Spikes, but these Flowers seem to fluid square, or in four pretty Corners. 

VII. The Places. The four last are found naturally in many places of Spain, and about Aegyptus in Africa, where the life also grows, but both the forms with white Flowers, are much more rare than the first or Common Kind. The fifth was found by Clusius about Malaga in Spain, and Maravedi in this Kingdom.
Salmon's Herbal. Lib. I.

Kingdom of Crocodylia; but with us they all of them grow only in our Gardens; of which, the first is by much the more common.

IX. The Turmeric. They all flower in England about the end of June, or beginning of July; last Capvon says, that he found the fifth about Auius in Spain to flower in February, and about March to flower in March; yet in these colder Climates, it flowers not until June at the least, or in the Month of July.

X. The Quailwort. Lagurus is hot and dry in the third Degree; it is Mollific, Aperitive, Astringent, Diffusive, Drenching, and Inflammary. It is Cephalick, Nervick, Stomackick, Cordial, Nephritic, and Hypurick. It is Alepharmacick, Alempick, and Anemapharmacick, being of very foul and the parts.

XII. The Specification. It is a peculiar thing for the Cure of Convulsions, Epilepsies, FALLs, Tremblings, Verrigo, Lethargies, Swolnines, Hypurick Fits, and other like Disturbances of the Head, Brain, Nerves and Womb.

The Virtues.

XIII. The liquid Juice. It is of good Use against Pains of the Head, and other Disturbances of that Part, as also of the Brain and Nerves, proceeding from Cold and Muffle, or the Afflux of cold Humors, as the Apoplexy, Convulsions, Cramps, Cephalick, Epilepsies, Painting, Lethargies, Fally, Tremblings, Verrigo, and other like Disturbances. It is good against SWooping, strengthens the Stomach, opens Obstructions of Liver and Spleen, provokes the Terms, facilitates the Birth, and expels the dead Child and After-birth. Dose one, two or three Spoonfuls of a Glass of Wine.

XIV. The Essence. It has all the Virtues of the liquid Juice; besides which, guilted in the Month, it eafe the Tooth-sick proceeding from a cold Caule, provokes Urine, and gives Eafe in the Colick: it prevails against Palpitation, and Palpations or the Heart, Strangling, Vapors and Swolnines of the Mother, Dose one or two Spoonfuls in a Glass of Wine, or of the distilled Water.

XV. The Infusion in Wine. It has all the Virtues of the liquid Juice and Essence, helps the Stomagick, and Scalping of Urine, expels Wind, and eases the Griping of the Guts, being given inwardly from two to six Ounces, according to Age and Extremity of the Disturbance. But it is to be noted, that this infusion may be made of the green Leaves, yet it is much more powerful being made of the Spikes of Flowers, which is most usual.

XVI. The Powder. It strengthens the Stomach, expels Wind, and is good against the Colick. One would apply to old running Sores and Ulcers, it stirs up the Humidity, repels the Virulence and Putridity, and drips them to the ground; note, that it ought to be made of the spiked Heads of Flowers. Mixed with Powder of Euphorbium it is good to Culate foul and corrupted Bones. Given to one Dram in White Port Wine to Women in Travail, it facilitates the Birth, and expels the Seconufine.

XVII. The distilled Water. This may be made of Leaves and Flowers together. It has the Virtues of the Juice, Essence and Infusion; but in a much lower Degree, so that it is to be used in a greater quantity, as from three to six Ounces, a little dulled against double refined Sugar; but it is most commonly used as a Vehicle to convey down into the Stomach the other Preparations of this Herb. Two Spoonfuls thereof does help both as to their Voice or Convulsion, Palpitations, Fevers, or otherwise, restoring it them again. It helps also the Tremblings and Palpations of the Heart, first and second Vomiting, for not only drugs, but even applied to the Temples, or to the Nodulins to be meted into. That which is made of the Flowers alone, is much the best.

XXIII. The Spiritus Tincture. It is made of the fulk Leaues of Flowers, (as also are all the following Preparations) and is a noble Cephalick, Nervick, and Stomackick. It very much strengthens the Head, Brain and Nerves, and affists all Disturbances proceeding from Cold and Muffle of those Parts. It gives Eafe in an inveterate or old Head-ache, called Cephalick, as also in an accidental Head-ache, called Cephalick, and in a half Head-ach, called the Megrim. It strengthens the Stomach to a Miracle, is good against Coldnesses, and Water-sicknesses therefrom, Wind and Over-surfing of the Stomach, Painting and Swolnines, Sickenss at Heart, and indeed all those Disturbances with which the Juice, Infusion, Infusion and distilled Water are prescribed. Dose from one Dram to three or more alone, if infulted: or otherwise mixed with some tonic generous Wine, or with a quart quantity of the distilled Water.

XIV. The acid Tincture. This is a great Stomackick, and very fit for a hot Stomach, because in the Preparation of the Acidity it effaies the Heart thereof, accelerates it, strengthens it, and causes a singular good Apple and Digestion, supports Vapors, as also a Pericardick, or Hypocholesterick Melancholy, and Fits of the Mother. It prevails against the Scoury in a cold and moist Habit of Body, and all the Symptomes of that pestilential Disturbance, carrying off the Mortick Matter or Cause by Urine, which it causes a plentiful Evacuation of; and therefore is good against Stomachick, Gravel, Sand, and Tartarick Matter or Sinne in the Knees, Urethra or Bladder. It is to be taken daily, in all that the Patient drinks, whether Ale, Beer or Wine, so much at a time as to give it a pleasing Ache. outwardly bathed upon Places affected with the Gout, it gives Eafe in the Pain, and in a short time cures it.

XX. The Oily Tincture. It is powerful against Palpitations, being unconined upon the Spina deep, according to Combinations of Nerves and Stomachick of the Parts affected, as also upon the Paralytick Part it does: it prevails against Convulsions, a Catarrhick, Cramps, Lethargies, Falling Rickets, Trembling, Verrigo, and other Disturbances of the Nerves, being anointed upon the grieved Places, and also taken inwardly from ten to thirty Drops in any proper Vehicle; and to given Morning and Night, it is good against the Stone, Gravel, Sand, and any Tartarick Morblage in the Uriny Parts: it powerfully provokes Urine, gives Eafe in the Strangury, and takes away the Pain, Heart and Scalping therefrom; conversely, it is good to cure Hurs and Buncures of the Nerves and Tendons, to distill Flatus, and ease Pairs of the jointed and other Parts, proceeding from Cold and Muffle.

XXI. The Spirit. It is one of the renaught of Vegetable Cephalicks and Cordialls: it compresses the Head, Brain, Nerves and Womb, supports Vapors, and reclaims Hypurick Fluor. It powerfully provokes a pleasure Pulsation of the Heart, Sickenss at Heart, Painting and Swolnines, and all other Distempers of that Part. It revives the Spirit, cheers the Heart, and strengthens all the Faculties of the Body: it is prevalent against a severe Cold, and eases a Lethargick in a short time. It may be taken two or three times
times a Day, or in a Paroxysm, either alone, if aplic- 
ayed, and dulcified with the Taste of white Sugar, or mit- 
with any proper Vehicle. The Patient troubled 
with any of the aforesaid Difficulties, shall not take it 
in Vain, especially such as are Patadytic. Dose 
done once a Day to two or three Days or more, ac-
ording as the Age of the Patient will admit, and 
Extremity of the Difficulties may require.

XXII. The distilled Oil. It has all the Vir-
tures of the Juice, excepting the Tinctures and Spirits; and 
almost all the hundred times more power-
ful than all of them, so that the Virtues hereof need 
not now be again reiterated in Vain: but this in par-
icular, it is one of the greatest Antipatodytics, 
Antispasmodics and Antisorrhatics in the World; 
and heales, being given to Women in Travel, it 
facilitates the Birth, and expels the After-birth, and 
gives Ease in Afterpartus, beyond any other Medi-
cine I know in the World. The Dose is from 
Four Drops to twelve, sixteen or twenty, (in Extremity) 
in any proper Vehicle. First drop it into Sugar, 
mixing that well taken together with the Point of a Knifes 
then put it into the Wine, distilled Waters, or other 
fit Vehicle, and so give it to the Patient to drink, 
repeating the Dose as oft as you see convenient.

XXIII. The Flowers. This Preparations has all the 
Virtues of the Oil alone, and may be given in the 
same Vehicle: but as it is a more diluted Sub-
stance, it may be given in a much larger quantity, 
even from half a Dram to two Drums or more, as 
the Exigency may require. It is very febl and pe-
necorative, and pierces more than the Oil does. Out-
wardly applied, it is admirable against the Scariata, 
as also against the Gout from a cold Cause; and is 
good against a Leathery, being bathed upon the 
Forehead and Temples, drained up the Nostrils, 
and taken aloft inwardly, as before directed.

XXIV. The Elixir. This is the Powers eluci-
dated, has all the Virtues of the Oill alone, and 
so operates in a less Dose, viz. from a Scruple to a 
Dram, or from twenty Drops to sixty Drops, which 
may be given Morning, Noon and Night in such 
proper Vehicle as the Physician shall advise. It 
is peculiarly commended against Palpies, and Difficul-
ities of the Womb, as Subfoction; as also the Eptiphes 
in younger Persons. It gives Ease in and cures the 
Scariata, immediately taken, and prevails against the 
Colic even by having the outward Part thereof with-
An Ounce of the Elixir being mixed with six Ounces 
of the distilled Water, makes an excellent lotion 
for the Head in Pains thereof, as also in Leatheries, 
and to strengthen the same.

CHAP. CCCXXIV.

OF LAVENDER-COTTON, 
or, 
SANTOLINE.

T H E Names. It is called in Greek, Λαυδέ-
νερωτικον, in Latin, Lavandula, in English, 
Lavender-Cotton, and Santoline.

II. The Kind, usually taken, is nine or ten Kinds of 
this Plant, as we shall be contented with fix of them, 
which we find growing in our Gardens, or in some 
of our Plantations beyond Sea, viz. 1. Abrotanum

007

1. Santolina officinalis, Santolina communis Anguillaria, 

2. Santolina Chamaecyparissus, Chamaecyparis herbacea Plinius, 

3. Abrotanum Gallaceum, Abrotanum officinale 

4. Abrotanum staminatum, Abrotanum officinale 

5. Abrotanum officinale, Abrotanum officinale 

6. Santolina eorum, Santolina communis, Santolina communis, 

7. Santolina officinalis, Santolina communis 

8. Santolina communis, Santolina communis 

9. Santolina officinalis, Santolina communis 

10. Santolina officinalis, Santolina communis

The
VI. The fourth, or Heath-leaved Lavender-Cotton. This has a flow much like for Form and Substance to the others; but the Plant is full grown not to great or high as the French Kind does; but has many short woody Branches, on which do perfectly grow smaller, flatter and their whith green Leaves. Very like to the Leaves of our Common Heath. The Flowers are yellow, standing in like manner as all the former do. And the whole Herb has a very pleasant (but not strong) Smell to commend it, somewhat relieves, and not very faintish or weak.

VII. The fifth, or Rofmarv-leaved Lavender-Cotton both Greater and Lesser. The Greater Kind has a mediately spreading Root, like to the others afore going; and it flows forth from this Root many slender hoary Stalks, something above a Foot long; about which grow many very narrow, small and the Leaves, like unto the Leaves of Rosemary, which while they are young, are of a more hoary white, and have but a small Show of denting about the edges; but when they are grown old, they are more green, and the denting about the edges is more apparent, of a firwer Smell and bitter Taste. From these Stalks come forth several short Stems, with very few Leaves on them, on the tops of which stand several yellow Flowers, like to Common Lavender-Cotton, but much larger, which die down to the main Stalks every Year, after perfectly the Seed as the others do. The Lesser Kind differs not from the Greater in NY, and Flowers, but in their Smallness, this being the more flender and small in every part, very off not by reason of the place, it is being more bore, (as done the thought,) but it has never found that growing in the same place with the former or Greater Kind, and the Seed being grown in the same places, that it still remains the Form and Magnitude it had, as growing in its natural place.

VIII. The sixth, or Small green Lavender-Cotton. The Root is woody, like the former, and replenishing with small Fibres. This Plant is very like to the last Small Kind, but that it grows somewhat greater and higher, having green, and not hoary Stalks at all; as the Leaves also are, being a little longer, and as bitter in Taste as the others, but not to sweet a Smell, having rather an Oily Sent. The Flowers grow in the same manner upon flender Stalks, and of the same Fashion, but of a paler yellow Color.

IX. The Places. The full grows naturally in Germany. The second in the Low-Countries. The third about Narbonne in France. The fourth and fifth Clauses found growing about Salamanca in Spain. The sixth is unknown, as in what place it is a Native; but they all grow well with us, being nurtured up in Gardens.

X. The Times. They all of them flower in July and August, and the Seed is ripe in some little time after.

XI. The Similarities. Lavender-Cotton, but more especially the Flowers and Seed, are hot and dry in the third Degree. It is Astringent, Digestive, Neurotic, Nervitie, and Averpharmacie.

XII. The Description. It stops the Whites, refills the Poylon of Serpents and other Venomous Creatures, kills Worms in Children, and cures Ith and Seats of all sorts in whomsoever. Euphormia, and to all other Writers generally after him, say, that the Virtues of Lavender-Cotton, and of Southernwood, are the same, and of like Effects, and that the Medicines made from this Plant are applied to all the Diseases to which Southernwood is appropriate.

XIII. The Preparations. You may make all the same Preparations hercuf as we teach you to make from Southernwood, which lies hereafter in its proper Chapter. But these following Preparations are more particular and special. viz. 1. A Powder of the dried Leaves. 2. An Infusion of the Leaves. 3. A Powder of the Seed. 4. A Spirituous Tincture of the dried Leaves or Seed.

The Virtues.

XIV. The Powder of the Seed. It kills Worms, (as also the green Seed, being bruised and drunk.) It is thought to be equal, if not superior to our Ufal, or Common Wormseed, and has the same Virtues against Worms, avoiding them with greater Force. Dole from half a Dram to a Dram in the Morning tallow, and at Night going to Bed, in any proper Vehicle. It is good also against the Biting of Serpents, Mad Dogs, or any other Venomous Creatures, being inwardly given as astringent, and applied Pouder-withe to the Fart wounded.

XV. The Powder of the Leaves. Matthioliys Days, that being given to half a Dram (It may be given to a Dram) in Water or Water, every Morning taking for ten Days at least together, and at all times every other Day, for some time. It is a very profitable Medicine to stop the Whites in Women, and to cure them. They says it is also good against the Poylon of all Venomous Creatures, and against that being taken in Wine. It kills Worms also, and has all the Virtues of the Seed, but not altogether, so powerful, and therefore may very well be used, when the Seed cannot be gotten, but in some what a greater Dose.

XVI. The
LEAD-WORT, see Scar-Wort, Chap. 
LAVENDER-SEA, for Limonade, Chap.

CHAP. CCCCXXV.

OF LAUREL, Dwarf or Ground.

I. THE NAME. It is called in Greek, Λαυρις; in Latin, Ludumbarum, Laurus Alexandrinus; in English, Herbs laurel, Bay-laurel, or Laurel-berries. It grows in Syria, Crete, Caria, and in other parts of Asia. It is a shrub, about 6 or 7 feet high, with a spreading branch, and leaves like those of the Laurel-tree, but smaller and thicker. The flowers are small and white, and the fruit is a drupe, about the size of a pea, with a hard black seed inside. The leaves are used in cookery and for medicinal purposes.

II. THE KINDS. It is a singular plant of the kind, the same would make it to be a second sort of Laurel of Alexandria, which I can no ways believe it to be.

III. THE DESCRIPTION. It has hard root, and very thorny, from silence rises up one stem or stalk, and sometimes two or more, which seem to be covered with the new leaves. The branches, or both sides thereof, the lower being larger than the upper, which leaves are long and narrow, also sharp pointed, very like to a Common Bay Leaf, having many ribs in the upper side, and paler underneath, full of ribs or veins also, not much unlike to Horse-tongue, faying that they are without any second small Leaf or Tongue, such as Horse-tongue has, but as hard in handling. This has Flowers, and red Berries, in the month of the Leaf, (and upon to fruit a Stark, that it seems to have none) growing out of the middle Rib; but these grow on the under side for the most part, which may make it to be thought a Species of the Laurel Alexandrinus, but indeed is not.

Dwarf or Ground Laurel.

IV. THE PLACES. It grows naturally on several Hills in Italy, which for its Rarity was brought into their Garden; and by the means of John Tradescant, it was brought into our Country and Climate, where it flourisheth very well.

V. THE TIMES. It flowers in June, and the Berries are ripe in September, in its native Country; but here in England its Fruit comes not to Perfection.

VI. THE QUALITIES. It is hot and dry in the end of the second Degree, Aperitive, Valerious and Diuretic.

VII. THE SPECIFICATION. It makes the Belly-sach, powerfully provokes Urine and the Concrections, and is good against Heart-burnings.

VIII. THE PREPARATIONS. You may have there-from, 1. A Decoction or Infusion of Herb and Roots in Wine. 2. A Powder of the Herb and Roots. 3. A Bath or Osmication.

THE VIRTUES.

IX. THE INFUSION or DECOCITION of HERB or ROOTS in Wine. It powerfully provokes Urine and the Terms in Women, cleanses the Womb of Excoriations, and the Reins and Bladder of Sand or Gravel, Meekliness, or Thrombus, and gives a great degree of the Strangury. Decocitories have a good effect in all motions of the Body, and particularly, in Belching, vomiting, and Colic. They are used in the following Manner. For a strong dose, take the Herb and Roots of Laurel growing at Great Westham, and boil them in four Quarts of Wine, and let them stand to cool, and then drink one Glass of the same every day. For a weak dose, take Laurel growing at Great Westham, and boil them in one Quart of Wine, and let them stand to cool, and then drink a Glass of the same every day.
X. The Powder of Herb or Root. It has all the
Virtues of the Infusion beforegoing, besides which,
it culls and cures the Heart-burning, and gives Ease
in the Colic, Gripings of the Guts, and other Di-
tempers of the Bowels, being taken Morning and
Night in a Glass of generous Wine, from half a
Draught to a Dram and half.
XI. The Bath or Fumigation made with Water.
It is very good for Women to sit over, to receive
the hot Kernes up the Womb, or to sit in as a Bath,
or to have it injected up the Womb, in case of fall-
ing down of the Womb, and to settle it in its right
place again.

CHAP. CCCCCXXVI.

OF LEEKS.

I. The Name. This Plant is called in Arabic,
Cales for Leek. in Greek, Κλαλεν. in Lat-
tine, Porrum; and by Palladius, Πορροιν. The
English Leek.
II. The Kinds. Of Leeks there are several sorts,
as, 1. Averno-Comfort, Porrum Capitatum, Common
headed or set Leek. 2. Tachysporus, Porrum Set-
tille, Porrum Scilicet aut Tenuile, Common cut or
unset Leek. 3. Almerinaceum, Anaphrodogum, Por-
rum Venerum, Porrum Filiforme. The Vine-Leek.
and this Parkinson says is the belt of all the Kinds.

Common headed or set Leek.

III. The Description. The set, or Common
headed or set Leek. The Root is a kind of bearded
Bulb, white, long, and flesher, that growing in some
to a considerable Thicke. From this Root rises
up broad fair Leaves or Blades, which grow out
long, and very many of them, having a Crest or
Ridge on the back-like, in Small and Talle very
strong, not much unlike Onions, or between Onions
and Garlic. The Stalks (if the Blades are not cut
often, but are suffer'd to grow uncut) will in the
second or third year after Sowing, send forth a
round and flesher Stalk, of an Eternity quite
throughout, and not swollen, or bigger in the middle,
as is that of an Onion, which bears at the top a
round Head or Ball, like to that of the Onion, con-
filling of purplish Flowers and black Seed after
them, so very like unto Onion-Seed, that it is hard
to distinguish them.

Leeks Unset, or Cut Leeks.

IV. The second, or Common cut or unset Leek,
but a Root which is also white, long, and flesher
than the former, with a great Bulb of Fibres hanging
or at it, like a Beard; but this being transplanted,
grows thicker and greater. The Stalk, Blade, Heads,
Flowers and Seed, is much like the other above.
Now, tho' most Writers distinguish the Common
Leek in two Kinds, i.e., Porrum Capitatum, & Se-
tilleum, the Healed and Cut Leek, yet Gerard
says, they both grow of the same Seed, and that
they differ only in Culture: for that which is of-
ten cut for the Use of the Kitchen, is called, Setti-
lleum, the other which is headed, is not cut, but
spireled, and removed in Autumn. Parkinson says,
Non differit a Capitatum, sed quod Capitatum in timely,
an, anum Servetur.

V. The third, or Vine-Leek, which some call the
French-Leek. Its Root or Bulb is headed or round,
hard and sound, and is quickly multiplied by sending
forth many Bulbs, and it will encoree altogether by
the Root, as Garlic does. It grows up with Blades
like those of Common Leeks, the Stalk is a Cudic
high, on the top of which sends a round Head or
Button, covered at the first with a thin Skin, which
being broken: the Flowers and Seed come both
like those of the Onion.

V. The third, or Vine-Leek, which some call the
French-Leek. Its Root or Bulb is headed or round,
hard and sound, and is quickly multiplied by sending
forth many Bulbs, and it will encoree altogether by
the Root, as Garlic does. It grows up with Blades
like those of Common Leeks: the Stalk is a Cudic
high, on the top of which sends a round Head or
Button, covered at the first with a thin Skin, which
being broken: the Flowers and Seed come both
like those of the Onion.
Vine-Leek.

Wild Leek.

VI. The fourth, or Wild Leek. The Root is a rounded Ball, of a lightish or dull Brown. Its Leaves and Stalk are much like unto those of Crow-Garlick, but much larger, and more acute, or sharp and strong. The Flowers and Seed also resemble those of the Crow-Garlick in Chap. 30. afore-mentioned: the Seeds being about the Bigness of Grains of Wheat, with small Strings coming forth at their ends.

VII. The Places. The first three grow with us in Gardens only, which ought to be a good Earth, such, well dug and digged, and are common to be had in all Countries, as well as in England. The Vine-Leek grows of itself in Vineyards, and near unto Vines, in hot Countries, from whence came the Name. The Wild Leek grows wild in several Regions, and is many times stirred up in our Gardens.

VIII. The Times. Leeks may be sown in March or April, and removed in September or October. The Vine-Leek bears its green Leaves in Winter, and withers away in Summer.

IX. The Qualities. They are all of them hot and dry in the fourth Degree. They are Appetitive, Aperitiue, Anodyne, Attractive, Digestive, Diuretic, Emollient, Inflamatory, Attenuating and Suppurative, Spermatick, Petrophilus, Nephritick, Emmenagogick, Alchemicksick, Analitick and Spermatogynick.

X. The Specification. They cure the Scorrv in a cold habit of Body, help a debilitated Appetite, ease the Strangury, and other Difficulties of the Reins and Bladders, as also Ulcers of the Lungs.

The Virtues.

XII. The Liquid Juice of Roots and Blades. A Spoonfull of it being mixed with Honey, and drunk, it is good against the Bitings of Vomous Beasts and Serpents, the Roes or Leaves being also beaten to a Pulp, and laid thereon. It wonderfully provokes Urine, eases the Strangury, and brings down the Terms in Women; cures the Bitings of Mad Dogs and other Perilous Creatures, but these things the Juice of the Vine-Leek more especially performs.

XIII. The Essence. It has all the Virtues of the liquid Juice, and may be given in any proper Vehicle from half a Spoonfull to a Spoonful and half; mix it with Vinegar, or Milk, or Oil of Roses, and drop it into the Ears, it eases their Pain, and takes away any Noise in them.

XIV. The Infusion in Wine. It has all the Virtues of the Juice and Essence, and being given from three Spoonfuls to five or more, it facilitates the Birth of Women in Labor, brings away the Afterbirth, eases After-pains, and cures a due cleansing.

XV. The Broth. It is made by boiling them in Boily Broth, or Boily Cream, till they are soft or dissolved, and in they are eaten with it, and may be called Leek Pottage. It cools, and cures Expectoration of crude and undigested Phlegm, and other Humors lodged in the Thora, or Lungs and Stomach, and_PARIS adjacent: besides, it nourishes much, and is good to be eaten by such as are in Consumptions.

XVI. The Leekte. Label prepares it thus: Take blanched Almonds three Ounces, Juice of Lemon two Ounces, decimal Leek two Ounces, soft Boiled half an Ounce, Sugar-Candy in fine Powder two Ounces, distilled in Juice of Leeks, a sufficient quantity: boat all in Boils, till they come into the Form of an Emulsion. Label commends it as very virtuall the gainst a Rheumatic Quinsey, and cold Catarrhs, which are in danger to cause Suffocation. It is an excellent thing against Coughs, Colds, Head-aches, Difficulty of Breathing, Wheezing, &c.

XVII. The boiled Saltee. It is made by boiling them in Water or Broth to Softness, then dressing them up with Burre, Vinegar or Lime-Juice, Salt and
Salmon's Herbal.

and Pepper. It is a very grateful rising to the Stomach and Bowels. We find in Scripture, in ancient Times, as in the time of the Children of Israel’s being in Egypt, and probably a long time before, three Herbs National to much upon Leeks, and Onion, and Garlic, which possibly they might either eat alone, or baked, or toasted, or boiled, in Water or in Booth with Fish, and the same manner of Feeding on them, seems to be in all Nations alike, in Megiddo and Raaba they are commonly eaten, and the Turks (as bathroom says) have them served up in their Dishes at Table, yes, to their General Liking so Bitza’s. They are eaten alo spite in Spain, and into all the Ifid Islands, in all the Spanish, French, Dutch and English Plantations. We in England likewise universally eat them, and they are a great and general Feeding in India, even among the Natives there; and in Loo-side we almost everywhere make Potage of them, and it is a profitable Food for poor People in hard Times.

XVIII. The distilled Water. It is a singular Distillation, good against Gravel, Sand, Mucigation and Tartarous Matter in the Reins, Uterus and Bladder. It has the Virtues of the Juncus, Lilium and Jonion, but being more weakish, is to be given in greater quantity, and may serve as a general Vehicle to give other Preparations of Leks in. Dose from four to eight Ounces.

XIX. The Spiritus. It is good to fire the Stomach, Lungs, &c. from putrid or rotten Fish, and prevail against Complex Cold, Colds, or Diffusions of Rheum, by which many have been brought into a Consumption. It invigorates the Instruments of Generation, wakes and comforts the Worm, provokes Urine and the Terms, and is profitable against Barrenness in both Sexes. Dose two or three Ounces, two or three times a Day.

XX. The Spiritus Turfus. It has all the Virtues of the Spirit, but much more powerful to all the Intentions, being given from one Dram to three in any convenient Vehicle; two, three or four times a Day, but chiefly every Morn or even Night going to Bed.

XXI. The distilled Turfus. It softens, cuts and incides rough Gravel which sticks Eft in the Branches of the Lungs, and there and the Parts adjacent from putrid or rotten Gravel lodged therewith, which is otherwise difficult to be avoided. It softens their Voice which has been lost that Heartsease and after an admirable manner expels the Stomach and Bowels, and cases such as have been petrified, or hardened by eating of Musthumes. Dose to many Drops as to make the Wine or other Vehicle pleasantly acid.

XXII. The only Turfus. It is good against Lamenefs and Weakness of the Nerves, Joints and Limbs, and therefore is of singular Use against the Palsy, and Gout from a cold Gout, being applied upon the Parts affected. Inwardly taken from eight to twenty Drops, being snuff’d into White Sugar, and mixed well with it, and given in White Port Wine, or in the distilled Water, or some other proper Vehicle, it gives perfect Cures in the Strangury, opens Diffusions of the Urinary Parts, and expels Gravel, Sand, Mucigation or Tartarous and Slimy Matter affecting those Parts. Given to a Woman in Labor, it quickens the Birth, brings away the Afterbirth, and causes a due Cleansing.

XXIII. The Powder of the Seed. Take Seeds, and dry them under a little Powder, and mix them, and make them into a fine Powder, and mix them. This Mixture given from one Dram to two in Red Port, or Red Bordeaux Wine, or other proper Vehicle, will stop any Spitting of Blood; and this, if done of long Continued, it is said, that if such Ingredients are put into Wine, they will keep it from Souring, and if it be already Sour, will amend the Time. This Powder will cut groats and rough Humors, and take away the Humors of the Bowels, yes, the Bloody-flux in the.

XXIV. The Capsuln. The Roots and Bladders being boiled in Water, or Milk, or Wine, and to make into a Pulpus, and applied to swell Balsam, or Piles, it dissolves the Tumor, gives False in the Pain, and in a short time after cures them. If the Capsuln is made of the raw Roots, by beating them in a Mortar, adding a few Crumbs of White Bread, as you see occasion, and be applied to any place bitten by a Man Dog, Viper, Rattle-Snake, or other Veninous Creatures, it infallibly attracts to, and draws out all the Poison; and this it does by reason of its vehement attractive Force, by which means it perfectly removes the Patient from all manners of Danger.

CHAP. CCCXXVII.

OF LENTILS.

I. The Nature. This Plant is called in Arabick, Hades; in Greek, Aulos, and in English, Lentil and Lentiles.

II. The Kinds. There are three Kinds hereof, viz.: 1. Lentus major, The greater Lentil. 2. Lentus minor, The less Lentil. 3. Lentus angustus, The fparted Lentil.

Great and Small Lentils.
those forth at several places long Stalks of small
withered Leaves, and of many smaller Leaves
on each side of a middle Rib, with no可用一
di the end of the flack, and the middle Rib of each Stalk of
Leaves, ends in a small Clasper. The Flowers are
小型的 those of Leek, and the Stalks, two for the most part at the end of a long
Foot-hall, of a full purplish Color, somewhat like
to those of Vetch, after which come small Orons;
and somewhat flat Pods, within which are contain-
ed two or three flat, round, smooth Seeds, of a pale
yellowish Al-Color.

IV. The second, or Lesser Lentil. It has a small
foot where the more pleasant and acceptable; but
the greater does with very great Difficulty come to
Maturity with us, if the Season or Weather is not
kindly and dry. Gerard says, that it had been told
him by Parfons of good Credit, that Husband-men
about Walford in Middlesex, and other places in
England, do sow them for their Cattle, even as
they do Tares. The third grows wild in Portugal,
with us only in Gardens.

VII. The Trees. They all flower, and their Seed
grows ripe in July and August, and sometimes later.

VIII. The Qualities. The Lentil is temperate in
respect to Heat or Cold, and dry in the second De-
gree: Afltringent, Stomachic, Hyterick and Vulne-
ary.

IX. The Specification. The Fruit of Grain Hopkins
Fluxes, and the Terms in Woman, chrestes and head
old Sores, Kibles, Ulcers, &c.

X. The Preperations. You may have therefrom,
1. A Decoction of the Grains, or of the whole Coa-
and Grains in Wine or Water. 2. A Compound
Decoction of the same. 3. A Meal or Flower. 4.
Pottage. 5. A Mixture with Honey. 6. A Cus-
plan with Vinegar. 7. A compounded Carapla. 8.
A Carapla made with Barbatus.

The Virtues.

XI. The Decoction of the Coa or Grains in Wine
or Water. Made with the Coa and Grains, it is
Afltringent or Binding; it stops the Terms, Fluxes
and Vomiting, and strenghtens the Bowels. If it
is used only in Glasses alone, it is said to沃den
the Belly, but their second Decoction binds the
Belly, and stops Fluxes.

XII. The compound Decoction. It is made by
jìointing a half quantity of Catechu of Red Rose Root,
Pomegranate Pits, Myrtle Berries, and Oranges
Unripe Pears, Quinces, Galls, Sassafras Berries,
Madder Unripe, Red Rose Leaves, and Pluotante
Leaves, and boiling them all in rough Red Wine.

Chap. 427. English Herbs. 613

of LENTIL Sea.

THE Uses. It has no Greek Name, be-
cause, I suppose, unknown to the Greeks:
but it is called in Latin, Lentilcula Marina, Una
Marina; in English, Sea Lentil.

II. The Kinds. Authors make two Kinds there-
of, viz. 1. Lentilcula Marina vulgaris, Lentilcula
Marina Angustifolia, Common Sea Lentil, or Nar-
row-leaved Sea Lentil. And this is called Lenti-
cula Marina Scopoli, and also do Tuberme
mortuum and Lapharapen: and this is the Ficus
folliculacea
Salmon's Herbal.

Lib. I.

L folliculosus Loraria falso Bauhinit, and the Acinaria Marine altera Species Imperati. 2. Lentilado Marina Serrata falso Bauhinit, Acinaria Marine tertia Species Imperati. The Jagged or Saw-leaved Sea Lentil. This Broad-leaved or Saw-leaved Sea Lentil, Cheilor in his Spec-

III. The Descriptions. The first, or Common narrow-leaved Sea Lentil. It has many thin long 

places, to the Question, whether this with the 
defined Leaves be not that Herb which is called 

Sargazo or Sargazo, but Bauhinit, in his Pflan-

determines it as certain.

Common narrow-leaved Sea Lentil.

very fragile and full of salt Water. There is no 

Root to be observed in this Plant, but only the 

Marks of the Breakings off appear. And it is like-

ly it grows in the deep and sandy Bottom of the 

Sea, and there may have small Roots. Yet some 

are of Opinion, That this Herb is picked up and 
carried away by the rapid Course of the Waters 

which fall out of many Hands into the Ocean. 

Now, the Matter of the Ship in which I was, did 

fully maintain this Opinion: and in falling here, 

we were becalmed, but as far as ever we could see, 

we saw the Sea wholly covered with this Plant. 

And landing down some young Sailors, to drive the 

Weeds from the Ship, and clear the Water, we 

plains saw round heaps thereof to rise up from the 

bottom of the Sea, where, by sounding, we could 

find no bottom.

Jagged or Saw-leaved Sea Lentil.

V. The Places and Times. The first is found in 

many places of the Mediterranean and Adriatic 

Sea, as also in other Southern Seas. The second 
is found in many places of the Atlantic Ocean to-

ward the South, in the Latitude and place afo-

mentioned, as also in several other parts of this 

Sea. They are to be found, by Report of Sailors, 

all the Year long, their Growth and Caste of Ap-

pearance being the time.

The Virtues.

VI. They are as yet unknown: but Acolos says, 

That if this Plant is picked with Salt and Vinegar, 
it will have the same Taffer as Sargazo has, and 
may be used instead thereof, and is also eaten by 
such as sail instead of Caper. Accoila caust it to 
be given, when it was fresh taken forth of the Sea, 
and to those which they carried in the Ship, and they 
fed upon it greedily: He confesses himself ignorant 
of its Qualities: but one of the Sailors, troubled 
with a Difficulty of making Water, by reason of 

Grave.
Chap. 429. English Herbs.

Gravel or Sand and groat's Humors, eat thereof by chance, both raw and boiled, only for that the Tulle thereof pleased him: after a few days he told me, that he found great Good by the eating thereof, and he took some of it with him, that so he might use it when he came abore.

CHAP. CCCXXIX.

Of LEOPARDS--BANE, OR

Round-leaved WOLFS--BANE.

I. The Name. It is called in Greek, Λυκείηνα, by Pliny, because the Herb used to kill Leopards, Wolves, and other like Creatures very speedily. It is also called, Горя, i.e. Lycium, Verum, and Thapsus (quod talis genitalicus fumem spectat semen animalium, cedem die inferat mortem) as Theophrastus, lib. 9, cap. 9, has named and described it. In Latin it is called, Thora, and Aconitum Paradislarche, also Theophrastus Theophraspis. Geffner and others take it to be the Lonicera Virginij in lib. 17, cap. 10, to which he says, is an Herb so called by the Greeks, whereas they do make a Medicine, to dip their Arrow-heads in when they Hunt Wild Beasts, and which they also call Grauira. Geffner says, that some called it Laurus, because the Leaves were round, like to a Full Moon, but he himself called it Thora Veneris, and Thora Vesurens. metro Plutonio, and Geffner makes it to be Romanus grunafa radix testina in English, Leopards-bane, or Round-leaved Wolf's-bane.

II. The Kind. Authors make two or three Kinds hereof, viz. 1. Aconitum Paradislarche, seu Thora minor, The lesser Leopards-bane. 2. Aconitum Paradislarche, seu Thora major, The greater Leopards-bane. 3. Aconitum Paradislarche communicatur Matthioth, Matthioli his fished Leopards-bane.

III. The Description. The first, or Small Leopards-bane, has a Root which is composed of seven, eight or ten small, long, round, very white, having Roots, somewhat narrower, as it were branched out like Roots or Joints in Leopards-bane; the second, or Round-leaved Leopards-bane, is a little larger, the Roots rather thick, and the Leaves round, and a little more than half a Foot high, bearing about the middle thereof one small flattish or hard Leaf, for the most part, but sometimes two or three, one above another, and sometimes two together, which are round, and somewhat like the Leaf of Asphodel, but thicker, smoother, and of a bluish green Color, and full of Veins, something finely dentated about the edges, not compassing the Stalk, but standing a little from it, upon short Foot-stalks. The top of the Stalk is sometimes divided into two or three Branches, with a small narrow Leaf at the Joint, and one smooth pale yellow Flower at the top thereof, somewhat like to those of Cornfoil or Fleece-bound Grass, confiding in many of them, in some of five round pointed Leaves, with a small greenish Head in the middle, which when the Flower is fallen, grows to a small Head, consisting of many small Seeds for together, like unto the Heads of several sorts of Ranunculus or Crowfoot.

IV. The second, or Greater Leopards-bane. Its Root is much like the former, and it is in all things like unto the Leopards before described, but that it is greater, and rises up higher, having larger Leaves, and finely dentated about the edges, and two or three flowering together about the middle of the Stalk, some smaller than others, and sometimes one above another, and some small long and narrow ones at the Joints, branched forth into two or three parts or more, bearing every one of them its finall yellow Flower, like to the former, with like Seed connected therein. These two sorts differ chiefly in the Magnitude of the Plants, and that this latter bears more Leaves than the former; which Parkinson thinks may rather be attributed to the Fertility or Sterility of the Soil wherein they grow, than to any differing Species, they being so very like one another.

V. The third, or Matthioli his fished Leopards-bane. It has a Root which consists of many KNOTS and Joints, like unto a Scorpion's Tail, in the same manner as Matthioli has set forth in his Figure. It rises up early in the Year, if the Spring be mild, with its Stalk, before any of the lower Leaves appear, as the Coldfoot and Butter-burr do, having four small, round, hairy Leaves upon the Stalk, let by couples at distances. The Flowers are many, growing in a Tuft or round Head together at the top thereof, of a pale yellow Color, with many yellowish Threads in the middle. When the Flowers are pale, then come up the Leaves, which are peculiar for the most part, and are almost round, hairy, and green on the upper side, and of a hoary White beneath, underneath full of Veins running thro' them, and full of small Spots.

VI. Note,
The third Dulcitamnion eyes grows on the Alps of Savoy, not far from the chief Mont Cenis of the Caritngen, in a rough rocky place, which they call Les Alpes, i.e. the Ladder, because the way of the Rock is cut into Steps, to get up unto the top thereof.

VIII. The Uses. The full and round, Gerard fays, Ewer in March and April, and that their Seed is ripe in July: but Parkinson fays they flower in June and July, which are the Spring Months of the Alps, and that their Seed is ripe in August.

IX. The Qualities. Leopards-bane is hot and dry in the Ultimate of the fourth Degree. It is reported by all Authors to be a deadly Poison, and that the Native of the place where it grows, do very much use it to Poison their Arrow-heads, the more speedily and fatally to destroy Wild Beasts, which greatly infest those Mountains of the Alps: for which Purpose it is also brought into the Mountains near those places, to be sold unto the Hunters; the Juice of which is prepared by steeping, and so kept in Horns for ready Use, being the most vehement Poison of all Vegetables: for an Arrow-head touched therewith, leaves the Wound incurable, (if it be but pierced the Skin as to touch Blood) unless that round about the Wound, the Blood be speedily cut away in good Quantity. This Plant may therefore be well accounted the first and chief of all the Aconites or Wolf-banes, by reason of its deletious and poiffuous Qualities abroad: and without doubt there is no wofe, nor any other speedy Vegetable Venom in the World, nor any other Aconite or Velsbom comparable hereunto. It is reported, that if any Beast or Man be wounded with an Arrow, Dart, or other Instrument poiffoned with the Juice herof, that remedies they will die in half an Hour after. Grefner in Libro de Lavarit fays, that if Man or Beast be wounded with Sword, Dart, or Arrow, touched with the Juice herof, that the Malignity of those poiffues inwardly, that is presently kills, by consuming all the Blood, unless the Hemorrhage about be instantly cut away, as aforefaid: and yet (which is admirable) he fays, that the Fifth of that Beast so killed, is not dangerous to any who shall eat thereof. That being given to Eels in a Bat, it kills them presently, which fows, fays he, that this Poison is an Enemy to the Blood. It is said to be as pernicious, that if it be but held in the Hand for some little time, that it will almost take away the Senesces; and aflso that one smelling thereof, after he had gathered it, fell down as Dead, and with some Difficulty was recovered again.

The Virtues.

X. Difforides fays, That being mixed with other Medicines for the Eyes, it gives Eas in their Pains. And Theophrastus, and Pliny after him, fay, that it is a Remedy against the Scorpion, being taken in warmes Wine: but that it defroys Nature, if it finds nor an Enemy in Nature to contest withal, and defroy: but if it finds such an Enemy, that then it4 it strength and Force upon that, to overcome it, and to saves Nature from the Danger. Thus Pliny. All the other Preparations and Virtues of Leopards-bane are the fame with Helmet-fower or Monst-bode, and the Cure of the Poison of this, the same which they apply to large Wounds, as Lacerated in Chap. 153, afo foregoing in this Book: so that we need speak no more thereof in this place.
But however, after all that we have said of the Virtues of these deliciuous or poytnous Plants, it is in my Opinion, much better to let them wholly alone, than to run any Hazard in making use of them, by reason of their dangerous Qualities, besides, many times the Folly and Ignorance of such as may adventure the making of such doubtful Trials; forasmuch as there are other Herbs and Plants enough, proper for all such Purposes and Intents, and possibely more effectual for the Cure of the same Diseases, which are free from any ill Effects, of what kind soever, and by reason of their innocent Properties, may be safely adventured upon by such as but very indifferently understand Physick.

CHAP. CCCXXX.

Of LETTICE Garden.

I. The Names. It is called of the Arabians, Chass, and Chorbus: in Greek, Σάβαον, 
Τερσασα, Βόργιανα Πυρηγότροφυν to in Latin, Lactuca 
Lactis copia, and in English, Lettece.

II. The Kinds. There are two principal Kinds, viz. 1. Common Lettece, Lactuca hortenfa, called Sarrione, 
Garden Lettece. 2. Cottony Lettece, Lactuca syputetris, 
Wild Lettece, of which in the Chapter following.

Common Lettece, which does not Cabbage.

III. The Garden Kinds. Authors make many Kinds of this Lettece, but we shall content our 
Selves with the chief of them, which are the fol-
lowing, viz. 1. Lactuca communis, Our common 
Lettece, which does not Cabbage or Head. 2. Lactuca Capitata, Lactuca sylvestris, called by Pliny, Lactuca Lanonica, Cabbage Lettece. 3. Lactuca Grissa, 
Plnt, Lactuca Ceteriana Columbiana, Curled or 

Crumpled Lettece. 4. Lactuca Romana Petri Gentis, Roman Lettece. 5. Lactuca Belgica, Flatt-
ders Lettece. 6. Lactuca Cyprus Columbiana, Red 
Lettece. 7. Lactuca Hypostrata, Our Winter Lettece. 
8. Lactuca Virginiana, Virginia Lettece. 9. Lactu-
enca Suberleica, Savoy's, or Savoy Lettece. 10. Lactu-
ca Venetica, Venice Lettece.

IV. The Description. The first, or Common 
Lettece, which does not Cabbage. It has a Root 
which is somewhat long and white, with yellow Fibers 
joining, which perish immediately after Seed-
time. It rises up with several Leaves, full of a 
milky Juice, of a light green Color, smooth, and 
Little or nothing covered on the edges, broad, and 
Somewhat long withal, and ending in a sharp Point, 
almost round in some of them. From among 
the middle of these Leaves comes forth a round Stalk, 
(in some greater, in others less, according to the 
Kind, and also the Goodness of the Ground,) full 
of Leaves, like unto the lower, but much lefs, 
smaller, and sharper pointed. This Stalk towards 
the top, branches it self forth into several 
parts, on which grow several small Star-like How-
ers, of a pale yellowish Color, after which comes 
Seed, either whithis or blackish, according as the 
Plant yields Cottony, which hangs from a small matter of 
Cottony Down, with which the whole Head is 
thread, and which is carried away with the Wind, 
it not gathered in time.

Cabbage Lettece.

V. The second, or Cabbage Lettece. This has a 
Root like the former, and grows up in the manner, 
with plain smooth Leaves, which after a time clothes 
it self, and becomes a kind of Cabbage Head, and 
hard; after which, from the middle thereof, springs 
up a Stalk, which for Substance, Branching out, 
Flowering and Seedings, is like the former, but bears 
black Seed.

k k k Cabbage
VI. The third, or Curled or Celphed Lettice. It has a Root like the former, and it has great and large Leaves, deeply cut or gaffed on both sides, not plain or smooth, as the former, but intricately curled, and cut into many parts. The Flowers are small, of a bleak Color, the which do turn into Down, which is carried away with the Wind. The Seed is like the former, save that it sometimes becomes black. There is a lefser fort of this Curled Kind, which has many Leaves, hard and torn in pieces, very coarsely, and withal curled in such an admirable fort, that every great Leaf seems to be made of many small Leaves, set upon one middle Rib, resembling a Fan of curled Feathers, which Gentlemens have sometimes used. The Roots, Flowers and Seeds agree with the former.

VII. The fourth, or Roman Lettice. It is threefold. 1. The green Roman, which is of a dark green Color, growing as long as most Kinds; it is an excellent sort of Lettice, and bears black Seed. 2. The white Roman Lettice. It has long Leaves, like to a Tadpole; and is in Goodness next unto the Red, but must be whitened, that it may eat kindly: the Seed hereof is white. 3. The Red Roman Lettice. This is the best and the greatest of all the red. John Tradescant was the first which brought it into England, and fowed it; and he said, that after one of them had been bound and whitened, after the Ruffle was cut away, the root weighed Seventeen Ounces. This has black Seed.

VIII. The fifth, or Flanders Lettice. This is a sort of Curled Lettice, which does Cabbage, and is called Flemish Coppers. This grows lowest, and has the lowest Head, but it is very hard and round, and white whilst it grows, and bears black Seed.

IX. The sixth, or Red Lettice. It is a large Lettice, with large Leaves, of a red or reddish Color, and an excellent sort of Salletting: it grows up with a smooth Slink, and has Branches, Flowers, Seed, and Down, like other Lettices.

X. The seventh, or Our Winter Lettice. It is a very hardy Plant, and able to endure our Cold, but it is flissue, and must be sown at Michaelmas, but will be very good before any other of the more excellent sorts, grown in the Spring, will be ready to be used. It bears white Seed.

XI. The eighth, or Virginia Lettice. It is of the Single Kind, and has very broad reddish Leaves, which by good Husbandry and Transplanting, may be very much improved, and be made an excellent Lettice. It bears black Seed.
upon the Ground, at the first coming up, booth cut or gaff about the edges, stiffing or curfing lightly this or that way, like in some measure to the Leaves of Garden Endive, with Stalks, Flowers and Seeds, like the former, as well in form as yielding that milky Juice, with which they do all abound. Of these Lettices some are open, with very curled Leaves, of a green or yellow, or yellowish green Color. Others are Hedged or Cabbage, and sometimes grow to large, even to resemble a small Cabbage, of a yellow or yellowish green Color. This Lettece is Tilled eaten raw, but is for the most part boiled like a Cabbage, and makes indeed the bell boiled Sallet.

XIII. The tenth, or Venice Lettece. It is an excellently useful Lettece. You may cut off the highest leaves, and let the others grow; and to be eaten at the latter end of June, or beginning of July; it grows sometimes to be as large as the Crown of a Man's Hat: it rises to a moderate Height, and the Seed is white. There is another sort which does a little Cabbage, and the Seed is white, and another sort which does not Cabbage, but is boole; this has many grey Leaves spread upon the Ground, like unto those of Garden Endive, but leaves or risers up to be about three Feet high; its Flowers are yellowish, which turning into Down, fly away with the Wind, and its Seed is white as Snow. These two last sort come all under Lettece.

XIV. How to gather the Seed, that it may be good. Mark out those Plants which you intend shall run up for Seed, which let the bell and most fruitfulness, and after they have begun to shoot forth Stalks, strip away the lower Leaves for two or three Hands breadth above the Ground; for thereby, in taking away the lowest Leaves, the Stalk shall not rot, nor the Seed be hindered from ripening.

XV. The Way to make Venice Lettece, to make it eat the more tender. It is done two ways. The one is by raising up Earth like Mole Hills round about the Plants, while they are growing, which will make them grow white. The other is, by rying up all the loose Leaves round about together while it grows; for so the close growing thereof will make it white, and be thereby the more tender and pleasant.

XVI. The Places. The several Names tell you where they came to us; but these are now many more of our Gardens. Palladion says, that Lettece delights to grow in manured, fat, mollen and dunged Ground, and in places where there is plenty of Water; and Cimona says it prospers bell, if it is grown very thin.

XVII. The Times. Palladion says, that it is certain that Lettece may be sown at any time of the Year, but especially at Spring time, and afterwards till Summer is high time, and after that as long as soon as Winter is done: however, it ought to be sown in Fair Weather.

XVIII. The Qualities. Lettece is cold and mollen in the second Degree: Anodyne, Digestive, Emollient, Relaxative, and Gout downhill.

XIX. The Specification. It allays inflammations, gives ease in the Strangury, induces Sleep, and repels Bodily Laff.

The Virtues.

XXI. The liquid Juice. Inwardly taken from one Spoonful to two or more, (according to Age and other Accidents) it breeds Milk in Nurses, quenches Thirst, cools the inward Heat of Fevers, abates inflammations of the Lungs, cools the Heat of Urine, and repels Bodily Laff. Mixed with a little Gaupe it is to be dissolved in Oil of Oleum, and a little Vinegar being added, and applied by anointing or bathing to the Cock, it cools Pain, and abates an inflammation in those Parts, abates Laff and repels General Diseases, which cause Nocturnal Pollutions.

XXII. The Essence. It has all the Virtues of the Juice, and is rather to be chosen to be administered to cold Conditions, it also induces sleep and Rest, being taken at Bed-time in any convenient Vehicle. The Essence, as also the former Mixture of the liquid Juice, being anointed or bathed upon the Reins, cools any burning Heat there, and eates the Pain of the Back.

XXIII. The Oil or Ointment. It is made either of the Juice or green Herbs, by boiling them in Oil Olive, Digestor, or Mullein Suet, mixed with Oil. Anointed on the Forehead and Temples, it eates the Head-ach proceeding from an hot Head, and pictures Sleep and Rest. Anointed also on other Parts which are inflamed, or are full of Pain, it cools the Parts and gives Ease.

XXIV. The Cataplasm. Applied to the Gout, it eates the Pain, and mixes with Camphir, and applied to the region of the Heart, Liver, or Reins, it repels their Heat and inflammation, comforts and strengthens those Parts, and eates the Heat of Urine. Applied to the Head in a vehement Head-ach, it eates the Pain, and gives great Relief, causing the Patient to rest and sleep.

XXV. The distilled Water. It allays great inflammations, extinguishes Milk in Nurses, quenches Thirst, abates the burning Heat of Fevers, repels Laff, takes away Nocturnal Pollutions, and has all the other Virtues of the Juice and Essence, but must be taken in a much longer quantity, as from two Ounces to four or five, a little diluted with double the Sugar.

XXVI. The Sallet. The bell is that which is made of the Cabbage Lettece, and is generally eaten raw, with Vinegar, Salt, Onion, or Pepper, and good Oil. Gulier advises Old Men to use it with Spice, and where Spices are wanting, to add Alum, Roque, Gref, Tartarum, and what like hot Herbs, as Correctives thereof. It is very grateful to the Stomach, comforts and strengthens it, and causes a good Appetite. Some make a Sallet of Lettece by boiling them: to six eaters, they are agreeable enough, are cooling and grateful to the Stomach, help Digestion, cleanse the Stomach, and loosen the Belly; and this Gulier says he found by Experience, that after moistening the Belly, it becomes the more slippery. This boiled Sallet is said to be sooner digested, and to nourish more. It eates all the gripping Pains of the Stomach or Belly which come from Choler.

XXVII. The Seed. It is said to have all the Virtues of the Herb, being given in Powder from a Drum to a Dram and half, in any proper Vehicle, Morning and Night.

CHAP. CCCCXXXI.

OF Lettece Wild.

I. THE Namer. It is called in Greek, Λετοκα, Thallicaster, and watered down by Dioscorides: in Latin, Lattica seraphe, Lattica Serapis, Let.
Salmon's Herbal. Lib. I.

Lettuce, or Leafy Lettuce. In English, Wild Lettuce.

I. The Genus. It is the second genus of Lettuce, and has the three following varieties, viz. 1. Latuca Salicaria, lettuce folis ovato-ovatis. 2. Latuca salicaria magna adere Opiji Gerard et Adonis major Trago, which he also calls Latuca salicaria altissima. 3. Latuca salicaria varia Dutchampii, the leaves of which being somewhat crumpled, makes mention. Latuca salicaria Anglica adere Opiji, Broad-leaved Wild Lettuce. 2. Latuca salicaria lomatii, Latuca salicaria Mattithii, Pfaffii, Poisson, Ceprini, Vollii, or Alburnum, Valeria Vulgaris Trago (because that generally in all the German Apothecaries' Shops it was so accounted and sold). 3. Latuca salicaria perennis, Scorpio Pesticard, Jugged-leaved Wild Lettuce. 4. Latuca salicaria tenuis purpurea, Gisere in brieti et alii Sambucus minor, Panicum lore, Hookerii, et Tabernarii. 5. Latuca salicaria purpurea, Water-melon Come-mone; Sambucus tertius Libanotianus, Latuca Almon purpurea carnata motor Basilius, (his minor being the Long-leaved or Fringed) Wild Lettuce with purple Flowers.

Wild Lettuce broad-leaved.

The Descriptions.

III. The first, or Broad-leaved Wild Lettuce. It has a Root which is white, long, and sandy, when it bears Seed, and perforates presently after. It rises with four or five somewhat long and Large Leaves, smaller at the bottom, and broader at the ends, being round-pointed, unevenly dentate about the edges, but not cut in or torn at all, of a pale or whitish green Color, and very like unto the Garden Lettuce, or Garden Salad Leaves, so that it will soon deceive one that never saw it before, which do, to a hide the first Winter after the Sowing, whether in the Spring or Autumn, of the third Seed: but in May following it begins to rise up to a Stalk, and then those lower Leaves will have the middle Rib on the backside grown full of small sharp Prickles. The Stalks have to be six or seven or eight Feet high at least, and as big as the Thumb of any Man's Hand at the lower Joint: some being, broken, and breaking it left into several very long Branches, on which grow large Leaves, like the others, but more crumpled, the lower, and 6 to the middle of the Stalk, set with Prickles in the manner of the bottom Leaves, but longer and sharper, and something jagged or divided on the edges, all and every part yielding plenty of a Milk Juice and Clamy, being broken, which smells strong, and very like unto Opium, being of a bitter Taste. The Flowers are very small and single, something like unto Lettuce, but smaller, and of a pale yellow, scarcely opening themselves, and hardly adding half a Day open, but turn into Down, with small black Seed, very like unto Black Lettuce Seed, and is carried away with the Wind.

Leaves Wild jag-leaved.

IV. The second, or Jugged-leaved Wild Lettuce. It has a Root which abides after the Seed-time, when or the other does not. This Wild Lettuce grows like the last, but not so high or green: the first Leaves are of a greyer green Color, smaller and narrower than the other, which do abide, and afterwards has Prickles growing on its backside, as the other has. Those which follow, are much more jagged than the others, and for with thorns Prickles also, and being broken, yields Milk as plentifully as the former, and as bitter as it is; and flowers also as strongly of Poppy or Opium. The Flowers and Seed are like it too, and fly likewise away with the Wind.

V. The third, or Wild Lettuce with purple Flowers. It has a Root which is thick for with Knots or several Places, not greening downwards, but spreading forwards, and having long Fibres shooting from it, which purifies not, it is a great Plant, and rises up sometimes (in good Ground) to be fix, from or eight Feet high, but usually three, four or five Feet, with a strong Gisere Stalk, set on each side with Leaves, smaller at the bottom, and larger as they rise up higher, being large about the middle of the Stalk, and then grow smaller again up to the top: all of them unevenly waved about the edges, and encompassing the Stalks at the bottom, of a dark, bluish green Colour, on the upper part, and growth underneath, yielding a Milky Juice when it

Waste Planta, libri quattuor, et it is called, Latuca salicaria, or Broad-leaved Wild Lettuce.
Chap. 432. English Herbs.

is broken. The Flowers stand upon small long Stalks, coming forth from the Joints, with the Leaves from the middle upwards, with many Flowers on them; condilling of four dark purple-colored Leaves, with divers Threads in the middle, tipped with a yellow Duff, and a three-focked Stilte in the midst, which stands in long Heads, and run into Down, with smooth greyish Seed among it, which flies a way with the Wind.

VI. The Places. The two first grow in several places of England, as well as beyond Sea: the first in the Borders of Fields, and by Hedges and Lane sides in Buckinghamshire and Cambridge.

The second on the Bank-sides by the Foot-way going from Groby-Laune to Bradford-Bridge or Farningham Church, and in many other places. The third is found upon Mountains and Hills in divers parts of Germany, as Gifhorn, Thuringia, and others by, also about Naples, as Campania; I have also been told by an English Gentleman, and a good Herball, who has been a great Traveller in many parts of England, that he had found it growing upon several Mountains and Hills in Wales, and in some other parts of the Kingdom.

VII. The Times. They come up in the Spring, and sometimes sooner: and they all flower about July and August, and their Seed-ripened in the month September, and is blown away whilst it is in flower, and has young Birds of Flowers upon it.

VIII. The Qualities. Wild Lettuce is cold in the end of the second Degree, and moist in the end of the first. It has nearly the same Properties of Cooling which the Garden Knot has: but the Bitterness of this makes it the more Appetitive; and yet it is more frequented that the masked fort, and comes up, as it is thought by some, almost to the Degree of Opium; but this Opinion I can never attest, to my Experience having tried the contrary.

IX. The Specifications. Some Authors are of Opinion also, that it may be used, instead of the Gardon; for any of the Intentions or Purposes for which that is used. However, it is said to be a peculiar thing against Droplets, to provoke the Terms, and to reliquit the Poison of the Spider, Phalangium, Scorpion, &c.

X. The Preparations. You may make all the same Preparations from this as from the Meadow; but there are particularly taken notice of, viz.: 1. A Liquor Vitae. 2. A Milky Juice instrument. 3. A Resolution. 4. A dillled Water. 5. A Powder of the Seed. 6. A Cataplasme.

The Virtues.

XI. The Liquid Juice. Given inwardly to one Spoonful, more or less, according to Age and other Accidents, in Syrup of Violet, Chase-applejuices, Wine, or other proper Vehicle, at Bed-time, it cau ses Rest and Sleep, calms Internal Pains of the Bow els, opens Obstructions of Liver, Spasm, Ribs, Bowels and Worm, provokes the Terms, expels wanty Humors out of the Body, prevals against the Dropsey, and relifts Poyton, chiefly the Stinging of Scorpions, the Biting of the Phalangium, of Mad Dogs, and of other Venonous Creatures. Oural ly applied, or bathed upon any place pained, disjaunrred or inflamed, it cools the Pain, abates the Inflammation; and strengthens the Part griven.

XII. The Milky Juice instrument. It may be instrument either in the Sun or in a Sand Furnace. If it is given from one Dram to two or more, according to the Judgment of the Physician, dillled in

dillled Vinegar, it is laid to evacuate Water in Droples, to provoke Women's Courtesies, and reslift Poyton, and has indeed all the Virtues of the liquid Juice along side. This Juice, dillled in White Wine, or White Liquor, and a little Honey mixed therewith, being droped into the Eyes, it does wonderfully strengthen the Sight, and clires them from Milfs, Clouds, Films or Skins growing over them, and removes any thing which oblituates the Sight.

XIII. The Decotion. It may be made in Wine or Water. It has the Virtues of the liquid and instrument Juice; but as it is much weaker, so the Dose must be much larger, as from three Ounces, five or fix, and it is also the offere to be receivd, as Morning and Night at least.

XIV. The dillled Water of the whole Herb. It is singular good to quench Thirst in any Burning or Pestilential Fever: and this it will do more effectual ly, if a few Drops of Oil of Sulphur, or Vitriol, or Spirit of Salt, is droped into it, and very well mixt therewith. This Water may be given from four Ounces to eight Ounces: if you please, you may fess it with a little double-refined Sugar.

XV. The Powder of the Seed. It has the Virtues of the Juice and Decotion, but it pools not so powerfully. It is very sratful to a hot Stomach, troubled with Heart-burnings and Vapours ascend ing from the Womb. If it is given at Night from half a Dram to a Dram in the dillled Water, or in any other Vehicle, it causes Rest, and induces Sleep, and therefore is probable for such as are subject to much Watching.

XVI. The Cataplasme. It is made of the green Herb beaten in a Mortar, and brought to a Confit with either with Early-flower, or Crumbs of Early or Wocenas Bread. Applied to Inflammations in their beginning, it abates their Heat, and difficutes them. Applied immediately upon a simple Contum, where the Skin is not broken, it hinders the Aggregation of Humors, abates the Swelling, and curst it: being applied to the Head to a Megrim, or other Head-ach, it presently gives Ease to the Pain, more especially if it proceeds from a hot Cattle. Applied to Farts paired with the Gour, whether Hocks, Arms, Knees or Feet, it presently gives Ease to the Pain, and difficutes the Tumors; and being continued for some time, does cure it, provided Universals and other proper Intemals be used in the mean time. Applied to the Forehead and Temples in a Frenzy, it abates the Symptoms, and restores in a good measure the Patient to his Sences again.

CHAP. CCCCXXII.

OF LIGUSTICK, or B.

Baffard LOVAGE.

The Names. It is called in Greek by Descoros, ork, by Gaulit, ork, taking its Name from Ligris, the Country where the beet of it, and the most Store of it is given, and therefore it is called, Ligrifolium, and Libifolium, as Mathias, laugandu, Callor Darantes, and others have it: Siler Montano, as Trage, Latit, Volatllu and Caslen.
Salmon's Herbal. Lib. I.

Clomus have it, formerly in Shops, but fally: for the true Sufel or Haurmot is another Plant, as we have declared: Chap. viii. aforespeaking, for it is like none of the Sufsels: Ser. Montanum, and Ser. Paleponsae, as Caliphenae has it: Tertius, that Ueurasus called it Cabil bodola; and some call it Poison: we in English call it Ligu-lick, Ligullick, Siler Mountain, and Ballard Loaveage.

II. The Kinds. There are two sorts of this Plant, viz. i. Liguicrium serutum, Liguicrium Jare- foleum, Liguicrium commune, Siler montanum vul- ge Sufelar. Liguicrium ligarese. The true Ligu- lick, or Ballard Loaveage. 2. Liguicrium com- munum, Siler Montanum Affrising, Siler Monta- num Amyulfolidum, Ligullick, or Ballard Loaveage of Audhia.

Liguick True or Common.

The Descriptions.

III. The first, or True Liguiclick, or Ballard Loaveage. It has a Root which is long, great, and round, on the outside, of a hot Sharp Smell and Taste, and abiding long on the Earth. This True Liguiclick of Liguria rises up with a round jointed Stalk, two or three Feet high, bearing both at the bottom and at the Joint, large, spaced, winged Leaves, divided into many small Leaves, whose small Foot- falls bear usually two Leaves, and sometimes four, set one against another, and three always at the end, each being much broader and thinner than small Foot- falls. The Leaves of Liguiclick of Liguria, about equal to those of Melilot, by which Reason it is called also Lusufolium, or Broad-leaved, respecting being had to the breadth of the Leaves of the next following. These Leaves, it they be a little rubbed, have a sweet Smell. The Stalk spreads at top into a few Branches, bearing very large Umbels of white Flowers, and after them, long, thick, fall, brownish, yellow Seed, longer by half than Cumin Seed, two always joined together, striped on both sides, and winged with yellow thinning Wings at the edges, and of a quick, sharp, hot Smell and Taste.

IV. The second. or Austrian Liguiclick, or Ballard Loaveage. This differs not much from the former, but that it is much leaner, and comes not up to half the Height thereof, being not above a foot and half high; whose Stalk is also divided towards the top into Branches, which bear small Umbels of white Flowers. It bears winged Leaves, (being but few) which are composed of many other Stalks of Leaves, growing not much unlike to the other, or like Swin Fennel, two Leaves, and sometimes four or more, set one against another, and three generally at the end. These Leaves are much thinner than those of the former, and also narrower, for which Reason it is called by some Authors Augifolium, or Narrow-leaved; respecting being had to the breadth of the Leaves of that just aforespeaking. These Leaves, as they grow nearer the top, are yet more finely cut, being narrower and softer.

V. The Places. The first is found growing wild upon the Appennine Mountains or Hills in Liguria, within the Dominions of Genoa. The second grows upon the Hills in Aufrisia, but with us it both grow in Gardens, but do not often bear ripe Seed, unless the Season be very kindly and warm.

VI. The Times. They flower from June to the end of August, and the Seed is found to ripe in the mean Season.

VII. The Qualities. The Herb, Root and Seed are hot and dry in the third Degree. It is Digestive, Affringent, Antibitive, Carminative, Digestive, Diffusive, Capillarick, Neurontick, Stomackick, Ne- phriticick, by bearing, commenagogueick, Sudorificick and Alexipharmick.

VIII. The Specification. It expels Wind, eases the Colick, provokes Urine and the Terms, is good against Poyion and the Bitings of Venomous Beasts.

IX. The Preparations. You may prepare there- from, 1. A liquid Juice. 2. An incense. 3. An Infusion.
Infusion or Decoction. 4. A Powder of Leaves or Seed. 5. An Infused Oil. 6. A distilled Water.

The Virtues.

X. The liquid Juice. Taken in any proper Vehicle, it gives Ease in the Colick, expels Winds, provokes Urine and the Terms, and helps the Suffering of the Womb. Dose two or three Spoonfuls or more in the distilled Water, or in Wine, or any other Vehicle.

XI. The Efficacy. It has all the Virtues of the liquid Juice, but more powerful to all those Intimations: it is of a warming and digetting Quality, gives Ease in the Griplings of the Guts, Pains of the Stomach, and Swellings proceeding from Wind. It prevails against the Bitings of Mad Dogs, Vipers, Rattle-Snakes, and other Venomous Creatures, and expelles Venoms in the Blood, and is efficacious in the pains of a Child in Women-kind. Dose two or Spoonfuls or more.

XII. The Infusion or Decoction of Herb, or Seed, or both. It has all the Properties, Qualities and Virtues of the Juice, and may be given from two Ounces to four, Morning, Noon and Night, as occasion may require.

XIII. The Powder of the Seed. If it is taken from half a Dram to a Dram and half, (according to Age) in a Glass of Whiskey or Wine, Morning and Evening, for some few Days before the expected time, it produces the Terms in Women in great abundance: it precipitates Vapors, and cures Hyperuria, curing the Womb to fertile in its right place again. So drink, it provokes Urine powerfully, and eases the Colick and Griplings of the Guts proceeding from Gretiness and Crudity of Humours; it strengthens the Stomach, and cures a good Apprentice and Digestion; it expels Wind, and diffuses the Sweating of the Stomach.

XIV. The Infused Oil. It is made in the brass Kettle, by Infusion, or Cotto, or Digestion in a Sand Heat; one Pound of the boiled Seed being mixed with two Pounds of Oil of Bees, or choice Olive Oil. It is Aromatic, and eases Pains and Aches proceeding from a cold Cause. It eases the Gout, and strengthens the Nerves, Tendons, and Parts afflicted.

XV. The distilled Water. It may be made either from the whole Plant, brought up in the Seed, according to the usual manner. It has the same Virtues with the Juice, Efficacy, Decoction and Seed, but in a much lesser Degree of Strength, and therefore it is more fit to be given in a much greater Quantity; however, it may well serve as a Vehicle for to convey down into the Stomach the Enum of the other Preparations.

XVI. The Spirituous Tincture of the Seed. It gives Ease in Colick Pains, strengthens the Stomach and other Bowels, expells Wind, and has all the Virtues of the Juice, Efficacy, Decoction and Seed afore expressed, but this warns and strengthens more, and therefore is more fit for cold Stomachs, and such as have a cold Constitution or Habit of Body. Dose two or three Drums in the Morning Erying, in a Glass of generous Wine.

XVII. The Acid Tincture of the Seed. It is good against Vomiting, expelles Vapors and Fists of the Mother, provokes the Terms and Urine, facilitates the Birth, and brings away the Afterbirth. Dose to many Drops in a Glass of Wine as to make it pleasantly sharp.

XVIII. The Oily Tincture of the Seed. It eases the Strangury after an admirable manner, provokes Urine, and opens all Obstructions of the Urinary Parts, has all the Virtues of the Juice, Efficacy, Powder, Spirituous and Acid Tinctures, brings away the After-birth, and gives Ease in the After-pains, tho' never so vehement. Dose from ten to twenty Drops in any proper Vehicle, Morning and Night, or at any time of Extreme.

XIX. The Spirit of the Seed or Root. It is Cordial, good against Erying and Burning Fiss, Convulsions, Sickens at Heart, Constellations of the Stomach, want of Appetite, Wind in the Bowels, Collick, Pleurisy, Palsy, Lethargy and the like cold and molli Dfumpers of the Head, Brain, Nerves and Bowels. Dose two or three Drums in a Morning setting, also half an Hour before Dinner, or at time of any Paroxysm, either alone, (being distilled or mixt) or mixt in a Glass of some Stomachick or Cordial Wine.

XX. The Oil of the Seed by Distillation. It has all the Virtues of Juice, Efficacy, Tinctures, Spirit, and is very powerful against the Foul, so that there is scarcely a better Vegetables Medicament in the World: it is to be taken inwardly from eight Drops to sixteen, Morning, Noon and Night, first drop it into white Sugar, and mix it well with that, and then mix it with a Draught of choice White Wine, or other Stomachick Wine, and so let the Patient drink it. Outwardly you must also anoint it along the Back-bone, chiefly upon those Vertebrae, from whence those Concupisences of Nerves proceed, which replenish the Parts afflicted: if all the Limbs are affected, then it will be necessary to anoint the whole Back-bone, from the very Nape of the Neck, almost to the Ass, which is to be done twice a Day, and to be very well rubbed in. For almost a quarter of an Hour at a time; and besides the Spirit dorf, the Parts or Limbs afflicted are also to be anointed therewith in like manner. This Oil is very strong and hot, and therefore some tenderreffes may not be able to bear it, being used alone: in this Cafe, it will be necessary to mix it with some other Chymical Oil lfs hot, which may be also penetrating, and efficacious to the same Intimation, as that of Turpentine, of Anise, of Pepper, or Saltspray, &c.

XXI. The Elixir of the Seed. It is efficacious to all the Purpofes above-mentioned, but is not so strong as the distilled Oil, but in Lethargies, Palpita, Convulsions, Swoonings, Sickens at Heart, Collicks, Griplings of the Guts, Pleurisy, Stitches, Hystericks, Hypochondriacal, Strangury Vomiting, Weakness of the Stomach, an Appartite and Digestion, you may give it Morning and Night, or in time of the Paroxysm, from twenty to fifty Drops, in a Glass of Wine, or other fit Vehicle.

XXII. The Cataplasm of the Root. It is excellent against the Bitings of Mad Dogs, Vipers, Rattle-Snakes, and other Venomous Creatures, being beaten raw in a Mortar, and applied warm to the Part hurt: if it is made with equal parts of Garlic. It will be so much the more effectual.

CHAP. CCCCXXXIII.

Of the LILLY White.

I. THE Names. Of the Lily there are many Species or Kinds: the Names of all which in general, are, in Arabic, Safen; in Greek, Xion; in Latin, Lilium: and in English, Lilly.
Salmon’s Herbal.

Common White Lily.

The Descriptions.

W. The first, or Common White Lily. It has a clean, solid Root, larger and yellower than any of the Red Lilies. The Stalk is of a blackish green Color, tall, and rises as high as most of the Lilies, having many tall, broad, and long green Leaves thereon, larger and longer beneath, and smaller upon the Stalk upwards: the Flowers are many or

The Turkey White Lily. These other White Lilies differ but little from the first of these, either in Root, Leaf or Flower, saving only that this grows with a greater number of Flowers than ever was seen in the Common White Lily; and the Stalk of this Lily many times turns the Stalk of the

Bread: of which in Chap. 444. following.

Bread: of which in Chap. 444. following.

The Turkey White Lily. These other White Lilies differ but little from the first of these, either in Root, Leaf or Flower, saving only that this grows with a greater number of Flowers than ever was seen in the Common White Lily; and the Stalk of this Lily many times turns the Stalk of the

Bread: of which in Chap. 444. following.

The Turkey White Lily. These other White Lilies differ but little from the first of these, either in Root, Leaf or Flower, saving only that this grows with a greater number of Flowers than ever was seen in the Common White Lily; and the Stalk of this Lily many times turns the Stalk of the

Bread: of which in Chap. 444. following.

The Turkey White Lily. These other White Lilies differ but little from the first of these, either in Root, Leaf or Flower, saving only that this grows with a greater number of Flowers than ever was seen in the Common White Lily; and the Stalk of this Lily many times turns the Stalk of the

Bread: of which in Chap. 444. following.
and applied to simple green Wounds, or Sinaews cut abonder, is said to coagulate them, or join them together again. It cleanses those Ulcers of the Head called Acrosalve, or Seid-bal, and the Mangeins or Scabins of the Beard and Face, called Mirtagra.

XV. The Capsulph of the Roots with Henbane-Leaves. It is made by blunting the Roots with Henbane Leaves and White Flower. Being applied, it cures Tumors and Apotemts of the privy Parts: it brings Hair again upon bald plates, and places which have been burned or scalded, being mixed with Bear's Oil or Grease, and so applied to the place.

XVI. The Capsulph of the Roots roasted, boiled, or boiled. The Roots so prepared, are to be beaten into a Capsulph with Cream of Rye-Head, or Hoby-Land, or Oil of Lilly-Flowers. Being applied to any Principal Balo or Sore, it ripens and breaks it: it also ripens and breaks other Tumors or Apotemts in the Groin, or in other Parts, proceeding from the Venereal Disease, or any other Cause.

XVII. The Decollation of the Leaves. It is made by boiling them in Red Wine. If old running Sore, or purit Ulcers, be often washed herewith, it cleanses and dyes them, and induces a speedy Cure.

XVIII. The Capsulph of the Leaves. It is made of the former Leaves, boiled in Red Wine, as aforesaid. Applied to rotten purit Ulcers, or to Ulcers, or Wounds undigested, it causes Digestion, cleanses them from their Filth, and causes them suddenly to heal.

XIX. The Oil of the Flowers by Infusion or Bolling. It is made with Oil Olive, or rather Oil of Ben, which will not grow rank, by Infusion in the Sun, or in a boiling Balance, or in a Sand Heat, repeating the Infusion or Digestion two, or three, or more times. It is emollient, and softens the Hardness of the Nerves, and extends Sinaews therein: it also softens the Hardness of the Womb. You may make an Oil also of the Roots, after the same manner, and for the same Purposes: it is good to bring to Digestion and Supputation, Tumors and Apotemts, and to soften hard Swellings.

XX. The distilled Water of the Flowers. According to Jullian alexandrinus, being drank from four Ounces to eight, it causes a speedy and early Deliver to Women in Labor, and expels the Secundine and Afterbirth with much Facility, as Athaliobus and Camerinus report. It is used also outwardly as a Codermick to cleanse the Face and Skin, and make them fresh, white and clear.

CHAP. CCCXXXIV.

OF LILLY Yellow or Red.

T H E N a m e s. It is called in Greek, Λυλία, μέν, μέν ; in Latine, Lilium Lacunae, vel Rubraeum ; and in English, The Yellow, or Red, or Orange-tawney Lilly.

II. The Kinds. The following Sorts offer themselves to our View. 1. Lilium Acerum, the Golden, or Orange-tawney, Yellow or Red Lilly ; This is Lilium Acerum major liberomuntus, Monoster callis Rationis, or Mortonis Chinapurum Lobeli ; and Porta thought it to be the Hyacinthus and Cyclomantolus of the Poets. 2. Lilium purpurium crenatus ; Lilium purpureum minor, The Dwarf Red Lilly. 3. Lilium rubrum flore multifoetis, The double-flowered Red Lilly. 4. Lilium majus bulbiferum, The greater bulbied Red Lilly. 5. Lilium minatum bulbiferum, The Dwarf or lesser bulbied Red Lilly. 6. Lilium creamatum bulbiferum, Martagon bulbiferum Lycy, The Fire-red bulbied Lilly. 7. Lilium creamatum flce plain, The Fire-red double Lilly not bulbied.

Orange-tawney, Yellow or Red Lilly.

The Kinds.

III. The first, or Golden, or Orange-tawney, Yellow or Red Lilly. It has a Root which is white and fealy, it grows much higher than the next following, and nearly as high as the Common White Lilly, or any other Lilly. The Leaves are somewhat longer, and very much narrower, of a dark or red green Color: the Flowers are many and large, standing upright, as all these Sorts of Red Lilly do, of a paler red Color, tendering to an Orange on the infide, with many black Spots and Lanes on them, as in the following, and more yellow on the outside. The Seed-Veils are like unto the roumds Hands of other Lillys, and so are the Seeds in them like-wise.

IV. The second, or Dwarf or low Red Lilly, This has a staid Root, like unto other Lillys, but white, and not yellow at all, and the Leaves or Scales thicker, shorter, and fewer in number than in most other Lillys. The Stalk is seldom above half a Yard high, unless it grows in extraordinary Ground fitted to the Nature of the Place, it is round and green, but confinfuly with many fair and yellow green Leaves, on the top of which do stand sometimlies but a few Flowers, and sometimes many, of a fair purplish red Color, and a little bluer in the middle, every Flower standing upright, and not hanging down: on the Leaves underneath, here and there, are some black Spots and Marks, and in the middle of the Flower, a long Pointed, with some Chives about it, as it is in the rest of thes Lillys.

V. The third, or Double-flowered Red Lilly. This Kind is sometimes found to yield double Flowers, if all the single Flowers should grow into one, and to make it to consist of many Leaves, which not

L111

wildflording
Salmon's Herbal. Lib. I.

VII. The fifth, or Dwarf or Leffed bulbled Lilly. It has a white bulbled foly Root, like other Lifles, and bears Bulbs on a Sort of Stalk, which rife up fimilar to feveral others. The Flowers are of a pale reddick yellow Color, and are made many times together. They grow within two or three Years, like the Maternal or Mother Plant; and fo will the Bulbs of that kind before-described, and of thefe other which immediately follow. The Flowers of this Lilly are of a fair Gold-yellow Color, shaded over with a threa of Purple, but not fo red as the firft, or the next to be defcribed. This Lilly is call'd the Lily of the Field, because they grow all over the field, and in the Green *.

VIII. The Faith, or Fiery-red bulbled Lilly. This kind bulbled Lilly rife up with its Sth or five to eight or nine Inches high, under three, and in the top many fair red Flowers, as large or larger of any of the former, and of a deeper red Color, with Spots on them likewise, having greater Bulbs growing about the top of the Stalk, and among the Flowers, than any other.

IX. Mr. Rea defcribes it thus: The Fiery-red bulbled Lilly rife up from a great foly Root, (as all Bulbs do) with a fhort tall Stalk, fed with many strong dark green Leaves, and at the top adorned with many large Flowers, each compofed of five bread thick Leaves, of a fowy red Color at the top, and towards the bottom of an Orange Color, with fmall black Spots, bearing among the Flowers, and along the Stalk, divers Bulbs, like little Roots, which being set, in time, and bring forth Flowers, like unto the Double made when young.

X. The feventh, or Fiery red double Lilly is not bulbled. This Lilly is without Bulbs, and the chief Difference therofe doth confift in the Flower, which is compofed of many Leaves, as if many Flowers went to make one, when it thus bears it, which is not accidental, but as the former double Lilly is said to be.

XI. Mr. Rea thus defcribes it: This Doubled Red Lilly is like unto the former in Root, Stalk and Leaves, but without Bulbs, and not folid, nor of fo dark a Colot. It commonly bears many Orange-colored single Flowers on one Stalk, with many fmall brown Spots on the infufi thereof, and sometimes but one fair double Flower, as if the Leaves of many Flowers were united in one, which with it be but accidental, yet it happens in this kind more frequently than in any other Red Lilly; for if you have many Roots of this kind, you will alwaies have some double Flowers, and many more in some Years than in others.

XII. The Places. The Native places of the Growth of their Lifles, are on the Mountains, and in the Valleys near them in Italy, as Mattothome Bay, and in many Countries of Germany, as Anfria, Bohemia, Trungaria, Speria, as Chaffins and others report, and with us they grow almost in all Gardens, where they admirably thrive.

XIII. The Times. These Red or Yellow Lifles flower a little before the White Lilies, and sometimes together with them; but they flower for the most part in June; but the ficord of them, or Dwarf Red Lilly, is the earliest of all the rest.

XIV. The Qualities. The Flowers of the Red Lilly are hot in the fifth Degree, and temperate in respect to Dryness or Moisture, of a thin and subtle Substance. The Roots and Leaves are hot and dry in the fifth Degree, Difficultive, Digestive, and Anti-vomitive, and Alkalizable and in indeed make Phials, if well, with all the fame Qua1ities and Virtues of the White Lilly, but not all out so efficacious or powerful.

XV. The Specification. The Red Lilly is a peculiar thing, the Cure of Burnings, Scaldings, green Wounds, and Wounds made by Venomous Beasts.

XVI. The Preparations. You may make therefrom all the fame Preparations which you make from White Lilies; but these following are usual.

The Virtues.

XVII. The Cataplasm of the Leaves. It is made by bruizing them raw in a Mortar. Applied to places bitten by Serpents or Mad Dogs, it is said to draw out the Venom and heal them.

XVIII. The boiled Cataplasm of the Leaves. It is made by boiling them in Vinegar. It is good against Burnings and Scaldings, and to heal green Wounds, 6; to cleanse, dry, and heal old Ulcers.

XIX. The Cataplasm of the Root with Oil of Roses. It is made by roasting it in the Limbo, and bearing it up with Oil of Roses. Applied, it cures Burnings and Scaldings, and Efeatnes a Scurf, or Hardnefs of the Womb.

XX. The Cataplasm of the Root with Honey. It is made of the roasted Root, beaten up with Honey. Its strengthens and confirms Parts out of Joint, or Joins new Set, heals wounded Nerves, and takes away Scour, Mollone, Disorderings, and other Deformities of the Skin.

XXI. The Cataplasm with Vinegar. It is made with the roasted Root, or raw, as some ufe it, beaten up with Vinegar, Henbane-Leaves, and Crumbs of white Bread. Applied, it diffolves and cools hot Tumors of the Grein, Teflicks, Yard, and Womb.

XXII. The Cataplasm of the Roots boiled in Wine. Being beaten up, and applied to Corns of the Feet and Toes, it is laid to take them away in a few Days time, renewing the Application Morning and Night till the Cure is effected.

XXIII. The
XXIII. The Devotion of the Roots in Wine or Honied-Water. Being drunk to six, eight or ten Ounces, according to Age and other Circumstances, it is said to help the Bloody- flux, and expel Clotted Blood out of the Bowels.

XXIV. The Juice of the Root extracted with Blood or Honied-Water. It purges gently, softens the Collick, and cleanses the Bowels of sharp, acrid and putrid Humors, and carries off the Mollusk Caule of a Bloody-flux.

C H A P. CCCCXXXV.

of the L I L L Y Mountain, O R,
MARTAGON.

THE Name. It is called in Greek, Ἡσύδων, in Latin, Lilium Montanae, and Martagon; in English, The Mountain Lilly, and Martagon, also Martagon Lily.

II. The Kinds. There are many sorts of these Martagon or Mountain Lillies, viz. 1. Martagon Lilium, a large, Lilium Montanae majus flore albo, of some Martagon Imperiale flore albo, The great white Martagon, or Great white Mountain Lilly. 2. Martagon flore albo maculato, The white spotted Martagon, or Mountain Lily. 3. Martagon flore canescente, The Blush or Flush-colored Martagon, of Mountain Lilly. 4. Lilium Montanum minus, Lilium Jucundum minus, Hemerocallis Dodonae. The Lefter Mountain Lilly. 5. Martagon luteum punctatum. The yellow spotted Martagon. 6. Martagon luteum non maculatum, The yellow spotted Martagon. 7. Martagon luteum fuscum, The Late-flowering yellow Martagon. 8. Lilium Montanae non maculatum, The Small Mountain Lily not spotted.

The Descriptions.

III. The stuff, or Great white Martagon, or Great white Mountain Lilly. The Root of this, as also of the two next which follow, are of a pure yellow Color, the Cloves or Scales of them being brittle, and not easily compact, yet so as it was, and sometimes three Scales or Cloves grew one upon the Head, or upper part of another, which Difference is a good Note to know to these three Kinds, from any other Kind of Mountain Lilly, as in all old Roots are to be seen, as also in those which are reasonably well grown, which in young Roots is not yet so evident. This has its Stalk and green Leaf greater than those of the Martagon Imperial in Chap. 439. following, the Stalk is a little higher, but not bearing to thick a Head of Flowers, after much more plentiful than in the Læter Mountain Lilly Sert. 6. following, being altogether of a fine white Color, without any Spots, or but very few, and those but sometimes also. The Peduncle in the middle of this Flower are not red, as the Martagon Imperial, but whitish. IV. The second, or White spotted Martagon, or Mountain Lily. Its Root is very much closed, like the former, as after said, and the Plant itself is like unto it in all things, excepting in this, that the Flowers hereof are not altogether white, and besides, it has many reddish Spots upon the inside of the Leaves of the Flowers: the Stalk likewise is not so green, but brownish.

V. The third, or Blush or Flesh-colored Martagon, or Mountain Lily. The Root of this, as also is the Head, is like the first, and in all its other parts it is like to it, the only difference, that the Flowers of this are wholly of a decayed or pale Flesh Color, with many Spots upon them, and in this it only or chiefly differs from the former.

VI. The fourth, or Lesser Mountain Lilly. This Lilly is so like to Root to the Martagon Imperial, or Greater Mountain Lilly, in Chap. 439, following, that it is difficult to distinguish them one from another, but when this is sprung up out of the Earth, which is about a Month after the fall Imperial, it also bears its Leaves in Rambles about the Ground, and the Flowers, and are of a little deeper Fleck or Purple Color, spotted in the same manner. The Buds or Heads of Flowers in some of these, before they are blown, are heavy, white or hairy, whereas in others there is no Heartfeal at all, but the Buds are smooth and purplish; in other Particulars this differs not from the former.

VII. The eighth, or Small Mountain Lilly not spotted. This differs not from the first, neither in Roots, Stalks, Leaves, Flowers, or manner of Growing, flowering, that the Color of the Flower in this is pale, and that it has no Spots upon it, or if it has any, they are but very few.

VIII. The fifth, or Yellow spotted Martagon. It has a great swel or clover Root, and yellow, like unto all these sorts of turning Lillies, from whence springs up a round, green, Strong Stalk, three Feet high at first, contudiously fit with long, narrow, green Leaves, white on the edges, up to the very top thereof almost, having several Flowers on the Head, turning up again, as other Martagon do, of a faint yellowish, or greenish yellow Color, with many black Spots or Strakes about the middle of the Leaf of every Flower, and a forked Pointed, with six Cloves about it, tips with reddish Pendent of a strong sweet Smell, very pleasant to the sense, that not to others, who love not the slight Smells, if they be strong and pungent. It bears a great plenty of Seed, in great Heads, like unto other Lillies, but a little paler.

IX. The sixth, or Yellow spotted Martagon. This Plant, in its Root, Stalks, Leaves, Flowers, Seed, and manner of its Growing, differs not from the Lilly last described, excepting only that the Flowers of this have no Spots at all upon any of their Leaves, in all things else it is exactly alike.

X. The seventh, or Late-flowering yellow Martagon. This is the third Yellow Martagon, which is a Species of the fifth Kind or Sect. 3. above, but there is no other Difference betwixt this and that, living only in its time of Flowering, which is not until July, and that its Color is of a deeper Yelow.

XI. The Places. The first, second, third, fourth, and eighth Sorts have been found in several Countries of Germany, as Austria. Hungary, Bohemia, but are all made Denizens of our Gardens near London, where they are now become Natives, and flourish as well here as in the places of their natural Growth. The fifth, sixth, and seventh have been found to grow on the Pyrenian Mountains, as also on Mountains in the Kingdom of Naples, from whence they have been brought home to us, with whom they thrive also very well.

XII. The Times. The fifth, second, third, fourth, L I L L Y

2 and
and eight, flower about the latter end of June, for the most part, and flower sooner than the Martin- 

gong flower in Chap. 439, following, but that springs 

out of the Ground a Month before the last, it 

being the more early up, yet never the nearer. 

The fifth and Sixth Yellow Martagon flower some-

thing more early than the Red Martagon, and 

first come at the same time with them. The fe-

venth, or Late-flowering yellow Martagon, flowers 

a Month later or more, and in Flower when the 

Red Martagon of Constantinople flowers, which is 

in July.

XIII. As to the Qualities, Specification, Prepara-

tions and Virtues of these, as all of those in the 

five following Chapters, Authors have said nothing 

at all, so that we have not much to write concern-

ing them, as having had no Experience of them; 

but if one may be allowed to judge of them, by the 

usual Criterion, then we must allow them to be 

much of the Nature and Quality of the White and 

Orange Lilies before-described, whole Virtues in 

their respective Chapters foregoing are at large 

laid down.

C H A P. CCCCXXXVI.

Of the L I L L Y Turky, or, 

Byzantine M A R T A G O N.

The Names. It is called in Greek, Λιλυ 

τουρκου, in Latin, Liliwm Turcicum, Li-

lium Byzantium, Lillium vel Martagon Constan-

tinopolitanum: in English, The Turky Lilly, 

or Byzantine Lilly. There are no great Varieties 

of this Plant; yet as few as there are, Authors deliver 

them confidently, thefe following are the chief or 

most observed, viz. 1. Liliwm rubrum Byzantium, 

Hemerocallis Chalcedonius, Martagon Constantin-

opolitanum rubrum, The Red Turky Lilly, or Red 

Martagon of Constantinople. 2. Liliwm rubrum 

Byzantium maculatum, Martagon rubrum Constan-

tinopolitanum maculatum, The Red spotted Turky 

Lilly, or Red spotted Martagon of Constantinople.

2. Liliwm Byzantium flore purpureo fanguineo. 

The purplish Sanguine colored Turky Lilly. 4. Li-

lium Byzantium flore dilute rubens, The light Red 

Turky or Byzantine Lilly. 5. Liliwm Byzantium 

miniatum YoVvzinoBo, The Vermilion many-flowered 

Turky or Byzantine Lilly. The Turky call their 

Lillies, Ζαφνικα or Ζαφναρα. 6. Martagon flore 

patiato Pannonicum, The bright Red Martagon of 

Hungary.

The Descriptions.

III. The firft, or Red Turky Lilly, or Red 

Martagon of Constantinople. It has a great, thick, 

yellow Root, which sends out early in the Spring 

before many other Lillies, a round brownish 

Stalk, both with many fair green Leaves confusely 

thereon, but not so broad as the Common White 

Lilly, upon the top of which stands one, two, or 

three, or more Flowers, which hang down their 

Heads, and turn up their Leaves again, of an ex-

cellent Red Crimmon Color, and sometimes puer, 

having a long Pointed in the middle, compofed 

with six whitish Chives, tint with leafe yellow

Pondors, of a pretty good Small, but something 

false. After the Flowers, come Heads or Seeds, 

like to other Lillies, but greater. It is a fair 

beautiful Flower, and was at first very much efteem-

ed with us, and ye notwithstanding its Insulte and 

Pity, deferves its Commination, for its being 

come common every where, and so well known, does 

not at all diminish from its Excellency.

IV. The second, or Red-spotted Turky Lilly, or 

Red-spotted Martagon of Constantinople. This is 
after of the former Kind, and grows something 
greater and higher, with a larger Flower, and of a 

deeper Color, spotted with several black Spots or 

Streaks and Lines, as are to be seen in the Mountain 

Lillies, and in some other Kinds, which is not fo in 

the former but juft now described, that having no 

few of Spots at all. This whole Plant is rare, and 
of much more Beauty than the former.

V. The third, or Purplish Sanguine-colored Tur-

ky Lilly. It has a large Lilly like Root, from which 

arifes a Stalk and half or two feet high, fat 

confusely with Leaves, like the firft above: the 

Flowers also reemine those before decribed in Sel. 

3. but are usually more in Number, and of a pur-

plish Sanguine Color.

VI. The fourth, or Light Red Turky or Byzan-

tine Lily. This is very like the left in Root, Stalk, 

Leaves, Vombers, and Seed, having, that in the Co-

lor of the Flowers, these are of a lighter Red than 

those firft decribed in Sel. 3. aboeoging: the 

Leaves and Stalks also, as Ίφυρια observes, are of 

a lighter green Color.

VII. The fifth, or Vermilion many-flowered 

Turky or Byzantine Lilly. This is also a Variety of 

the firft, but according to Clibus, the Difference is 
in these things, that the Flowers grow equally 

from the top of the Stalk, and the middle Flower 

rises higher than any of the rest, and sometimes confis 

of twelve Leaves, as it were a Twin, which thofe 

who obferve it, will find.

VIII. The firth, or Bright Red Martagon of 

Hungary. This seems to be a Species of the firft, 

(beth it may grow in Hungary) by reason of the Likc-

ness both of Leaf and Flower thereunto. Its Root 
is very like the fame, but the Leaves are fomewhat 

larger, and more perfecly fit upon the Stalks, fhe 

not much unlike. The Flowers bend down, and 
turn up their Leaves again, but fomewhat larger, 

and of a bright Red, tending to an Orange Color, 

viz. somewhat yellowish, and not Crimmon, like 

the other.

IX. The Places. The firft, second, third, fourth, 

and fifth, grow naturally in Turky, as or near Con-

stantinople, formerly called Byzantium: the left 

on the Mountains or Hills of Hungary, but now 

they are made free Denizens in our English Gar-

dens.

X. The Time. They generally flower in June, 

when other Lillies do, some earlier, others later, 

and continue flowering till the beginning of July.

XI. Their Qualities, Specification, Preparations, 

and Virtues, have not been oberved in any Author, 

yet they all feem to be of the Nature and Properties 

of the Common White and Red Lilies.

C H A P. CCCCXXXVII.

Of the L I L L Y Perifan.

The Names. It is called by the Perifans or 

Turks, or fome coming from thence, Πειλι

mas
Chap. 437. English Herbs. 629

The Description.

III. Its Root is very like unto the Root of the Crown Imperial described in Chap. 177, aropping, and losing its fibres in like manner every Year, having a Hole therein likewise, where the old stalk grew, but whiter, rounder, a little longer, smaller, and more like at all like it. From whence springing up a round, whitish green Stalk, not much lower than the Crown Imperial, but much smaller, beetle from the bottom to the middle thereof, with many long and narrow Leaves, of a whither or blishow green Color, almost like to the Leaf of a Tulip. From the middle upwards, to the top of the Stalk, grow many Flowers, one above another, round a-head, with Leaves at the foot of every one of them, each whereof is pendulous, or hanging down the Head, like unto the Crown Imperial, not turning up any of the Flowers again, but smaller than in any other kind of Lily, and open to large as the Flower of a Frisitilla, consisting of six Leaves a piece, of a dead or over-worn purplish Color, having in the midst a small long Point, with several Chives, having yellow Punctures adhered to them. After the Flowers are paff, (which abide open for a long time, and for the most part flower by degrees, the lowest first, and so upwards) if the Weather is favorable and temperate, come forth Heads of Seed- Vefils, five-square, yet leaning to be but three-square, by reason of the Wings, very like to the Heads of the Crown Imperial in Chap. 177, foregoing, but smaller, and shorter, in which are contained much like flat Seed, but smaller alfo, and of a darker Color.

IV. Note. Gerard has this Defcription hereof. The Persian Lily has (says he) for its Root, a large Bulb, differing in Shape from the other Lillies, having one great Bulb, firm or solid, and full of Juice, which commonly each Year jets off or successions one other Bulb, and sometimes more, which the next Year after is taken from the Mother-Bulb, and so brings forth such Flowers as the old Plant did. From this Root rises up a fat, thick, and strait Stem, of two Cubits or three Feet high, whereon is placed long narrow Leaves, of a green Color, declining to Blyness, as doth that of Wood. The Flowers grow along the naked part of the Stalk, like little Bells, of an over-worn purple Color, hanging down their Heads, every one having its own Foot-Bulb, which is about two Inches long; as also its Pedal or Clipper from the middle part of the Flower: which being paff and withered, there is not found any Seed at all, as in other Plants, but it is increased by its Root.

V. The Places. It is said to be first brought from Peru to Confantinople, and from thence sent to us, by means of several Early Merchants, or their Factoris, which Dwelt and traded there; but now it is become a Native of England, and flourishes as well in our Gardens, as in the places where it first grew.

VI. The Time. It springs out of the Ground nearly a Month before the Crown Imperial, and does not flower till the latter end of April, or beginning of May. The Seed (when it comes to Perifollion, which it does not often) is not perfectly ripe till July.

VII. As to its Qualities, Nature or Virtues, etc. of this Persian Lily, esteemed for its Rareness and fine Figure it makes, there is not anything written by any Author, only it is thought to participate of the Qualities, Ufe, of the other Lillies.
XI. The Times. All these Lilies do spring very late out of the Ground, at the end of May, or beginning of June, and that is a Month at least before the Red or Confiantinople, in Cap. 436. Sect. 5, and 4, and

X. Of the Qualities, Nature, and Vertues of these Authors have also found nothing; but doubtles they are much of the Properties of our Common Lilies.

C H A P. CCCCXXXIX.

Of the L I L L Y Imperial.

I. The Names. It is called in Greek, Baro Gennan : in Latine, Lilium Imperiale : in English, The Imperial Lily.

II. The Kinds. There are several Species of this Plant, viz. 1. Coronilla Imperialis, called also Lilium Byzantium, the Turk call it Corola late, and Tari-

III. The Descriptions. Imperial. 3. Coronilla Imperialis flore late, The Yellow or Yellow Imperial. 4. Coronilla Imperialis angustifolia flore rubrario, The

1. The Large, or Broad-leaved Early Red Lily, or Red Maraggon Pomponee, This is the same with the former Plant, "The Maraggon of Pompony has a great yellowish, brown, fusty Root, from whence springs up a green Stalk, two or three Feet high, promiscuously thick set, with many small, long green Leaves, almost to the top, where stand many Flowers, in number according to the size of the Plant: in some which have flood long unmove, I have had four score or an hundred Flowers upon one Stalk, which are of a yellowish Orange Color, with small black Spots on the inside thereof, in fashion like to the Red Maraggon of Constantinople, but smaller.

V. The second, or Other narrow-leaved Early Red Lily, or Red Maraggon Pompomee. This differs from the former only in two things, viz. 1. That the narrow Leaves are not so thick set upon the Stalk. 2. That when it flowers, it is a Fortnight later. In other Particulars it differs not.

VI. The third, or Broad-leaved Early Red Lily, or Broad-leaved Pomponne or Macedonian Maraggon. This is also like to the former in Root, Stalk, Flower, Seed, and manner of Growing, but the Difference is scarcely to be discerned: but it confounds chiefly in these two things: 1. That the Leaves of this are a little broader, and shorter than the former. 2. That it bears its Flowers a Fortnight earlier than the last. In the Color or Form of the Flower, there is no Difference to be discerned, nor yet in any other thing alike.

VII. The fourth, or Lily or Maraggon of Macedo-

VIII. The Plants. The Knowledge of these Early Maraggon came first to us from Italy, from whence they were sent into the Low-Countries, and into England; but it seems by their Name, that their original or native place should be upon the Mountains in Macedonia: with us they grow only in Gardens.

IX. The Times. All these Lilies do spring very late out of the Ground, at the end of May, or beginning of June, and that is a Month at least before the Red or Confiantinople, in Cap. 436. Sect. 5, and 4, and

X. Of the Qualities, Nature, and Vertues of these Authors have also found nothing; but doubtles they are much of the Properties of our Common Lilies.
Flowers, there grows a Tuft of green Leaves, like those on the Scale, but smaller. After the Flowers are faded, there follow Cod's or Seed-Veils, fix-square, wherein is contained flat Sacs, tough and firm, of the Color of Mars. The whole Plant, as well Roots as Flowers, do swell very like a Fox. As the Plant grows old, so does it wax rich, bringing forth a Crown of Flowers among the uppermost green Leaves, which some make a second Kind, although in Truth they are but one and the same, which in time is thought to grow to a triple Crown, which comes to pass from the Age of the Root, and Fertility of the Soil. The Figure we have thought good to subjoin here.

Single Crown Imperial.

IV. Mr. Ree. In his Flora, Cap. 7. gives this following short Description thereof. It has a great round Perfected Root, from whence springs up a tall and strong Stalk, garnished from the Ground unto the middle thereof, with many long shining green Leaves, from whence it is naked upwards, bearing at the top a Tuft of small green Leaves, and under them eight or ten Flowers, according to the Age of the Plant, hanging down round about the Stalk, in fashion like unto a Lilly, confiding of six Leaves of an Orange Color, with many Veins of a deeper Color on the back sides of the Flowers. Next the Stalks every Leaf thereof has a Bunch or Eminence of a fadder Orange Color than the rest of the Flowers, and on the inside of those Bunches are filled with faint-tailed Clear Drops of Water, like unto Pearls, each Flower having in the middle a Stile, compassed with fixed white Chives, tipp'd with yellow Pendants.

V. The second, or Double Crown Imperial. This is of a late Discovery, and in much more Effect than the former; and it is indeed a gallant Plant, and deserving Notice, which in form resembles the other to be the best regarded. It chiefly differs from it in the Flowers, which in this are constantly double, each Flower containing fifteen or sixteen Leaves, whereas those of the other Common Kind bare but fix. The Leaves of those double Flowers are narrower, with a Drop or Pearl at the Head of each of them, of the same Color with those of the Common Kind, and as many Flowers on one Scale. The Plate at first coming up, is redder, and continues longer so than the Ordinary, the green Leaves are of a darker Color, and the Tuft on the top above the Flowers bigger, and confiding commonly of more Leaves.

VI. The third, or Yellow Crown Imperial. It is in its Root, Stalk, Leaves, Flowers, Seed, and manner of Growing, differs not from the first Common Kind, but only in this, that the Flowers are of a fair yellow Color. This is more rare than that with the double Flowers.

VII. The fourth, or Narrow-leaved Crown Imperial with a reddish Flower. This likeness in its Root, Stalk, and manner of Growing, differs not from the other Single Kinds, but in this the Leaves are much narrower, and the Flowers of a light red, or of a pale Rose Color.

Imperial Martagon.

VIII. The fifth, or Imperial Martagon. This Imperial Lilly has a flaky Root, like unto all the rest of the Lillies, but of a paler yellow Color, closely compatt or set together, being short and small oftentimes in respect of the Greatness of the Stem growing from it. This Root is very apt to increase or set off, as it is called, whereby the Plant seldom comes to so great a Head of Flowers, but rises up with many Stalks, and so then bears the fewer Flowers. The Stalk is brownish, and round at the bottom, and sometimes flat from the middle upwards, three Feet high or more, being at certain distances with Rundles or Circles of many broad Leaves, larger and broader for the most part than any other of this Kind, and of a dark green Color; it has two or three, and sometimes four, of these Rundles or Circles of Leaves, and bare, without any Leaf between; but above, towards the tops of the Stalks, it has here and there some Leaves upon it.
Salmon's Herbal.

Lib. I.

III. The first, or Spotted Lilly or Martagon of Canada. It has a small foot, but many long small Flowers thereon, from whence rises up a reasonable great Stalk, almost as high as any of the former Kinds, bearing at three or four Distances many long and narrow green Leaves, but not so many nor so broad as some others, having thick or flaky, of a fine delay purple Color, spotted with many blackish or brownish Spots, of a very pleasant sweet Smell, which makes it the more acceptable. In the middle of the Flower hangs down a Stille or Pointed, knobbed at the end with six yellow Chives, tip with hoofs Mantels, of an Orange Red or Vermillion Color, which rather thick like Dull upon any thing that touches them. The Heads of Seed-Velvets are small and round, with small Edges about them, wherein is contained flat brown Seed, like as in other Lilies, but smaller than any of the other.

IX. The third, or Imperial Martagon not Spotted. This is a Species of the last Kind, which is found in some Gardens. It is in its Root, Stalk, Leaves, Flowers, Seed, and form of Growing, very like that, but its Flowers are without any Spots the Leaves thereof, and Stalk likewise, are of a pale Color, but otherwise not differing.

X. The Place. The first four were brought to us without doubt out of Turkey, and places near a hour Conflantinople; but some think them, especially the first, to be Natives of Persia. The two last come from several Countries of Germany, as Austria, Hungary, Silesia, Tyrol, &c. and now are bred in the Dominions of England, and Natives in our Gardens.

XI. The Times. The first four springing out of the Ground about the end of February or beginning of March, and the Heads with the Seed are ripe in the end of May or beginning of June. The two last flower about the latter end of June for the most part, and yet they springing out of the Ground before the other Martagons, or Mountain Lilies in Chap. 435. foregoing.

XII. Of their Qualities, Nature, and Properties. Authors have said nothing, but by their Flowers and other Orients, they think they have the Virtues of Our Common White and Orange-tawny Lilies.

C H A P. CCCXL.

Of the L I L L Y American or Floridian.

I. T H E Names. This Plant being but of late Invention or Discovery, can have no Greek Name; but modern Authors call it in Latin, Lilium Americanum, Lilium Indicum, and Lilium Floridatinum, and in English it is called, The American or Floridian Lilly.

II. The Kind. Mr. Rea, in his Flora, Cap. 7, gives us two several sorts of the American Lilly, viz. 1. Martagon Canadenfis maltatum, Lilium Canadenfis, Comunus, Lilium Floridatum, or Multatum, The Spotted Lilly, or Martagon of Canada. 2. Lilium Americanum, Martagon Americanum, Martagon Virginianum, and Lilium Virginianum, The Virginian Lilly or Martagon, The American Lilly or Martagon.

The Descriptions.

III. The first, or Spotted Lilly or Martagon of Canada. It has a small foot, but many long small Flowers thereon, from whence rises up a reasonable great Stalk, almost as high as any of the former Kinds, bearing at three or four Distances many long and narrow green Leaves, but not so many nor so broad as some others, having thick or flaky, of a fine delay purple Color, spotted with many blackish or brownish Spots, of a very pleasant sweet Smell, which makes it the more acceptable. In the middle of the Flower hangs down a Stille or Pointed, knobbed at the end with six yellow Chives, tip with hoofs Mantels, of an Orange Red or Vermillion Color, which rather thick like Dull upon any thing that touches them. The Heads of Seed-Velvets are small and round, with small Edges about them, wherein is contained flat brown Seed, like as in other Lilies, but smaller than any of the other.

IX. The third, or Imperial Martagon not Spotted. This is a Species of the last Kind, which is found in some Gardens. It is in its Root, Stalk, Leaves, Flowers, Seed, and form of Growing, very like that, but its Flowers are without any Spots the Leaves thereof, and Stalk likewise, are of a pale Color, but otherwise not differing.

X. The Place. The first four were brought to us without doubt out of Turkey, and places near a hour Conflantinople; but some think them, especially the first, to be Natives of Persia. The two last come from several Countries of Germany, as Austria, Hungary, Silesia, Tyrol, &c. and now are bred in the Dominions of England, and Natives in our Gardens.

XI. The Times. The first four springing out of the Ground about the end of February or beginning of March, and the Heads with the Seed are ripe in the end of May or beginning of June. The two last flower about the latter end of June for the most part, and yet they springing out of the Ground before the other Martagons, or Mountain Lilies in Chap. 435. foregoing.

XII. Of their Qualities, Nature, and Properties. Authors have said nothing, but by their Flowers and other Orients, they think they have the Virtues of Our Common White and Orange-tawny Lilies.

C H A P. CCCXLI.

Of the L I L L Y Balfard, or D A Y - L I L L Y.

I. T H E Names. It is called in Greek, Λυλλανομον by Theophrastus, Λυλλανομον by Dioscorides, Λυλλανομον by Galen, Λυλλανομον by Pliny, and Lyllumon by others; Lilius affinis, quae &
Chap. 442. English Herbs.

Of LILLY Water White.

I. THE Names. This Plant is called in Greek, Nuphala; in Latin, Nymphaea, quod loco vocatur aqua amara, ut Deiphrades fatis; it is also called by Apuleius, Water Eruculum, Alga pauli, Paeon palumbi, Cynus venosa, Digitali Veneti; and Lycia, an old Writer, fatis, that it was called Lycia Cerucis; in the Shops, Nymphaeae. The Abbacy call it, Nicolai, and Nicofor: and we in English, Water Lilly.

II. The Kinds. There are two principal Kinds hereof, viz.: 1. Nymphae alba major, Nymphae alica major, The White Water Lilly. 2. Nymphae alica minor, The lesser White Water Lilly. 3. To these we may add a third, which is an Exotic, and is called Suck, bearing at the top thereof four or five small Lilly-like yellow Flowers, blowing one after another, like the first Gold-red Day Lilly, but continuing many Days before they fade. The Leaves die to the Ground before Winter, and the Flowers are many, long, yellow Strings, very much increasing.

VII. The third, or Lilly Alphodil with white Flowers. This Lilly is in all the parts thereof, as Roots, Leaves, Stalk, Cod, Seed, and in its manner of Growing, like the former, only, that the Leaves are of a lighter green Color, and the Flowers of a Snow white, like unto the Snow Spiderwort, but that the Seed is higher, and the Flowers larger.

The Descriptions.

III. The fifth, or Gold-red Buffard Lilly, or Gold-red Day Lilly. It has for its Root many thick and long knabb'd Strings, like unto the Small yellow Alphodil-Roots, but somewhat greater, running under Ground in like fort, and flowering out young Hoicks round about. For this Root bringing up divers broad and long fresh green Leaves, folded at the first, as it were double, which after open and remain a little hollow in the middle; among which rises up a naked Stalk, three Feet high, bearing at the top many Flowers, one not much distant from another, and flowering one after another, not having commonly above one Flower blown open in a Day and a half, but the Flowers last a Week, and closing at Night, and not opening again, whereupon it obtained the English Name of Day Lilly, or Lilly for a Day. These Flowers are almost as large as the Flowers of Yellow White Lilly, and made after the same fashion, but of a fair Gold-red or Orange-yellow Color. Seed is very seldom seen to follow these Flowers, for they them the next Day after they have flowered, (except the Seafon is very fair and dry) to be so rotten, as if they had been laid in Vet to rot them.

IV. Nota. Gerard says, That this Plant brings forth its Bud in the Morning, which at Noon is full blown or spread abroad, and the same Day in the Evening it thus it fell, and in a short time after becomes as rotten and flaking as if it had been trodden in a Dunghill a Month together, in foul and rainy Weather, which is the Case that the Seed seldom follows, as in the other Kind, fearfully ever bringing forth any at all.

V. The second, or Yellow Buffard Lilly, or Yellow Day Lilly. It has a Root consisting of many Knobs or tuberos Burditches out, proceeding from one Head, like the Tope of the White Alphodil or Peony. From this Root proceed long flaky Leaves, chamber'd or channelled, hollow in the middle like a Gutter, among which rises up a naked or bare Stalk, about three Feet high, branched towards the top, with several broad Arms or Branches, on which it bears many Flowers, like unto those of the Common White Lilly, in Shape and Proportion, and of a shining yellow Color, which being full, threecornered Codes or Hooks succeed, full of black hairy Seed, like those of the Common White Lilly.

VI. Mr. Ray, in his Fera, Cap. 14. says, That this Yellow Day Lilly, or Lilly Alphodil, rises up with many long Holly Leaves, out of the middle of which proceeds at length a large Flower, like unto that of the Common White Lilly, and which is made in the Shape and Proportion, and of a shining yellow Color, which being full, threecornered Codes or Hooks succeed, full of black hairy Seed, like those of the Common White Lilly.
had met with it in several Marshy places in Florida. It is Nymphaea alba major, the greater Egyptian, or \textit{Nymphaea alba major,} and \textit{Nymphaea major,} which is \textit{Nymphaea major,} or \textit{Nymphaea alba major,} of which we have already discourse in Chap. 302, above.

\textbf{Greater White Water Lily.}

\textbf{The Description.}

\textbf{IV. The first, or Greater White Water Lily, has a long, thick, round, long, tuberous Root, juicy or fatty, and with many Roots therein, like Eyes, and either within: from whence proceed very large and very round, thick, dark, green Leaves lying upon the Waters, like with those of \textit{Falla Tigridia}, or \textit{Dodecatheon fontium,} and that very truly,) furnished by long and thick Foot-stalks: from the middle side, and other places of this Root, rise other the like thick and great Stalks, forming one large and white Flower thereon, green on the outside, but exceeding white on the inside, white as pure Snow, consisting of several Rays of long, and somewhat thick and narrow Leaves, smaller and thinner, the more inward they grow, encompassing a Head within, with many yellow Threads or Thorns in the middle, which stuff they are pale, round, Pointed like Heads, full of broad, oily, bitter, blackish and glittering Seed.

\textbf{V. The second, or Lesser White Water Lily.} It has a single Root, with some five or six Leaves along and therefrom, from which rise up many long round Foot-stalks of Leaves, which Leaves stand also upon the Water, as the other does, being fair, of a light green Color, broad, smooth, soft, round, and Buckler-like in Form, and from the same Rise up also several long, round, smooth, soft, lightish green Stalks (but softer than those of the Greater Lily) of Flowers, standing upon Foot-stalks, some longer, some shorter, each Flower consisting of five small Leaves apiece, having a little yellow in the middle thereof.

\textbf{Lesser White Water Lily.}

\textbf{VI. Parkinson says, That this Lesser Water Lily differs not from the former, or Greater, but in the Smallness both of Root and Leaf, and in the Single-stalks of the Flower, which consists but of five small pointed Leaves, spread open and laid abroad, (as you may see by one of the Figures) with yellow

\textbf{Lesser White Water Lily.}
Chap. 442. English Herbs.

The Virtues.

XIII. The liquid Juice of Flowers or Root. That of the Flowers is the inner Juice, but that of the Root is the Broth. It stops Fluxes in the Belly and Womb, and the Overflowing of the Seed in Nocturnal Pollutions. Prevents against Spitting, Vomiting, or Piling Blood, or the Bloody-flux: and being constantly used for some time inwardly, it is said to extinguish the Seed, and thereby Luff and all Venereal Defects. It cools the Head and Brain, is profitable in Frenzies, and helps the Diftemperance of those Parts. And as it cools and anoint it Roots, and cures a Gonorrhoea, or the Running of the Reins, and is also profitable against the Whites in Women. Do one, two, or three Spoon-fucks, mix with a little Red Powder, and, according to Age, Sex, and other Accidents, Morning and Night.

XIV. The Decotion of the Root in Red Port Wine. It has all the Virtues of the Juice, but not full out so powerful. It may be taken inwardly from three to eight Ounces, Morning and Night. It is peculiar against Spitting and Piling Blood, and other Difficulties of the Reins and Bladder. If the Decotion is made in Water, it helps against the Strangury, powerfully renews Luff, and abates hot burning Fevers.

XV. The Concoction of the Flowers or Root, or of their Juices. It is good against burning Fevers, and Ravings in malignant Fevers, and indeed has all the Virtues of the liquid Juice or Decotion, but may be given in double the quantity the Juice is given in. It procures Rest, softens the Brain, and stops Deformities of Humors upon Wounds, Ulcers, Fissions, Pimpls.

XVI. The Elixir of the Flowers. It has the Virtues of the Syrup, and may be given Morning and Night against Coughs, Catarrhs, Watchings, Finsings, Writings, and Confusions, as also to abate Luff. Dose, as much as a Chaldron or Half-a-Chaldron at a time, washing it down with a little of the distilled Water, flavoured with white Sugar.

XVII. The Powder of the Seed. It has all the Virtues of the Root, and may be given Morning and Night, from half a Dram to a Dram and half, in any convenient Vehicle, as Concoction of Sees, or of Hops, Concoction of Barberries, or in Syrup of the Juice of the Root, &c. It is good against Venereal or Fieble Dittes, destroys Luff, cools the Reins, dries up the Seed, and hinders its Generation, therefore by cauting Chastity in Man or Woman. Some give it in Water-gruel or Muston-Broth.

XVIII. The Oil of the Flowers. It is made by Infusion or Bowling, with a treble or fourfold Repetition, just as we make Oil of Hops, &c. It is profitable to cool inflammations and hot Tumors, as also the Inflammations of Wounds and Ulcers, to safe Pains and head running Sores. It calms Rest and quiet Sleep, represses Visionary Dreams and Nocturnal Pollutions: anoint therewith the Temples, Forehead, Nostrils, Reins of the Back, and Tendons, Evening and Morning. It is good also against black and blew Sores, Yellowness of the Skin, Sunburnings, &c.

XIX. The Ointment of the Root. It is made by boiling the bruised Root in Tar till it is currish, straining it out, and repeating it three times more, adding a little Oil Olive, it is too thick. It is good against Scars, Morphea, Fecras, Ringworms, Scirpigo, Mononage, Scabious, Leuca, Ingrowths, and such other like Deformities of the Skin. It is said also to be a kind of Deploritio for taking off of Hair; but of this I can say nothing by Experience.
XX. The Capsules of Leaves or Roots. It is made by beating in a Mortar. Laid upon a Wound, it stops the Bleeding, and if it is burning or hot, it abates the Inflammation. Laid upon the Region of the Back, over the Heinz, it gives Ease in Pains of the Back, takes away the Preternatural Heat thereof, stops the involuntary Flowing of the Seed, hinders Nekritial Foliations, and abates Lust, being repeated three times or four times in twenty-four Hours. It does the same thing, being applied to the Teflies.

XXI. The distilled Water of the Flowers. At such times as the Flowers cannot be gotten, a Water may be distilled both from the Herb and Root. It is very effectual against all the Dificuts afore-mentioned, but it cannot have the Strength of the Juice, for which Reason it is to be given in greater quantities, as from three to six Quinces, sweetened with double-refined Sugar, and the other to be repeated, as three or four times a Day, as the Physician shall see fit. Outwardly applied, it cools all sorts of Inflammations, is good against Ambontit, Fire, eases Pain proceeding from Heat, as Head-ach, Megrim, Gout, &c., and is much commended also against Lentils, Freckles, Sun-burning, Tanning, Yellowness of the Face, black and blow Spots, Scuff, Murrain, or other Deformities of the Skin, being applied three or four times a Day or more: but it will be much more powerful, if it is mixed in equal quantities with the liquid Juice of the Root.

CHAP. CCCXLIII.

Of LILLY Water Yellow.

I. THE Names. It is called in Greek, Νυμφεα lanitalis; in Latine, Nymphæa hæres; and in English, Yellow Water Lilly.

Greater Yellow Water Lilly.

II. The Kinds. There are three Species of the Yellow Kind, viz. 1. Νυμφεα laevis or, Nymphæa laevis major; The greater Yellow Water Lilly. 2. Νυμφεα lanitalis minor, The lesser Yellow Water Lilly. 3. Νυμφεα hæres minor, Nymphæa hæres minima, The leaf Yellow Water Lilly, or Yellow Water Lilly with a leaf Flower.

The Descriptions.

III. The first, or Greater Yellow Water Lilly. It has a Root which is great, thick and long, very like unto the Root of the Greater White Water Lilly, but with certain Sorts, not blackish on the outside, but whitish, and after white within, of a loose or spongy Substance, and somewhat succent in Tastc, as is that also of the White Kind. This grows likewise much like the Great White, with Leaves almost as large as they, but somewhat longer, and standing on corncral Scales; the Flowers also which grow upon the tops of the crowded Scales, are not so thick of Leaves as the White, but confind only of five large round or short Leaves, of a thinning yellow Color, with a round green Head in the middle, composed with yellow Threads, which Head, when it is ripe, contains within it greater Seed than those of the White, and more shining, but less than Grains of Wheat.

Lesser Yellow Water Lilly.

IV. The second, or Lesser Yellow Water Lilly. This has a large Head, but a single Root, with some few Fibres adjoining to it, creeping in the bottom of the Water, and dispersing it itself far abroad: from which rise up many long, round, smooth and soft Foot-balls, form'd of which do bring forth at their ends, small, fair, round, Buckler-like Leaves, like to the former, but lesser, yet larger than those of the Lesser White sort: on other some of these Foot-balls, grow pretty Tufs of small Leaves, floating on the Waters as the others do, but yet larger than the Flowers of the small White Water Lilly before described.

V. The third, or Yellow Water Lilly with a lesser Flower, which is said to be the Leaf Water Lilly.
Chap. 444. English Herbs.

Of Lilly Convally, or May-Lilly.

I. The Names. This is an herb not known to the Greeks, but may well enough be called by this Greek Name, Lelium ; but by our translators, in Latin, Lilium Convallum : some have it to be Lilium Vernum Theophrasti, others Onanthe Thoephrasti, Colchisnum Geras, Caesar Longera, and Ephememon non Lathob Echecoll, but they all of them, for the most part, are mingled in these Names. In English we call it, Lilly Convally, Lilly of the Valley, and May-Lilly.

II. The Kinds. Authors have given us two special Kinds hereof, viz. 1. Lilium Convallum flore albo, The White Conval Lilly, or Lilly of the Valley, with white Flowers. 2. Lilium Convallum flore rubro, The Red Lily Convally, or Lilly of the Valley, with red Flowers.

The Descriptions.

III. The first, or White Conval Lilly, or Lilly of the Valley, with white Flowers. It has a small, slender, stringy Root, which runs far abroad under the Ground, creeping every way, with many small white Fibres, and spreading up again in divers places. From this Root rise up together three or four Leaves, one inclosed within another, each of which, when it is open, is long and broad, of a greyish green Colour, forming something resembling the Leaves of the Small Elchoorion, or Small Wild White Hellebor, at the sides whereof, and sometimes from the middle of them, rises up a small, short, naked Foot-Stalk, an Hand breadth high, or somewhat more, bearing at its top, one above another, many small white Flowers, like little hollow Bottles, with open Mouths, nick or cut into five or six Notches, running all downwards one way, or on one side of the Stalk, of a very strong sweet Smell, and comparable to the Memory and Senses, which being past away, turn into small Berries, of a red Colour, something like unto Ajpargus, in which is contained white hard Seed.

IV. The second, or Red Lilly Convally, or Lilly of the Valley, with red Flowers. This is in its Root, Leaves, Stem, Flowers, Seed and manner of Growing, exactly like the other, and differs from that only in the Color of the Flowers, for whereas those are of a white Colour, these are of a fine pale red Colour, of a sweet Smell, but not altogether to faine as the former.

V. The Places. The first grows abundantly Wild in many places of England. Gerard says it grows on Hampstead Heath, not far from London, in great plenty; also near to Lor in Essex, and upon Bunny-Heath, about thirteen Miles from London, and in many other places. The second is a Stranger in England as to its Original, but both of them (for their excellent Virtues) are nursed up in our English Gardens.

VI. The Times. They both flower in May, and their Berries are ripe in August and September.

VII. Note. These Plants increase wonderfully, even too fast for the Bigness of some Gardens ; they flourish best in the Shade, and in a Soil which is not too fat, or in a mean between rich and poor : if the Earth is too rich, they many times rot and die, and so come to nothing : in a meaner Ground they do better.

VIII. The Memory. This Lilly is hot and dry in the beginning of the second Degree, and their Bigness, Aperitive and Altheative; Cephatic, Neurotic, Stomatatic, Antipellptic, Antispertletic, Antiparalitic, and Alphamalic.

IX. The Specification. It is a peculiar thing in a...
against the Head-ache, Megrim, Lethargy, Vertigo, Epilepsy, Apoplectic, Folly and Gout.

X. The Preparations. Of this Plant the Root is most efficacious, the Flowers next, then the Leaves, which are the medicinal part thereof. You may have, 1. A Juice of the Root or Flowers, or of the whole Plant. 2. An Essence of the same. 3. An Infusion of Root in Wine. 4. A Powder of the Root, or Flowers, or Leaves. 5. An Oil by Infusion or Infusion. 6. A Liqueur of the Flowers. 7. A Distilled Water of Roots or Flowers. 8. A Spirit of Roots or Flowers. 9. An Elixir.

The Virtues.

XI. The Juice of Roots or Flowers, or of the whole Plant. It strengthens the Brain and Nervous Parts; is good against the Lethargy, Vertigo, Megrim, Falling sickness, Apoplectic and Folly, revives the Animal and Vital Spirits, strengthens a weak Memory, and is profitable against the Gout. Dose: A Spoonfull or two Morning and Night in a Glass of Cold or White Wine, fasting some of it also (as a Liquid Elixir) up the Noddle, every Evening, an Hour before Bed-time.

XII. The Essence of Flowers or Roots, or both. It has all the Virtues of the Liquid or Juice, but of greater Strength, and pleasurableness to be taken, and may be given in the same quantity with that, and used in both the same Methods. 'Tis doubtful if a Specific against the Epilepsy and Folly, and for which Purposes it is not to be despised. It places affected with the Gout be bathed therewith, as hot as can be endured, it gives Ease, and in a short time removes the Difficulties. Drop it into the Eyes, it eases their Pain, allays their Inflammation, and eases an Ophtalmia, as also that Difficulty called the Pin and Web.

XIII. The Infusion of the Root or Flowers in Wine. It has all the Virtues of the Juice and Essence, but less powerful; and therefore may be given from three to six Ounces, in the Morning fasting, an Hour before Dinner, and left at Night going to Bed. It comforts the Heart and Vital Spirits, strengthens the Brain, and makes a strong Memory. It is good against the Palpitation or Trembling of the Heart, or other Members, opens Obstructions of the Bowels, and prevails against Hypochondria, Melancholy, Dullness, Drowsiness, Lethargy, and other cold and moist Diseases of the Head, Brain, and Nerves. It opens Obstructions of the Nervous Parts, and of the Brain, that being taken for some time, it prevents the coming of an Apoplectic, or the Induction of that Difficile, by strengthening the Parts, and preventing the Cause.

XIV. The Powder of the Root, or Flowers, or Leaves. Inwardly taken, it has all the Virtues of the Juice, Essence and Infusion, but operates not so speciously nor so powerfully as the two last, because the Force or Power thereof is first to be extricated out of the Substance of the Powder by the Stomach; the which, if the Stomach be weak, will be bitterness performed. It may be given from half a Dram to a Dram, or more, every Night at Bed-time, in Wine or some other convenient Vehicle; and the same Dose every Morning fasting, in like manner. If it is laid up the Noddles, it purges the Head and Brain of superfluous Humors, which proceed from Cold and Mollitude, and prevails against all those Difficulties of the Head and Brain which proceed from the same. It is an excellent Medicine, and not to be despised.

XV. The Oil by Infusion or Infusion. It is made by adding a Drop of the Flower or Root into choice Essence Oil, or rather in Oil of Ben, because this latter Oil never grows rank. It is made either by Infusion, or Digestion in Bulins, or a Sand Heat, for fourteen Days or more, then pressed out, and in the Infusion or Digestion it is first boiled over the fire for the completing thereof. Anointing hereof, it hinders the spreading of the Leproty, and takes away Scabs and Ringworms, Scari, Morphopl. Yellowness, Turning, Sun-burning, and other Deformities thereof; and this it does to much more effectually, if the Parts affected be first well bathed with either Juice or Essence, as hot as the Patient can endure, every time before the Anointing. It gives Ease in the Gout, being anointed upon the Part.

XVI. The Liqueur of the Flowers. It is thus made according to Gerard. Take a Glass, which fill with Flowers of May-Lillites or Lilly Casualty, drop it close into a Cork dippt into Wax, or with a Glass Stopper, and set it in an Ant-hill for a Months, space or longer, and then take it out: so will you find a Liqueur in the Glasses, which decant from the Flowers, and keep it for use in another Glasses close stoped with a Glass Stopper. Whenever you drink it, it gives Relief in the Gout, and other Pains of the Nerves and Joints. Inwardly taken Morning and Night, a Spoonful at a time in a Glass of Wine, or it is the Infusion at Night and Morning an excellent thing against the Epilepsy, Folly, Lethargy, and other cold and moist Difficulties of the Head and Brain.

XVII. The distilled Water of Roots or Flowers. Authors ascribe the same Virtues to it which is given to the Juice, Essence and Powder, but as it is much weaker than those Preparations, so it ought to be given oftener, and in larger Doses, as from two Ounces to four or fix Ounces, either alone by its self, dulcified with double-reduced Sugar, or mixt with some of the Infusion in Wine. If it is dropped into the eyes, it is said to help their Inflammations, Pin and Web, Cloudines, Dimnes, of the Sight, but this it more excellently performs, if you dulcify it a little with choice Honey. It is good against Scurf, Morphopl, Scars, Tetras, Ringworms, and other Deformities of like kind, by withering the Parts affected therewith; but it will do more effectually, if it is mixed with a proportional part of the straw Lysar by delignion. The Water also eases the Pain and affliges the Swellings coming by the Stinging of Bees, Wasps and Hornets, being applid to the Part. Taken to the quantity of six Ounces, it helps those who are poysioned by the Biting of a Mad Dog; but I am confident that the Juice or Essence being taken instead of it, will be much more effectual; and being drunk for Forty Days together, it cures the Epilepsy or Falling-sickness. The same Water drank, is said to help the Strangury, as also the Pain at Heart, the Inflammation of the Liver, and to stop the Overflowing of the Courts.

XVIII. The Spirit of the Roots or Flowers. It may be distilled from new Wine, or from Henryd, after a small part of the Flowers Digestion therein. A Spoonful of this Spirit being drank, returns Speech to such as have lost it thus the Dead Folly: it comforts the Heart, strengthens the Brain, revives the Spirits, fortifies the Memory, and refreshes the whole Human Frame; is good against Fantings, Swoonings, and Palpitations, or Trembling and Beating of the Heart: it is also good agaist the Epilepsy, Vertigo, Lethargy and Apoplexy; for being drunk with a few Grains of Pepper, and two Drains of the Powers of Lavender, it is said to prevail against the Apoplace, cure the Coffee Heart against the Biting of Mad Dogs, or the Poison of other Venomous Beasts. M-X-
The Descriptions.

III. The first, or Common Limonade, or Sea Marth Bugloss. We have already largely described this Plant in Chap. 97, but some few obervations more after themselves in Consideration, and therewith a more elegant Cut of the Plant. The Root then is thick and long, somewhat like unto a Small Red Beet Root, or Small Dock Root. From this spring up several Fatt, long, thick, fift, green Leaves, like to those of the Limon or Orange Tree, but of a darker green, and sometimes a little crumpled, or not much unlike to those of the Small Beet. From among these Leaves springing up several naked, hard, brittle Stalks, of a Foot or Foot and half high, divided towards the top into many other small Branches, which Branches grow for the most part upon one side of the Stalk, and are replenished with many small bluish purple Flowers, somewhat like unto Bugloss Flowers, but that they are less, or as some Authors say, in shew like to Lavender Flowers, which Flowers grow also, all of them for the most part, on one side of the fold Branches; which being pulled away, long red Seed follows, contained in the husks which the Flowers flood in before. See the Figure annexed.

IV. The fourth, or Small Limonade, or Small Rock Bugloss. This differs but little from the first, facing that it grows much lower: It has a small long reddish Root, parted at the top into several Points, from whence come forth in a kind of Foliis, a number of small, thick, fat, smooth, and somewhat roundish Leaves next the Ground, in form and manner of a small Hooye-Lett, some of the Leaves being not pointed at all. It grows now a love six Inches high, the Stalks being some higher, and some lower than others, bare, and without Leaves to the tops, where they spread into several small Branches, bending a little backwards, being...
V. The fifth, or Limonade with indented Leaves, or Spanish Sea Marth Baglodi. It has a long slender Root, with some few Fibres adjoining. From the Head of which Root spring forth long green Leaves, lying spread upon the Ground, being also deeply incised or indented on both sides, and somewhat rough. From among those Leaves grow up the Stalks, walled with slender indented Skins: towards their tops they are divided into several Branches, after the manner of the Ordinary Kind; but these Branches are also winged, and at the tops they carry Flowers, some four, five, six, or more clustering together, consisting of thin, crisp, or crumpled Leaf, of a light blew Color, (which continues long, if you gather them in their perfect Vit- 
gor, and to dry them:) and In the midst of this blew, comes up little white Flowers, consisting of five little round Leaves, with some white Threads in the middle.

VI. Or thus, as Parkinson describes it. This Limonade of Bauwolfinis, has a Root which is small and long, and blackish on the outside, perishing at the first approach of Winter. From this Root spring forth many long, narrow, and somewhat rough Leaves, lying spread upon the Ground, turned or cut in on both sides like an indenture, something like the Leaves of Cer- terach or Spleen-wort: among which rise up two or three Stalks, somewhat rough also, and with thin Skins like Wings, indented on both sides; there of all, like the Leaves, having three small, long, rough, and three-square Leaves at every Joint, where it branches forth, at the tops whereof stand many Flowers, upon their Foot-halts, in such a manner as is not seen in any other Plant: for almost that some of the small winged Foot-halts, are shorter and some longer, flaring as if they were Tire- 
wife, or all on one side, and not round like an Umbre- 
ble, yet are they even at the top, and not one high- 
cr or another; each of which small Foot-halts do bear four or five grandish Heads or Husks, joined together, one of each of which do arise other pale or Black blew stiff Husks, as if they were Flowers, made as it were of Parchment, which hold their Color after they are dry, a long time.

And out of those Husks likewise do come (at seve- ral times one after another, and not all at one time, or together) white Flowers, consisting of five small round Leaves, with some white Threads in the middle. After these Flowers are pale, there come in their places small long Seed, enclosed in many Husks, many of those Heads being unfruitful, or not yielding any good Seed, but Chaff, especially in our Country, for want of a sufficient Heat of the Sun.

VII. The Places. The first grows in several Marshes and moist places in Kent, as is related in Cap. 97. Sect. 8. also going. The fourth grows up on the Chelthy Cliff going from the Town of Margate in Kent, down to the Sea side, on the left Hand. The fifth was first observed by Rauwolfson in Syppa in Syria; it grows also on the Coasts of Bar-

kury, and Cadiz in Spain, from whence it has been brought to us, and is now naturalized up in our Gar-

dens.

VIII. The Times. They most usually flower in June and July, and yield their ripe Seed the next Month after.

IX. The Qualities, Specification, Preparations, and Virtues, are much the same with those of the fifth Kind, which we have declared at large in Cap. 97. Sect. 15. ed. 17. also going.

Mountain Cotton-Weed.

I. THE Names. It is called in Greek, Alpinio-

a, or Mtn. in Latin, Leontopodium, and 

Cnmon or Comos: and in English, Lions-foot, Lions

Cudweed, and Mountain Cotton-weed, or Cudweed. Some affirm, That the Title of Leontopodium is not found in some Copies of Dioscorides, but in Me-

nus or Comos; but that by it may appear, that Le-

ontopodium and Comos are one and the same thing, 

which latter Name you may also find in Pliny, lib. 

27. cap. 2. where he speaks of Catenanum, which was only often about Love Mistresses.

II. The Kinds. This Plant is certainly a Species of the cudweeds or Cudw-weeds; tho' various Au-

thors speak variously of the Plant, to which the 

Name Leontopodium properly belongs, or which 

should be the right, some accounting one Plant, 

and some another, and some none, to which it has been yet applied. Leontes has his Leontopodium, 

which is the Lobium or pappis palustris Bauhini, or the 

Lepidium scrophularioides Lob. Apuleius, Atius, 

and Orbisius, will have it to be Leontopodium, or 

Lobed, but that it is not, however for Satta-

tion fake, we will describe that Plant in the third 

place of this Chapter. Ophiogon (from ophiogon de 

Catenanum, by the Name of Leontopodium 

Catenanum, Alpinia is alle far from the true thing. 

Babinius fixes the Herb for the true Leontopodium Diffr

ides, but with Lugaeus, thinks Pliny his Leon-

topodium to be much differing from that of Diffr

ides, and that that of Matthiola, Lobel, and oth-

ers, are only Kinds of Gnopaphis or Cudwweed, 

as we here determine them. Brunfelsius makes our 

Adenylla or Ladies-Mantle to be it, as is hinted 

in Cap. 241. also going, but that is not the Leon-

topodium Diffrides, nor any ways agree with his 

Description of the Plant.

III. The Kinds of this our Lions-foot. There are 

two sorts which Authors have taken notice of, viz. 

1. Leontopodium majus, Per Leonana maior, The 

greater Lions-foot, or Mountain Cotton-weed. 2. 

Leontopodium minus, Per Leonana minor, Per Le-

onana Minor, The lesser Lions-foot, or Mountain 

Cudweed. 3. To these we add, (tho' not of the Stock 

or Kindred) for the Name sake, Adenylla, Le-

ontopodium folium Leonis, Lions-Leaf, Lion-looped 

Tunep, and Black Tunep. This Apuleius and 

Atius calls Leontopodium, but truly may be 

turned, if compared with the Description of the first 

Kind of that Name. It is also called in Latin, 

Rupicaria, Pap Auger, Ernasum, Scrofula, Leon-

na, Per Leonana, and Per Leonana, but very im-

properly these three latter, the last five one, belong-

ing to the first and second aftergoing, and the last 

of all, to the Plant called Adenylla, or Our Ladies-

Mantle:

The Descriptions.
and something woody, with several Strings and Fibers adjoining to it. From this Root spring forth several small and something narrow Leaves, lying upon the Ground, hairy or woolly all over, yet more hairy white underneath than above; the Stalks rise up above half a Foot or more high, set with each like Leaves thereon unto the tops, where stands one great brown Head spicke, compasse about with many woolly or hoary white Leaves, representing the hairy Foot of a Lion, Hare, or Dove, or fuch like Creature, from whence came the Name. Out of this Head comes forth many short Threads, which make the Flowers seem to have Holes therein, in which lies afterwards small brownish Seed, wrapped up in so much Down, that it is hardly to be found or seen.

V. The second, or Latter Lions-foot, or Mountain Cudweed. The Root is small, long, a little woody, with several Strings or Fibers adjoining to it. It rises up with one Stalk for the most part, with several Leaves thereon, somewhat longer, but not broader than the former; at the tops whereof stand divers woolly Leaves, and in the middle of them, three or four or more Heads of Flowers, like unto the other Cudweeds, consisting of Thrum, or a pale yellow Color, with some black Hairs among them; after which follows the Down, as also the Seed like the other.

VI. Lions-foot, Lions-footed Turnep, or Blind Turnep. The Root of this Plant is ineracious, somewhat like to a Turnep, or Sow-Bread, or Great Ground-Nun, being of a blackish grey Color, with several small Branches or Knees on the side, from whence springing up several large and long Leaves, much divided or cut into divers parts, (like unto Cudweeds or Potatoes,) as Discovered says, or more like unto Penny Leaves: the Foot of the same, but we find they are more jugged or cut in) of a dark yellowish green Color, as it grows with us, but of a darker yellow Color in those places where it is a Native, coming nearly unto the Color of a Lion's Skin or Hair, from whence it's supposed came the Name of Lions-foot, more than from the Foot. From among these Leaves springing up a broad Suck, spotted with pale purplish Lines and Strakes, divided into many Branches, fur at the Joinings with smaller Leaves, and fitter cut in (as on the tops of which stand several small Flowers, made of six Leaves apiece, of a dark or brownish yellow Color, red like an Anemone on the outside; and therefore called by some Authors, as Discovered says, and yellow on the inside: after which come small Pads, thicker and shorter than those of Hollow-Root or Radix Cosus, in which is contained small round Seed.

VII. Gerard thus describes it. The Root is great, roundish like a Turnep, and black without: From which spring forth broad Leaves, like unto Coleworts, or rather like unto Peony, cut and divided into several great Givues. The Stalk is two feet long, thick, and full of Juice, dividing it self into divers Branches or Wings; in the tops whereof there stand red Flowers, which being pulled away, red Cores come in their places, in which lies the Seed, like unto Tares or Wild Chiches.

VIII. The Places. The Root has been found growing on the Alps of Germany, and in Mountain Fields in Italy. The second on divers Mountains in Germany and Italy also. The Lion's-foot is a Native of Syria, Greece, Canidia, Naples, &c. but they are all of them mixed up with us in Gardens.

IX. The Times. The two first flower in July, and somewhat in August. The last in Winter-time in Cundy, as Bellinis says, but with us very late.

X. The Qualificata, Specification. This Plant has and Virtue of Lions-foot of Mountain Cudweed, are the same with those of our Common Cudweed, which we have expressed at large in Cap. 18o. Sid. 8. ed. 15. preceding. Parkinson says, that the Taste hereof being astringent and drying, with some Bitterneds in it also, dous lightly, that it is very applicable against all Fluxes of Blood or Humors, as also very effectual for all Sores, either green Wounds or old Ulcers, and conductible for whatsoever Cures the other Cudweeds may be applied to.

XI. A Decadence in a Lucarium of Bat After. It cleanseth the Hair from Nits and Lice: and being made not too strong, it is good against Scurf, Mephit, Leucra, Leprocy, Yellowwinds, and other Deformities of the Skin.

XII. A Decadence in Wine. Being drunken, it kills Worms, and expels them; and is prevalent against the Biting and Stinging of Serpents, and other Venomous Creatures.

XIII. The Emblem of the Herb. Being taken as Tobacco, in a Tobacco-pipe, it is good against the Cough of the Lungs, cleanseth the Throat of phlegmatic Matter, and eases vehement Pains of the Head.

Of Lions-foot.

XIV. The Qualificata. It is hot and dry in the third Degree, Ablutiferous, Digestive, Vomitory and Asphaltramick.

XV. The Specification. It cleanseth old and filthy Ulcers, is profitable against the Scabious, and is an Antidote against Poison, the Biting of Serpents and other Venomous Creatures.

Salmon's Herbal. Lib. I.

VI. The third, or Branched Lions-Tail. It has a stringy fibrous Root, like the former: from whence springs up a Stalk, which is branched forth several ways, and yet many of those Herbs are found with single and unbranched Stalks, those with branched Stalks being or growing for the most part lower than the others, which are unbranched: they are of differing Colors, some white, some more yellow, some brownish yellow, and some blood or purplish, for they are found in several places. Intermittent takes notice of a small fort here!!, which grows lower, under Trees, Foot-Traies, and Foot-Brooks; differing in nothing else but in being of a darkler Color, and the Flowers whiter.

VI. The first, or Branched Lions-Tail, is called in Greek, Aenian, and by Dioscorides Nollos: in Latin, Limodoron, Liriodon, Orobanche, and Cauda Lefaris. In English, Lion-Tail, Kil-Herbe, and Herb-Bone.

II. The Kinds. There are three sorts of this Plant, viz. 1. Limodoron vel Liriodon major, Great Lion-Tail of Monpelier. 2. Limodoron vel Liriodon major, vel Cauda Lefaris flore majore purpurascente, Great purple Lions-Tail. 3. Limodoron vel Cauda Lefaris, vel Orobanche unigena, Branched Lion-Tail.

The Descriptions.

III. The first, or Great Lions-Tail of Monpelier, has a long and round small Root, without Scales, and with some Fibres under it. The Stalk is great and thick, with very short Leaves thereon, from the bottom unto the middle thereof, where the Flowers begin to grow, and with every one of them a larger and longer Leaf. The Flowers are long, and of a brownish Color.

IV. The second, or Great purple Lions-Tail. This has such a like Root, with Fibres thereon, as the former, which feeds forth several Stalks, with many thick and short Leaves on them, sharp at the ends, having sometimes Branches rising therewith, and sometimes two or three Stalks from the Root, which at the tops are set with longer Flowers than those of Broom Ropes, and on longer Foot-stalks, each ending in a Hash, with a long Thread so as it were growing out of the Flower, which turns up again. The whole Stalks, Leaves, and Flowers, are of a blood-red Color.

CHAP. CCCCXVII.

Of LIONS-TAIL, or
KILL-Herb, or
HERB-BANE.

I. THE Names. It is called in Greek, Νουθεωσαι, and by Dioscorides Νολλον, in Latin, Hematodon, Limodoron, Orobanche, and Cauda Leonis. In English, Lion-Tail, Kil-Herbe, and Herb Bone.

II. The Kinds. There are three sorts of this Plant, viz. 1. Hematodon vel Limodoron major, Great Lion-Tail of Monpelier. 2. Hematodon vel Limodoron major, vel Cauda Leonis flore majore purpurascente, Great purple Lions-Tail. 3. Hematodon vel Cauda Leonis, vel Orobanche unigena, Branched Lion-Tail.
Chap. 448. English Herbs.

Glycyrrhiza inflata, Glycyrrhiza tricuspidata, and Glycyrrhiza uralensis are our Common English Liquorice. 2. Glycyrrhiza Dipsacioides, a plant resembling Dipsacus and Dipsacum, with long, narrow, linear leaves, and small, white flowers, is cultivated in the Prato of Genoa, and is called the Genoese Herbalist's Plant, and is used as a substitute for Liquorice. The Wild Liquorice is also twofold, viz. 3. Glycyrrhiza flosfructus, a plant with large, compound leaves, and small, white flowers, and is cultivated in the Prato of Genoa, and is called the Genoese Herbalist's Plant, and is used as a substitute for Liquorice.

Common English Liquorice.

The Descriptions.

I. The first, or Our Common English Liquorice. It has a root which grows deep into the Ground, as large as a Man's Thumb, or larger, at the Head thereof, and spreads itself out into divers other long Roots, diameters, and fissions, by which it is much increased, of a brown Color on the outside, and yellowish within, of a very sweet Taste. From the Head of this Root rises up many round woody Stalks, fat at several distances with many winged Leaves, made of many small long ovals on both sides of a middle Rib, very well resembling the Leaves of a young Ash sprung up from the Seed, and having an odd Leaf at the end. This Plant, by many Years continuance in a Place, without removing it, and not else, will bring forth Flowers, many standing together, Spike-like, one above another upon the Stalks, of the Form of Pea-flowers, but of a very pale or bleak blow Color, which convert into long, flaxen, somewhat fine and smooth Cores, containing three or four small, round, hard Grains or Seed within them. The sweet Taste of this our English Liquorice Root, is much more pleasing to us, than that of the Italian or Spanish Liquorice, (which we shall describe in the next Place) because that being of a stronger sweet Taste, has a kind of Bitterness joined with it, which makes it something less acceptable and pleasing.

Liquorice of Dioscorides.

IV. The second, or Dioscorides his Liquorice, (which is indeed the Italian and Spanish Liquorice. The Root of this grows as deep or deeper than the other, but branches not under Ground like it, but in a smooth, continued Length, and of a stronger sweet Taste, with a little Tang of Bitterness at first. This Spanish Liquorice grows in the same manner which the other does, with the like Leaves and Flowers. It rises up to two or three Cubits in Height, and is beft with Leaves of an over-worn green Color, consisting of many small Leaves, set upon a middle Rib, like the Leaves of Cucurbita or the Melon Tree, somewhat glutinous in handling; from among which come up small Knobs or brown Heads, like to the Burs of the Platanus, or Plane-tree, as Dioscorides describes them, which grow upon short Stems or Root-stalks, between the Leaves and the Branches, clattering together, and making a round Form or Shape, out of which grow small blew Flowers, of the Color of an English Borage, after which succeed round prickly Heads, consisting of many rough fealy Husks or Cods, closely and thick compact together, being rough like those of Lentilles, in every of which Cods is contained one black Seed. This Liquorice grows in the same manner which the former does, with the like Leaves and Flowers, flowering that the seats are of a deeper blew Color, and growing for the most part at the tops of

Nonna
of the Branches, in round rough Heads, as before described.

V. The Rhiz., or Mott Common Liquorice Vetch.
It has a Root which is thick and long, drawing it from two or three long Stems, running very deep into the Ground, sweet in Taste, like unto Liquorice Root, which does not, but makes long, soaring forty new Branches every Year in the Spring. From the Head of this Root spring forth many weak, round, hard Stalks, trailing on the Ground, branched upwards. It is somewhat thick with winged Leaves, made of many small ones, set on both sides a middle rib, something like to a Vetch or Tarare, but much longer and pointed. The Flowers come forth at the Joints, at the end of a long Stalk, many together, of a black white Color, tending to yellow, which being pulled away, crooked Roots come in their places, containing two Rows of Seed, corrected and greyish, of the Taffo of other Pflanzen.

VI. The fourth, or Other Liquorice Vetch. Its Root is like the fift before, growing deep and spreading, and as great as the former, injurious that Thallius, for that this Plant is very like to the True Liquorice, excepting in some particulars. This Wild Liquorice takes up all with fuch Stalks and Leaves as the last, but spreads not fo far, nor turns down as mochi, nor are the winged Leaves altogether to large, but they are of a darker green on the upper Side, and more underneath. The Flowers are of a purplish Color, and the Gods are of a brownish Color, long and round, and the Seed within them more round.

VII. The Places. The fifth Root of Liquorice grows plentifully in Germany, about Nuremberg, and is planted with us in England in Gardens: in the Northern parts of this Kingdom, it is manured with great Care and Diligence, where it is produced in very great plenty, replanting it once in three or four Years. The second grows plentifully in Spain, Italy, and France, but with us only in Gardens. The third grows in many places of Cambridgeshire, in Cornish Land by Satisfaction, and at Wiltshire in Northamptonshire—and in many other places of our Land. Gerard says he found it growing in Suffolk. On the Highway on the right Hand as you go from Sudbury to Norwich Church, about an hundred Paces from the end of the Town, and in several other places of the same Country, and in Essex, about Dunmow, and in the Towns called Clare and Hemingford, it grows also by Farture. About the Foot of the Hill on which the Windmill stands, and in several parts of Kent. The fourth grows Wild in Germany, but has not been found in England, except married up in Gardens.

VIII. The Leaves. Gerard says, that the two first flowers in July, and their Seed is ripe in September: the other in June, and that their Seed is ripe in August, but Parkinson says they flower with us late, and feed as late, if at all.

IX. The Qualities. Liquorice (the Root which is chiefly used in Phylics) is temperate in action to Hot, Cold, Dryness, and Heat, and is not warming, nor cooling. If there is any thing of Intemperance in it, it is something hot and moist. It is a little Attractive, Diureticke, Relaxive and Traumatick, Pectoral, Nephritic, and Appetite.

X. The Specification. It is prevalent against Coughs, Colds, Wheezing, Hoarneifs, Obstruction of the Lungs, Catarrhs, Contumacies, Strangury, Obstruction of the Reins and Bladder, Ulcers of the Bladder, &c.

XII. The liquid Juice. It may be given from a Spoonful to two, every Morning Eafing, an Hour befofe Dinner, and at Bed-time, in a Glass of feat Water, to soften the Stomach against Coughs, Colds, Hoarneifs, Wheezing, Shortness of Breath, Difficulty of Breathing, and all sorts of Obfitrations of the Lungs, ending only Exploration: it also provokes Urine, cleanse the Reins, Ureters and Bladder, takes away the Heat of Urine, and gives Ease in the Strangury.

XIII. The Infusiorre Juice. It comes from Spain, and ought to be fliced very thin, or bruised in a Mortar into great Bits. Take of this Juice thus prepared an Ounce, fair Water a Quart, boiling hot, or White Liquorice Wine, or Spring Water, of each a Pint mix, and put this on boiling hot, has it fliced or bruised Liquorice: let them fland three, or four Days without the least stirring them, to will all the Tincture or fine Juice of Liquorice rise up into the Body of the Water, or Water and Wine, leaving out unprofitable Faxes at bottom; decant this clear Tincture into another Vessel, without the least disturbing the Faxes or Bottom, which keep for Life, calling the Faxes away as a thing of no worth. It has all the Virtues of the Liquid Juice, but is vastly finer and purer than it. It may be given from two to four of the Spoonfuls, in all the Colds of Distempers before-mentioned. It is a singular good thing against Catarrhs, Contumacies, Ulcers of the Lungs, Ulcers of the Reims and Bladder, being frequently taken according to the Direction of the Physician.

XIV. The Decordion. It has the Virtues both of the Liquid and Infusiorre Juice, but is much weaker, and therefore must be given in larger quantitities. It may be made by boiling brufled Liquorice in Wine, or in Wine and Water, or in Water alone, in which half, if it is boiled with a little Gummo added to it, it agrees instead of Drink in many places, espe- cially if it is set to work with Yeast, as Ale or Beer do, and then Turn’d up, which in a small time will become clear, thorny and heady, as Ale and Beer do.

XV. The Pehan. Take Liquorice well bruised four Ounces, Mace per three Ounces, Pennis per three Ounces, Spring Water three Quarts; let the Ingredients be well bruised, half is consumed, then take it into a Pote, and put this on boiling hot, which is good for such as have a dry Cough, digests Flegm and corrump Humours in the Lungs, and causes Expelloration: it helps Catarrhs and Cold Distempers, softens Contumacies and is against all the Diseases for which the Liquid and Infusiorre Juices are applied to. Dole four or fix Spoonfuls.

XVI. The Loboch. It is made of the Spanish Juice, by extrallating its Tincture with Potte Water, and making it thick with Gum Tragacanth, evaporating away the Water to a do Confusion. It is good against Flegm, Wheezing, and all manner of Roughneifs of Mouth or Throat: it helps to expellorare tough Flegm, and to condentifie thin Humours falling into Throat and Mouth.

XVII. The Electory Compound. Take six Powder of Liquorice twelve Ounces, fine Powder of Elecampane eight Ounces, Ginger in fine Powder four Ounces, Black Pepper in fine Powder two Ounces; mix them, and well Hung a sufficient quantity make an Electory. Dole from half a Dram to a Dram every Night at Bedtime, every Morning Raffing, and an Hour before Dinner, washing it down with a Glass of generous Wine, or Wine mixed with Water.
Chap. 449. English Herbs.

LIVER-WORT. Common or Great.

THE Names. It is called in Arabic, Azer and Asaphed; in Greek, Liverwort: in Latin, Lichen, Lotion of same, Hepatica, and Teocarpus: in English, Liver-wort.

II. The Kinds. There are two principal sorts hereof, viz.: 1. Lichen, for Hepatica vulgaris, Hepatica major, The Greater, or Common Liver-wort, Great or Common Ground Liver-wort; of which in this Chapter. 2. Lichen, for Hepatica minor, Small Liver-wort: of which in the following Chapter.

The Descriptions.

III. The Common or Great Ground Liver-wort, has Roots which are very fine and small, whereby of force, and with which it draws its Nourishment. It grows close, and spreads much upon the Ground in moist and shadowy places, with many flat green Leaves, lying, or rather as it were sticking flat one upon another, very unevenly out to the edges, and crumpled, from among which rise up small slender Stalks, an inch or two high at the most, bearing small Star like Flowers at the tops.

Common or Great Ground Liver-wort.

IV. The Places. It is often found in moist and shadowy places upon the Surface of the Ground, and in moist places near Highways, and other common Paths, where the Beams of the Sun seldom come, and in places not often frequented by Travellers, as also in shadowy and moist places on Rocks and Rocky Grounds, &c.

V. The Times. It brings forth its blazing Stems and Leaves oftentimes in June and July.

VI. The Qualities. It is cold and dry in the first Degree, and somewhat Astringent and Binding.

VII. The Specification. It is a peculiar thing, against the Rickets in Children, to allay inflammation, cure the Yellow Jaundice, to help the Gonorrhea in Men, and the Whites in Women.

VIII. The Preparations. You may have therefrom, 1. A liquid Juice or Essence. 2. A Decoction. 3. A Syrup. 4. An Ointment. 5. A Cataplasm.

The Virtues.

IX. The Juice or Essence. It is singular good against the Inflammation or Heat of the Liver, being taken from two Spoonsfull four to five in clarified Whey or Buttermilk Broth: it cures the Idrick Fits of Agues, and Tonsils which proceed of Cholick. I have known several Children which have been troubled with the Rickets, (which the Vulgar call Liver-grown,) to be cured by the constant taking thereof for some time. It cools the Inflammation of the Tongue, as also the Yellow Jaundice, which proceeds from an Inflammation of the Liver. It cools also the Heat of the Reins and Bladder, and cures a Gonorrhea in Men, and the Whites in Women;
and bathed often upon Tettars and Ringworms, and
other running Sores and spreading Sores, it is laid
to dry and heal them.

X. The Deceit. It may be made in Water of
Wine, according to the Nature of the Disea.
It has all the Virtues of the Juice of Elelence, but much
weaker, and therefore is to be given in a greater
quantity, as from a quarter of a Pint to half a Pint,
and that Morning and Evening.

XI. The Syrup. It is made of the Juice with
Honey or Sugar. It has all the Virtues of the Joces,
but is chiefly made for Children which have the
Rickets, by reason it is pleasant to take, and then
they generally add to it Alkaufait, Refiners of the
Sun flawed, and Figs slit, and to give it to the Child,
soon after at a time, five or six times a Day.

XII. The Ointment. It is made of the Juice, or
rather of the green Herb boiled in Hogs Lard, or in
Beef Suet mixt with Oyl Olive, of each equal parts,
till the Herb is crisp; then strained out, and
repeate three times in like manner. It is good a-
gainst Sores, running Sores, old Ucers, Tettars,
the Ringworm, called in Greek, Lichen
(whence the Name of the Plant for curing
this Disease) and some like Deformities of this kind.

XIII. The Stipulations. It cools and allays In-
flammations, and is prevalent against an Erysipelas or
Abrasions Fire, and has all the Virtues of the Oint-
ment, and may be used when that cannot be had.
It is made by heating the green Plant in a Mortar,
and applying it. Difcorides says, that being ap-
l lied to an Hemorrhage, or Flux of Blood, (1 sup-
posed to mean in a Wound) that it will stop the
Bleeding; but Galen dothes of this, tho' fo great
a Man as Difcorides reports it.

C H A P. CCCCXL.

Of LIVER-WORT Small.

THE Names. It is called in Greek, Hepatica
minor; in Latin, Lichen herba hepatitis
minor, liverum minor; and in English, The Small
or Smaller Liver-wort.

II. The Kinds. Of this Small Kind there are se-
veral sorts, as 1. Lichen herba hepatitis
umbellata, Small Ground Liver-wort with round
Heads. 2. Lichen herba hepatitis minor Scellaris,
Small Ground Liver-wort Starry-flowered. 3. Lich-
en herba hepatitis Perros, Stone Liver-wort.
4. Lichen herba hepatitis piloculus, Liver-wort
with a hooved Head. 5. Lichen herba hep-
atis minor alter minor folia calcana, Small Liver-wort
with Wing Heads. 6. Lichen herba hepatitis
minus, or Lichen herba hepatitis minor
Stellata, Small Liver-wort without Stalks.
7. Lichen herba hepatis minor purpureus
Dibicollis, Purple Liver-wort, called Cork or Archal.

Small Ground Liver-wort with round Heads.

Salmon's Herbal.

III. The first, or Small Ground Liver-wort with
round Heads. This differs not from the Great Kind
in the former Chapter, but in its Statue, this being
alongther left, and more smooth or even: the Flowers
on the tops of the blander Stems, are not so
much laid open like a Star, but the especial
Difference consists in this one chief thing, viz. that
this Kind being planted in a Pot, and let in a Gar-
den above the Ground, yet will it spread is left
round about, and increasses in great plente, where
never any did grow before.

Small Ground Liver-wort Starry-flowered.

IV. The second, or Small Ground Liver-wort
Starry-flowered. This Small Liver-wort grows in
like manner as the former, and sends forth such like
Starry Flowers as the Great Kind in the former
Chapter, but is smaller for the most part in all
places where it grows, for so as it grows in the
Shadow, it will live in Pots, as well as on the
Ground, if the place is not floured or turnst up.
The Difference between this and the former is, that
that has little tender Stalks about an Inch long,
with round Heads at their several tops, whereas
this Small Kind has like Stalks, of an inch in
Length, with a Star-florence Flower of Head
at top.

Stone Liver-wort.

V. The third, or Stone Liver-wort. It grows not
upon the Stones, but except we far abroad, on the
Ground.
Ground Liver-wort does: it only refts it self in Spots and Tufts, for here and there, of a diffy ruf-
fer: Covers the underwate, among the crumpled Leaves rise up feve small Sterns or
Stalks, on which do grow little Star like Flowers, of the Color of the Leaves. The Leaves are leffer that Liver-wort and lighter green Color, and a
little hairy: the Stalks are flender, naked, and a-
about two Laches high.

VI. The fourth, or Liver-wort with a hooved
Head. It is upon green confiding of small Leaves, fine
and white. Its Leaves lie one upon another, of a
yellowifh green Color, dafft over with an Anth-color,
and fpotted a little in their middle. The Stalks
grow to be about three or four Laches high, being
white, smooth, clear or transparent, and of the
thicknees of a Raff, on which goes a small Head,
something like unto an Hat, darer underneath in-
to five pairs, of a fpongy Subflance, green at the
fift, then yellow, and fally redifh; under which are
growing the Fruit, which are of a dark purple
Color, and juicly while they are freh; but being dry,
has a fmokey Pofter within them, iufteed of
Scent.

VII. The fifth, or Liver-wort with skinny Heels.
Its Root is compofed of branches as well as Silk. Its
Leaves are smooth and transparent, more tender and
flint than any of the former, growing in time to be
of a kind of purple Color, and not lying or
flicking one to another, as the others do; from the
back whereof grows forth a Skin or Sheath, flaped
like a Shoe, whofe brims or edges are a little
crumpled, and ruffled higher than the reft; from
whence rife up about four little, dark, green, finking
Heads, of the Bignefs of the fpotlajl Profe, which
allgether open into yellow Flowers, having four
Leaves apiece, fpreading upon yellowifh Stalks four
Inches high, with divers implorable Threads in the
middle.

VIII. The fiext, or Smalled Liver-wort without
Stalks. Its Root confifts of very fine short white B-
bres, which cleare to the Leaves, by which the Plant
is nourifhed and brace. This is the fpallest of all the
Liver-worts, and its Leaves are no larger than the
Nails of ones Finger, green and rough, with
white Spots. It has alfo certain flif purpliffh Skins,
fer on both fides of the lower part of the Leaf, be-
fore the Flower appears; but when the Leaf grows
greater, it becomes of a flif purpliffh Color, like
the Skins, and fwells at the end, fending forth a
small Fruit, as big as a small Pea, being of the fame
Color as the Leaf, fappy, or full of a whiffi-
water Juic, which afterwards, as the Fruit grows
ripe, changes yellow, and being broken, has then
a yellow Pofter, which will color the Fingers
which touch it.

IX. The seventh, or Purple Liver-wort, called
Corl or Archial. It is a kind of Herb or Plant much
refembling Liver-wort, of a fad purpliffh Color, which
the poor People in Derbyfhye gather, and grinding
it, make into a moiff Maff, which they keep in
Barrels, and therewith they make a kind of Munny
or purpliffh Dye, which, tho’ it will not hold Co-
ror long in Cloth, but will thrive and change, yet
it ferves poof People for their Wearing very well.

X. The Places. The firft and fefcond grow in
moiff Shadowy places in Gardens, and other like
Grounds, and fometimes they are planted in Parks,
for to hide moiff places, thrive very well. The
third grows upon Stones by Wells and Springs, and
is found upon Roocks and Stony places, as well near
unto the Sea, as farther on the Land, and it is of-
ten growing upon high Mountains, especially in Shadowy
places. The fourth, fifth and fiinth grow alfo in the like
moiff Stony and Rocky places. Thefe growths in
Derbyfhye, on the Mountains there, and is found in
great plenty.

XI. The Times. They bring forth their Flowers
for the moift part in June and July, and are in a
bouffiling Condifion all the Summer Months.

XII. The Qualities, Specification, Preparations,
and Virtues, are the fame with thofe of the Great
Liver-wort in the former Chapter, fo that no more
need be faid thereof in this place.

CHAP. CCCCLII.

Of LIVER-WORT Noble, o R.

Golden TREFOIL.

His Name. It does not appear that this
Plant was ever known to the Greeks, and
therefore has no Greek Name, but it is called in
Latin, Hepatica, Hepatica nobilis, Hepatica aurea, Hepatica
trifolia, Hepaticum trifolium, Hepatica
trinitatis, albo Herba Erinitatis. (but there is a
other Plant, which is the proper or true Hepa-
tica trinitatis, viz. Hepatica nobilis, of which we have already
trained in Chap. 346 and 347 abovegoing). It is alfo
called Trifolia aurea, Trifolium aureum, Trifolium
nobilis, Trifolia nobilis, and Trinitas: in English,
Noble Liver-wort, Golden Liver-wort, Noble Tre-
foil, and Golden Trefoil, and Hepatica.

II. The Roots. There are various forts of this
Plant, viz. j Hepatica flore carojo simplex major,
Hepatica Trifolium, The great flingle blew Hepa-
tica, or Noble Liver-wort. 2. Hepatica minor flo-
re folio carojo. The flmall blew Noble Liver-
wort or Hepatica. 3. Hepatica flore purpurea,
Purple Noble Liver-wort. 4. Hepatica flore albo
minor, The lefier White Hepatica. 5. Hepatica albo
aurea floribus. The great White Hepatica. 6. Hepatica
albo flore flavo aureo, Allo-colored noble Liver-wort,
or that of a Wild truth-color. 7. Hepatica albo
preminibus rubra. White Hepatica or Noble Liver-
wort with red Threads. 8. Hepatica flore rubro,
Hepatica trifolia rubra, Red Noble Liver-wort or
Hepatica. 9. Hepatica Americanum, or Virginiana.
The American or Virginian Noble Liver-wort or
Hepatica. 10. Hepatica flore purpureo fimplici
floris. Hepatica multiflorae. Double-flowered purple
Hepatica, or Noble Liver-wort.

11. Hepatica flore caroetis pluribus, Double-flowered
blew Noble Liver-wort.

The Descriptions.

III. The fiift, or Great flingle blew Hepatica, or
Noble Liver-wort. The Roots are compofed of a
fluff of black-Stripes or Viver: from the Crowns.
Button, or Heads whereof the Flowers going up,
blow open, and sometimes bed and fall away, before
any Leaves appear or spread open. This Flowers
stand every one upon their own Foot, of which
the fame Height with the Leaves for the moft part,
which is much about four Inches high, and some-
times a little more, which utually confift of fix or
Leaves, (but fometimes they have seven or eight) of
a kit blow Color, with many white Chives or
Threads in the middle, a fmall middle green Umbone or Head, which after the Flowers

272
Great Bree, Noble Liver-wort.

Double Noble Liver-wort.

W. The second, or Small Bree Noble Liver-wort or Hepatica. The Roots are fibrous Strings of Soil, are like the former; the Leaves of it are elfe long, but smaller by half, and grow more abundant by bulging, thick together. The Flowers are of a pale or blackish Bluish Color, and not large as the foregoing. It very seldom bears Flowers for Parkinson says he had the Plant half a score Years in his Garden, and yet never saw it bear Flowers above twice in all that time.

V. The third, or Purple Noble Liver-wort. This Plant in its proper Roots, Stalks, Flowers, Seed, Leaves, and manner of Growing is wholly like unto the first described; so that there is no need to reiterate the former Description at Sect. 2, above; but the only Difference in this is, that the Flowers are of a deeper blue, tending to a Violet purple Color.

VI. The fourth, or Leaff White Hepatica, or Noble Liver-wort. The Flowers of this Noble Trefoil are wholly white, of the Large size of the Red or Purple-colored, and the Leaves of the Plant are somewhat smaller, and of a little whiter or paler green Color; in all things else it is wholly agreeing with the first.

VII. The fifth, or Great White Hepatica, or Noble Liver-wort. There is no Difference between this and the last described, neither in its Root, Stalks, Leaves, Flowers nor Seed, tending that the Flowers of this being full as white as the former, are as large as those which we shall describe in the next Section.

VIII. The sixth, or Anther-colored Noble Liver-wort, or that of a Wild Thistle Color. Both the Leaves and the Flowers of this Hepatica are larger than any of the former, except the last; the Flowers herein, at first opening, seem to be of a bluish Ash-color, which to able for three or four Days, decaying full, until they turn almost white, having yet full a shoe of that bluish Ash-color in them, till the very half.

IX. The seventh, or White Hepatica, or Noble Liver-wort with red Threads. There is very little Difference between this Noble Liver-wort, and the last White One of Sect. 6. after growing, proving that the Threads in the middle of the Flower are purely white, as in the last they are apt at the ends of a pale reddish Color, which adds a great Beauty to the Flower.

X. The eighth, or Red Noble Liver-wort, or Hepatica. The Leaves of this Trefoil are of a little browner red Color, both at their first coming up, and afterwards, especially in the middle of the Leaf; more than any of the former: the Flowers are in Form like unto the red, but of a bright bluish or pale red Color, very pleasant to behold, with white Threads or Chives in the middle of them.

XI. The ninth, or American or Virginian Noble Liver-wort or Hepatica. This differs somewhat from the other sorts already described: it bears very dark green Leaves, much of the Form of the other kinds. The Flower is small, and white, with white Threads in the middle: in other respects the Difference is very small.

XII. The tenth, or Double flowered Hepatica, or Noble Liver-wort. This Double Hepatica is in all things like unto the Single purple Kind, saving only, that the Leaves are larger, and stand upon longer Stalks, and that the Flowers are Small Buttons, but very thick of Leaves, and as double as a Flower can be, like unto the Double White Cornflower, but not so big; of a deep blue or purple Color, without any Threads or Chives in the middle, which fall away without giving any Seed.

XIII. The eleventh, or Double flowered, blew Noble
Noble Liver-wort. This differs but very little from the last, the whole Plant is a little less, the flower is not half cut so large, but altogether as double or manifold in the Leaves.

XIV. The Places. The ninth is a Native of Virginia, and was brought from thence by John Tradescott. Moit of the red grow naturally in the Woods in India, and some of them in Italy, as those with the dear Flowers, and the double-flowered, at Tuffa Bay; but with us they only grow in Gardens, mounted up for the Flowers sake, which are beautiful in their Kind, more especially being cultivated as to their early Appearance.

XV. The Times. The Times of these Plants do flower very early, and are some of the first Flowers which appear after the hard Frosts in January or February; so that next unto the Winter Woolfsbane, these them selves towards the last of Winter, which because they are so early in the Year, are so much the more to be valued. The Double Kinds flower not altogether so early, sometimes in March and April, otherwise they continue when the others are past. The Seedling Kindes perfect their Seed in April and May.

XVI. The Qualities. All these Kinds of noble Leaves, are cold and dry in the first Degree, Astringent, Traumatick or Vulgarly, stomachick, Hepatick and Nepaleptic.

XVII. The Preparations. You may have, 1. A liquid Juice or Essence of the whole Plant. Decotion of the whole Plant. 2. A Powder of the Root.

The Virtues.

XVIII. The liquid Juice or Essence. Either of these Preparations admirably comforts and strengthens the Liver, refrigerates it, and takes away any preternatural Heat of the Bowels; being given in Red Port Wine, it cleanses and strengthens the Ventricles, cools Fluxes and Bloody-fluxes, helps Pitting Blood, and the Over-flowing of the Courses in Women, and is of very good Use in Spitting Blood, restoring fuch as are in Consumptions. Being taken as a Diet, they are of excellent Efficacy in curing of Wounds, old Sores, Ulcers, and the like: and outwardly applied as a Wash in those Cares, they disperse the fume to a speedy Healing. Dofe two, three or four Spoonfuls at a time Morning and Evening, in any fit Vehicle.

XIX. The Decotion. It has all the Virtues of the liquid Juice and Essence: and may be made in Wine or Water, according as the Occasion may require. It may be given Morning, Noon and Night, from three Ounces to fix or eight; and outwardly it may also be used as a Lotion for Sores and Ulcers, which are of difficult or hard Cure. It is an excellent thing for the Hepatick Flux.

XX. The Powder of the Root. The Powder has possibly the Virtues of the Juice and Essence. Baptifla Sarcula commends it, and writes, that if a Spoonful thereof is given at a time in Wine, for several Days together; or in Broth, it is very beneficial against the Diseafe called Enterocele or Bubbling.

YELLOW WILLOW--HERB.

Of LOOSE--STRIFE Yellow or Common.

O R,

Yellow WILLOW--HERB.

I. THE Names. It is called in Greek, Λυσίμαχος, &c. and in Latin, Lyfimaehus, and Lyfimaehion, (so called from Lyfimaehus, King of Illyria, (as I suppose) who was the first Finder of it out;) it is also called Salicaria, ant quod inter Salices ortus, ant quod Salicia judex habet, uter. WILLOW-HERB, either because it grows among Willows, or that it has Willow like Leaves. In English, Loose-Strife, or Willow-Herb.

The Kinds. We make four principal Kinds of the same thing. 1. Lyfimaehus major, &c. Lyfimaehus major, major & communes, The Yellow, or Greater, or Common Loose-Strife: of which in this Chapter. 2. Lyfimaehus picata, Spiked Loose-Strife, or that with spiked Heads of Flowers; of which in Chap. 453. 3. Lyfimaehus non picata, Loose-Strife not spiked: of which in Chap. 454. 4. Lyfimaehus filipina, Corded Loose-Strife: of which in Chap. 455. following.

Common Yellow Loose-Strife.

III. The Kinds of the Common or Yellow Loose-strife. We have, 1. Lyfimaehus lutes & verna, Lyfimaehus verum & Legitimum Cordis apud Dresddonen, Lyfimaehus lates major, que eft Dreydockii Bauhini; Salicaria Tragi & Guerti; Aemnica Leuceteri, The Common Yellow Loose-Strife, or Willow-Hebr. 2. Lyfimaehus late atra Claffy, Lyfimaehus lates in his foliorum flores, Cafiolum, Lyfimaehus lates minor folis nigri punctis nitatis Bauhini, The fetter Yellow Loose-Strife, or Willow-Herb. To these

The Descriptions.

W. The first, or Common Yellow Loofe-flake, or Willow-herb. It has a Root which creeps under Ground much like to Quitch-grass or Dog-grass, but greater, which shoots up every Spring with branched Heads, that afterwards grow up into Stalks. This is the most common Kind, which grows in rank moift Ground, to be four or five feet high or more, with great round Stalks, a little crooked, and diversely branched from the middle of them to the tops into great and long Branches, on all which, at the Joints, there grow long and narrow Leaves, greater and broader below, most commonly two at a joint, yet sometimes three or four, branching like unto Willow-leaves, without Nicks or Dents on the edges, and of a faint green Colour, from the upper Joints of the Branches, and at the tops of them also, stand many yellow Flowers consisting of five Leaves apiece, with several yellow Threads in the middle, which turn into small round Heads, in which are contained small cornel Seeds.

V. The second, or Leifher YelHow Loofe-flake, or Willow-herb. It has a Root which creeps under Ground, and shoots up again in the same manner as the former. This Plant rises not up to high as the first, with its round jointed Stalks, which are some-what woody or hairy, the Leaves being also woody, and something like them, are narrower and shorter than they, four or the short part, and sometimes but three set together at a Joint, spotted with blackish Spots on their under sides, not compressing it at the bottom, but every one standing upon a short Foot-stalk, and not at all denter about the edges. From the middle of the Scalke almost, upwards at every Joint comes forth the Branches, which are short, nothing to long as the former, and standing closer together, upon which grow a few Leaves, lefer than those below. At the tops of the Branches of some Zone of the upper Joints also, grow a few Flowers, lefer than those in the before-described, which are of a yellow Color, and consisting of five Leaves as they do, with many yellow Threads in the middle, of a strong Fever, Smell, which do join together at the bottom, that the whole Flower falls away together, and not any Leaf apart. The former Plant has no Smell or Taste, but only Spickes, as Bitter and Dying, whereas this Smaller now described, has a little Aromatic it is, which will cause one to spire, after chewing it a while in the Mouth.

VI. The third, or Yellow Loofe-flake round headed. Its Roots are long, creeping under Ground with many Joints therein, and growing forth Vibes or every one of them. The Stalks of this Plant rise not up to be above a Foot in Height, bearing only two Leaves, and no more at a Joint, which are shorter and narrower, yet very like to those of the Common for, and of a pale green Color. At the Joints of the Stalks, which are crooked and hollow, with the Leaves come forth long Stalks of Flowers, without any Leaves on them, which are close set together, almost round, or rather of an oval form, but yet throwing the small yellow Flowers, consisting of five Leaves apiece.

VII. The Places. The first grows in many Places of England, in moyst Medowes, and by Water-sides, especially along the Medowes as you go from London to Ely, near London, &c. The second grows also near full Rivers and Water-sides, and in Valleys and moyst Fields, it is a Native of the Hills in Austria, and of the moyst Fields on the Alps. The third is found in the Ditches near Gouda in Flanders, and among Reeds near Amsterdam in Holland; and古iff luyo, that it was also found in places near the Alps. With as the two last are only mett'd up in Gardens.

VIII. The Times. All these Plants flour in June and July to August, and the Seed is perfected some time after.

IX. The Qualities. Loofe-flake is cold and dry in the end of the first Degree; Altirgent, Transfixit, and Cofmetick.

X. The Specification. It is an excellent thing for curing Wounds in any Part, to stop Bleeding inward or outward, as also to cure fore Tumours, and help Def- cacies of the Eyes.

XI. The Preparations. The Plant most used in Practice, is the fifth or Common great yellow kind, from which you may have, 1. A liquid Juice or Essence. 2. A Decoction. 3. A Clyster. 4. A Tincture. 5. An Ointment. 6. A Cataplasme of the green Herb bruised. 7. A distill'd Water. 8. An Acid Tincture.

The Virtues.

XII. The liquid Juice or Essence. It is of an exceeding binding Quality, and therefore Digestions says it is good to stay all manner of Bleedings at the Mouth or Nose, of all Wounds, or any other Bleeding whatsoever: it stops all Fluxes of the Belly, even the bloody-flux it self, given either to drink, or taken as a Clyster, it stops also the Over-flowing of the Tumors in Women: it is of good Life for green Wounds, to stop their Haemorrhage, and to conglutinate their Lips, being applied to them. It is often used as a Gargle for foe Mouths, and to cure Sores and Ulcers in the Secret Parts. It is beneficial for the Eye-tight, and of good Life to clear the Eyes of any thing gotten into them. Dose two, three, or four Spoonfuls.

XIII. The Decoction in Wine or Water. It has all the Virtues of the Juice or Essence, but much weaker, and may be given in any of the Calks afo-mentioned, from three Ounces to eight Morning and Night. It makes an excellent Gargle for sore Mouthes, and Ulcers in other Parts of the Body.

XIV. The Clyster. It is made of the liquid Juice or Essence two parts, Chicken-breath one part, mix them for a Clyster. It is good against a Diarrhœa, Dysenteria, and Luterness, and other Weaknesses of the Bowels.

XV. The Evagination. It is found by Experience, that the Smoke of Loofe-flake being burned, drives away Flies and Gnats, and other such hide troublesome Insects, which abound near Fens, Marshes, Water-sides and Pools, which are troublesome by biting and sucking the Blood in the Night Seaes, leaving Marks and Spots upon the Skin. It is said able to drive away Serpents and other Venions Creatures, being made where they usually haunt.

XVI. The Ointment. Take Bicer-Wax, Sage, Oil Olive, Beef-suet, of each an Ounce; Juice of Loofe-flake four Ounces; mix and boil all together in Balne to the Confince of an Ointment. Know some, instead of Oil and Suet, ufe May Butter, but that I avoid, because the Butter will quickly make the Ointment grow rancous: it is an excellent thing against Wounds and Punctures of the Muscles, Nerves and Tendons; let the Teeth be dip't in it, and put into the Wound, and the place covered with a Linen Cloath dipp'd, and spread with the Oint-
Chap. 453. English Herbs.

Of LOOSE-STRIFE Spiked, or, WILLOW-HERB with spiked Heads of Flowers.

1. The Name. It is called in Greek, *Limonaita micra*, in Latin, *Limonum miniatum*, and in English, Spiked Loose-strife, or Willow-herb, or Loose-strife with spiked Heads of Flowers.

2. The Kinds. There are two sorts of this Plant, viz.: 1. *Limonum micranum* purpureum, *Limonum micranum* purpureum purpureum, *Limonum micranum* purpureum purpureum purpureum purpureum purpureum purpureum purpureum purpureum purpureum purpureum purpureum purpureum purpureum purpureum purpureum purpureum purpureum purpureum purpureum purpureum purpureum purpureum purpureum purpureum purpureum purpureum CHAP. CCCCV.

Of Loose-Strife, not spiked, or Willow-herb with dispersed Flowers.

I. The Name. It is called in Greek, Πτερονικον; in Latin, Lythraceae, non specia, et in English, Loose-strike not spiked, or Willow-herb with dispersed flowers.

The Description.

III. The first, or Small purple-flowered Loose-strike not spiked, or Litter purple Willow-herb, is not creep as the others do, but is hard and somon but woody, with many small Tubers springing from the sides thereof. This small herb is much lower than that of the Purple spiked Head, or first kind described in the former Chapter, being but about a Foot and half high, with smooth and square Stalks, whose tops are pitted into many Branches; on the lower part thereof stand long Leaves, smaller and narrower than the other purple spiked Head in the last Chapter; two always set together at a Joint, one against another; but those which grow towards the tops of the Stalks, are smaller than the lowermost, and keep not that Order, but stand confusedly thereon, one above another; near unto which, at the Joints with the Leaves, come forth several Flowers, but not Spike fashion, usually in five Square Heads, whose tops are not pointed, but laid so open as in the other, but being more stout, thrust forth their Flowers out of them, which consist of six small reddish purple Leaves, with some Threads in the middle.

IV. The second, or Leaf purple-flowered Loose-strike not spiked, or Leaf purple Willow-herb. It has a small, long and brown Root, from whence it rises up (being the leaf Kind) to be about a Foot high. The Stalks branch themselves from the very bottom, and are set thick with small, long and narrow Leaves, almost like those of *Linea* or *Flax*, but shorter; with whom, at the Joints, come forth the Flowers, sometimes two at a piece, but more usually one, standing in green Hoods, like unto the last, composed of five small bleevish purple Leaves, enclining to red; in which Husks, after the Flowers are fallen, stand small Skiny Heads, wherein is contained small whitish Seed.

V. The Places. The first grows in molt Medows and Grounds near unto Water-Courses, as also in wet places about Ditches and molt Woods. The second grows in the like wet places also. This is a Native of Hungary, as we gather from Clusius. The second grows in Italy and Germany; but with as they are only nurled up in Gardens.

VI. The Times. They both flower in June and July, as the former do, and perfect their Seed in some small time after.

VII. The Qualities, Specification, Preparations and Virtues of these, are laid to be the same with those in the two former Chapters; and it is not to be doubted, they being so like in face and outward form unto them, as also in Small and Taste, and other Properties, and as being a Species of the same; and therefore we refer you to Chap. 452, where they are handled at large.

CHAP. CCCCLV.

Of Loose-Strife Codded, or Clogged Willow-herb.

I. The Name. It is called in Greek, *δοξολογος*, and in Latin, *Lythrum salicaria*, and in English, Clogged Loose-strike, or Clogged Willow-herb.

II. The Kinds. Of this Plant Authors have recounted the following Species, viz. 1. *Lythrum salicaria* angustifolium, Commenarianus Gesneri did, (but this latter Name more properly belongs to the seventh Species following), and Gesner himself rather calls this Sort Kind, *Erythrum*, Epithelium, a Word made of three, i.e. *erythros*, ανακαρδα, κάτι μονον, id est, sine super filicina alterius, of which he accuses six several sorts, at the end of ch. 452, his History of Plants.) The narrow-leaved Clogged Loose-strike. 2. *Lythrum Campanulatum* della Alpina, The Mountain Clogged Loose-strike. 3. *Lythrum salicaria* major, Ongre gen. alterius Gesner, the greater Clogged Loose-strike. 4. *Lythrum salicaria* minor, calvus, *Lythrum* the Wild lefter Clogged Loose-strike. 5. *Lythrum salicaria* filicina minor, calvus, *Lythrum* hirsuta, the hairy Wild Clogged Loose-strike. 6. *Lythrum salicaria* virginiana, The Virginian Clogged Loose-strike, or Tree Primula of Virginia. 7. *Onagre Glasu*, *Lythrum salicaria* purpurea minor Dodoni, Commenarianus Gesneri, Commenarianus filio Delphinae, Delphinae laciun Labei, as it is thought, which yet Parkinson will hardly
hardly allow of a Willow-Flower, or Leffer purple Batfure Loos-ífrife. 8. Lythrum salicaria galericu-
stata. This is a narrow-leaved Loos-ífrife, and is called Loos-ífrife. This almo-
sert to be a Kind of Gratiola, and which we have already de-
scribed in Chap. 389. Sect. 4. aforesaid, and it seems that it is rather a Kind of Hedge-Hystr, than an-
other Sort of Loos-ífrife, because of its ex-
treme Bitterness, and that it has hooped Flowers; both which are proper to the Gratiola, and not to the Lythrum salicaria, and some have properly enough,
called it Gratiola cerulea. Blvwd Hedge-Hystr, with other Names, as you may see in Sect. 2. of the above-aid Chapter: However, in this Chapter we shall give you the proper Cut or Figure of the said Plant, which was omitted there.

The Descriptions.

III. The fift, or Narrow-leaved Codded Loos-
ífrife. It is a Root which creeps after the same manner which the Yellow and Blov do. It rifle up
with hard Stalks, sometimes two, and sometimes
three Feet high, with many very narrow long green
Leaves theron, something like unto Rosemary
Leaves, yet very thick, two or at a Joint, thofe being shorter than those higher up. At the tops of
the Stalks come forth many Flowers, made of four
small round pointed Leaves, of a fine reddifh Color,
and four Threads in the middle, every one hand-
ing on the top of a small, long, almost square Cod,
whitifh on the outside, and filled with fine Cotton
or Down, within which does lie bright red Seeds.
These Cods with Seeds therein appear before the
Flowers break forth at end of them, upon which
fome have called it Filius ante Patrem. This Codded
Loos-ífrife we have put in the full place, for its
beauty, as well as for its Species, Qualities and Virtues. Grefter, Clafus and Thalitf say,
that there is another of this Species, fiora albo, with white Flowers, not differing in any thing else
from that even now described.

IV. The fecond, or Mountain Codded Loos-
ífrife. It has a Root which creeps not, but is com-
pofed of many Fibres, which whether it be Annual or
Perennial has not yet been observed. It has very
short Stalks, feldom exceeding a Foot in Height,
on which grow very narrow Leaves, like unto the
former, yet fome longer than others, and let with-
or Color, for the Stella come often fometimes from
the middle of the longest, and that has hooped at the
Joints. At the tops of the Stalks fland the
Flowers, upon fender long purplifh Stalks, and
fometimes whitifh, or a purplifh or reddifh Color,
and in fome of a whitifh blew Color, con-
sifing of four prett large Leaves, even as great as
the former, which the Smallnefs of the Plant does
fcriely admit of, with four Threads in the middle,
every one of them flanding in a small Husk, com-
pofed of four fhort green Leaves, in which, after
the Flowers are fallen, grow up fmall long Pods or
Cods, with fmall Seed in them, enclosed in Down
like the other.

V. The third, or Greater Codded Loos-ífrife.
It has a Root which is somewhat great and white,
creeping every way under the Earth, and quickly
prolifera, and a good quantity of Ground, which (as the
Stalks die away every Year) while the Winter.
This Greater Loos-ífrife shoots forth feveral round
green Stalks, a Yard high at the leaf, bearing there-
on three or four Joints, two Leaves apiece, which are
fomewhat like to the Common yellow Loos-ífrife,
but smaller and smoother, green on the upper fide,
and of a yellowifh green underneath, and denoted a-
bove the boughs. The Stalks fnd out from the mid-
dle upwards, many Branches, at the tops whereof
come forth many fmall long Pods or Cods, of a
whitifh green purple Color, wherein the reddifh
Seeds lying in its Down, is contained. And at their
ends, after they have appeared a good while, come
forth the Flowers, confifting of four round pointed
Leaves apiece, with fome Threads in the middle,
of a faint reddifh or purplifh Color. Of this Kind
there is another fort found, flor aTho, with white
Flowers, but it is very rare.

Wild leffer Codded Loos-ífrife.

Greater Codded Loos-ífrife.
Salmon's Herbal.

VI. The fourth, or Wild Self Coddled Loofe-strefte. Its Root is but faint and flivern, dying away every Year. This Self grows Wild in many places, and rises up nearly two Feet high, but in some places not above a Foot high, with thin Stalks and narrower Leaves, not so green, but rather of a greyish dully green Color, spread out into several Branches, bearing its Flowers, of four Leaves a-piece, at the ends of long Pods or Cods, of a deeper red Color, as the former does, and has like Seed involved in Down, but smaller.

VII. The fifth, or Hairy Wild Coddled Loofe-strefte. This in its Leaves, Pods and Flowers, manner of Growing, Height, and yearly Dying away, is like unto the Self described, the only Difference between them, is, that the Leaves are more hairy, and as it were woolly, and the Flowers also small and Pale.

VIII. The fourth, or Virginian Coddled Loofe-strefte. Its Root is length, white, and about the thickness of one Thumb, from whence grows up a tall Stalk, divided into many Branches, of an onehorn Color, and a little hairy. The Leaves are like those of the Globe-headed yellow Kind, but somewhat sharpened along the edges, and being very much termed a tender Color. Towards the tops of the Branches, among the Leaves, come forth very pretty thick Cods, which growing smaller on their tops, fruitful in very fine large Flowers, consisting of four Leaves a-piece, with a Peaule in the middle, upon which stand four yellowish Thumbs in fifhon of a Cross. And there are also eight Threads, with their Points in the middle of them. These Flowers have something of the smell of a Primrose, whence Par-kinson gave it the Name of Tree Primrose of Virginia. After the Flowers are fallen, the Cods grow to be about two Inches long, being thicker below, and sharper on the top or end, and something twined, which at length open themselves into four parts, to scatter their Seed; which is black and small: this being-farm, grows not the first Year into a Stalk, but seeds upon small dry Leaves, lying hand-folly one upon another, Robustition.

IX. The seventh, or Willow-Flower, called Rose by Gerard, Rose-bay Willow-Herb. Its Roots are like the Roots of Lythurnica, or Common yellow Loofe-strefte, but greater, running and spreading under Ground, and shooting up in many places, whereby it quickly fills a Ground where it is pleased to grow in: the Root is perennall, but the Stalks die every Year, springing up fresh in many places the second. This Root sends up many thin, woody, round, brownish great Stalks, three or four Feet high, beating here and there without Order, with one head, and a long, with green Leaf at each joint, turning this into Loofe-strefte or Willow-Herb, as also into a Peach Leafe, but larger and longer. At the tops of the Branches stand many Flowers, one above another, of a pale, reddish, purple Color, consisting of five Leaves, spread open, with an Heal or Spur belted about them, and many yellow Threads in the middle, much larger than any Larkspur Flower, and filling forming sweet withal. It bears a mass of long Pods or Cods with Seed, but the Seed has never been observable.

X. The eighth, or Hooded Loofe-strefte. It has a Root which is small and jolivous, differing it self under the Earth far ahead, by which it much increases. It has many small tender Stalks rising upon the Ground, befit with divers Leaves, somewhat like those of the edges, of a deep green Color, like the Leaves of Scordium or Water-Comander, among which are placed several small Bell-flowers, fatted like a little Hood, in shape resembling those of Aker-hoof. Thus Gerard. But expressing this plant to be rather a Kind of Ground than a Lythurnica, we have given a more ample Decription of it in Chap. 239. See 4. aforementioned, to which you are referred, but whereas the Figure is wanting in that place, we have erected it to be put in here.

Hooded Loofe-strefte.
most goudly and fatted Plant of all the rest, having Leaves like the Greatest or Largest Willow: the Branches come out of the Ground in great Numbers, growing to the height of about fou Fect, adorned with broad Flowers, of great beauty, consisting of four Leaves piece, or fourfold, of an Orient purple Color, having some Threads in the middle, of a yellow Color; after which are Ceds, long and full of Down, which when opened, flies away with the Wind.

XII. The Times. Most of these Herbs flower thro' all June and July, and sometimes till Auguft; but the seventh, or Willow-Flowers, flowers in May, and continues a long time in flowering.

XIII. The Qualities, Specification, Preparations, and Virtues of thesefold Leaf-Strife, are the fame with thofe of the Common yellow Leaf-Strife in Chap. 470, foregoing; but the Virtues, &c. of the fpedd Leaf-Strife, being the fame with Gratia's or Hedge-Plauge, you may fee them in Chap. 588. and 389, foregoing this Work.

CHAP. CCCCLVI.

Of LOVAGE Common and German.

I. The Names. This is a Plant which was unknown to the Greeks, and therefore can have no Greek Name; but it is called in Latins, Lycoficum, Lyphificum, Olyphificum Vulgare, Lycospus tertium Dodonaeus, Hippofelium Chifcrifiti, according to Lycus, but this I believe is a Miftake, for I cannot find that thole Ancients knew anything of it, it is also by handfome accounte accounted among the Libanoffides, and is thought to be the Lycosius tertium Theofluri, in English, Lovage.

II. The Kinds. We have only two Species of this Plant, viz. 1. Lycoficum vulgare, Lycospus tertium Dodonaeus, Our Common Garden Lovage. 2. Lycosus Germanicum, Lycospus vulgare Germanicum, German Lovage.

The Descriptions.

III. The first, or Our Common Garden Lovage. It has a Root which grows great and deep, spreading much, and enduring long, of a brownish Color on the outside, and white within. It has many long and great Stalks of ranged Leaves, divided into many parts, four or five, like unto Smallage, but much larger and greater, every Leaf being cut about the edges, broad at or towards the end, and smallest at the Stalk, of a fair green Color, smooth and fliuant. From among which rise up several thong and hollow green Stalks, five or fix Feet high, and sometimes seven or eight Feet high, according to the Goodness of the Soil, full of J ours and fuch like, but lefser Leaves fce at them than those which grow below. And with the Leaves come forth towards the tops, long Branches, bearing at their tops large Umbels of yellow Flowers, like unto thofe of the Wild Yorkshire, and after them laid brown Seeds, larger by much than Dill, but lefser than that of Dillfore, and thicker alfo.

IV. The second, or German Lovage. It differs not much from the foregoing, but chiefly in the following things. Whereas the Roots of the former are great and thick, and not at all ftringes, in this they are small and very full of fibrous Strings: and the Flowers of the former are yellowish, but in this they are white, as Dodonaeus fays, and of the fame Magnitude.
Salmon's Herbal. Lib. I.

nitude and Form. The whole Plant, and every part thereof, both in the former and in this, have a somewhat strong and aromatic smell, as also a hot and sharp biting Taste. The Figure of this latter we have given you from Camenarius his Epitome of Matthiolus.

V. The Places. They grow no where Wild in Europe, but are only planted in Gardens, where they generally prosper very well, and will grow large and great, if suffered.

VI. The Times. They flower for the most part in July and August, and the Seed is ripe in August or September, or in some short time after their Flowers.

VII. The Qualities. Largeness is hot and dry in the third Degree, of subtle and thin parts, Aperitive, Digestive, Antifermentative, Diuretic, Cephalick, Neurotic, Stomachick, Nephritic, Hyper- and Alcoholematic.

VIII. The Specification. It powerfully provokes Urine and the Colic, as much as any of the Kinds of Parsley; powerfully refills Poyson, gives Eafe in the Colick, and prevails against Agues, Quinsies, Pleurisies, &c.

The Virtues.

X. The Juice of the Root. It is made by beating it in a Mortar, and nothing it out with Water or Wine, &c. It digests and softens and tough Humors, causes Expectoration, wonderfully provokes Urine and the Terms, confumes superfluous Moisture, and therefore is good against the Droppings, causes Gagings of the Bowels and the Colick, and refines the Spleen, and the Infection of the Plague. Dose two, three or four Spoonfuls at a time, as the Physicall shall think fit.

XI. The Essence of the Root. It has all the Virtues of the Juice; besides which, it admirable ly quenches Thirst, whether in a Fever, or out of a Fever, or from what Cause soever. It is prevalent against all sorts of Agues Quotidian, Tertiar or Quartan, simple or compound, expels Wind, and eases all Pains of the Vickers proceeding from a cold Cause. Dose from two Spoonfuls to four.

XII. The Tincture or Infusion of Herb, Root, or Seed. They have all the Virtues of the Juice and Essence, but must be given in much larger quantities, as from a quarter of a Pint to half a Pint; it quenches Thirst much, is good against Poyson, and refills the force of malignant Fevers; and used as a Gargle, it is good against a sore Mouth and Throat; and drunk down, it is probable against the Pleurisy, Pains and Stitches in the side.

XIII. The Pounder of the Root. It may be given from half a Dram to a Dram in Wine, or warm, and comfort the Stomach, expel Wind, ease the Colick, provoke the Appetite, and help Digestion.

XIV. The Pounder of the Seed. If it is taken to a Dram for several times, in a Glass of Wine or other Vehicle, it is good against the Pleurisy and Colick, provokes Urine and the Terms powerfully, and prevails against Sand, Gravel, Stone or Tumorous Matter in the Reins, Ureters and Bladder, and has indeed all the Virtues of the Juice, Essence, Distillation and Powder of the Root; but as it makes the whole Body, so it is longer before it comes into Act, and therefore Allowances must be given for the time of its Operation.

XV. The Preferre of the Root. It is cordial and stimulatick, expels Wind, comforts the Vickers, warms the Stomach, and causes Digestion: it may be eaten as other Feast Morsels are.

XVI. The Pichle of the Root. It is an admirable thing to provoke Appetite, warm a cold Stomach, and cause good Digestion.

XVII. The Coplination of the Herb. The Leaves being bruised, are Eried in a Frying-pan, or other proper Vessel, with Hogs Lard, and made into a Poultice. Applied hot to any Boch or Bone, it quickly brings it to Subperation, and breaks it.

XVIII. The distilled Water of the Herb, Root, or Seed, or of all of them. It is said by Authors to be good against the Quinsy in the Throat, by purging the Mouth and Throat, therewith. It is also said to help the Pleurisy, if it is drunk three or four times or other. The said Water dropp also into the Eyes, takes away their Redness and Dimness. And when it is used in a Liniment, or Skin, it takes away Spots and Pimplies in the Face, and other Di-colorings, as Yellowness, Towniness, &c. of the Skin.

XIX. The Spirit of the Seed. Mixt with some few Drops of Spirit of Hars-horn, or Volatile Spirit of Man's Blood, or of other Blood, it eases the Pain of the Stomach, gives present Relief in a Pleurisy and Quinsy, and cures the Colick. Dose from one Dram to two, three or four, according to the Age of the Patient and Force of the Diseas.

XX. The Oyle of the Seed. It has all the Virtues of the Juice, Essence, Decollution, Powder, Water and Spirit, and may be given in all the Cares for which those things are given, from three Drops to ten or twelve Drops: first drop it into the Sugar, then mix them well together, then mix them with a Glass of Wine, or other Vehicle, and order the Patient to drink it up. It gives present Eafe in the Colick.

XXI. The Elixir of the Seed. It has all the Virtues of the Oil, but is much more subtle and penetrating: it may be given from a Dram to two Drams or more, in choice generous Wine, or in a Condy or other proper Vessel, as it is good against all Fevers, the Spotted Fever, and all other malignant and pestilential Fevers; as also against the Plague it is efficacious.

XXII. The Spirituall Tincture of the Seed. It provokes Urine and the Terms in Women, facilitates the Birth, and brings away the After-birth, prevails against the Colick, Strangury, Stone, Sand, Gravel, or Tumorous Matter in the Urinary Parts, and eases the After-pains of Women in Child-bed.

Dose one Spoonful at a time, in a Glass of Wine.

XXIII. The Acid Tincture of the Seed. It may be given to a grateful Belch against all sorts of burning, malignant and pestilential Fevers, against which it cannot be given without Successes; and destroys even the Poyson and Efeence of the Plague it is felt. It stops Vomiting, admirably strengthens the Stomach, and causes a good Appetite.

XXIV. The Oily Tincture. It cures the Colick upon the spot, gives Eafe in the Strangury, provokes Urine and the Terms, facilitates the Birth, and brings away the dead Child, giving Eafe in all After-pains of Women in Child-bed. It is good against Sand, Gravel and Stone, or Tumorous Mater-
ter in the Reins, Urethra and Bladder; and an excellent thing against the Falsy in Old or Young, taken inwardly in some proper Vehicle from eight to twenty Drops, and outwardly anointed upon the Backbone and other Parts afflicted, Morning and Night, for many Days together.

CHAP. CCCCLVII.

OF LUNG-WORT Golden.

I. THE Names. It has no Greek Name that we know of, but is called in Latine, Pulmonaria, Pulmonaria aurea, Pulmonaria Gallorum, Corchorus Dalechampii: in English, Lung-wort Golden, and French Lung-wort.

II. The Kinds. There are two Kinds herof, viz.
1. Pulmonaria Gallorum, Pulmonaria Gallica, Pulmonaria aurea latifolia, Pulmonaria Gallorum Hieraci facie, Pulmonaria vera Trazi, (as the French take it to be) Hieraciurn florae aureae, Pilosella major, Pilosella vet Aurea, Maria major florae aureae, Chondrella florae aureae, Corchorus Dalechampii, Golden Lung-wort, or Golden Moufe-Ear broad-leaved.
2. Pulmonaria Gallorum angustifoliae Labelfs, Pulmonaria Gallica Angustifolia; Hieraciurn Aureum, Beathii, Pulmonaria aurea angustifolia, Pulmonaria Gallorum florae Hieraci, Golden Lung-wort, or Golden Moufe-Ear, or French Lung-wort narrow-leaved.

Golden Lung-wort.

III. The Descriptions.

The first, or Golden Lung-wort, or Golden Moufe-Ear broad-leaved. It has a Root which is firm, and starchy, which spreads under Ground, and shoots up in divers other places, by which it much increases, more especially if it grows in any moist or shady place. From this Root rise up many longish broad green Leaves, spread upon the Ground, spotted with pale Spots, yet more conspicuous at one time than at another, somewhat hairy, both on the upper and under Side, First and unequally divided, and commonly cut in the form of the Stalk. These Leaves are of a dark green Colour, sometimes broader and shorter, and sometimes narrower and longer, (whereas Hieracium montanum makes three sorts of this, which yet are nothing but different Appearances of the same Species.) From the middle of these Leaves rise up one, two, or more blackish hairy Stalks, about a Foot and half or two Feet high, bare or naked up to the Top, or having at most no more than one Leaf a-piece, and that about the middle of the Stalk. These Stalks are divided at their tops into several Branches, which bear double double yellow Flowers of an indifferent Bigness, in Form or Fashion almost of the Hemlock, or Common Moufe-Ear, of a deep Gold or Orange Tawney Colour, with some Threads in the middle, and of little or no Smell at all. After the Flowers are faded, the Heads turn into Down, which contain small short black Seed, which are commonly carried away with the Wind when fully ripe. The whole Plant is milky, as the Hemlockes are.

IV. The second, or Golden Lung-wort, or Moufe-Ear narrow-leaved. Its Root is yellow and firm. The Leaves are few, of the Bigness, and sometimes of the Shape (but yet with a little indented or fringed) of Daily Leaves, whitish, and hairy or hoary. The Stalk is about an hantful high, crofted, hoary, and fat with many longish narrow Leaves, and at the top one short Foot: The Flowers, it bears four or five Flowers, of a bright yellow Colour, and pretty Large, confiding the Small-leaf of the Plant. The Flowers, like as others of this Kind, by away in Down, and carry their Seed with them.

V. The Places. Label says the first grows in the shady Woods of France near Lyons and Mompeller, but with us it is only nurfed up in Gardens, in shady rather than in funny Places. Yet Mr. John Gooder found it in May 1652, in a Copse in Goddesson in Surrey, adjoining to the Orchard of an Inn-keeper there, whose Sign was the Antelope. The Second was found growing in England by one William Cost, on a Hill in the then Lady Bridgmat's Ground at Siddonham, not far from Newbury, in an old Roman Camp, close by the Dencman Pitt, towards the West, South West, upon the Skirts of the Hill.

VI. The Times. The first Flowers in Summer, and sometimes again in September. Mr. Gooder found it flowering in May 1651, in the place, I suppose, afore-mentioned, and is said to flower from July to August and longer. The second flowers in May, July, and August, about the latter part of which Month, they both ripen their Seed.

VII. Notes. It is to be taken notice of, That there is another Plant which is called Pulmonaria, or Lung-wort, as well as this, which Name I think not to be so proper to that, as to this. This is the Spotted Cowslip, which some call Sage of Jerusalem, the Description of the chief Kinds of which you may see in Chap. 178. Also among which Names are more fit for it than this of Lung-wort, which Pppp truly
Salmon's Herbal. Lib. I.

true belongs to the Plants described in this Chapter; in that, Chap. 138, you have three of these Plants described. The Cut or Figure here inserted, belongs to the second of them, viz. the Begloyed Jerusalem Conspip; but the Figure of the fifth or Common Root, was there overlipt by the Printer, which that it might not be wholly lost or forgotten, (since in this Chapter we treat of Lungwort) we have caused to be placed here.

Spotted Lung-wort, or Jerusalem Conspip.

VIII. The Qualities. These Plants are temperate in respect to Heat or Cold, and probably dry in the first Degree. They are Abstensive, Astringent, Valerianey, Anaphlegmatics, and Pectoral.

IX. The Specifiaction. They are peculiar for healing of green Wounds, as also of Ulcers, and other Diftempers of the Lungs.

X. The Preparations. You may have these from.

The Virtues.

XI. The Juice or Effusion. Given inwardly to two or three Spoonfulls, it is profitable against the Phlegm or Ulceration of the Lungs: being also inwardly taken, and outwardly applied, it confounds much to the cleansing and healing of green Wounds. If it is droped alo into the Ears, it takes away any Noise, and eases any prickling or stinging Pain with which they may be troubled.

XII. The Decoction in Wine. It has the former Virtues, but must be given in a larger Dose. It is an extraordinary Valerian, and good to be given to wounded Patients inwardly (as the Physician shall direct) as well as outwardly to be applied.

XIII. The Syrup. It is Pectoral, good against Coughs, Cold, Hoastrém, Wheezing, Ulcers of the Lungs, Excoriations of the Viscera, and other the like Diftempers of thse Parts.

XIV. The Powder. It has the Virtues of the Syrup and Juice, and is peculiarly good against and Excoriation of the Stomach. Do of from half a Dram to a Dram, mixt with a little Honey, and if swallowed, Outwardly applied to Ulcers and running Sores, it cleanses, dries, and induces their healing.

XV. The Conserve. It is peculiar for the curing of ulcerated Lungs and deep Confusions, but where it is not come to the degree of a Morbus, it ought to be taken two or three times a Day, drinking after it half a Pint of warm Milk, or more, and to be continued for some considerable time.

XVI. The Conspip. It is made of the Herb by boiling in Wine. It is good against foul and running Sores and Ulcers, being applied to the Parts affected: it stops the Afflux of Humors, strengthens the Part, and induces the healing.

XVII. The Ointment or Balsam. It is a singular Digestive, cleanses, dries, heals but if it is immediately applied to a simple green Wound, it commonly conglutinates it, and heals it at one Intention. It is an admirable thing for curing of Whitlows.

XVIII. The Distilled Water. It has the Virtues of the Juice, Effusion and Decoction, and may be taken for Diftempers of the Lungs, sweetened with fine Honey, or double-refined Sugar. Simple of it itself, it is good against internal inflammations, and hot Diftempers of the Stomach, Heart, Liver and Lungs.

CHAP. CCCCLVIII.

Of LUNG-WORT Tree.

THE Name. This Plant was unknown to the Greeks, but is called in Latin, Lobelia, Pulmonaria, and Pulmonaria foerga, Pulmonaria Lusii, Pulmonaria, Lobelia gehes; in English, Tree Lung-wort, and by some Tree Licer-wort. It is called Pulmonaria or Lung-wort, from the Likeness it has to Lungs or Livers; and by some called Oak Lungs.

II. The Kinds. It is a singular Plant of the Kind; but by some Authors is taken to be a Species of the Night, and therefore is by them called Aloes, by others it is taken to be a Species of the Mushrooms, and therefore to the Name Pulmonaria, Lobel/ has added the Epithet Alderfo, which I think is proper enough.

The Descriptions.

III. The Leaves hereof are pretty large, and diversely folded one in another, not so smooth as Liver-wort, but more wrinkled, rough and thick, almost like to a Fell or Hide, and tough within. On the upper side it is whitish, and on the枘ter side darkish or dully, so that it seems after a fort to resemble Lungs or Lights.

IV. Parkinson fys it grows with broad Ash-colored Leaves, or of a greyish Color and tough, variously folded, cramped and pitted on the edges, and spotted also in some places, with many small Spots on the upper side. It is only a foliace, for it was never seen to bear any Stalk or Flower at any time.

V. The Places. It grows upon the Bodies of old Oaks, Beeches, and other Forrest Trees in dark and thick
Chap. 459. English Herbs.

of the LUPINE, or FLAT-BEAN.

I. The Name. It is called in Arabic, Turm and Torum: in Greek, Λοπίνεια, in Latin, Lupinus, and in English, Lupine and Flat-bean.

The smallest Blow Lupine. Where note, That the Grains of the first or Garden Lupine, are generally called Lupini: and Pleasants calls them LUPINUS CANDELAS, because they were used in Concoits instead of Money, when in any Scene thereof there was a Duty thereon.

White Garden Lupine.

The Descriptions.

III. The sixth, or White Garden Lupine. It has a Root which is not very great, but woody, and full of small Fibres, by which it firmness strongly in the Ground, yet perishes every Year, as all the rest of these Kinds do. It fills up with a great round Stalk, hollow, and somewhat woody, with several Branches, on which grow, on long Foot-stalks, many Leaves, confiding of five, or four divided parts, or other smaller Leaves, equally standing round about as it were in a Circle, much like those of the Chaff-Tree, of a whitish green Color on the under side, and white and downy on the under side, which in the Evening, about the setting of the Sun, hang a little drooping downwards, as if they were a going to wither. Among these, at several Joints, come forth Tufts of Flowers, standing many together, like unto Beans, of a white Color in some places, and in others of a very bluish Color, tending to white, and in others a pale or light bluish Color, (as Gerard has it.) After the Flowers are full, there come in their places great, long, broad, flat and tough Cods, in which are contained round and flat Seed, like a Coile, covered with a tough white Skin, but yellowish on the inside, and of a very bitter Taste, where they cleave unto the Cods in that part, they have a certain Dent, like a little Navel.

IV. The fourth, or Spotted White Lupine. This in its Root, Stalks, Branch, Leaves, Flowers, Seed, and manner of Growing, is altogether like to the former, save in the Magnitude, this Plant being less than that: and in the Flower, this being spotted with Bluw on the Heads of the internod Leaves, and in the Hollows of the uppermost.

pp 3  

V. The
Salmon's Herbal.

Lib. I.

V. The third, or Yellow Lupine. It is like to the first Garden One in Stalks and Flowers, which are both better and stronger, but the Leaves are larger than those of the Small Blew Lupine. The Flowers are in three or three bundles or Tufs round about the Stalk and the Branches, of a beautiful, delicate, and exceeding fair Gold-yellow Color, in Fashion and Form like unto the other Kind, being larger than those of the Leffer Blew Lupine, but nothing so large as those of the Greater Kind. They are sweet of Smell, and made up into an Ear, of the Color of the Yellow Velvet, and something of the Smell. The Stalks are small, hard, and somewhat hairy. The Seeds are little, flat, and round, ill-evolv'd, much about the Form and Bigness of the Small Blew, or somewhat bigger, but far lighter than those of the White Garden Kind, on an extrem bitter Taste, of several Colors, or rather of a whifh Color on the outside, spotted with many Spots.

VI. The fourth, or Greater Blew Lupine. The Stalks of this Lupine are greater than that of the first or White Garden Kind, and the Leaves are more fecky. The Flowers are of a most perfect blew Color, with some white Spots in the middle. The Pods are long, rough, greenish, and very large or great, in which are contained hard, fat and round Seeds, not to thief on the out- side as the first or Garden Kind, but somewhat yellow, greater also, and more rough or hard in handling.

VII. The fifth, or Leffer Blew Lupine. This Kind of Wild Lupine differs not in the Form of Leaf or Flower from the former, but only that it is much smaller, the Leaves are greenish, and have fewer Divisions in them; the Flower is of as deep a blew Color as the last. The Pods are small and long, containing small round Seed, not so flat as the former, but more difcolored or spotted on the outside, than the Greater Blew forfc kind.

VIII. The sixth, or Smallest Blew Lupine. This small Plant is very like unto the last described in its form and manner of its Growing: it is little or nothing woody, but is smaller both in its Stalks and Leaves. The Flowers likewise are wholly blew, as they are, or very seldom with a white Spot in them. The Seed is smaller also, and a little spot- ted.

IX. The Pinnitc. The first is accounted the only Garden or Lowe Kind, the others are said to be Wild. Weeds, and the places where they are not Cathy. They all require, as Thymopus Eys, a fandy and poor Soil, and difficultly grow in tilled or rich Land, because they are naturally Wild Plants. The first is a Native in many places of Greece, and the Eastern Countries beyond it, where it was ancestrally known for their Food, being often watered to take away the Bitterness. The Yellow Lupine is a Native of Spain, from whence it was brought to us. The Great Blew Lupine is thought to come from beyond Peru, and to be a Native of Carolina. The Leffer Blew is found plentifully Wild in many places beyond Spain and Africa. The Small or Smallest Blew Lupine was brought by Boul out of Africa: but they all grow now in our Gardens, with fuch as are great Lovers of Flowers.

X. The Times. They are planted in April, and they bring forth their Fruit at two or three several times, counting as they did flower once, and bring both as many Crops. The first Flowers in May, the third in July, and at all times in the fifth, the sixth in September, but that seldom comes to Ripeness, but the others, after the times of their Flowering, soon bring their Seed to Perfection.

XI. The Qualities. Lupine, &c. The Gains or Meal, is hot and dry in the first Degree; Aperitive, Digestive, Diuretive and Alkaliurie, so long as the Bitterness remains in them; but if that is taken away, it is a Medicine for the Heat of the Blood, an Earthy, clammy Sub stance, Empathic, and kind of Digestion.

XII. The Specification. They are peculiar to open Obstructions of the Viscera, provoke Ulcers, and the Terms, facilitate the Birth, expel the dead Child, and kill Worms, but these things they do as not directed of their Botanists.

XIII. The Preparations. You may have therefrom, 1. A Melt. 2. A Poult. 3. A Decotion. 4. A Cataplas. 5. An Ointment.

The Virtue.

XIV. The Meal. Strewn upon old rotten Sores and Ulcers, it is said to digest, cleanse, dry and heal them. Mixt with Honey and Vinegar, and given to drink, it kills Worms in the Belly. Boiled in Yce, it cleanseth the Head and other Parts from Fissures, Scabs, South, Morphew, and other De- fections.

XV. The Poult. It is made of the Meal of Lu- pine after they have been to often or long steeped in Water, and with their 5 ternures, whether it is made into Puddings or into Bread, it seems to be hard of Digestion, and to breed no very good Nourishment, engendering gods and clammy Humors.

XVI. The Decotion in Wine or Water. It is good against the loathing of Meat, and provokes Appetite. Drink sweetened with Honey, it cures Worms in the Belly, and if a little Rose and Pepper be added to it, it will be most the more efficacious. Taken three or four Ounces in the Morning and Night, it opens Obstructions of the Liver and Spine, provokes Urine and the Terms, expels the Birth and dead Child, as also the After-birth; and being used as a Lotion or Wash, it is good against Spots, Freckles, Tumors, Sun-burnings, Discoloring of the Skin, Pimples, Scurf, Morphew, and other De- fections of the Cutis: it also cleanseth, dries, and heals Scabs, running Sores, old Ulcers, and is said to take away the Marks of the Small-Pox, which are left after healing, as also all other black, bruis- ed, and yellow Spots of the Skin. The Decotion of the Root in Water being drunk, provokes Urine. If the Decotion of Lupines in Wine be made with this Meal of Lupine, and the above Flowers, it is good to stop the running or Spreading of a Gangrene, being applied thereunto very hot; and corrects Spreading Ulcers, being applied very hot there- to with Stupas of Taw or Haled.

XVII. The Cataplas. It is made of the bitter Meal with Vinegar by boiling. Being applied, it takes away Pimples, and softens Nodes or Kera- tiles arising in several parts from the King's-Evil, or other Cancers. It ripens and breaks hard Tumors and Apotemps, and is laid also to break Carbuncles, if used by a skilful Hand. Applied to the Stomach and Belly, it helps to kill Worms in the Body, the Decotion being also given inwardly at the same time. It likewise cures Cuts, Scabs, running out, Ulcers, and Pus in An, being for some time applied to the Part.

XVIII. The Ointment. It is made of the bitter Meal by mixing it either with Honey, or with the Gall of Ox: Sleep or Goat, or with both of them. Externally applied to tumors and Swellings of the Decotion and Cataplas: some add also the Juice of Lupine to it, and so it cleanseth the Face and Skin of all Determined affections thereof, as Exc-
Chap. 460. English Herbs. 661

Chap. CCLXX. C H A P. CCCCLX.

Of MAD-WORT.

I. The Names. It is called in Greek, Αλθίσιν and Αλθίσα, in Latin, Alyffum; and in English, Mad-wort; so called because it is a prevalent Remedy for the Bitting of a Mad Dog, as Guten de Amtstada, lib. 2. writes, being an Herb very like to Horse-bay, but rougher, and more full of Prickles about the Flowers, which are of a Color tending to blew.

II. The Kinds. Authors have found out five several sorts of this Herb; but by Reason the most of them are not to be found in England, we shall only define those of Dioscorides his Greater and Lesser, viz. 1. Alyffum & Alyffer Dioscoridis major, 2. Dioscorides, Camerarius, Chelus, Lagaudenus, and Kebei think, and Lobel says Lambs. That there is no Herb to be found which better agrees with Dioscorides his Alyffum in all things, than this herb. Some will have it to be Lunaria Graece, and call it Lunaria major, and Lunaria latise, Cefalusius calls it Lunaria Graece orta, and Gaffreis, Lunaria orta, making it a Kind of Moon-wort, but it is doubt left the Greater Mad-wort of Dioscorides. 2. Alyffum Dioscoridis alterum & minus, Leucanthem Alyffum Dioscoridis alterum et minus Buchani, (for he calls the first Leucanthem Alyffum Dioscoridis major) the lesser Mad-wort of Dioscorides.

The Descriptions.

III. The first, or Greater Mad-wort of Dioscorides. It has a Root which is small and woody, dying every Year after it has given Seed, but seldom perishes the first Year before it runs up to a Stalk. It has many hoary, hard, and rough Leaves lying on the Ground, somewhat broad and round for the first Year of their Sprouting; but the next Year, when the Stalk begins to grow up, they grow thereon both greater and longer, and a little torn in on the edges in some places, which Stalk is hoary, and about a Foot and half high, spreading it fall into two or three Branches; at the tops of which come forth several pale, yellow, and very small Flowers, standing one above another severally, on both Sides of the Stalks, which convert into somewhat large round, flat, thin, hoary, hard, rough Husks, resembling little Bucklers; or rather most like the yellow Husks with Seed of Bofhunch, or Lunaria major, which is the White Satin, but that these are smaller, rougher and harder; and in which lies small, flat, reddish Seed, in a double order, on both sides of the thin middle Skin, which in this is not white, like that of the Satin, but elfe very like.

Greater Mad-wort of Dioscorides.
662
Salmon's Herbal.
Lib. I.

IV. The second, or Lesser Mad-wort of Discolor.
It has a Root which is small and long, with very slender fibers adapting, which divides and shoots forth anew, and is more sharp in Taste than the Leaves, which are drying and astringent. From this Root spring forth several long Leaves, lying on the Ground, a little waved on the edges, of a pale or bluish-green Color, about three Inches long, and one broad, rough and hairy, but softer than the former. From among which Leaves rise up slender, weak, rough Stalks, scarce able to stand upright, parted into several Branches, on which grow the Leaves by Couples, one opposite to another, smaller, but not less hairy and rough than the aforesaid. The Flowers first begin to break forth at the tops, and afterwards on the sides or Wings, which are many set together in Tufts, consisting of four white or nearly white, nestling in the middle, which makes every Leaf seem like a Heart, with divers yellowish or green Threads in the middle of them, and each standing in a green Husk. The outermost whorl of leaves lower down, from thence to three or more inward, and each flower larger than the inner ones, which being pelt, round Seed-Vessels succeed, in Form like Bucklers, a little smaller than the Buds, hard and rough on the outside, in which are contained the Seed, in four round reddish Cells or Partitions, divided by a certain thin shining Skin, two Seeds lying in each Cell or Division.

V. The Places. They grow in Gardens both with us and in Italy, France, and the Low-Countries, but their original or native place is scarcely or not well known.

VI. The Times. They flower in the Summer, Months, as in May, June, July and August, the second year after their sowing, and their Seed is ripe not long after.

VII. The Qualities. It is hot and dry in the fifth Degree. Digestive, moderately Abstainive, Expectorant, and Aleipharmac.

VIII. The Specification. It is peculiar for curing the Bitings of Mad Dogs, as also of Green Worms, and of old burning Sores, and filthy rotten Ulcers.

IX. The Preparations. From the Green Herb you may have, 1. A liquid Juice or Essence. 2. A Decocition in Wine. 3. A Powder. 4. An Ointment or Balsam. 5. A Cataplasm.

The Virtues.

X. The liquid Juice or Essence. Being taken in Bombs or Wine, it cures the Bitings of Mad Dogs, and presently takes away the Venom or Poison thereof, which Galen affirms Simplicium Medicamentorum, t. 6. and this I think to be manifest from the figure of the Plant, or likeness of its whole fulness, and that this is the Virtues thereof, had been found from great Experience, and that it would perform many other Cures, from its drying, digesting, and moderately clearing Faculties: and therefore Galen and Dioscorides both lay of each of these Plants, that they cleanse the Skin from Wheals and Fimpleys, from Spots and other offencings, as Morpheus, Sunburnings, &c., which is performed to be done by the Juice or Essence.

XI. The Decocition. It may be made with Water or Wine, but the latter is the better. It has the Virtues of the Juice and Essence, but much weaker, and therefore may be taken to half a Pint or more, according to Age, &c. It is good for the Cure of Wounds, either inward or outward, to digest, congealed or clostred Blood which is gather'd together by any fall, blow or arraile, and to cleanse and heal old rotten and filthy Ulcers, and other creeping Sores.

XII. The Powder of the Herb. It has the Virtues of the Juice and Decocition, and particularly it has a virtue to stop the Hiccough, and this it will do if the Powder, or green Herb is put forth in the Mouth, and also to mend it. Do one Dram at a time twice a day, in Ale, Beer, Wine, or Poller Drink, &c. Outwardly thrown upon running and putrid Ulcers, it drys up the mofliture, and contributes much to their healing.

XIII. The Ointment or Balsam. It is of singular use to be applied to the Bitings of Mad Dogs, because it excites, or draws forth the Venom or Poison out of the Woundings and Sores are of Opiates, that it might have the true Operation, if it was applied to the Biting of a Viper or Rattle-Snake; however outwardly applied to running Sores, inveterate Ulcers, Pustules, &c., it has been found to digest, cleanse powerfully, then to dry, and induce a speedy healing, and this to much the more if the Powder of the Herb be thrown thick upon the Sores or Ulcer.

XIV. The Cataplasm. It is of great use, being immediately applied to attract or draw the Poison or Venom out of the Bitings of Mad Dogs, and to good Tumors or Swellings caused by simple Contusions, as also to open the Pores so as to cause an excretion of the Mutterish cause of the Scab, or Scrofula, &c.

XV. Note. That the second Figure, which is that of the Lesser Madwort of Discoloratais taken from Altheidus his Epitome, in this Cut, the Seed Vessels are very exact, but the position of the Leaves are not just, for they ought to stand by Couples, and be of three times that length.

C H A P. CCCCLXI

of Madder Great.

I. T H E Name. It is called in the Arabic Maw, and Feve aja in: in Greek Rhodon, &c. in Latin Rubra, in Italian Rosso, and in English Madder, Maw, &c.

II. The
Chap. 461.  English Herbs.  663.

II. The Kinds. It is either Great, of which in this Chapter; or Small, of which we shall Treat in the Next. The great Kind of Madder, is, 1. *Rubia Rubia Sativa, Rubia Timiflora, Garden Madder or Red Madder, which some call Dyers Madder, and Crep Madder.* 2. *Rubia Sylvestris, Wild Madder.* 3. *Rubia Sylvestris foliis longioribus, Wild Madder with long Leaves.* 4. *Rubia Marina, Sea Madder.* 5. *Symoachia Dalechampi,* Quiinley-wort or Quiinley Madder of Dalechampius. 6. *Rolliga Montana, Rubia Sylvestris altera Gesneri, Great Buffard or Mountain Madder.* There are other Herbs which some Authors will have to be kinds hereof, as *Aparine, Aperula, Crucida, Galticum,* which we can scarcely admit of, and therefore you will find them in other Parts of this Book, in their proper places of the Alphabet.

The Descriptions.

III. The first, or Garden Madder. Its Root is fat and full of substance, yet not very great, but very long, running down half a man into the ground, red in color, and very clear within it is

![Garden Madder](image)

*Garden Madder.*

form, very like to the Garden Madder before described, but the Stalks are smaller, not spreading so far, nor are the Leaves so rough and hairy, but rather (as *Gerrard says*) smooth and shining; and finer also, and the Flowers white.

IV. The second, or Wild Madder. In this the Root grows greater, but not so full of red nor clear as that of the Garden Kind. It grows up in

**Wild or Field Madder.**

places, where there are many small, black, white, and yellowish Flowers, Star, and white within, and Woody, which is about five or six inches long, with many hairy fings: From this Root arise many small, red, round, and white, and yellowish Flowers, growing along the Stalk on certain knees.
Knees or Joints, four or five together, and sometimes four. From these joints the stalk divides and a plant is set towards the top into many parts, on which grow many flowers, each flower having four leaves, sometimes white, sometimes a faint red, and every leaf of this red color. The stalks are artificially streaked in the middle, and near the sides with three lines of a deeper red, but of no pleasant smell. After which comes the seed, fomering round, growing two together like Roes, or as it is seen in Google Grafs.

VIII. The forth, or Great Bollard or Mountain Madder. The Root is black without, Verruous, and shilling all Winter. From this Root those forth a number of slender and weak stalks, but yet such as have so much strength in them, as that they need no propping, but will stand upright of themselves, which diversely branch forth themselves into many parts, so that it seems to be a pleasant bushy Plant, well spread, and having many shorter and broader smooth green leaves for at the joints, than either the common, or red, or white flowered Ladies Bed Straw. The flowers are very small and white, hanging at the tops of the branches, pretty thick or plentifully, which being pull away, turn into small, black, round Seed.

IX. The Places. The plant is only Manured either in Gardens or Field in many Countries of Europe for the profit which is made thereof; and is very common, in most places of England. The fourth grows in most Meadows and Moorish grounds, and under Bushes almost everywhere: it is said to grow also in Fields and Hedge sides near to Spire, and in many other places of Germany. The third also grows in many places in England, as at a place called Hed-hill in Dorsetshire, on the side which is next the River, in the Parish of St Sampaine, two miles from Blandford, and at Wembury Vicarage in the parish of Wharnie, and in the same town, and at a place called Soumerpitt near a Chapel by the Landing place, coming from Asijerry to the Church, in great abundance. The fourth grows by the Sea side in most places; as also by the Sea side in Provence, and near Montpelier in France, and in Spain also, as Alchas fays. The fifth grows in dry chalky Grounds abundantly, being found Wild more in many places; it has been found in great plenty on the Hill beyond Chartum in the way to Chichester. The sixth is found on divers Hills in Germany, and grows in Hedges and amongst Bushes in many places.

X. The Times. The first, second, and third, flower towards the end of Summer, and the seed is ripe quickly after, but Gerard says, they flower from May unto the end of August; and that the roots of the first are gathered in Autumn for the use of the Dyers, and for Physical purposes. The fourth or Sea Kind, seldom gives ripe Seed in our Climate. The fifth flowers all the Summer long. The sixth Flowers in May, June, and July, and the Seed is ripe in July and August.

XI. The Qualities. Madder is Temperate in respect to heat or cold, but is manifestly dry in the end of the first, or beginning of the second Degree: it is Aperient, and also Astringent, and admirably Traumatick or Venenum.

XII. The Preparations. The first Kind is most in use, and of that the Root, chiefly, and also the Seed: From the Root are prepared, 1. A Decoction in Water or Wine. 2. A Decoction in Malt or Honied Water. 3. A Bath, or Foment, or Fomentation. 4. A Pouder. 5. An Elegance or Eleluency. 6. A Cataplasme of the Roots and Leaves. 7. A Pouder of the Seed. 8. A Decoction in Wine or Quinquy Madder. 9. A Pouder and Cataplasme of the same.

The Virtues.

XIII. The Decoction in Water or Wine. It opens obstructions of the Viscera, and clears the body of tough Flegm and gros Humors; it provokes Urine plentifully, as also the Courtes in Women, and expels the dead Child and After-birth. It makes the Urine red like Blood, but it is from the Thickeur of the Root, like as Rubarb makes it yellow by virtue of its Thickeur; and opens and softens, as Rubarb purges and blinks: infangibly it is said that it is feld to be good against Ruptures, and to stop the flux of the Whites in Women: It is probable against the Hemorrhoids or Piles by Fomentation: and taken inwardly to fix or rid out consti., it is said to felp a Diarrhah.

XIV. The Decoction in Malt or Honied Water. It opens obstructions of the Gall, Liver and Spicen, and is probable against the yellow Jaundice, Hypochondrick Melancholy; and is good for such as have the Palpse, nummets, and trembling of the Limbs; being also often taken it is effectual for the healing of inward Wounds.

XV. The Bath, Fomentation or Fame. It is made by boiling a great quantity of the Green Herb, Stalks, and Roots in Water. Being fat in, as hot as it can well be endured, it is good against the Palpse, Gout, Sciatica and Rheumatick Pains: It is a good Fomentation for Women to fit in to, to provoke their Courts, and to cleanse the Womb from fift, or any purid Matter.

XVI. The Pouder of the Root. Given inwardly to one Dram it stops Fluxes of the Bellow. The Ground Pouder is often used in Venetian Wine and other Drinks, for the curing of Wounded Parts, and such as are afflicted with running Sores, old Ulcers, Fiftida, and the like: and is of excellent use for fift
such as have had outward or inward Brutices by Ills or blots, or any internal flux or Blood, which it effectually stops.

XVII. The Elegaum or Edible Madder. Take duos of
Honey clarified together Ounces: Madder Root in 
very fine Powder sae Ounces: Rhus album in fine 
Powder three Ounces: mix them and let them sim- 
er over a gentle Fire, till the mixture is of a good 
scorlet color, which being cold put into a Stillepot, 
and keep it close cover'd for use. It quickly cures 
aall Sores and Ulcers in the Gums, Mouth, Throat 
or Gullet, and Wind-pipes, and eases the pain and 
strengthens a weak Back. It may be taken Mor-
ing and Night, and several times a day, as much 
as a small Chellnut upon a Knife point, letting it 
diffil down the Throat very leterfly, and for 
the pain and weakness of the Back, a Spoonful 
of it may be given at a time in a Glass of 
strong Ale, Tant, or Allant.

XVIII. The Catalepsin of Roots and Leaves. 
Being beaten and applied to any part which is 
discolored, with Sunburnings, Blemishes, Freckles, 
black and blotted Spots, Scarf, Morphoe, or of 
any other like deformity of the Skin, it cleanses it, 
cures all those deformations.

XIX. The Powder of the Seed. Taken from 
half a Dram to a Dram with Vinegar and 
Honey, it prevails against the swelling and 
hardness of the Spleen, opens its obstruc-
tions, and removes Hypochondriack Melancholy.

XX. The Decotion in Wine of Quiseys 
Madder. It dries without biting, and is excel-
sent against any swelling inwardly taken 
twice a day to fix or eight Ounces, and out-
wardly applied, both as a Gargarism, and a "s-
mmentation.

XXI. A Powder and Catalepsin of the same. 
A Carapalin is to be made of the Root and 
Herb geem, and to be brought to a Confinity 
with the Powder of the Herb or Root, and 
then it is to be applied to the Neck and 
Throat of such as are affected with a Quinsey, 
 renewing it twice or thrice a day, as often as 
it grows to be absolutely cold.

CHA P. CCCCLXII.

OF MADD ER Small.

I. T H E N O M E S. It is called in Grecb, Rhus-
ada, ad vus: in Latin, Rubus minor, and Rubus pseve, 
avid English, Small Madder.

II. T HE K I N D S. There are 1. Rubus fruticos 
Cetica, Cluffy, Canula Madder with spiped Heads. 
2. Rubus minor pentarni foliis, small creeping 
Madder with purplish blew Flowers. 3. Rubus 
minor sectiolis, small Rock Madder. There 
are about five other Kinds of the small Field 
or Wild Madder, but not being Natives or 
Inhabitants of our Country, and of little use 
in Phytk, we shall lay nothing more of them 
here.

III. The first, or Canula Madder with spiked 
Heads. It has a Root which is small, hard, weakly, 
crooked or scragged, with many little Strings or 
Threads, red with oat, and sottice with in, which 
always perishes when the Seed is ripe. From this 
Root spring up many knotty four square rough 
small Stalks, about a foot high, divided immedi-
ately from the Root into many Branches, having 
each one two Branches growing toward a Joint, 
about which Joints grow and spread abroad four 
or five, and sometimes fix narrow short sharp pointed 
Leaves, somewhat rough. The tops of the Stalks 
and Branches are nothing but long small, foursquare 
Spikes or ears, made of three Leaved green husks, 
Out of the Top of each husk grows a very small 
greenish yellow Flower, having four exceeding 
small Leaves, scarcely to be seen: after which 
follows in each husk one small blackish Seed, some-
thing long, round on the one side, with a dent 
or hollowness on the other.

IV. The second, or small Creeping Madder 
with purplish blew Flowers. Its Root is small and 
and of a reddish yellow color, abiding all the Winter 
with green Leaves therein, and will increase 
plentifully from the Seed it sheds every Year. 
This small Plant cresses upon the Ground, with 
many small, square, smooth Branches, much di-
vided or spread out into other smaller ones, full 
Joints, and at every of them, five or fix small, 
round, and very feth green Leaves, smooth also, 
or but very little rough. From these Joints, and 
rondules of Leaves, as well as from the Tops of 
the Branches, come several small Flowers, made 
of five, blowish purple round petals or Leaves, 
with some small Threads in the middle. The 
Seed is small and long pointed, two for the most 
part flanding together.

V. The third, or small Rock Madder. Its Root 
is small and reddifh, as all the other sorts are. 
This small Madder grows not much above an 
hand breath high, with a square Stalk, spreading 
small Branches from the Joints, which grow 
seven or eight small long pointed Leaves, even the 
smallest and narrowest of any before mentioned, 
being somewhat rough also. The Flowers are small, 
and of a pale red or bluish color, standing in Tufts 
or Umbles at the Tops of the Branches.

VI. T HE P LACES. The frtt is a Native of Can-
des, but with us grows in Gardens only. The 
second grows plentifully in many places of Eng-
land. The third also is in many places of our 
British Continent, as upon the Ch’Tley Hills 
near Drayton, over against the Isle of Wight. It 
grows also upon Vincents Rocks not far from 
Brillot.

VII. Nota. Lobel says this last very small Kind 
has its Leaves of the bigness of Rupture-Wort, 
sharp pointed, and growing after the manner of 
those of Madder, upon little creeping Stalks, an 
Inch and half high, on which groweth yellowish 
small Flowers; and that the Root is small and of 
the color of Coral.

VIII. T HE T I M E S. They all Flower in the Sum-
mer Months, as May, June, and July, and their 
Seed is ripe soon after.

IX. T HE PREPARATIONS, Virtues and 
Uses of these are all the same with those of the 
Great Madder, in the former Chapter, and there-
fore I retort you either: but neither any of these 
small
The Description.

Common English Maiden-hair.

III. The first, or English Maiden-Hair. Its Roots are small, hard, black, and fibrous or Thready, from whence come forth a great many blackish filting little Stalks, scarcely a Span in length, and in many Plants not half so long, on each side of very thick with small round dark green Leaves, and spotted on their backs like Citron, and other small Terms.

IV. The second, or Greater Golden Maiden-Hair. It has a small and thickness Root, whose Fibres are wondreful fine. It is a kind of Nod, and the Stalks are not above a handful high, covered with short hairs standing very thick together, of an obfure yellow green color, out of which Stalks, springing up sometimes very fine nacked Seems somewhat black; upon the tops of which hang as it were little Grains like Wheat Corn.

V. Farkington fays it has a very small and Thready Root: and that it has a company of small brownish red Hairs to make up the form of Leaves, growing about the Ground from the Root; and in the middle of them in Summer time, rise up small Stalks of the fame color, fet with very fine yellowish green Hairs on them, and hanging a small gold yellow Head, feller than a Wheat Corn, hanging in a great Husk.

VI. The third, or Lesser Golden Maiden-Hair, of this there are two Kinds, viz. the Leffer, and the Leeff, both of which are very like the former, but that the Stalks grow not to much more than half the height of the greater, and smaller.

VII. The fourth, or Common White Maiden-Hair, commonly called Wall Rue, but is generally accounted one of the Capillary Herbs or Maiden-Hairs, and that not of the left account, but has a Root which is black and full of Springs, from whence spring forth many Leaves almost round and slender standing upon short foot Stalks. It has rising up from among those Ground Leaves fine pale green Stalks, almost as fine as Hairs, fet fullered, with divers pale green Leaves, on very foot Stalk, somewhat near unto the color of Garden Rue, and not differing much in form, but somewhat more like unto the true Adiantum in the next Chapter, being more and more diversly cut in on the edges, and thrcier, smooth on the upper part, and spotted fonely on the under.

VIII. The Places. The fift grows upon old Stone Walls in the West of England, and in Wales, in Kent, and in several other places of this Land. It delights also to grow by Springs and Wells, and in Rocks, moift and shadowy places, and Mr. Gooder fayd, that in January 1623, he saw enough to lade a Horse, growing on the Bank in a Lane, as he rode between Rake and Heafly in Hampshire, near Woolmer Forrest. It was also found growing in a fudy Hands Lane in Berfon, in the Parish of Southwift in Kent: and also upon Stone Walls at her Majefties Palace of Richmond. The fcond is feldom found but upon Bogs and Moflift places, yet fometimes also in fudy dry Ditches, where the Sun does not come. Gerard found it in great abundance in a shadowy Ditch upon the left hand, near unto a Gate which leads from Hampstead Heath towards Highgate. The third is found in or near the fame places where the fcond is faid to grow. The fourth is found in many places of England, as at Dartsford, and the bridge at Ashford in Kent, at Becketford in Buckinghamshire, at Woolf in Hants, in Hampshire, on Cangle in Cambridgeshire; on the Church Walls at Mayfield in Sussex, and on the Rocks near Wefton Super Mare in Somersetshire; on the Wall of the Church-pav at Sitterby in Albion, in the middle of the Town near a Lake of Water, and upon the Church Walls of Dafly in Essex, and other places.
Chap. 463. English Herbs. 667

IX. The Times. These Plants are always green both Summer and Winter, but have neither Flowers, nor Seed.
X. The Qualities. All these several sorts of Maiden-Hair are temperate in respect to heat or cold, but dry in the first Degree. They are Aperitive, and Diuretics, Pectoral, Hepatic, Nephritic, and Alexipharmic.
XI. The Preparations. They are almost equally in Use; but if there is any difference, the first and fourth are most in Vogue. And from any of them, or all of them, you may have 1. A Decotion in Water or Wine. 2. An Infusion or Tincture in Wine. 3. A Powder of the Herbs.

The Virtues.

XII. The Decotion in Water or Wine. It is very effectual against Coughs, Colds, Cataracts, and other Dittensions of the Brain and Lungs, causing an easy expiratation; it opens the obstructions of the Liver, Spleen and Reins, and is available to break the Stone, especially in the Kidneys, expel Sand, Gravel, and other Tarrauous Matters, to provoke Urine, and give ease in the Strangury. It is also of good use for such as are troubled with the Spleen, or afflicted with the Falling-sickness. The Head wafted therewith, it strengthens the Roots of the Hair, stays it from falling or falling, and causes it to grow thick where it is thin.

XIII. The Infusion or Tincture in Wine. It has all the former Virtues, but much pleasanter to be taken, for it has left of the Styptic, Terrene or Earthy parts, than the Decotion, the which are extracted by boiling; and more of the fine, subtil, and volatile parts, most of which in the former are lost, but in this retained, because not tortured with the violence of the Fire. Dose from 4 to 6 Ounces, Morning, Noon, and Night, as the Physician, shall think fit, of the former also; as well as of this. But this is to be noted, that they may be both sweetened with Chilled Honey, which also contributes to the same ends.

XIV. The Powder. It has all the Virtues of the Decotion, or Infusion or Tincture; and being mixed with Chilled Honey and made into an Electuary, it causes Expiratation, and is a singular Experiment against the Athma, or shortness of Breath, and difficulty of Breathing, as also against all Tarrauous Moles in the Urinary parts, Stone and Gravel, Ulcers in the Reins and the like. The Powder may be given from half a Dram to a Dram, in Wine or other Vehicle, but seems to me to be best made up into an Electuary with Chilled Honey, and so taken. These Maiden-Hair treated in this Chapter have been found by Experience to be of the same Nature, Qualities and Virtues, and to have as good Effects, as the True Maiden-Hair, of which we shall treat in the next Chapter; and because easier to be come by, the offerer makes use of.

CHAP. CCCCLXIV.

Of MAIDEN-HAIR True.

I. THE Name. It is called in Greek, Αδιαντος (because the Rain rests not on it, but slides off), and Πυρικος Δυσερωτος, γραιφος μανεκον, good Capillus muter & denfer fluctus, Καπίλλων Αναπήγα, good Pochnion, good Capillus tiges pulchrioregine reddis: in Latin, Adiantum, Polytrichum, Callicrimum, Capillus Venus, (a Species reddambo Capillus) Capillus Venus, Superfuitum Venus, & Crinum: and in English, Maiden-Hair.

II. The Kinds. The True Maiden-Hair is but two fold, viz. 1. Adiantum minutum (which is verus) Capillus Venusus verus, The True Maiden-Hair. 2. Adiantum majus (which is also a kind of the Verus, and grows only larger according to the Region; it grows in) Adiantum Syricum, Capillus Verus Syricus, the True Syrian Maiden-Hair. To these we may add, 3. Adiantum nigra Vulgaris, Onopteris nigra Dodonei, Adiantum pulchrum Lygdamii, smalle Thoos, Common black Maiden-Hair. 4. Adiantum album Pflini, Adiantum filicis folii Babiini, Diuretic herb. Dryopteris alba, Dryopteris Candida Dodonei, of which we have already written in Chap. 260. Sect. 2. and 9. foregoing. 5. Adiantum Verticis sum Americanum. The American Maiden-Hair.

The Descriptions.

The true Maiden-Hair.

III. The First or True Maiden-Hair, has a Root which consists of a number of blackish brown Fibres, or Threads, from whence springs up a small low Herb, not above a span high, whose Stalks are Q q q 2 smaller,
668  Salmon's Herbal.  Lib. I.

smaller, finer, redder, and more shining than those of Tribuchania, or our Common English Maiden-Hair, on which are placed delicate fine Leaves on both sides, without orders, one above another, somewhat like unto the lower Leaves of Coriander, or like the Leaves of Anise, but larger, cut in equally on the edges, and spotted on the back with very small brown Marks scarce to be discovered.

IV. The second, or True Syrian Maiden-Hair. Its Root is tough, and threadily like the first, and the whole is an humble or low Plant, having Leaves flat, smooth, and plain, set upon a blackish middle rib, like unto that of the other true Maiden-Hair, cut or notched on the edges, Nature keeping no certain form, but making one Leaf of this fashion, and another of another, far different from it. But yet in the main, this Syriacum is but one and the same Herb and Species with the former, tho' somewhat larger, which is from the Country, and nature of the Soil, for which reason, Label calls it, Capillus Venus, Verseus.

V. The third, or Common black Maiden-Hair, this differs little or nothing from the Dryopteris Cardia Dodonae, which is the fourth Species next following, as is declared in the Kind, and of which we have already written in the place aforeret, but that the Stalks of this are blacker, and the Leaves of a fadder green, whereas that is greener and paler, so that that aforesaid to come in the fourth place here, may very well be accounted a Species of this: There are many Species of winged Leaves, much higher than the foregoing, Parcele exceeding 6, 7, or 8, Inches in length, but the Leaves on the Wings are broader, flouter, and more deeply cut in on the edges.

VI. The fifth, or American Maiden-Hair. It has a fibrous Root, and grows up like unto a Fern, with a slender blackish brown Stalk, bunched forth into other Stalks about which are the Leaves, and from 12 to 20fresh green Leaves, small and somewhat long, jointed together by small foot Stalks, somewhat like unto the first true Maiden-Hair, but cut in on the cut side at the tops of the Leaves only, and not at the bottom.

VII. The Places. All the aforesaid grow on Stone Walls, and by the sides of Rocks, or Gravelly Springs, and other shady and moister places. The first plentifully, as Peins and Label say, about Mannchester in Northmore in France; as also in some parts of Gloucestshire, and in divers parts of the Weft of England. The second grows in Syria, and is not to be found with us unles in Gardens. The third in many Barren, Rocky, and Untilled places, especially where Springs are near. The fourth upon Oaks and among Oak Mops. The fifth in Virginia, Carolina, New-York, Maryland, Pensylvania, and other parts of Florida.

VIII. The Times. They all abide green through the whole year but have not any of them, either Flower or Seed.

IX. The Qualities. Maiden-Hair is temperate in respect of Heat or Cold, and dry in the first Degree, Aperitive, Diuretic, Triummatick, Pectoral, Splenick, and Nephritic.

X. The Specification. It opens Obstructions of the Lungs, Liver and Spleen, and provokes against Ulcers of the Lungs, Coughs and Affections of the bladder, and cures the Rickets in Children.

XI. The Preparations. The Preparations are much the same with those in the former Chapter, viz. 1. A simple Decotion in Water or Wine. 2. A Compound Decotion. 3. A Powder, 4. A Tincture in Wine. 5. A Leaf.

The Virtues.

XII. The simple Decotion in Wine and Water. It prevails against the Cough, shortness of Breath, difficulty of breathing, the yellow Jaundice and distemps of the Spleen: It is said to break the Stone, opens obstructions of the reins and Uterus, and provokes Urine: it provokes the Termal. Women, renews the Blood, and cleanses the Lungs of Tartarous and purd matter, by Expectoration. Dose four Ounces four or five times a Day.

XIII. The Compound Decotion. Takes Maiden Hair 12 Handfuls; Ceterach, or Spleen-wort, Liver-wort, Osmund Royal, of each 4 Handfuls; Liqurice brised 1 Ounce; Fennel Seeds brised 1 Ounce; Balsam of the Sun-Stone, blew Coriander, of each half a Pound, blew Vigs 4 Ounces; Spring Water 3 Quarts, mix and Boil, then strain out and keep it for Use. Let it be taken in the Morning falling an hour before Dinner, at 3 in the Afternoon, and at Bed-time, always squeezing into it, at the time of taking it the Juice of an Orange, or four of the Juice of a Lemon. It not only opens Obstructions of Lungs, Liver, Spleen reins and Womb, having all the Virtues of the simple Decotion, but cleanses the Lungs of Ulcers and purd Matter, heals Ulcers of the Lungs, and cures the Rickets in Children. It provokes Urine, gives ease in the Strangury, prevails against interterate Affections, and being long taken, proffsively gentle the Gout and Rheumatick pains to a Miracle.

Dose

True Syrian MAIDEN-HAIR.
Dose four Ounces or more at a time, as often as it first appears before directed.

XIV. The Powder of the Herb. Being taken a Dram at a time in Red Barcelonc Wine, or other like Syrup in Wine, Morning and Night for 40 or 50 days together, it is said to cure Ruptures. It is profitable against the Biting of Vipers or other Serpents and Venemous Creatures, and has indeed all the Virtues of the Decotion and Tincture, but for the other Diseases, it is best to be made up into an Eleusiey with twice or thrice its weight of Clarified Honey, and the Eleusy to be given from 2 to 4 Drans.

XV. The Leu. It is made of the Alhes by Elextivation in fair Water. It is singularly good to cleanse the Head of Scurfy, Morphew, Dandrif, and to heal a Scald Head, whether it be a dry or running Sore: It blys the falling of the Hair, and is said to make it grow thicker, fair, and well colored, for which purpose some make the Lixiviurn in Wine, and others use the Decotion of the Herb in Wine. And some boil the Alhes in Oil, and anoint therewith to cure Baldness, Scurfy, Dandriff, Scald-Heads, &c.

CHAP. CCCCLXV.

Of MALLOW Common.

1. THE Names. It is called in Arabic. Chubeez and Chubiz, and the Seed thereof Biarii Chubire: in Greek, Marsale, ab emathendo Vencre, but in the Copies of Ephemerides and Antiq. Authors it is written Malva: in Latin, Malva, quafi Malva, quod abun Molia: in English, Mallow.

II. The Kinds. There are several principal forms of Mallow, as 1. The Common Kind, of which in this Chapter. 2. The Marsh Mallow, of which in the next Chapter. 3. The Vermean Mallow, of which in Chapter 467. 4. The Tree or Shrub mallow or Murph Mallow, of which in Chapter 468 following.

The Descriptions.

IV. The first, or Common purplish Mallow. It has a Root which is long and edific, tough and somewhat Woody, and running deep into the Ground. From this Root spring forth many large, soft, green, roundish Leaves, yet somewhat cornered and dentd about the edges, standing upon long foot Stalks next the Ground; from among which rise up several round, green Stalks, growing in time to be 2 or 3 feet high, especially when growing in good Soil, and to be more hard and almost Woody, especially at the bottoms, divided into many Branches, towards the tops, and with many lefer Leaves, and more divided upwards, where it brings forth many Flowers, flowering in soft hanks, which Flowers twine themselves, at their first opening forth, before they open themselves into five, large, broad pointed Leaves of a fine delayed purplish red color, with many Aripes or Veins running through every Leaf, of a deeper color, which makes the Flower seem very beautiful: after which come round flat Cakes, with many blackish Seeds for in order round about them.

Common Purplish MALLOW.

V. The second, or Common white Mallow. The Roots of this are like to those of the former: and in its Springing up, Stalks, Leaves, Flowers and Seeds, height, and manner of growing, it is fo like to the first, that it cannot be dffered from it, till it is in Flower, in which confids the whole difference: Those Flowers being not full out so large as they, and of a pure white color, without any Arie or Vein of any other color running through them.

VI. The third, or Small, or Dwarf Wild Mallow. The Roots are like those of the two former: so also are Stalks, Branches, Leaves, Flowers, and Seeds: living that this Kind lies with its Branches more upon the Ground, and that it has many smaller and rounder Leaves, not so much cut in, or very kildom, and less dented on the Edges than the other Common; the Flowers are also smaller and more white, otherwise it is in all respects like the Vulgar Mallow.

M A L
MALLOW Dwarf.

VI. The fourth, or Mountain Mallow. The Root is like that of the Common Mallows: its lower Leaves are as large as those of the fifth or Common Kind, but a little longer, with some round divisions or cuts in them, but not deep, and not much like in shape to an Ivy Leaf; the Stalk grows not so great and high as the fifth Common, and with finishing smaller Leaves thereon, and upwards they are somewhat rounder and leafier: the Flowers and Seed are wholly like to those of the fifth.

VIII. The fifth, or Spanish Blush Mallow. It has a Root which is small and long, and perishes every Year; this Spanish Mallow, in form and manner of Growing, very like unto our fifth (or) Common Field Mallow, having upright Stalks two or three feet high, spread into divers Branches, and from the bottom to the Top, bever with round Leaves, like unto our Mallows, but some what smaller and rounder, and left divided, yet larger below than above: the Flowers plentifully grow upon the small Branches, folding or withering their Leaves, one above another, before they be blown, and being open confits of five Leaves, with a forked Clapper therein, of the same color with the Flower: the chiefest difference from the fifth Common Kind, confit in this, that the Leaves of these Flowers are larger and more wide, open at the brims (almost like a Bell Flower) and of a fair blush or light Carnation color, opening all the day time, and closing at night. After the Flowers are past, there come rich like round heads, with small black Seed like to those of the fifth Common Kind, but somewhat smaller.

IX. The sixth, or Curled Mallow, or French Crisped Mallow. It has a Root like to the fifth Common Kinds, which perishes when it has perfected its Seed. This Crisped or Curled Mallow, (which is called by the common People French Mallow, tho' it grows as frequently and naturally in England in our Gardens) has many small upright Stalks, growing a foot and a half or two feet high, and sometimes higher, as I have seen it, which is growing to the goodness of the Soil, on these Stalks and Branches do grow broad Leaves somewhat round and smooth, of a light green color, which are Crumpled or Curled about the Edges, and also in the substance of the Leaf like a Ruff, very admirable and pleasant to behold. The Flowers are small and white, much like the former Kinds.

X. This Kind Parkinson thus describes. The Root usually abides the first year, and the second year it runs up to Flower and Seed, but from after the Seed is perfected it perishes: from this Root flows up an upright green round Stalk, as high sometimes as a Man, on which from all sides grow forth round whitish green Leaves, Curled or Crumpled about the Edges like a Ruff, else very like to our fifth or Common great Mallow Leaf. The Flowers grow both upon the Stalk, and on the other Branches, which spring from it, being small and white, after which come small Cales, with black Seed like the other Mallows. This Kind is much used as a Potherb, especially when there is cause to move the Belly downwards which by its slippery quality it helps forward. It has formerly, and is at this time in some places, used to be boiled or stewed, either by it self, or with Butter, or with Sperings, or other Herbs, and so eaten.

XI. The seventh, or Summer Mallow (called Malea granulata, & Malea altiva). It has a small Root which perishes with the first Cold or Frost which comes, but sometimes if the Summer be kind, it gives its ripe Seed before the coming of Fruity Nights. It has foot, round, green Leaves, without divisions, yet dented about the Edges, and something pale underneath. The Stalk rises up to about a Foot and a half high, and sometimes higher, bearing smaller Leaves, and a little divided, somewhat like unto those of Marth Mallows. The Flowers are of a paler purplish color, than the Common and Large, the bottom of whose Leaves are of a deeper color, handing upon longer foot Stalks, and not so many together; after which comes small Seed.

XII. The Places. The three first grow commonly by Ways, and Hedge, and Ditch sides in Fields, Gahens, and all artificed places, unless in some whole Land; but the second Kind with white Flowers is not so plentiful; it has been found at Bafford in Kent, and at Tophill in Northamptonshire, and in several other places. The fourth is found on Hills and Mountainous Grounds. The fifth and seventh are Native of Spain, from whence they have been brought to us and are nourished up in our Gardens. The fifth grows plentifully both in England and France, in Gardens, for it grows not Wild, that ever I heard of.

XIII. The Times. They all flower all the Summer Months, from May, even to August, or later, till the Coldness of the Weather nips them; and the Seed comes to ripeness in the mean season.

XIV. The Qualities. These Plants are all temperate in respect of Heat and Cold; and moist in the first Degree. They are Deodrificative, Emmollent and Traumatic, Pulmonary, Nephritick and Hypuric.

XV. The Speciation: They expel Tarraurous Mucilage out of the Bile and Lungs, as also from the Guts, Reins, and Womb: are profitable against the
the Bloody Flux, and prevails against the Stone and Gravel, whether in the Reins, Uteruses or Bladder.

XVI. The Preparations. You may prepare them from 1. A Liquid or Instrisse Juice. 2. An Efficacious Syrup. 3. A Pouder. 4. A Ointment or Balsam. 5. A Catarapis. 6. A Distilled Water. And all these Preparations may be made either of the Leaves or Roots alone, or of both together.

The Virtues

XVII. The Liquid or Instrisse Juice. The first taken to 2 or 4 Ounces, or the latter to half an Ounce diffilved in Barly Water, opens the Body, and causes an Evacuation of Hot, Cholerick, and other offensive Humours, eases the Pains and Tumours which come by Oldtrausions of the Bowels and Conflipation of the Belly, and is, therefore, good to be used in Clysters conducting to those purposes: Taken by Nures which give Suck to Children, it encourages their Milk, and helps to excreaduate putrid and rough Humours of Rheum from the Head, and Lungs, heals eczemas of the Stomach and Guts, prevails against the Phthisick, the Plurifie and other like Diseaes. Given in Wine, it causes speedy and easy delivery; and is probable against bloody Flux, as also other Fluxes of the Bowels.

XVIII. The Efficacious Syrup. It has all the Virtues of the Liquid or Instrisse Juice, and being made to an Ounce or two in a Glass of Generous Wine, it is profitable against inward Convulsions of the Stomach, and Tumours of the Guts. It is also profitable against Poison, to the Poison be presently volted by a Vomit. Bathed upon the affected parts, it is good against Scabs, Scrofula, and all other places, and is probable against Scabbing with Water, or Burning by fire, and to help an Erythema, or Anabes Fire, and to diffuse all other hot, red, and painful Swellings in any part of the Body.

XIX. The Decoction in Wine or Water. It has the Virtues of the Juice and Syruppe, but not full of its powerful, but prevalent against most external Diseaes. The Feet being bathed therewith, it helps much against Diffusions of Rheum from the Head, rilling from the Stomach; and if the Head is walled therewith, it prevents the shedding or falling of the Hair; if a little Honey and Rock Alum be diffilved in it, it makes an excellent gargle for any sore Mouth or Throat, for it cleanses and heals them in a very short time.

XX. The Syrop. It may be made of the Juice, Efficacious or Decoction, with Honey. It is effectual against all the Diseaes before Specified, but is an admirable Pectoral and Nephritic. It loosens the Belly gently, and is, effectual in Clys for to eade all pains of the Bowels, opening the obtubated passages and making them flippity; given inwardly by the Mouth, it causes Expectoration, and helps most Diffusions of the Head, and Lungs, as Coughs, Colds, Hoarseness, Wheezing, throats of Breath, difficulty of Breathing: It is probable also against Expectation of the Guts, Bloody Fluxes from the Bowels, by clarifying the sharpness and acrimony of the Cholerick Humour; and by its mucilaginous property, it eases the Pains and heals the Ulceration or Soreness. It may be given from an Ounce to 2, in Barly Water, against the Stone, Gravel, Sand, and other Tatumous Matter in the Reins, Uteruses and Bladder, it eases the Pain and causes small Stones and Gravel the more easily to be removed, and to be expelled, for which thing it is most celebrated Remedie. But tho' for all these purposes Common Mallow may be used, yet we generally take the Marsh Mallow first described in the next Chapter, which is the chiefeft Mallow of all others, and is called Eryhmos, for that it is twice as powerful in its effects as the others, and you may make use either of the Leaves or Roots, or of both.

XXI. The Pouder. It may be made either of the Leaves or Roots, or of both, and that of the Common Mallow, of or the Althis of Marsh Mallow. Given to a Droak, more or less, it has the Virtues of the former Preparations, and is peculiarly good against the Strangury. It is good to be given so much as are troubled with Ruptures, given in red Barcelona Wine, or other Syruppe Wine, or Syruppe mixed of Ale, and rendered into a pulvis, makes Vomit. It is used in the head, and prevents the heating of Wounds and Ulcers, and retore them to their first state. In Scabies, it is eade to make it by the Nerves, Tendons or Muscles in any part of the Body. Applied to green Wounds it prevents conrigurations and heals them.

XXII. The Ointment or Balsam. If made of the Muckle, chiefly of the Roots, and rather of the Althis, than of any other, it takes away the roughness of the Skin, diffuces Inflammations; and strengthens the Nerves and Dificutions, mollifies and digests hard Tumors, or such as will Apoplexy, digests and cleanses purit Wounds and Eating Ulcers, making them fit for a Cure.

XXIII. The Cataplasme. Made of the green Herb and Root it is good against hardness, and thinning of the Sines: laid to the Eyes with a little Honey, diffuces their Inflammations, and if aplicated, prevents the coming of a Filthia. The Cataplasme made of the bawled Leaves, is applied to the Stinging of Bees, Wasps, Horness, yea of the Scorpion, and the biting of that poisonious Spider the Pholionium, is laid presently to take away the Pain, relieves and swelling arising thereupon, and keeps them from purification. It is made of the Leaves boiled and beaten, with Bean or Barly Flour, and Oil of Ropes, It is an effectual remedy against Inflammations, and hard Tumors, Apoplexies, and swellings of the Toffles and other parts, and eases their Pain, as also the pain and hardness of the Liver and Spleen, being put upon the place grievous. The Cataplasme made of the green Leaves beaten up with Nitre, and applied, draws Splinters, and Thauris out of the Flesh. It is made of the mucilage of the Roots with the flower of pouders of Lin-Seed and Fanageret-Seed and applied, it gives ease to pains in any part of the Body.

XXIV. The Distilled Water. This being made when the Plant is in Flower, is good for all those Diseases the Juice, Efficacious and Decoction are applied to, but acts more weakly, yet it is much commended to be used in Burning Fevers, and the hot Fits of Ague.
The Seed. If green it is bruised, and
infused in Vinegar, or being dry, it is made into
Pouder, and if bruised, it will cleanse the Skin
from Freckles, Tanning, Sunburning, Sores, Mor-
pheus, and all other ailments thereof, being well
bathed therewith. And being made into Pouder
(more especially the Seed of the Althaea or Marsh-
Mallow) and given to a Drum, or a Drum and half
at a time, it gives ease in the Stone, gravel and
Strangury, and provokes Urine, and this more
especially if it be several times repeated; where
note, that it is left to be given in Parsley, or
Asparagus, or Onion Water, or some other proper
Diuretics.

CHAP. CCCCLXVI.

Of MALLOW Marth.

I. The Names. It is called in Arabic.
Chitini, Chureen, and Roja Zameni, and
by Serapio, in one place Altham: in Greek, ‘Abba-
Alltham, or Werner, Ibifcus, Hufesin, Hufecim,
Allthain, Arifhites (from the excellency of its
effects:) of some Ouir Judacum, the True Pot-
Herb: and by some Authors, Efsinam, and Alth-
aisifens (as it were from Alltham and Ibifcus:) in
English, Marsh-Mallow.

II. The Kinds. Authors make many sorts of
this Plant: but we shall describe only those five
varieties following, viz. 1. Altham vulgarn, Ef-
bim, 2. Altham Palaferis Cordi, Altham aggrifens
Geofferi: Altham vegetus Angulus, Altham
Hufecim Laebis. Our Common Marsh Mallow.
3. Altham palafieris Cyrilis bore, Water Mallow.
4. Altham femper vivens Beyonde folio, Altham fru-
tefens Beyonde folio Bussemi, Evergreen Marsh
Mallow. 5. Altham hufeis. Altham haufus hufeis
Laebis. Altham Pefpina Geofferi in hortis; Altham
Thalpoflii, Altham haufus lafeis palafieris Peto,
yellow Marsh Mallow. 6. Altham rofae peregrina,
vel Americanus, Rose Marsh Mallow of America.

The Descriptions.

III. The fist, or Common Marsh-Mallow.
It has a Rose which is long, spreading it self in-
to manifold parts from one Head, of the bigness
of a Thumb or finger, very plant, tough and
bending like Liquorice, of a tuberous yellow color
on the out side, and more white within, full of a
viscous or slimy Juice, which being laid in
Water, will so thicken it, as if it were Gelatil,
from this Rose spring forth several soft hairy
whence Stalks, rising to be three or four Foot high,
spreading forth many Branches, the Leaves of which
are soft and hoary of woody, somewhat leffer than

IV. The

MARSH-MALLOW.

WATER-MALLOW.
Chap. 467. English Herbs.

IV. The second, or Water Mallow, (or Marsh Mallow red bloomed, it) has a Root which is long, white, and tough, somewhat like the former, but nothing else: from the which grows forth many soft Leaves, somewhat like upon thefe: but is not of the same color, but of a pale green color, on the upper side, and white or whitish on the under side; and used for something deeper about the edges, standing upon long Foot Stalks, among which rise upright round green Stalks, 3 or 4 feet high, bearing the Like Leaves or Leaves upon them; the joints of the Leaves, towards the tops of the Stalks, and at the tops of them likewise come forth the Flowers, consisting of five Leaves, longer and narrower than in other Mallows, and broad but pointed at the ends, of a deep reddish purple color, tending to an Orange, and sometimes paler or more dilated, and in long Plaits of a white color, with divers threads standing in the middle, among them; when these threads become the Seed Vellum, or round Bladder, in shape like the Fruit or Seed Vellum of round Arbothelobia, or Earth-root, of a flat brownish color, in which is contained two or five divisions: small blackish or brownish Seed.

V. The third, or Evergreen Marsh Mallow. Its Roots are divided into several parts under Ground, and the Leaves are found four of the Leaves upon them all the Winter, above the Stalks die and perifh away. This Evergreen Althaea has many fair large, white green Leaves, somewhat thick, full of Veins, and rough under, and the Seed ripens in many underrun, cut in or divided uniformly into five parts somewhat like a Byzonic Leaf. The Stalks are hoary, white, and round, rising to be two or three feet high, having six or eight large Leaves upon them, and smaller also among them, finding all of them upon long Foot Stalks. The Flowers are like unto those of the Mallows, and much about the same color, consisting of five broad pointed Leaves, having many soft threads in the middle: after which come flat Leather Hands, such as other Mallows have, wherein is contained such like small Seed.

VI. The fourth, or Yellow Marsh-Mallow. Its Root is not great or long, but with divers Fibres at it, and perifhes every year. This Althaea rises up with one foot, woolly green, round Stalk for the most part, seldom with more, divided oftentimes even from the bottom into divers Branches. At every Joint stand several large round Leaves, as fow as Velvet, pointed at the ends, and doubt about the edges, hanging down at the end of long Stalks which stand forth right. The Flowers stand fingly but one at a Joint with the Leaf, which is small and yellow, composed of five small pointed Leaves, and hanging in a small green Head, which being put, there succeed soft green Pods or Seed Vellums, turning black when they are ripe, composed of many small Horns or Pods for together, like unto an Head, or Seed Vellum of Franki, in every one of which is contained small, black, roundish Seed.

VII. The fifth, or Rose Marsh-Mallow of England. It has a Root which is thick, white, and starchy, which abides safe in the Earth all the Winter, tho' the Stalks die away, and perifh every year. This Plant flowers forth about May, several round white, soft, branched Stalks like to the first Althea or Marsh-Mallow, better with several soft green Leaves, which are grey underneath, resembling the first Althea but longer pointed; and on these Stalks and branches stand several white Flowers, made of five large Leaves apace, somewhat like a Hollyhock, with a tuft of white threads, composing a middle Urnshone or Pointed, lifting out of a great Button or Husk, which is as it was Ribbed, and broad at the bottom, narrowing to the top, before the Flower blows, and without any smell.

VIII. The Plants. The first grows in most of the Salt Marshes from Winchelsea down to the Sea, both on the Kentish, and Essex Shore, and may be found near Woburn, Erith, Greenhithe, Gravesend, Tilbury, Lee, Celsea, Harwich, and in most Marshes about London, being Planted in Gardens, it prospers well, and continues long. The second Commonmarsh says he, found it in Italy, and in abundance, about the River Arno, hard by Anghiaria, where men past over that River; and in the most and Marshy places of Ferraria between Padua in Italy and the River Erissena, The third is not known in what place it is a Native. The fourth, its Seed is brought to us from Italy and Spain, where it grows in very Grounds near Lakes, Rivers, and Ponds, we yearly Sow it in our Gardens, the which does seldom or never bring forth Seed to ripen, for which can't fake, we are forced to have fresh Seed from the afo named places. The fifth was brough (as Common says) out of Africa, but now this, as all the other four kinds, is natural up with us in Gardens.

IX. The Times. They all Flower in the Summer Months, from May to the end of August, and in the mean Seaon, living that the yellow and red Flowers, do Flower in the latter end of Summer, but fo, that if the Season is not fair and warm, they never yield ripe Seed.

X. The Qualities. Specifions, Proprieties, Virtues, and Uses of these, are the same with those of the Common Althaea in the last Chapter, living that the first Althea, or Common Marsh-Mallow in this Chapter, is of more than double Virtue to any of them, or any other in this or in the following Chapters; and therefore ought to be chosen, and have the preference before them all, for all the powers and uses before expressed, and to which they are intended.

CHAP. CCCLXVII.

OF MALLOW Vervain.

I. The Name. It is called in Greek, Άνθος; in Latin, Althaea, and by some Mallow Subsortica; in English, Vervain Mallow.

II. The Kinds. Authors make many Kinds of this Plant, as 1. Althea Vulgaris, Mallow Verbena, Althea major, Herb Althaea Vulgaris, Our Common Vervain Mallow. 2. Althea Vulgaris Flos Cornis, Common Vervain Mallow with blath Flowers. 3. Althea Vulgaris Flos albi, Common Vervain Mallow with white Flowers. 4. Althea minor Matthioli, Tragi, & aliorum, small Vervain R. T. Mallow.
The Descriptions.

III. The first, or Common Vervain Mallow. It has a Root which is long, rough, and white, but somewhat more Woody within. The lower Leaves of this Plant are flat and green, something like to the Wild Common Mallow, but thick, and more cut in on the Edges, besides the denting: but those which grow up higher upon the Stocks, (whole Bark may be broken into herds or threads like Hemp, and sometimes as high as the ordinary Wild Kind s) are more cut in and divided, something like unto Vervain. The Flowers are of a paler purple color than those of the Common Mallow, but in molt, so not much divided into several Leaves, and laid so open, but abiding more close, or less spread, and often without their Stripes, being smooth and a little thinning, the Seed and Seed Vessels, are like those of the Common Mallow.

IV. The second, or Common Vervain Mallow with blath Flowers. Its Root is much like, and lives as the Root of the Common Mallow does. This is long Stocks, and Flowers like unto the Common Wild, and of the same deep color, so that you can scarcely know it from that ordinary Kind, and is found growing wild together with it, but only by the Leaf, which is round and as large as the former, but cut into many one Divisions, even to the Stocks which upholds it, so that it seems to confold only of Rags, or pieces of Leaves, there is also another Plant of this Kind growing in all respects, like to the last row declared, but differing only in the color of the Flowers, which are of the same blath or light Cornflower color, not much differing, but with some Veins therein, of a deeper color.

V. The third, or Common Vervain Mallow with white Flowers. The Roots of this are like the first, from which it differs something in its Leaves, for that these are more finely cut in on the edges than that is; but in the Flower confold the chief difference, for that this is white, yet tending to a little blath: the Seeds are also like the first.

VI. The fourth, or Small Vervain Mallow. This is a lesser Kind, never growing so great or high as the others, but in lower like as the Small Mallow. The Leaves hereof, are more divided, and cut in on the Edges, and most usually into five parts, being deeply dent and also. The Flowers are purple, like the Common Vervain Mallow, but lesser, in which confolds the difference.

VII. The fifth, or Small, hairy, Walth, Vervain Mallow. Its Root is of a pale brown color, about the length of a Men's Hand, with scant Fibers adhering to it. It is many very low and hairy Stalks, not above a foot high, divided into lesser Branches, set with several small hoary hairy Leaves, cut into three or more divisions. At the top of the Stocks and Branches come forth several large purple Flowers, like unto the first Kind, but every one standing in a hairy Husk, so as it is almost prickly, after which comes black Seed, contained in those hairy Husks, but more closely inclosed in them, than in the others.

VIII. The Sixth, or Venice Vervain Mallow. It has a Root, which is long and small perforating every Year. It has long and weak Stalks, most usualy lying on or leaning upon the Ground; having here, and there upon them long Leaves and somewhat broad, cut in or gathered very deeply on both edges, so that it seems as if it were divided for together, every one standing upon a long foot Stalk, at the Joints of these Stocks where the Leaves are set, come forth several Flowers, standing upon long foot Stalks, which are some what larger than any of the former Flowers, consisting of five Leaves, small at the bottom, and wide at the bitterns, of a whitish color tending to a blath, and sometimes all white, with spots at the bottoms of the Leaves on the infides, of a very deep purple or murrey color, which adds a pleasing grace to the Flower, which has a long pointed or pullet in the middle as yellow as Gold. These Flowers are so quickly faded and gone, that you can scarcely see any of them blown open, unless it be betimes in the Morning, before the Sun shines warm upon them, for as soon as they feel the heat of the Sun they close up, and never open again; so that you shall very seldom see a Flower blown open in the day time, after nine or Clock in the Morning. After these Flowers are past, there come up in their places, thin, round, flishing, or transparent Blisters, pointed at the top, and ribbed down all along, in which are contained small, round, blackish Seeds of a former; but cut into many one divisions, even to the Stocks which upholds it, so that it seems to confold only of Rags, or pieces of Leaves, there is also another Plant of this Kind growing in all respects, like to the last row declared, but differing only in the color of the Flowers, which are of the same blath or light Cornflower color, not much differing, but with some Veins therein, of a deeper color.

IX. The seventh, or Cinkfoil or Hemp-like Vervain Mallow. It has Roots which are great and long, spreading in the Ground like unto the Roots of Marsh Mallow, and sprouting up a fresh every year.
Chap. 468. English Herbs.

675

C H A P. CCCCLXVIII.

OF MALLOW TREE or Shrub.

I. THE NAME. I know no Greek Name that this Plant has, but you may call it Malvam, Malvam, or Malva arborea, Malva arborea, Malva arborea, or Malva arborea, etc.

II. The Kinds. There are several sorts of this Plant, as 1. Malva arborea marginata, or Anglica, our English Sea Tree Mallow. 2. Malva Rosae arbores Indica, Rosae Simples Ferraria, Malva Japonica arborea, Indian Tree Mallow. 3. Althea Pratex flora altera purpuracea, Althea arborea, Shrub Mallow with white or purple Flowers.

The Descriptions.

III. The first or English Sea Tree Mallow. It has a white great and Woody Root, being many long fringes annexed to it. Its Stalk is Lignious or Woody, 5 or 6 inches in Diameter, and of a brown hoary color, whereas grow whitish and hoary or woody Leaves, which are fib in feeling, and almost as large as the Leaves of the Tree Holl-olch, being as smooth as velvet. The Flowers are of a considerable largeness, and of a Duller purple color, not much unlike to the form of the Common Wild Mallow Flower.

R E F F 2
SALMON'S HERBAL.

676

Chapter CCCCLXIX.

1. The Name. It is called in Arabeck, Hebrew, and Tardwaci in Greek, Mandragoras; in Latin, Mandragoras; and in English, Mandrake. Dioscoridey says, that in his time some called it Atragacca, and Nepale, Greenes, (from Gre the great Enchanter:) Pythagoras called it Anthropomorphe, a forma humana, because the Root has in some Measure the likenes of an Human Body, with a kind of Head and Belly (as it were) and two Legs.

The Descriptions.

3. The first, or Male Mandrake. It has a Root which is long and thick, Blackish on the out side, and white within, consisting many times but of one long Root, and sometimes divided below its Head or Belly,

Mandrake Male.
Chap. 469. English Herbs.

into two main roots running down right into the Ground, like to a Plum Tree, and Leaves and sometimes (as not often) three of those roots have been observed, which some by Transplanting have Occasionally cut off for honor or admiration sake, and in amulets made, to which are annexed several small Roots. From this Root springs up many leaves together, which being fully grown, are large, large and green, lying round about the old Root, and are larger and longer than the Leaves of any Tree, to which it is likened by some. From the middle among those leaves arise up many flowers, each one upon a long, slender foot stalk, standing in a whitish green Husk, consisting of five pretty large round pointed leaves, at a greenish white color, which turn into small round apples, being green at first, and afterwards when they are through ripe, as yellow as Gold, very smooth and shining, and as big as a reasonable Pippin, of a strong succulent or hearty Smell, in which are contained several whitish, round, flat Seeds.

IV. Mandragora mas ater, another Male Mandrake. This was formerly found growing in the Lord Wotton’s Garden at Canterbury. Its leaves were of a more greenish green color, and somewhat folded together, differing in those particulars, from the before described Plant, which grows hard by it also: but as to its fruit it is unknown for at that time the Plant had not born any.

V. The second, or Female Mandrake. It has a root like the former, blackish without, and white within, near unto the same firm with the male, but sometimes with more, and sometimes with fewer parts, or legs. This has likewise many leaves, lying on the ground, but smaller, narrower, more crumpled, and of a darker green color, resembling that of lettuce, as Dioscorides compares them, being more thinning, and of a stronger smell. The flowers also rise up from among the leaves, each upon a slender foot stalk as in the former, but of a bluish purple color. The fruit which follows, is much smaller than that of the male, but round like it, (and not Peru ballon, as some have thought said Edd, and which Clusius, who has several of them growing, also denies) of a pale yellow color when ripe, and of a more pleasing, or rather of a less heady smell, than that of the male, in which are contained such like seed, but smaller and blacker.

VI. The Places. They grow in Woods and shady places in many places beyond the Alps, and in many places in Italy, especially on Mount Garganus in Apulia, in Gracchi, Castris, and other parts of the Mediterranean Sea, and in Spain, and other hot Regions, but not naturally on this side the Alps. Clusius says he found the female in many wet grounds in Spain, as also in the Borders of those Meadows which lie near unto Rivers and Water Courses. But with us they are only Nurtured up in Gardens, for pleasure, as well as for use. And the female, as it is the more Tender, so is it the more Rare, and only kept by such as are very Curious.

VII. The Times. The Male Kind Flowers in March, and the fruit is ripe in July: Gerard says it flowers in the end of April, and the fruit is ripe in August. Clusius says, he found the female in Spain, in flower in February, and that in several places of Spain, he had ripe fruit in the same month. But with us, where it is kept preserved and taken care of, it flowers not until August or September, but without extraordinary care (as by its Situation, help of Glades, Coverings and the like) the fruit seldom or never ripens or comes to perfection.

VIII. The Qualities. The Herb, flower and fruit, are said to be cold in the third Degree; but the root in the fourth. Degree, and moist in the face. It is Staphylic and Soporific, has a Cathartic and Emetic quality withall; and if taken in too great a quantity, Delirious.

IX. The Specification. It cools inflammations, helps against Anticipate fire, softens the hardens of Tumors, and induces Sleep.

X. The Preparations. You may make therefrom,

The Virtues.

XI. The liquid Juice of the Root. It is good in all cooling Ointments, and is profitably put into the Ointment Poponun, and applied outwardly in an Erysipelas, it helps on the Cure. And mixed with Honey or Oil, and applied, it cures the Stingings of Scorpions, Hornets, Wasps, Bees, &c.

XII. The
XII. The Infusiate Juice. Given to a Stupefied in sweet Wine, it purges Hagm and Melancholy by Vomit, like into Helobor; but taken in a greatest quantity, it kills; but for ordinary use to Grains is enough to be taken at a time.

XIII. The Decoction of the Root or Bark in Wine. It may be given from half an Ounce to an Ounce or two, according to Age and Strength. It is Soporiferous, or Causing Sleep, and eases extreme Pain in any part; and it is sometimes given to fish where an Annuation be to be performed, or have a Limb or Member to be cut off, to take away in great measure the Sense of Pain.

XIV. The Opiumbalm. Its made either of the Liquid Juice, or of the Infusiate Juice, being diffolved in Fenest or White Bofe Water, and sweetened with a little Honey. Being often put into the Eyes, it cures their Inflammations and eases the Pain.

XV. The Juice of the Apples. It is not so cold as that of the Root, and may be used in all the same cases; mix with Fenest, Drencher, or other proper Water, it makes a good Collarym for Sores, Inflamed, and Pained Eyes. Basted upon the Head, Temples, Forehead and Nostrils, it induces Sleep and Rest.

XVI. The Seed. Taken to half a Dram in any proper Vehicle, it is said to cleanse and cool the Womb, and to give ease to such as have any Cancer, or other Humour in those parts, the Dose being often repeated.

XVII. The Suppository. It may be made of the Liquid or Infusiate Juice of the Root, or of the Root it self in Substance, being put up the Womb, at the Seacon, it provokes the Courtfe, it also brings away the dead Child, and the Afterbirth.

XVIII. The Peflhaw. This may likewise be made of the Juices, or of the Root it self in Substance, being put up the Womb, the Seacon, it provokes the Courtfe, it also brings away the dead Child, and the Afterbirth.

XIX. The Cataplasia of the Leaves. Being beaten up in form with Hog's Lard, or Balby Fower, and applied, it will help all Hot Tumours and Inflammations; difculd all Hardnesses, Knots, and Kernels in the Flefhy, otherwise it Appallences, it will maturate and caufe fuppuration, and is good to eafe the Pain of hot and Infamed Ulcers.

XX. The Cataplasia of the Root. Applied to the Head it eafes the Megrim and other vehement pains thereof, it cools the heat of Anvlemes Fumes, being beaten up in form with the biff Dutch white Wine Vinegar, and so applied it eases all hot Pain in any part of the Body, and performs all that the Cataplasia of the Leaves can do.

XXI. Olean Mandragora, Oil of Mandakes. The Composition you have in our Pharmacopoea Londinena, lib. V. chap. II. fett. 52, which because every one has not that Book in their Hands, we will insert here. It is thus made. Take Oil Olive 2 Pounds, Juice of Marigolds, 3 Pounds, of Rhubarb 2 Pounds, of Black Poppy Heads 3 Ounces, Juice of Wine 24 Ounces, Yelk of white Henbane 2 Ounces, Juice of black Poppy Heads 3 Ounces, Juice of Wine 672, and young Henlock, of each 1 Ounce, Opium, Stiper Calamine, of each half an Ounce; mix all together, except the Opium and Stiper, and Infuse for ten days, after which boil to the Confumption of the Oils and strain out, then put in the Opium in fine Powder, and after that the Stiper dissolved in half an Ounce of fine Tartar Trompentine, and mix them according to art. It is very Cold, and may be anointed upon the Temples and Noses of such as have a frently, if the Patient Sleep too long, dip a Spunge in Vinegar and hold it to the Nape. It eases vehement pains of the Head, as also the Toothach, anointed on the Forehead, Temples, Nostrils Cheeks and Jaws, and for Watchwineb and Restlesse, upon the Pelle, and Soothes of the Feet. It is good also against the Gout, running Gout, and other Inveterate Pains.

XXII. The Distilled Water. If a little Honey be dissolved in it, it is an excellent thing for Herp, Infamed and Sore Eyes, and bathed upon Womans breasts, which are hard, or paired, or are Carcinated, it softens the hardness, and eases the Pain.

XXIII. The Antidote. If any one is Poysoned scrueweth, it but left done, the only remedy is a Vomit made of Vinum Benedictum, Tarver Emeticum, &c. but if it has been of commencing, the Antides are Caffeurn, Contravent, Ruffard, Oriental, Ruc, Crampo, Virginia Snake Root, and Wine: and Preparations made from them.
MARI GOLD.

V. The second, or Greater double flowered Marigold. * Caltha sect. Calendula Polyanthina vulgaris, the common double Marigold. 4. Calendula Polyanthina minor, the lesser double Marigold. 5. Calendula multiformis or Orbiculata, the double Globe Flowering Marigold. 6. Calendula Profunda, the many headed Marigold, called by some Tack an Apex or Horse-back, and this is also two-

told.

The Descriptions.

IV. The first, or Common single Marigold. It has a white Root which spreads itself under Ground, sometimes oblong after Seeding and sometimes perishes, rising again of its own Seed; there is little or no difference between this and the following Kind, but in the Flowers, this consisting only of one Fig. row of gold colored or yellow Leaves, and forms a pale, and forms a deeper yellow, standing about a great brownish yellow Thrum in the Middle; the Seed also, is alike, but for the most part, greater than that of the double Kind.

V. The second, or Greater double flowered Marigold. The Root of this is also white, and spreads in the Ground, dividing in some places after the Seeding time, tho' for the most part it perishes, and rises again of its own Seed. It has pretty large, round, green Stalks, branching out from the Ground, into many parts, on which are set long, flat, green Leaves, broader and rounder at the point than any where else, and smaller also at the setting to of the Stalks, where it envelopes it about. The Flowers are sometimes very thick and double (breaking out of a Scaly, clanny, green head) composed of many rows of Leaves, set to clothe together one within another, that no middle Thrum can be seen; and sometimes less double, having a small brown spot of a Thrum in the middle, and sometimes but of two or two rows. The Leaves, with a large brown Thrum in the middle, every one of which is somewhat broader at the point, and nicked into two or three corners, of an excellent fair, gold yellow colour in form, and pale in others, and of a pretty strong and firmous smell. After the Flowers are past, Heads of crowded Seed follow running inwards, of which the outward most are the biggest, and the innermost least.

VI. The third, or Common double Marigold. The Root of this thick is and hard with some Fibers or Threads adhering thereunto. From this Root spring up many fat thick crumpled Leaves upon a grofs and spungy stalk: upon which do grow fat, double, yellow Flowers, having for the most part in the middle, a bunch of Threads, thick set together, which being put, He and the crowded Seed follows like as are described in the former.

VII. The fourth, or Lesser double Marigold. The Root of this is like the former. It is a smaller, and finer double Leaved Plant, and grows upright, having for the most part one Stem, or Spungy Stalk, replant with thick and fat Leaves confusedly. The Flowers grow at the tops of the small Branches, very double, but larger than any of the former, consisting of a more fine Jaggledefis, and of a fair, yellow, gold color.

VIII. The fifth, or Double Globe Flowering Marigold. It has a Root much like the others, from which rise up many large broad Leaves (immediately out of the Ground) and from among which rise up also a stalk about a foot and a half high, dividing it self towards the top into other smaller Branches, replant with the like Leaves, but confusedly, or without any order. The Flowers grow at the Tops of the Stalks very Double, the small Leaves of which are set in a very regular order, by certain Ranks or Rows, as several lines are in a Globe, traversing the whole Compass of the Same, whereupon it took the Name Orbiculata. There is another of this Kind, which differs nothing in its Description from it, excepting in the color of the Flowers, these being Flowers of a very light yellow or straw color, in which consists the only difference.

IX. The sixth, or Many Headed Marigold. Its Roots, Stalks, and Leaves, are like to the Common foot of Marigold, differing only in the Shape of the Flowers, for this Plant does bring forth at the top of the Stalk, one Flower like the other Marigolds, from which come forth several other small Flowers, yellow likewise, and of the same fashion; This is thought by some Authors to be a перевод, or ßutes Natura, which sometimes comes to pass in several other Flowers also, as Some Children are born with two Thumbs on one Hand or with two great Toes, or with five or even Fingers, and sometimes no Arms or Hands on one side, &c. And such is the Seed of this Marigold, which yet, if it be found, it brings forth but one Flower in a thistle, like the Paint of the Face, from whence it was taken. There is another prolix, or many Headed Marigold, coming from the Seed of the Double Marigolds, and is doubled a Degenerate Kind: whereas the former many Headed, always springs from the Seed of the single Kind, and produces the diminutive Flowers upon very much the larger foot Stalks.
Salmon's Herbal. Lib. I.

The Place. We know of no Native place where these Plants should come, with us they never grow Wild, but always in Gardens, where they prospers admirably, but the Telle single Kind is said to grow Wild in Spain.

The Time. The Flower from April and May, thro' all the Summer Months, even till Winter, and sometimes even in Winter time if the Soil be warm.

The Qualities. The Flowers are hot in the first Degree, and temperate in respect of dryness or moisture. The Herbs is hot almost in the second Degree, and moist in the first. They are Emollient, Cardiac, and Alkopharmacite.

The Specification. They refit Poylon, as also Malign and Pet DOJ ial Fevers, provoke the Terms and bring away both Bitch, and Afterbirth.

The Preparations. You may have these from 1. A Juice of the Leaves. 2. A Juice of the Flowers. 3. A Confect of the Flowers. 4. A distilled Water of the Leaves and Flowers.

The Virtues.

XV. The Juice of the Leaves. Given from one Ounce to three it softens the Belly, and Purges by Stools: and afloat as a Gargrallin in the Tooth-ache, it eases the Pain.

XVI. The Juice of the Flowers. It is Cordial, comforts and strengthens the Heart very much, refits Poylon, and is prevalent against Pet DOJ ial Fevers. Dose from half an Ounce to an Ounce in a Glafs of Generous Wine.

XVII. The Confect of the Flowers. Taken in the Morning, Diagn. It Cures the Palpitation or Trembling of the Heart, and is given as a Prophylatick or Preventive in time of Plague or Peltility.

XVIII. The distilled Water of Leaves and Flowers. Drop into Red and Rheumatick Eyes, it cools the Inflammation, stops the Rheum, and eases the Pain.

CHAP. CCCCLXXI.

Of MARIGOLD African.

I. The Name. It has no Arabick nor Greek Name that I know of. In Latin, it is called Flos Africanus, Caltho Africanus, /o Jo Luminens, Pedw Panor: in English, African Marigold, and by some French Marigold, (so it is no more French than English.) Where note that some, as Lacasse think it to be Odonia Plum, others Leopurdian Galera, but with what truth is uncertain.

II. The Kinds. There are several Kinds of this Plant, as 1. Floi Africanus major simplex, vir simplex Flor: the Great single African Marigold. 2. Floi Africanus minor simplex, vel simplex Flor: the Lesser single African Marigold. 3. Floi Africanus major multiplex, vel multiplex Flor: the Great or Greater double African Marigold. 4. Floi Africanus minor multiplex, the Lesser double African Marigold. 5. Floi Africanus Flor: Elusile simplex Flor: multiplex, the Hollow or Fillobus African Marigold, both single and double, as Fabius Columba calls it.

The Descriptions.

III. The Chief, or Greater single African Marigold. It has a Root spreading much in the Ground and full of small Branges: and it is in all things so like to the double greater Kind, that it is hard to distinguish it from it, but by the Flowers, only the Stalk of this is broader than that of the double, and it has been observed that this single Kind does every year rise from the Seed of the double Flower: So that when they are in Flower, you may see the difference (as not much before, even when they are in Bud:) this single Flower ever appearing with a Head of Thrums in the middle, and the Leaves, which are the border banding about them, showing hollow or Fillobus, which afterwards by themselves die and open (the double Flower appearing with all its Leaves folded clofe together, without any Thrums at all:) and are of a deeper or paler color, as in the double.

MARIGOLD African single small.
II. The second, or Lesser single African Marigold. This very much resembles the Lesser double in every proportion, in the Roots, Stalks, Leaves, and Seeds; only the Flowers of this are single, having five or six broad Leaves, of a deep yellow crimson color, with deep yellowThorns in the middle, and of a strong flinking smell, more than those of the lesser double.

V. The third, Great, or Greater double African Marigold. It has a Root which is small and full of strings, spreading much under Ground. It is

**MARIGOLD African double great.**

A Noble Double Flower, which is the Grace and Glory of the Garden in the time of its Flowering and Beauty: The Plant rises up with a straight and hard, round, green Stalk, having some clefts or edges all along the Stalk, before with long winged Leaves; every one whereof is like to an Aloe Leaf, being composed of many long and narrow Leaves, filpiti or dentèd about the edges, standing by couples one against another, with an end at the end of a dark or full green color. The Stalk rises to be three or four feet high, and divides it self from its middle upwards, into many Branches, set with such like Leaves to the Tops of them, every one bearing one double Flower, of a gold, yellow color above, and paler underneath; yet some are of a pale yellow, and some between both, and all these rising from the Seed of one and the same Plant. The Flower before it is blown open, has all its Leaves hollow: but when it is full blown, it spreads it self larger than any Daisie or Prunella Rose, or equal to it at the least, if it is growing in good Soil, and rises out of a long green Husk stript or furrowed, in which after the Flower is full (which stands in its full Beauty a Month, and sometimes more) and being gathered, may be preserved in its full Beauty for two Months after, if set in Water) the Seed is contained, for thick and close together upright, of a black color, and something flat and long. The Flower of this, as well as of the single, is of the very small of New Wax, or of an Honey Comb, and not of that Poysonous Scent of the smaller Kinds.

VI. The fourth, or Lesser double African Marigold. The Leaves are like the former but differ. Its Leaves also are in all things like unto the former, but smaller, which are set upon round brown Stalks, not so thick or upright, but bowing and bending several ways, and sometimes leaning, or lying upon the Ground. The Stalks are branched

**MARIGOLD African double lesser.**

out variously, on which grow fair double Flowers, like the former, and in the like green Husks, but lesser, and in some, the outwardmost Leaves will be larger than any of the rest, and of a deeper orange color, almost crimson, the innermost being of a deep gold yellow color, tending to crimson. The whole Flower is smaller, and of a stranger and more unpleasant flavor, just for its doublehalk, beautiful color, and perfumes to the Eye, it surpasses almost all other Flowers which grow. The Seeds are like to the former.

VII. The fifth, or Single and Double African Marigold, with hollow or pipe Leaves. As the former greatest sorts of Africans single and double, have risen from the Seed of one and the same Pod or Husk of double Flowers, so is it in this Pipe Kind, the single and double kinds rising both of them from the Seeds of one and the same Plant, nor does it differ in any thing from them, but that these are lower, and have smaller green Leaves, and that the Flower being smaller, has every Leaf abiding hollow, like unto a hollow Pipe, broad open at the Mouth, and is of as deep a yellow color for the most part, as the deepest of the former, and yet sometimes it is also pale.

VIII. The
Salmon's Herbal.

Lib. I.

VIII. The Places. They grow naturally in Africa, about Tunis, and where old Carthage stood; from whence long ago they were brought into Europe, where with us, they are only kept in Gardens, and flourish wonderfully well, being Sown for the most part every year, unless in some mild Winters. But that kind with hollow or Pipo-Leaves, comes not from Africa, but from Mexico in America, and is so denominated according to Puhion Columns.

IX. The Times. They are to be Sown in the beginning of April, if the Sketton falls out to be warm, otherwise they must be Sown in a Bed of Dung, or in very good Earth, and in a warm place. They bring forth their pleasant Flowers very late, not till towards the end of Summer; especially the greater Kinds, but the leffer, if they abide all the Winter, do Flower more early, for this reason those which are of the later flowering, ought to be Sown the more early, that they may Flower and Seed so early, as not to be overtaken with the Fruits, before the Seed is ripe.

X. As to the Qualities. They are unknown farther than that they have been found by experience to be of a delicious nature: and therefore no other Observations have been made of them as to their Virtues and Uses in Physical Practice: their chief design in this Book, being to bring them in Court, for the Ornament of our English Gardens, where they already appear so Beautiful and delisble to the Eye.

CHAP. CCCCLXXII.

Of MARIGOLD Corn.

I. The Name. It is called in Greek Κορίνθιον: in Latin, Chrysanthemum, of aureus Flore coloris sic Dillen: and in English Corn Marigold.

II. The Kinds. There are many sorts of this Plant, but not above two or three varieties grow in England; one in our Cornfields, the other in our Gardens; yet because several others of them are found in some of our Plantations in the West Indies, we shall describe the following, viz. 1. Chrysanthemum fontanum Hortens, Bella latea Eudemon, this Corn Marigold, of our Country. 2. Chrysanthemum Creticum, the Candy Corn Marigold. 3. Chrysanthemum fontanum hericium, the Spanish Corn Marigold. 4. Chrysanthemum luteolum Americanum, oral Brachiscam, Broad Leaved American or British Corn Marigold. Authors make five or six Kinds more of this Plant, but being wholly strangers with us, we shall lay no more of them in this place.

The Descriptions.

III. The first, or Corn Marigold of our Country, its Root perishes every year, and the Plant rises again of its own Saving. It rises up with several tender, pale, green, Herb Stalks, breaking forth into some few Branches, with several long, whitish, green Leaves, for without order on them, being narrow at the Bottom, and broader at the end, cut in a little on both edges: the Flowers grow singly at the top of every Branch, being large, growing out of green Scaly heads, and of a shining yellow color, both the Thorns, and the borders of the Leaves about it: each Leaf being broad or flat pointed, and cut into three or four parts, smelling a little sweet.

IV. The second, or Cardia Corn Marigold. It has a Root which perishes every year, and rises again (as the other does) of its own Saving or Seed. It is a fair Flower, and has for the most part one upright Stalk, two feet high, on which are few some winged Leaves, at every Joint one, divided and cut into several parts; and they again parted into several pieces or Leaves. The Flowers grow at the tops of the Stalks, rising out of a fully Head, composed of ten or twelve large Leaves, of a fair, but pale yellow color, and more pale, almost white at the bottom of the Leaves, round about the yellow Thorn in the middle, being
Marigold Corn of Grec. or, Mathiolus his Corn Marigold.

The Times. The first Flowers in August; the second in June, the others in the end of Summer, and sometimes so late, that the early Frosts taking it, never thieves its Seed to come to its ripeness.

The Virtues.

The Liquid Juice, being drunk by such as have the yellow Jaundice, after coming out of a Bath, or from Bathing, it quickly renews them to their natural color.

XI. The Balsam or Grove. It is made of the Flowers boiled in Oil to crispsell, then drained, and made up with Wax, Franklin, and Roffin: or, beaten up with Oil and Wax; applied it cures that Tumor called Scleroma, which contains in it a Substance like Fat or Tallow, and dissipates other cold and hard Swellings.

XII. The Salter. The Stalks and Leaves of the Corn Marigold are eaten (as Dioscorides says) in the manner of a Salter, as other Salter Herbs are: But I suppose this is meant of the Candy Kind, tho’ I know not, but that ours when very young may be so eaten also.

Chap. CCCCLXXIII.

Marigold Marth.

I. The Names. I know no Greek Name; that it has; but it is called in Latin, Calotis Palustris by Gesner, and Calotha Virginiti by Tragus: Some call it Ferraria, from the Hermes of its Leaf to a Horse Shoe; Cordus calls it Cheilothria Palustris: and Tberes montanus, Pogulus, tho’ its Leaf is not like either to the Leaf of the Poplar Tree, nor of Cult-Bour: in English we call it Marsh Marigold.

II. The Kinds. Some Authors make three several sorts herewith, viz. 1. Calotis palustris Vulgaris simplex major, the Greater single Marsh Marigold; 2. Calotha palustris simplex minor, the Lesser single Marsh Marigold; 3. Calotha palustris multiplex, vel flava plena, the Double Marsh Marigold.

The Descriptions.

III. The first, or Greater single Marsh Marigold. It has a Root which is composed of several long Springs, which run down deep into the Mire. From this Root rise up several great, broad, round, deep green, filigree Leaves, a little dented or waved about the Edges, each one, on a long, thick,
Great Marsh Marigold, Common, Single.

IV. The second, or Lesser single Marsh Marigold. It has a like Root with the former, from whence rise many round Leaves spread abroad, of a dark green color, among which rise up divers Branches, charged with the like Leaves, and all surrounded with the like Leaves, and the Flowers grow at the tops of the Branches, of a most shining yellow color. This Parthenium will have to be one and the same with the former, being only lesser or greater in one place than in another.

V. The third, or Double Marsh Marigold. It has Roots which are composed of many thick, long and round, white Strings, which run down deep into the Ground, and there are furnished very strongly. From this Root come forth many broad and round green Leaves, a little indented or waved about the edges, like unto the single Kind, but not altogether so large, especially in a Garden where it stands not a little Moff. The Stalks are weak, round, hollow and green, divided into three or four Branches at the top, with Leaves at the several Joints, on which stand very double Flowers, of a gold yellow color, the five outward Leaves being larger than any of the rest which are encompassed by them which fall away after they have stood blown a considerable time (for it continues in Flower a month or more, especially if it grows in a flaxy place) without bearing any Seed.

VI. The Places. The two first grow only in Waters and watery Ditches, and by their Bank-sides, as also in Marshy and Watery Medows, the third grows naturally in Marshes and Moilt Grounds, (in some places more than in others) but with us it has been for a Long time Nurtured up in out Gardens.

VII. The
of Marjerom.

I. The Names. It is called in Greek, 
Marjoram & Ambrosia; in Latin, 
Sampfum, Amariunc & Marjoram: in English, 
Marjoram; of the Arabs it is called 
Marsimar & Mansour.

II. The Kinds. There are several Species of this Plant, as 1. Majorana officinalis vulgaris, 
bula Plini & Dioscorides, Wild or Field Marjoram.

The Descriptions.

III. The first, or Our Common Garden Sweet Marjoram. It has a Root which is 
compounded of several small Fibres or Strings, 
which perish with the whole Plant every year. This Herb is commonly Sown Annually in our 
Gardens of Foreign Seed, and is a small 
low Plant, little above a foot high, full of 
Buds and small Whitish and soft round-
ish Leaves on them, smelling very sweet. At the tops of the Branches grow several 
small long and round fleshy Heads or Knots 
and therefore by some called Knotted Marje-
rom) of a whitish green color, out of

which come here and there small white 
Flowers, and after them small reddish Seed.

Garden sweet Marjerom.

IV. The second, or Marjoram Gentele. Its Root 
is like the other, from whence grow up several 
small Stalks and Branches, not exceeding the for-
mer in height, but it has finer and smaller Leaves, 
hearty and less, and much sweeter than the former; 
the Heads are like unto that, and to are the 
Flowers and Seed, the whole Plant being more 
tender than the the first Common sweet Marjoram, 
and abiding but a Summer in like manner.

V. The third, or Winter sweet Marjoram. 
This is an excellent Plant, and abides green all 
The winter, if it is not to violent, growing in the 
same manner and form which the first does, and 
its Leaves are a little smaller and greener than is, 
but with the like Heads and Knots. Yet some 
take this to be but the Common Summer sweet Marjoram, which by Transplanting, is made more 
strong, and able to abide the Winter.

VI. The fourth, or Winter or Pot Marjoram. 
It has a Root which is white and thready, not perfuming 
in Winter, but abiding many years, and is en-
crusted rather by Slippery and felt, then by Sowing 
the Seed. It is a small low bushy Herb, not growing 
much higher than any of the others, but spreading 
its Branches wider, on which grow broader and 
greener Leaves, set by couples, or pairs, with 
some smaller Leaves also, at the several Joints, 
all along the Branches: at the Tops whereof 
grow a number of small, purplish, white Flowers, 
set together in a Tuff, which turn into small and 
ground Seed, larger than the Seed of the Common 
Sweet Marjoram. The whole Plant is of a sweet 
mixture, but much less and inferior to the other, 
being also nothing to bitter as is the Common 
Sweet Marjoram, and therefore the more fit for a 
Pot-Herb.

VII. The
The Virtues

XIV. The Liquid Juice. It is good against all Diseases of the Throat, which cause shortness of Breath, or difficulty of breathing, opens the obstructions of Liver, Spinal, Reins and Womb, clearing them of those Tartarous Humours, which fluff them, and strengthens and confirms the Viscera. It expels Wind, gives ease in the Cholick, provokes the Terms in Women, brings down the Loches, and causes a due cleaning to Women in Child-bed. It is also very profitable for such as have the Strangury, or cannot easily make their Water, being taken Morning and Evening from one Spoonfull to three in good white Porr, or white Lisbon Wine: Drop into the Ears, it eafe their Pain.

XX. The Distilled Water. It has the Virtues of the Juice and Essence, but more powerful, and may be given to 6 Ounces, or more, sweetened with white Sugar, or mixed with an equal quantity of Common Wine: it may also, being dulcified, be used as a Vehicle, to convey some of the other Preparations in, down into the Body. It is good against Infammations and weakness of the Eyes, and is mixed with other Sweet Waters, to make a Sweet Wash of.
Chap. 475. English Herbs.

XXI. The Spirit. It is very Cordial, Narcotic, Cephalick, and Somnifereus, expels Wind, gives present ease in the Cholick, is good against the Apoplexy, Leaffallies, Palsy, Convulsions, pain in the Stomach, want of Appetite, Indigestion, and loathing of Food; it comforts the Heart, cleans the Spirits, and prevails against Fainting and Swooning Fits; and as a Diuretic of the Head and Thorax. Dole (being first defeated with double-refined Sugar) is from 2 Drains to 4, either alone, or mixed with a Glas of Generous Wine.

XXII. The Chymical Oil. It is a Specifick against the Collick, Pufick, Leaffallies, Convulsions, Gout, Fyfterick Fits, and the Poison of Serpents. Dole from 3 or 4 Drops to 15 or 12, in white Sugar, or Syrop of Chince Giffords, mixing the Oil very well therewith, and then with a Glas of some Generous Wine, or Sack, Wine, or to drink it off, Morning and Night.

XXIII. The Spiritual Tincture. It has all the Virtues of the juice, Essence, Spirit, and Chymical Oil, but not so powerful as the last: it gives ease in the Cholick almost in a moment: Dole from 1 Dram to 2 Drains, in a Glas of Generous Canary Morning Faffing, and at Night going to Bed.

XXIV. The Oily Tincture. Given from 10 Drops to 20, 30, 40, or a Dram in any convenient Vehicle, it gives present relief in the most vehement Collick, cleanses the Reins, Ureters, and Bladder, of Sand, Gravel, or small Stones, provokes Urine, expelling the remnants of those Parts, which drop the Urine and cause pain; Anointed well on the Back Bone, as also on the parts affected, it many times cures the Pufick, Nummans, and Trembling of the Limbs, beyond most other Medicaments, and has had a good effect in those cases when all other things have failed.

XXV. The Castorplum. Made either of the Powder of the Herb, or of the Green Leave, beaten up to a Confitency with Honey, and applied, it takes away the black and blaw marks of Blisters, Bruises, Pochings and the like: If it is made up of the Green Herb beaten with Salt and Vinegar, and Powder of Ginger, and Long Pepper, and so brought to a Confitency and applied, it is good against the Poison of the Scorpions Sting, as also the Bitings of Mad Dogs, Vipers, Rattle-Snakes, &c. being immediately applied after the Hurt done.

XXVI. The Puffy. Made of the Green Herb beaten, and brought to a Confitency with Powder of the Roots of Pellitory of Spain, a little Salt, and Vinegar, and Boes Wax, and then reduced into Form, and put up the Womb, and so contained there for some time, it is said to produce effectually the Terms in Women.

CHAP. CCCCLXXV.

Of Marjorom Goats.

I. The Names. It is called in Greek, Theroposv. in Latin, Tragorganum; and in English, Goats Marjorom.

II. The Kinds. There are four especial Kinds which Authors take notice of, viz.

1. Tragorganum Criticum, Tragorganum Cre-safe opad Vecentis Lobelli & Tine; Tragorganum Clufii, Tragorganum tertium Hifpanicum Caps, Bubinti, Goats Marjorom of Candy.

2. Tragorganum latifolium, Bubinti, Marum Cor-tci Marjorom, Tragorganum alterum Gefneri & Lobelli, Tragorganum loftolium Bubinti, Broad Leaf’d Goats Marjorom: this second is that Marum which Corvusus sent unto Mat-thiolius, for Thymum Criticum; and by the Name of Marum, it is called by Durentes, and Lugendanfis: and Lobel says, that among all the Plants which are called Tragorganum, he could find none which came nearer to thote of Dufcendere, than these two first Kinds we have here Named. 3. Tragorganum Hispanticum, Tragorganum secundum Clufii, Dodoni, Genera-ri, Lantaneus & Tabernamontani, Spanish Goats Marjorom. 4. Tragorganum Mauhosi, Lugdunensis & Tabernamontani, Tragorganum forpilifolium, Matthiolius his Goats Marjorom, or Goats’ Marjorom with Wild Time Leaves.

The Descriptions.

III. The first, or Goats Marjorom of Candy. The Root speads it self with many small Fibres, and the Plant abides green all the Winter, if care.

Dants R & A R 0 R.
Salmon's Herbal. Lib. I.

fully preferred and holden in, but left without decent, is for the most part preferable. It is a low Plant, and has several small low Branches, not above a Foot high; something Woody, on which are set several joints, two Leaves, and some times more, which are somewhat broader, rougher, and harder than the Leaves of Lythrum Officinale, and something like unto Summer Savory, but of a fadder green color; the small, hooded, gaping, Flowers, stand at the tops of the Branches, in several distances about the Stalks, of a purplish red color. The whole Plant, and every part thereof, tastes very hot and sharp, and smells very sweet, with a very strong liveliness, and very quick and piercing.

IV. The second, or Broad Leaf'd Goats Marjoram. It has for its Root, a blackish Buff of many colors, set together like those of Marjoram. This Herb grows up to be a fine small bushy Plant, little above half a Foot high, whose Stalks are not so woody, but tenderer like Marjoram, with many small, smooth, gentle Leaves, two for the most part set together at a joint, something broader than our Mastick-Thyme, of so strong, hot, and quick a smell, that being a little bruised, and smelt unto, it paries the Senses more than the former, and comes somewhat near unto the small of Columm or Pennyroyal. The Flowers are small, and purple, growing up to the tops of the Branches. From between the Joints this abides green all Winter as the former, but requires as much care in preparing it in the Winter, as that does.

V. The third, or Spanish Goats Marjoram. The Root of this is more woody, and less bushy than the former. And this Plant rises up somewhat higher than the last, with whiter and harder Stalks; the Leaves are whiter also, smaller, narrower, and longer than they, and more flore of them usually at every Joint; smelling something Sweet, but nothing so strong or quick, nor talking so hot as they. The Leaves are white, and grow at several distances, towards the tops of the Stalks, but larger and more gaping, standing in brown and green Husks. This also abides green in the Winter, but is preferred with more difficulty than either of the former.

VI. The fourth, or Matthiolus his Goats Marjoram, or Goats Marjoram with Wild Thyme Leaves. This Plant Matthiolus still for itself, and calls it Tragopogium. It has a bushy Famous Root, from whence spring up several hard Stalks and small Leaves growing upon them, at several distances, which are like unto the ordinary Wild Thyme. The Flowers are purple, standing in rosettes at the tops of the Branches, and the whole Plant smells not much unlike to Penny Royal.

VII. The Places. The first grows in Crete and in Spain also. The second is unknown. The third in Vallesia in Spain. The fourth in the Province of Perugia, and several parts of Italy; but all of them grow with us in Gardens.

VIII. The Time. They all Flower with us very late in the year, Gerard lays in Auguft; others say that we scarcely see any Flowers till September or October, and sometimes scarce see any at all.

IX. The Qualities. They are (especially the two last) hot and dry in the third Degree: and much more strong, piercing and effectual, in all their other Properties, than either Sweet Marjoram, or Originum, of which we have and shall speak in their proper Places.

X. The Specification, Preparations and Virtues. are also the same with those of Sweet Marjoram, of which we have largely discoursed in the former Chaper: Living that as these two latter especially, are more strong and potent, than any of the Marjorums, so all the Preparations of these are much more effectual, to all the intentions and purpoze there specified.

C H A P. CCCCLXXVI.

OF MASTR--WORT.

I. T H E Names. It has no Greek Name, as being unknown to the Greeks: but is called in Latin, Imperatoria, & Aflristis; in English, Master-wort.

II. The Kinde. Authors make but two Species hereof, viz. 1. Imperatoria, fine Aflristis vulgaris, Laserafinum Germanicum buffay, Imperatorium bursa-fovea, Traga, & Offertionis, but the generality of Authors call it by the two last Names. In English, our Common Master-wort. 2. Imperatoria Alphina, vel Aflristis Alphina Camerafii, Mountain Master-wort.

The Descriptions.

III. The first, or Our Common Master-wort. It has a Root which is something great, and rather grows side wise, than deep into the Ground, flowing forth several Heads, which taste sharp and bring on the Tongue, and is the bottom and sharpest part of any of the root of the Plant, (to which the Seed in heat comes next) this Root is blackish on the cut side, with several fibres or fibris ading to it, and smells very well. From this Root springing up several Stalks of winged Leaves, divided into divers parts, three for the most part standing together, at a small foot Stalk, on both sides of the greatest and three branches of the Stalk, each of which Leaves are somewhat broad, and cut in on the edges into three or more divisions, and all of them armed about the brims, of a dark green color, somewhat resembling Angelica Leaves at first sight, till they be better viewed, as that these grow lower to the Ground, and upon
MASTER-WORT.

leather Stalks; from among which Leaves rise up two or three Stalks, which are short in comparison of Angelica, being about two feet high, and slender, with flake like Leaves at their Joints, as grow from the Root below; but lefter, and with fewer divisions, bearing Umbles of white Flowers: and after them small, thin, flat, blackish Seed, something larger than Dill Seed.

IV. The second, or Mountain Master-wort. The Root grows in like manner as the former, and is black on the outer side, but is more hot, sharp and being upon the Tongue, than the Root of the first or Common Kind. This Plant grows also in form much like to the first, but lester in every part, having nine Leaves standing on each Stalk by three and three, but they are smaller and narrower, and have fewer divisions in them, but finely divided about the edges: The Flowers and Seed of this are also very like to the first, without any material difference, unless it be in the magnitude, there being something the lester.

V. The Places. The first grows Wild on the Hills in Italy and Germany, in Woods also and Furt’s: The second was found growing on the Alps in Switzerland; With us they only grow, and are Nurt’d up in Gardens.

VI. The Times. They are Soid to Flower from the beginning of June to the beginning of August, but if the Season is cold, and very moist, they grow, and Seed late with us, as not until the end of August.

VII. The Qualities. They are hot and dry in the fourth Degree, being hotter than Pepper, and of very fulful parts. It is Attrative, Aperitive, Carminative, Digestive, Diffusive, and Diuretic; Cephalic, Neurotic, Stomatik, Cordial, Nephrick, and Hyterick; Aperitive; Emmenagogue, Sudorific and Alephiartick.

VIII. The Specification. It is said to cure the Cholick, expel Sand, Gravel, and Small Stones; provoke the Terms, rediff Caranths, and is profitable against the Falling-ickness, Hyterick ick, the Goat from a cold caufy, expels all forms of cold Poisons, and heals wounds made by Poisoned Weapons.

X. The Preparations. The Root is chiefly used, and then the Seed for water of it, the decoction very fiddon, you may have therefore from the Root,
5. An Infusion, or Decoction of the Seed in Wine. 6. A Powder of the Seed. 7. A Distilled Water

The Virtues.

X. The Bifpance Juice. It is good against all cold Griets and Difleas, both of the Stomach, and other Bowels, expels Wind powerfully both upwards and downwards: It provokes Urine, and helps to break the Stone, and expel it from the Bladder, and heart, and powerfully brings down the Couries in Women, and forces away both Dead Child and After-birth; It is profitable against Vapors and Hyterick Fits; and being mixed with White Wine, and used as a Gargatlin, it attracts Flegm, Rheum, and cold and wonder Fumes out of the Jaws, Glands, Throat, Almonds, Head, Brain, and other parts adjacent. Being put into old Ulcers and pufh’d running Stones, or Tobe, or Pledge, dipp’d therein, and applied to the same, as also into Green Wounds, it makes recover, cleanses and heals them, yes tho’ a Gargatlin, seems impending: And applied to the Gout from a cold Caufe, it gives ease in the pain. Doze from half a Spoonful, to a Spoonful, or more, in any proper Vehicle.

XI. The Decoction, or Infusion in Wine. It has all the Virtues of the Juice, and may be given in the fame Doe and Vehicle, Morning and Evening; besides which it stirs Vomiting, wonderfully strengthens the Stomach, cau’s a good Appetite, and a strong Digestion, diffus’d Vind, and gives present ease in the Cholick; and is profitable against the Droopie, Janulice, Epilepsie, Lethargy, Drowsi-ness, and Sleepneth, and other cold and moft Difleas of the Head and Brain; it has also a singular Virtue and Power against all sorts of cold Poisons, as also against any mifgen Difleas, and the Plague is fit; it provokes Sweats, and defends the Heart against any Venom, Malnourishment or Infection.

XII. The Infusion, or Decoction in Wine. It has all the Virtues of the Juice and Infusion, but not altogether so powerful, and may be given from 3 to 4 Ounces, or more, Morning and Night, or as need requires, being diluted with Syrup of Cherapy-flowers, or Syrup of Violets, and used as a Wash to any putrid or rotten Ulcer, it expels the Putridification, cleanses it, and induces the healing. Trac-sus says that the Decoction of the Root in Wine, be ing drunk, does relieve the Ability of Genera-tion in such as are Impotent, or where it is almost extinct, and this he speaks as a certain Truth.

XIII. The Powder of the Root. It has the Virtues of Juice and Infusion, and may be given inwardly from 15 Grains to a Dram, mixt with a little

Honey.
Honey: It is good against Quaumis, and expels the Fetter and Afterbirth: used as an Anrile, it Purges the Head and Brain of Cold Humors, and is preferable against Apoplexy, Convulsions, Hiccoughs, Cramps, Epilepticks, Lethargies, Vertigo's, Migrains, and other like distempers of those parts. And inwardly taken, it excites the Generative Faculty, and powerfully corrects the cold and moist habit of the Stomach and Bowels: And being strewwed upon old running Sores, and putrid Ulcers, it corrects the Purulency, cleanses them of the Corruption, and induces the Healing.

XIV. The Infusion or Decoction of the Seed in Wine. It has all the Virtues of the Infusion or Decoction of the Root, and may be given in the same manner and the same Dose. It is a singular Proplyflick against pellitential Airs, and against the very Infection of the Plague it self. Taken in the Morning Fasting, it comforts the Stomach, helps Digestion, creates an Appetite, and expels Vomitofys out of the Vipers.

XV. The Powder of the Seed. It has all the Virtues of the Powder of the Root, and may be given to a Dram, before the coming of the Fit of a Quaunian Ague (for also the Powder of the Root) for the Cure of the same, it takes away the extreme sight of the cold, provokes Sweat, and prevails against the Dropties: It may also be used as an Anrile, as well as the Powder of the Root.

XVI. The Distilled Water of Root, Herb, and Seed. It has all the Virtues of the Juice, but much weaker, and may be given from 1 Ounce to 6 Ounces, it may also serve as a Vehicle to convey other Preparations in, which are to be given inwardly. It may also be mixed with the Juice for a Gingerlin, or for a Lotion to wash old Sores, Ulcers, &c. for it notably cleanses and dries them.

XVII. The Spiritusem Tincture of the Root or Seed. The titled it has all the Virtues of Juice, Essence, Infusion, Powder, &c. yet in an especial manner, it reddens the cold and moist habit of the Stomach, taking away all Pains and Aches there, and almost in a moment cures the Cholick. And it is profitable for such as have inward Blisters, occasioned by fally blows, or other accidents, diffusing the concreted Blood, and giving relief to the Patient. Dose from 1 Dram to 2 Drains, in any proper Vehicle, Morning Fasting, and last at Night Going to Bed.

XVIII. The Acid Tincture of the Root or Seed. It is a potent thing against the Plague, and all sorts of Pedlimental or Malign Fevers, used either as a prophylactic, or as a Corrective: it prevails against Poylons of all sorts, and the Bitings of venomous and venemous Creatures, as of Mad-Dogs, Vipers, Rattle-Nakes, and other Serpents; it caules Appetite and helps Digestion: is powerful in breaking the Stones, and expelling Gravel, both from the Reins and Bladder: It is good alo against cold Catarrhs, or dilatations of Rheum upon the Throat or Lungs, gives ease to vertebre Couplings, and helps such as are troubled with Headaizes, Wheezing, shortness of Breth, difficulty of Breathing. It is to be taken in all that the Patient desires, whether at Meals, or otherwise, so many Drops at a time as to give the Ale, Beer, or Wine, a pleasing Acidity.

XIX. The Only Tincture of the Root or Seed. It has all the Virtues of the Juice, Essence, Decoction, Powder, and Tinturier; but in particular it is good against Palsy, Tremblings, Numbnefs, Cramps, Convulsions, Lethargies, Collicks, Gours of all sorts, and the Stone and Gravel, whether in Reins or Bladders, provoking Urine, and giving ease in the Strangury, beyond many other Medicines, being externally anointed on the back-bone, and other parts affected, and inwardly taken from 1 to 60, according to Age and Strength, in any proper Vehicle. It provokes the Terms, facilitates the Birth, brings away the Dead Child; and Afterbirth, caule a good cleansing, and gives prefect ease in After pains, &c.

XX. The Lotion. It is made of the Liquid Juice, mixt with a half part of Honey, soft purified with whites of Eggs, and by the heat of a Bath brought to a Condyfency. It gives ease in Coughs, Cold, Affaffs, and most other Distempers of the Head and Lungs, proceeding from Cold, and a Vitious Flegm.

XXI. The Cataplaff. It is made of the Roots and Leaves, beaten in a Mortar, and brought to the form of a Puslie. Being applied, it is said to cure Pellarional Caruncules and Bichoses, and other like Apodems, Bubo's and Tumors: it cures Corrosions, difficultes congealed Blood; and is an absolute Remedy for the biting of a Mad-Dog, Viper or other Serpent, or venomous Creature, by strongly attralizing or drawing forth the Poylon, &c. but this is to be understood, of such an Application as is made, when the Biting is newly done: applied also to poyloned Wounds, or putrid Ulcers, it draws forth the Poylon, and destroys the Purulency.

MATCH-WOOD, see Touch-Wood, Chap. MATFELLON, see Knapweed, Chap. 414.

C H A P. CCCCLXXVII.

Of M A T- W E E D; or,

M A T - R U S H E S.

I. T H E Name. It has no Greek Name, but called in Latine, Spatum Herba; and in English, Mat-Weed.

The Descriptions.

III. The third, or Our English Mat-weed. Its Roots creep in the Ground, and fitten themselves strongly thither: It has divers long, hard, and very sharp pointed Roots, plowing their Legs who go among them that are not Booted. The Stalks have felt folièd Long Heads, like unto the Ears of Rye, and Blooming like alo.

IV. The second, or Our other Sea Mat-weed. Its Roots creep likewise in the Ground, and are strongly fist in the Earth, as the others are: and this Sea-Mat-weed is in the growing like the former, but that the Roughs are broader and shorter, and do also for the Heads or spikes.

V. The third, or Small Mat-weed. The Roots of this are likewise long, hard, and some what thick, fit to be wrought into little Bankers or the like. It has shorter, smaller, and harder Roughs; the Stalks are about a foot and a half high, having small, thin, long Spikes, and broader at the tops than the former.

VI. The fourth, or Our smallest English Mat-weed. The Roots are long and yellow, like the former small Kind. From which rise up many small, flinder, round Ruffles, like Threads, about 4 or 5 Inches long, growing thick together, among which, the Stalks which are very small, have smaller Heads, and fingle, that is confiding but one or two small Rows.

VII. The fifth, or Spanish Mat-weed or Frail-weed. The Roots sprawl in the Ground into many Tufts, matting therein, that in some places they take up two feet square of Ground or more: from which rise up a number of round Roots, a foot, and a half high, each of which is parted a little above the Ground, into 3 or 4, or more, flinder, long, tough, and green Ruffles, something broader at the fift, being whith in the middle, which soon after have both their edges to draw together, that it makes them feel round, so that the Partition is scarcely defined, and then grow harder and whithal, when they are dry (as we see them in Ruffin Fralls, &c.) and in the round Mats, with which the Floors of Chambers are Matted, as they are wrought there, and brought over here to us: from among which rise up several Stalks, something higher than the Leaves, bearing at the top a small long Head of many sharp pointed Hooks, after which come small long Seeds, like unto some other Grasses.

VIII. The sixth, or Letfer Spanish Ruff or Mat-weed. The Roots of this do most lie the other, but grow in mossy places. From whence rise up the Ruffles or Fralls, in the very same manner and order as the other Spanish kind do. These Ruffles are more fine and flinder, fitter af, and bear a shorter Tuft at the Top, breaking out of a forming Hook or Hole.

IX. The Places. The fift, second, third, and fourth, grow very well with us in England, very plentifully on the Coasts of Norfolk, and Suffolk, and in many other places on the Sea Shore. And the fift of them has been found growing also in the Isle of Tern, near the Sea side, between also Merger and Sandwich, the two last grow in Spain,

the Canaries, Maderas, and other warm Climates.

X. The Times. They bear or bring forth their Heads in the middle, and towards the latter end of Summer.

The Virtues and Uses.

XI. These Plants are all useful in Physick, having no known Medical Virtue, and also hurtful to Cattle, but serve to make Mats and Straws whithall.

Chap. CCCCLXXVIII.

Of MAUDLIN.

I. The Name. It is called in Greek, Νουδαλις; in Latin, Ageratum; (prope non Sensensus, vel Senanum non Sentinent, because the Flowers thereof gathered in a fit time, will not wax old or decay by Age:) and in English, Maudlin.

II. The Kinds. Authors make about five several Species hereof, viz. 1. Ageratum Des/perlis Cameraria, Cafrerus, Durvetis, Geyteris, Luponamen-fis, Matthulis, Tabernemontani, Ephaterum Meat-jus, Balanista Semina, & minor, Dodonae, Cyger Hortentisi minor Geferis, Mentha Carymm, Sibera minor Cordis, Camphora, Cajalia, Meris, Herba Turra Angulare, & Geyteris, & Ephaterum meua, Geferis, Loniceri, Matthulis & Traig, and in short, this is that Plant, which most of the ball and latter Writers, or Authors affirm to be the true Ageratum Desperlis, and the true Ephaterum Meat-jus, and is our Ageratum Vulgaris or Common Maudlin.

2. Ageratum Vere albo, Ageratum feconvert Lagonullen-fis, & Matthulis, Ageratum Florus Condidi-dis Labeli, Cameronis, & Tabernemontani, our white Flowered Maudlin.

3. Ageratum minus Labeli, Cameronis, & Tabernemontani, Ageratum Fulds or tertius Baudini, Small Maudlin.

5. Ageratum serrulatum Lagonullen-fis, Cyathuntinum Alpinum fictit. Aboontani Multividus, Field Lowd Maudlin. This Sort Bastions refers to the Achilles Montana Arthenusa serrulata Jane Labeli, and to the Achilles Montana Lagonullen-fis & Tabernemontani.

The Descriptions.

III. The fift, or Our Common Maudlin. It has many Roots with Fibres adlined, which are long, lifting, or abiding all Winter for some years. It is somewhat like to Coiffmary, (of which

Tett 2
it is kind to be a kind, and has somewhat long and narrow leaves, tinged about the edges. The stalks are about a foot high, bearing at the tops many yellow flowers set round together, and all in umbels of an equal height, much like to Tansy, after which follows small white Seed, almost as large as linseed, the whole Herb, is sweet, feeced and of a bitter taste, and is increased as well by drying, as by sowing. Gerard says it is something like to Commary in color, small, tall, and in the golden flowers set upon the tops of the stalks in round clusters, or Tufis.

IV. The second, or Our white flowered Maudlin. The root is small and fibrous or stringy, like the other. It has woody stalks, and many small leaves set thereon like the other, but something finer, and luster daintied in on the edges.

At the tops of the stalks grow many flowers, as it were in an umbel or Tuff together, like to the former Common Maudlin, but in a manner wholly white, except a little flew of yellow in the middle. The smell of the whole plant is not so strong as the other, yet very sweet and pleasant.

V. The third, or Small Maudlin. The root is small and white, with many fibres adhered to it. It is but a small plant, and has several hoary stalks, not rising much above a foot high, beneath thick with leaves, or thicker than the former, upon all sides of the stalk, or rather round the stalk, which are thinner, longer, narrower, and whiter than the other, and not dented at all about the edges, but something like unto the Leaves of yellow or golden Valerian or Gold-Locks, in Chap. 122, Sect. 4, Fig. 1 aforegoing. At the tops of the stalks stand many yellow flowers, thickly set together in an umbel or Tuff, very well resembling the fifth or Common Garden Maudlin, of a very good and quick smell, which covert into down, and is carried away with the wind. The flowers of this and the first kind, are very beautiful, and will not lose their glory in growing, till they are very old, from whence came the Name Azian or ay-an, not finefeen, and are like in the Tuff to Elshchryson Baswolfrath, which some will have to be the Gold-Locks attentive, others the Aurelia, Some aurea, or Golden Mabth aure.
Chap. 479. English Herbs.

VI. The fourth, or Purple Sweet Maulton. The Root is yellow, small and short, bafing forth many small Fibres, by which it takes hold of the Ground. This rare and delicate Plant, has many small Leaves lying upon the Ground, round about the top of the Root, something like to the Leaves of the first Maulton, above described, dented in on the edges, towards their points, and not backwards or towards the foot Stalk, or thickening on to the Stalk; it is bireth in Talle, but not to biter as the first or common. From among the Leaves rise up many small Stalks, befet with fuch like Leaves as grow below, but fomething smaller, into the very tops; where many Flowers Stand, one above another, every one upon a fhort foot Stalk, conflitng of five small green Leaves, of an admirable Violet like purple color, coming fuch of small green Hanks, of fo excellent and defirable flavor small, that it much exceeds the Violet, and may be compared with Hark it fell. After the Flowers are fall, ferval small Seed Velifs rise up, containing in them small Seed.

VII. The fifth, or Fennel Leaf'd Maulton. Its Root is fomething long, black, and woody, rugged, and a litte Whiteth, with fervalfibers growing to it. It has many Fennel like Leaves, lying upon the Ground round about the Root, which fibres grow ferval crefted or cormed Stalks half a Yard high, on which do grow at certain distances, on each side only three another, fuch like Leaves encompaffing the Stalk at the feet of them, as thofe of Fennel do. At the tops of the Stalks stand large Umbles of Flowers, none of the Stalks not rifting to high as the leaves, all covered and encompaffed with a Tuft of yellow Flowers, very like to thofe of Groundelf for the Form, but of a more excellent Gold yellow Color, which being gathered before they be grown to full Maturity, will abide a long time in their perfel Beauty: and this is that which has chiefly called this Plant to be joined to the Maulton for that the Flowers decay not being gathered, for a very considerable Season.

VIII. The Places. The two parts grow Wild in rough and untilled places in Italy and France, The third on dry Grounds, and out of old Mud and Stone Walls. The fourth upon Rocks and Clifts, where there is fometimes but little Earth upon the Root, it growing or running many times into the Clifts, and mollified only by the Vapors of fome Waters puffing near it, or Dew falling on it. The fmall grows in dry and hungry Wood Lands; but with us they are all Nursed up in Gardens.

IX. The Times. They bring forth their Tufts of yellow Flowers in the Summer Months, viz. June and July, in moft Gardens where they are Planted and prosper.

X. The Suditories, Specifications, Preparations, and Virtues of Maulton, are the fame with thofe of Calmyr, which we have at large declared in Chap. 156. Sect. 6. ad 23. adjoining of this Book; fo that we need fay little more of it in this place.

XI. Noti. A Compound Balfam of Maulton is thus made. Take frefh gathered Maulton, Adder-tongue, of each 12 Handfuls; Or Olive 2 Quarts White Wine a Pint; Boil to a Crispness, and prefift out thus repeat twice more, draining out at all with very gentle preffe: to this add Turpentine 12 Ounces; Benezin 8 Ounces; Begin in the Powder 4 Ounces; mix and in a Bath make a Balfam, Bailing till the muffle is evaporated. It is an Excellent Balfam for Burnings and Scaldings, as alfo for cleaning, incumbrance and healing old and running Sores, and rotten Ulcers, and to raise and bring up the Flesh from a deep and hollow Wound, which things have been proved by a long Series or Number of Experiments.

CHAP. CCCCLXXIX.

Of MAY-WEED.

O R, Stinking Camomil.

I. T H E N ottes. It is called in Greek, Κωτολία, & in Latinus, Camomilla, Camomeli & Ωμονοντάνη & Ωμονοντάνη, λα κομόμαλια, in Latin, Camomila: and in English, May-Weed.

II. The Kinds. There are three Kinds hereof, viz. 1. Camomilla sativa, Stinking or Iling May-weed. 2. Camomilla multiplex, May-weed not finking, or with out fmall. 3. Camomilla Multiplex vel flore plano; double flowered May-weed.

The Descriptions.
Salmon's Herbal. Lib. I.

when the Seed is perfolled, from whence shoot forth round Stalks, green, brittle, and full of Juice, divided into many branches, more thicker and higher than those of our common Garden Camomil, the Leaves in like manner are broader, and of a blackish green color, the Flowers are like in Form and Color to those of Camomil, but commode larger, and of a rank smell, the whole Plant giving also a rank or stinking smell. This grows more upright than either the Common Garden Kind, or the two sorts which follows, and its Leaves are longer and greater than it, as also are the Flowers, by the small of which alone this sort is distinguished from the others.

IV. The second, or May-weed not stinking or without smell. The Root of this is like the former, and its manner and form of growing also; but it grows not altogether so high, yet creeps not or runs on the Ground, nor takes Root at the Joints or Branches, as the Garden sort does, but the Leaves hereof are longer and greater than those of this, yet very like, but of a paler green color, having no smell at all: the Flowers are also very like to the former, and to those of the Garden Kind, but larger, both in the white row or border of Leaves, and in the yellow middle Thurin: by which this sort is differenced from that of the Garden.

V. The third, or Double Flowered May-weed. This is very like to the first Kind here described, and differs nothing at all from it, but in the Flowers, which are commonly very double, and almost as large as double Camomil Flowers.

VI. The Places. They grow plentifully Wild, in most Counties of England, in Corn-Fields, and in, or near unto Furrows in Plowed Lands, and by Path-ways in the borders of Fields. The double Kind has been often found in several parts of England, growing Wild, as the Single Kind do.

VII. The Times. They Flower in the Summer Months, sometimes in June, alfo in July and August; some times earlier, and sometimes later, according as the season of the year is kind-

The Virtues.

VIII. These Plants as they are never used for Food, nor yet scarcely for Medicine, to their Medical Qualities and Properties are for the most part unknown. Yet,

IX. The Juice or Essence of the first, or stinking Kind, is Commended as Gerard says, against Diflabies of the Womb, and Hypertick Fits, and therefore may be profitable against Vomits, and other Crying Fits and Diflabies of like Kind, Dole a Spoonful or two in a Glass of fair Water, or in Angelica Water, or in some other fit Vegetable.

X. The Oution and Capsules made of the Herb. They are Said to be good to dissolve Tumors or Swollings, to difsolve Wind, and to ease Pains and Aches in the Joints, especially being made of the Stinking Kind, and applied Morning and Night to the parts affected.

CHAP. CCCCLXXX.

OF MEDE-SWEET:

OR, THE QUEEN OF THE MIDDOWS.

I. THE KINDS. It is thought to be unknown to any Ancient Greek or Latin Authors: but several Writers call it Ulmaria, a fumarum Ulni f уни стат. From its likeness to Eme Leaves, in English, Medi-sweet, Medowsweet, and Queen of the Meddows.

II. The Kinds. There are two Species hereof, viz. 1. Ulmaria Vulgaris, Regia Prae Dedoni, Borba, vel Barbara Coapa, et Barbara Coapa Trago, Barbara Coapa Chufifif, Barb Cappa Lediti, Moto-

safium Cordi, our Common Medi-sweet, or Meddow-sweet: some have thought it to be Rham Phyllis, but that cannot be positively affirmed. Tragus thought it might be Picken;

mon Disforos, as did also, Gefer in herbis et Loniceras. 2. Ulmaria major, or altera, Poten-

tilla major prae Anguillarias, Argentina major Thiff. The Greater Medi-sweet, or Meddow-
sweet. Lagunus, fays, Some took it to be Molardum Pluroy, and some call it Drymeggon. Camerarius fays the German call the first Worm-

brator, Worm-sweet, because the Roots of this Plant is often found, as if it were eaten by Worms: but it is more likely, from its curing Horfes of the Bots and Worms, for which purpose the Country people use it.

The Descriptions.

1. The first, or Our Common Medi-sweet. It has a Root which is somewhat Wedy and blach-

dy, with the out side, and brownish within, with feve-
rul greater Strings, and feller Fibers adjoining, of a strong smell, but nothing so pleasant as the Vomitors or Leaues, yet perhaps not in Winter, but oldest many Years, growing forth a new every Spring. Its Stalks are reddish and cysty to break, rising to be 4 Feet high, and sometimes to 4 or 5 fit, having at the Joints thereof, large winged Leaves, flasking one above another at Distances, which are made of many somewhat broad Leaves set on each side of a middle Rib, being hard, rough, or rugged, and Cramped much like to Plane Leaves, from whose it took its Name; but having also some smaller Leaves with them, like as Agrimony
MEDESWEET.

Flowers, thruf thick together, which finell much sweeter than the Leves, which being fallen, in their places come crooked and cornered Seed, crookedly turning or winding one with another, and fo making a fine little Head.

IV. The second, or Greater Mede-sweet, or Medlow-sweet. The Root of this is more Woody than the former, with many blackish flinters, which faulf strong, and taste somewhat bafily. This Plant grows higher than the former, with longer winged Leves, fer one above another upon the Crested brownish Stalks, having long foot Stalks support ing them, each being ufually divided into three parts, the two lowest one againft another, and every part alfo confifling of three or five finaller Leves than the other, feparate each from the other, being hard, crumpled and fcarce denoted about the edges, at the tops of the Stalks grow the Flowers in longer Spikes, more fpreadly and not fo thick thruf together, turning down their Heads, which are white like the former, and finellling very fower alfo, more nearly reftimbling a Goat's Beard, (which Name fome Authors have given to it) than the fift kind here defcribed. Gerard fays, it has Leaves of the kind of Wild Angelica, and grows somewhat after the manner of Wild Angelica, that the Stalks are crefied and divided into feveral Branches, which carry long bending Spikes of Ears of white Flowers or Seeds, each fingle

Flower and Seed being something like the former.

V. The Place. The fift grows in moift Medeswer which by much wet, or near Watercourfes, as the fides of Rivers, and wetary Ditcher, almost evry where. The corned grows in Woods, Copfes, and shady places in Germany and other Countries, but here in England, only in Gardns.

VI. The Times. They are found in Flower through all the three Summer Months, viz. June, July, and August, and their Seed is ripe in fome short time after.

VII. The Qualities. Mede-sweet is temperate in refpeft to heat or cold, but dry in the fift Degree. Alutivive, Affretingen, and Traumatick, or Vulnerary, Cephalick, Neuroticck, Scramatic and Hyferick.

VIII. The Specification. It ftops Bleeding, and cures Fluxes of the Bowels of all forts, ftops the Whites and Termis in Women, and gives eafe in the Colick and Grippings of the Guts. And heals Wounds and old Ulcers.

IX. The Preparations. You may make from either Flowers, Leves, or Root, or from all of them. 1. A Liquid Juice. 2. An Effege. 3. A Decoration or Infusion in Wine. 4. A Powder. 5. An Oil. 6. An Ointment or Baffam. 7. A Cataplasm. 8. A Distilled Water. 9. A Spiritual Tincture. 10. An Acid Tincture.

The Virtues.

X. The Liquid Juice. It stops all forts of Fluxes, Bleeding, and Vomiting, as alfo the over fhowings of the Terms in Women, and the Whites. It is faid to alter and take away the fins of Quaffi Agues, eafe the Grippings of the Guts and moves the Belly downwards. Outwardly applied it heals old Ulcers, which are cancerous or eating, and fills up fihulous or hollow Ulcers with New, and cure Soreis in the Mouth and secret parts. Dofe from 2 to 6 Spoonfuls Morning and Night, or other in any Convenient Vehicle.

XI. The Effege. It has the Virtues of the Juice, and is more powerful to all the Intentions before fpecified, and is only to be given from 1 to 3 or 4 Spoonfuls in any proper Liquor, Morning and Night. It is Cordial and very much Cheers the Heart.

XII. The Decoration or Infusion in Wine. They have the Virtues of the Juice and Effege, but may be given from 2 to 6 or 8 Ounces, flrewed a little with white Sugar: It is very Stomachick, fireshens the Bowels, and caufes a good Appetite.

XIII. The Powder. It has the Virtues of the former Preparations, taken from half a Dram to a Dram in any proper Vehicle: if mixt with Honey and taken, it is good againft Coughs, Catarrhs, Colds, Wheezings, Hoarfeck, Swolnnefs of Bruith, and difficulty of breathing. Strewed plentifully upon old, moift and running Sores and Ulcers, it dries them, and induces a fpoedy healing: it is alfo faid to kill Worms in Chil dren.

XIV. The Oil by Infpiration or Baffing. It eafe Parst being applied, and fireshens weak Joints, which have been lately Set, or where the Bones have been Broken.

XV. The
Salmon's Herbal.  Lib. 1.

CHAP. CCCCLXXXI.

OF MELILOTE: OR, KINGS--CLAYER.

I. THE Name. It is called in Arachab, Albehebchek: in Greek, Melilotus; in Latin, Melilote, Melilota, Melilotus; from Latins, which signifies sweet like Honey; in Latin, Melilotus; and in English, Melilote. This Plant was anciently called in Latin, Serula Campana, from its growing in Campana, where they used to put it in Garlands: also Corone Regis, because the yellow Flowers Crown the Tops of the Stalks: and Trifolium Odoratum, from its pleasant scent, but improperly, because the Trifolium Odoratum, truly so called, is Campanula Trefoil, of which we shall speak hereafter in its proper place. It is also called Trifolium Equorum, & Cavilsimum, because Horses delight to eat it, and thrive well with it: and so in many places of England it is called Hors-Clover (from Deers and Stags greatly feeding on it,) and in some places Hert-sward, but it is generally called with us Kings--Clayer (as being the Noblett and chiefest of all the Trefoil, or three-leaved Grasses) and Melilote, from the Latins and Greek; as being the Name now most used, and indeed best understood.

II. THE Kinds. Authors have given us fourteen or fifteen several sorts of this Plant, but the most of them being unknown, and not growing in England, not in our English Plantations beyond Sea, we shall only describe the four following Species, viz. 1. Melilotus Vulgaris, Melilotus major, Melilotus Tragi, Melilotus Germanica Cameraria, &c. 2. Melilotus, Trifolium Odoratum, &c. 3. Melilotus major candidus Tragi, Lato Sylvestris Puro albo Dolichoppon, white flowered Melilote. 4. Melilotus vulgaris, Melilotus Germanica Cameraria, Melilotus dictus floridus Subrustans Anubius, Italian Melilote. 5. Melilotus Germanica, Melilotus vulgaris Species tertia Tragi, Melilotus dictus floridus, &c. 6. Melilotus Syriacus, Melilotus Syriacus odoratissimus, (because it came from Aegypt, as he says, but is used in Iraq for the true Melilote, and therefore called by other Authors, as aforesaid, Melilotus Syriacus, and this Tragus thinks to be the Melilote of Syria;) Alybian Melilote.

The Descriptions.
edges, and oecasionally eaten about the frame. One of the branches of the leaves come small slender stalks about a handful long, set thick on their tops with little yellow flowers, hanging down and turning up again; each flower being composed of two little yellow leaves, of which the uppermost runs up again, and the undermost seems to be parted into three: they are made much like other Trifolium, but small and standing in long spikes, one above another for an hand breadth or better; which being put away, turn afterwards into long crooked pods, in which is contained the Seed, which is brown and something flat.

IV. The second, or white Flowered Medillo. Its Root is tough, white and slender, with many springs or threads adjoining, persifing commonly after it has given Seed, but springs up again of its own Seasing, flowering the next year after it springs, or after the Seeding. This Medillo is very like the former, but has more Woody Stalks, rising up higher, greener, and with flat smaller green Leaves, smeling much like the former, but weaker. The flowers grow also in long spikes and more in number, of a white color, and look also, which turn into small round Heads, and not crooked like the other.

V. The third, or Italian Medillo. Its Root is small and long, and Woody, persifing every year, and seld moves again of its Seed, but must be new every Spring. It has more or less than one Stalk rising from its Root, which quickly grows white and a little Woody, set here and there with three Leaves at a Joint, which are much larger than the former, and the end Leaf larger than the other two; something unevenly waved or cut in on the edges, of a smell almost as strong as the first, but somewhat more pleasant. At the tops of the Stalks grows many Flowers, quite flat

VI. The fourth, or Affyrian Medillo. Its Root is Woody, and persifing every year, after it has given Seed, it rises up with several Stalks about two feet high, set with Joints; at every one of which grow three Leaves, something larger than those of the first, but not so large as those of the leaf of third described, and a little dented about the Edges. The Stalks spread themselves forth in Branches towards their tops, on which grow many pale yellow Flowers, set in order one above another, as in the former, which turn into small, long, and somewhat flat, Crow, a little crooked or bending at the end like an Haws Bill, in which is contained the Seed. The whole Plant, as well Flowers as Leaves and Seed, did smell very sweet at their first bringing out of Asia, or Syria, into Europe, but gradually, it grew year weaker and weaker, so that it seems, it has not now near half so good a smell as it had formerly. This Kind Peru says, is used in Italy instead of the true Medillo (which is the plant described in this Chapter) for that there is great store of it growing in that Country.

VII. The Places. The first grows plentifully in Germany, and also is very common in most parts of England, as in the edge of Suffolk, and in Essex in divers places, also in Huntingdonshire,Cambridgeshire, and the life of Ely, but most usually in Core-Field, in the corners of Alderton, and on plowed Lands ends, and in the Barrows of Corn-Fields, and sometime among the Corn it fell; and certain it is, that it grows not more plentifully in any part of the World, than in England, especially in the Counties aforesaid. It grows between Sudbury in Suffolk, and Clare in Essex, and from Close to Henningham, and from there to Oatlow, Pulham and Pedemus, where many Acres of Ground are overgrown with the same, insomuch, as it becomes almost an annoyance to both the Land and Com, generally overspreading that part of the Shire. The second grows not Wild with us, but is Nurtured up in Gardens; in Germany it grows plentifully as the other does. The third grows in Italy. And the fourth in Syria about Aleppo, from whence it was brought to Venice, and these two last grow here also in Gardens, as the second does.

VIII. The Times. They all Flower in the Summer Months, in June, July, and August, and their Seed is ripe quickly after.

IX. The Qualities. It is hot and dry in the first Degree; Altringen, and Maturative; and yet within Difffusive, where Suppression cannot be expected, alio Traumatic or Vomitory, Disturbing, Nephritic and Lithuretic.

X. The Specification. It diffuseth Tumours, heals Wounds and Ulcers, provokes Urine, expels Stone and gravel, and cleanses the Kins, Uerters and Bladder of Putridous Humors and Tartarous Matter.

The Virtues

XII. The Liquid Juice. It comforts the Stomach and Bowells, and is good to stop Fluxes of the Bowells. Drop into the Eyes it is singular good against Pains and Inflammations there, and to take away Clouds, Films or Pannicles growing up on the Sight, and to strengthen the Eyes. And it is effectual to be given to those who are in fear of an Apoplexy, or have suddenly lost their Senses by a Paroxysm, to strengthen the Head and Brain, and reforest the Memory; the head being alio externally washed with the same. Dose of one Spoonful in a Glass of Wine Morning and Night.

XIII. The Essence. It has all the Virtues of the Juice, and may be given from one to three Spoonfuls in some proper Vehicle. Drop into the Kins it eases their Pains, and drops into fore and running Eyes, it stops the Flux of Rheum. Applied to hasted Tumours or Swellings, it diffuseth and lessens them, and is probably apied to simple Contusions.

XIV. The Decolletion in Wine or Water. Basted upon the Head it gives ease in the Head-ach, spreading Ulcers being wafted thereby it cleanses and dries them. The Decolletion of the Tumours with Camomit in Mutton broth, and used Clyster-wise, expels Wind, and eases parts of the Belly. Made with Wine and Drink, it is good to strengthen the Memory.

XV. The Vinegar. It is admirably diffusive, eases Pain and dissolves Tumours by bathing the part affected therewith: and is used, it compacts the Head, Brain, and Nerves: It diffuseth Hardness, dissolves Wind, and Tumors of the Splen, Liver, and Belly.
Ethy, and Hypochondrists, mightily easing the Pains of those Parts.

XVI. The Infused Oil. It mollifies hard Tumours and Inflammations, discloses Swellings in the privy parts of Man, or Woman; it is a most Sort for being applied both for green Wounds, and old Sorens, for Tumors, Cramps, Convulsions, Pains and Aches in any part of the Body, whatsoever, whether in the Mucous or Phlegy parts, or among the Nerves, Tendons, Veins, Arteries, &c. It is made of the Flowers and Herb with Oil Olive, Infused, or boiled in Balane, and then strained forth, repeating the with fresh Herbs and Flowers three times.

XVII. The Simple Employer. It is thus made. Take green Melilot cut small 5-Pounds, purple Gums 3-Pounds, yellow Rose-Wax 3-Pounds, Sleeps 2-Pounds, Turpentine 1-Pound, mix, boil, strain out, and make an Employer according to Art. It ripens Tumors, breaks and cures them, draws, and heals Wounds admirably in any part of the Body, only be cautious of applying it to Wounds of the Legs, or other🇪Ing parts, for fear it should cause a flux of Humors, not easily to be diversed.

XVIII. The Compound Employer. Take Flowers of Melilot 6-Ounces: Common Flowers, Tanagreec Seed, Bay Berries, tarax, Altho Roots, Tops of Wood and Marjoram, of each 4-Drachmes; Seeds of Purify, Bispoto-seed and Cardiose, Roots of Orise, Coperia and Spickhard, Cabbage-lime, of each a Drachme and half: Ammoniacum 1-Drachme: Stomach, Catamen, Black or White, 8-Drachmes, of each 3-Drachmes: Turpentine 1-Ounce and half: Pulp of fat Figs, N* xviij: Great Suet, Raps, of each 2-Ounces and half: Wax 6-Ounces: Oils of Sweet Marjoram and Spickhard, of each 2-Ounces: Beat those things which are to be beaten, extract or things which are to be extracted, as the Pulp of Figs, Altho Roots, and Tempegreck, &c. Digest the Ammoniacum and Tatalium in Tomar, &c. Then mix and make the Employer according to Art, adding the Oils of Sweet Marjoram and Spickhard, towards the end of the Operation. It is Marrenive, Emlenion and Antend, draws, cleanses and heals, strengthens the Stomach, Liver, Spleen, and Bowels, discloses Wind and Tumors, helps Hypochondriack Melancholy, Vomiting, Indigitation, Blisters, &c.

XX. The Balmia. It is made by boiling the green Herb bruised 5-Pounds, into Olive 3-Pounds, in 9-Drachmes, then streaining out, and renewing this Work three times, as much to every Pound of the strained Liquor add 3-Pounds: Half: Chian Turpentine, Balsam Capvis, Gum Elemi Extracted, Balsam of Peru, of each 2-Ounces: mix and comminut the Balsam. It heals green Wounds commonly by the first Intention, and many times at once dressing: It digests eating Ulcers, cleanses putrid running Sores, incrustates, drys and heals, cures Pains in any parts, chiefly of the Nerves and Tendons, and cures the Gout, being fully applied.

XX. The Coprinus. It is made of the Flowers and Leaves boiled in Wine, and brought to a Confection with Miscell of Tanagreec and Lin Seed, or Early Flower, or Poppy Seed beaten soft and small, or Parts of Eggs boiled hard. It serves all hard Tumors and Inflammations in the Eyes, Nerves, Tendons, Muscles, &c. in any part of the Body, Fundament, Tendicles, or private parts of Man or Woman. ripens and breaks Apoptomes, helps the course of cutting and spreading Ulcers, renews the potency, digests and cures the Pain, &c.

XXI. The Difftilled water. It is made of the Herb and Flowers, by an Alkmeur with a noted Fire, or in Balane. Some use it as a Perfume; but mix with an equal quantity of common Spirit of Wine, it makes a Collyrium, which seeps into the Eyes, cools, takes away Inflammations, and hot Rheums, clears the Sight, cures the Pain, and strengthens the part, thereby preventing many new or future Fluxions of Humors to the Time.

C H A P. CCCCLXXII.

OF MELON Garden:

I. T H E Names. It is called in Greek, Μέλον; in Latin, Pepo; and in English, Melon, Millon, and Pompion.

II. The Kinds. There are four principal sorts of this Plant, viz. 1. Pepo Habitatia, the Garden Melon or Pompion, of which we have this Chapter. 2. Pepo Sylvestris, the Wild Melon, or Pompion, of which in Chap. 482. 3. Melo pepo, the Muskmelon, of which in Chap. 486. 4. Melo var. aquatica, Carvallio, the Curril or Water Melon, of which in Chap. 485. following.

III. The Kinds of the Garden Melon or Pompion. These are these following Species, viz. 1. Pepo maximum oblongus, the great long Melon or Pompion. 2. Pepo maximum radulaus, the great round Melon or Pompion. 3. Pepo maximum compresfus, the great flat bottomed Melon or Pompion. 4. Pepo maximum oblongus, the great Rattle-like Melon or Pompion. 5. Pepo minor, five Virginian, the smaller or Virginian Melon or Pompion, called also Virginian Muscovet.

The Description.

IV. The soth, or Great long Melon or Pompion. Its Root is of the height of a Man's Thumb, or larger, covered under Ground, with many small Fibers thereto adhering. From this Root come forth thick and rough prickly Stalks or Branches, which creep upon the Ground, if nothing is near it to take hold of, otherwise with its clasping Tendrels, it climbs upon such things as are near to it, as Poles, Arboles, Pales, Hedges, Shrubbs, &c. upon which it grows, thicket, rough Branches, grow very large, rough Leaves, cut in on the edges with deep gashes, and dented all round as like a Saw, with many Cliffs, which wends about every thing it meets withall. The Flowers are
are great and large, hollow and yellow, like unto a Bell Cup, divided in the brim into five parts or points flinting out like Teeth. At the bottom of which, (as is in all the Melons) grows up the Fruit, which is very great, thick, round, and long, or of an Oval form, sometimes of the bigness of an ordinary Mason's Body, fer round with bunched Ribs in some, and more plain and flat in others. The Rinde is either of a green, or grey, or yellow color, or whitish, or party colored, as Nature is pleased to vary it, and of a mean hardness. The harder pulp of the Fruit is yellowish, or of a whitish yellow, and of a flinty tafte; but the thinner pulp within that, lying in the middle, is of a Slummy, P hipous, and Watery Substinance, in which the Seed is contained, which is white, large, broad, flat, thin, and almost Oval, but somewhat narrower pointed at one end, and of a sweet or Milky, Nut-like tafte.

V. The Fourth, or Great round Melon or Pompion. This is like unto the former, in its Root, Stalks, Branches, Leaves, and Clasping Tendrels; but the fruits in the Leaves are not so deep, and the Stalks are tenderer. The Flowers are in like manner yellow, gaping, cornered or pointed at the top, as those of the former; but the Fruit is something rounder, sometimes greater, and sometimes lefter, and often times of a green color, with a harder Rind, and sometimes now and then softer and whitier. The harder pulp within is like the other, and the Seeds have also the same form, with very little difference in their manufature.

VI. The third, or Great flat bottomed Melon or Pompion. This differs much from the other two in its Root, rough Stalks, or Branches, and in its Gathered or dentined Leaves. The Flower is also great and yellow, like those of the others; but the Fruit (which is of a great bignes) is com-

Chap. 482. English Herbs.

preffed or flat bottom'd, and its Rinde is full of little hilly Whelks, not much unlike to those of the Citrus Rinde or Peel, which when it is ripe, is in like manner, yellow.

VII. The fourth, or Great Rocker-like Melon, or Pompion. This very much differs from the others in form; the Roots, Stalks, Leaves, and Flowers, are much like the others; but the Fruit is not long nor globular, but altogether broad, and in a manner flat, like unto a Shield or Rocker, thicker in the middle, but thinner in the circumference, and curled, hilled, or bunted, up and downabout the edges, like the rugged or uneven Peel of the Citron: and this Rinde is very soft, thin and white. The folder pulp within, is hard and durable, and the Seed in form, color, and tafte, like the former Kinds, but somewhat less.

VIII. The fifth, or Smaller or Virginian Melon or Pompion. Its Root consists of many whitish Branches, creeping far abroad in the Earth, which stand up in the Starch of Winter. From whence springing up rough cornered or fracted Branches, trailing upon the Ground; 8 or 9 feet long or longer, which spread themselves and run upon the surface of the Earth, and are again divided into other Branches of a blackish green color, covering and taking up a great deal of room, sending forth broad, cornered round Leaves, on great stalks, long, rough, hairy foot Stalks, like and full as large as the Leaves of the first or common Melon or Pompion; with clasping tendrels, and green, broad, thriving, yellow Flowers, like to those of the common Pompion. After them comes the Fruit, upon the Stalks, not commonly to near the Root, but towards the tops or ends of the Branches, something round, and not extending in length, but flat like a Bowie, and not so big as an ordinary Bowie, being faltened above an inches in thickness or length, and a Inches in breadth; of a blackish green color when it is ripe. The edible pulp is of a whitish yellow color, containing within that, a great deal of a thinner, soft, flaky, fibrous Substinance, in which the Seed lies in certain rows, like that of the first or common Pompion, but much smaller.

IX. The Places. These are all planted in Gardens in England, and other Countries, and delight in a rich and fruitful Soil, and even in our Country, they come to great perfection.

X. The Times. They are planted in the latter end of March, or the beginning of April, Flower in the latter end of July, and August, and their Fruit is ripe in September and October.

XI. The Qualities. The Fruit (which is that which is chiefly made use of) is cold and moist in the second Degree, Astringive, Acrid, Diuretic, Lenticve, Nephtirick, and Lithurtrick.

XII. The Preparations. You may have herefrom, 1. A Liquid Juice of the Fruit. 2. The Pulp of the Fruit. 3. An Emulsion of the Seed. 4. A Cephalus of the Pulp. 5. A Diluted Water of the Fruit.

The Virtues.

XIII. The Liquid Juice. Given from a Spoonful to two, in the Diluted Water, and sweetened with Syrup of Clove- Gillflowers, it quenches Thirst, abates the violent heat of Burning Fevers, allays the heat and inflammation of the Stomach and other

Uu u u B Bowels.
Salmon's Herbal. Lib. I.

Chap. Cccclxxiii.

Of Melon -- Wild.

Or,

Pompion -- Wild.

I. The Name. It is called in Greek, 

Melon, in Latin, Melo vel Pepo Syvosteriis ; and in English, Wild Melon or Pompion.

II. The Kinds. There are two sorts of this 

The Descriptions.

III. The first, or Greater Wild Melon or Pompion. It has a Root which is thick, round, and sharp pointed, having several Fibres adjoining to it. From which come forth rough, uneven Stalks, fit with sharp, thorny Prickles: The Leaves are also rough, and jagged or much cut in on the edges, of an uneafening green color, and the Flowers are of a yellow color, much like those of the Garden Kind. The Fruit is thick, round, and long, almost of an Oval fashion, sharp pointed, and having a hard green Kind, whole soft Pulp or Meat is hard like the others; but the middle Pulp soft and flimsy, In which it contains the Seed, which is like that of the Garden Pompion, but the whole very bitter in taste.

IV. The second, or Lesser Wild Melon or Pompion. This in its Root, Stalks, Branches, Leaves, Flowers, Fruit, Seed, and manner of growing, is very like the former but now defaced, and differs from it only in its Magnitude, this being every ways much less than it.

V. The Places. These Plants grow Wild in Barbery, and most parts of the West-Indies; but with us in England, they only grow (being Sown) in Gardens.

VI. The Times. They spring up, and Flower in the same Season, with those of the Garden Kinds.

VII. The Qualities. These Melons are hot and dry in the third Degree, and are very bitters: they are also Alkotropic, Hypotrochick, and Cathartick.

VIII. The Specifick. They are peculiar for the curing of Dyspepsies and the Kings Evil: and to provoke the Terms in Women.

IX. The Preparations and Virtues, of these Wild Melons or Pompions, are the same with those of the Wild Cucumber, in Chap. 479. 6th Edit. p. 27, where you may have abundant satisfaction.

X. Nota.
II. The Kinds. Authors make four Species of this Plant, to which we shall add a fifth, growing in America, viz. 1. Melo, vel Melopepo vulgaris, Our Common Musk-Melon. 2. Melo Hi- jacanone, the Spanish Musk-Melon. 3. Melo Pyri- formis, the Pear-doom'd Musk-Melon. 4. Melo Saccharinus, the Sugar Musk-Melon. 5. Melo Americanus, vel Floridissimus, Melo Carolinosus, vel Virginicus, the American or Carolian Musk-Melon.

The Descriptions.

III. The first, or Our Common Musk Melon. It has a long Root with many Fibres at it, running not very deep into the Earth, but in a great measure under the upper crust of the Ground. From this Root shoot forth Stalks, Branches and Leaves, much resembling those of the Cucumber, both in the manner of growing, and in its trailing Branches, which are rough, with rough uneven Leaves, with yellow Flowers: after which come the Fruit, which is rounder, thicker, bigger, and ruggeder than any Cucumber, and spotted on the out side, of a reddish color, and green underneath, which when it comes to be full ripe, will change a little yellowish, being deep furrowed and ribbed, and sometimes without Ribs, and having many times chaps and rifs in some places of the Rind. The inward hard Pulp, is yellow, and of a pretty flat or fold Substance, and is only eaten: The Pulp within that, is very soft, slimy, and watery, and of a pretty deep yellow color, in which is contained the Seed, which is something larger and yellower than that of the Cucumber. The Fruit coming to be of a strong sweet smell, and changing its color, either to yellowness, or a green yellow, fiwes its coming to ripeness: but it requires much watering in the hot time of the day, to induce its sooner ripening.

IV. Gerard has this Description of it. It is like to the Common Cucumber in its Stalks, lying flat upon the Ground, long, Branched and rough. The Leaves are much alike, but leather, rounder, and not so corneled. The Flowers in manner are yellow. The Fruit is bigger (than the Cucumber:) at first somewhat hairy, something long, and somewhat round, often times greater, and many times bicker. The Bark or Rind is of an over-grown ruffer green color, ribbed and furrowed very deeply, having chaps or Chinks, and a confuted roughness. The Pulp which is to be eaten is of a faint yellow color, the middle part of which is of a flamy moisirre, in which is contained the Seed, much like to that of the Cucumber, and of a browner color.

V. The second, or Spanish Musk-Melon. It has from its Root which is like the former, long trailing Branches, on which grow broad Leaves, slightly indented about the edges, not divided at all, as are all the rest of the Melons. The Fruit is large for the most part, and grow near unto the Stalk, like unto the Common Garden Melon or Papaw, very long, not creted or furrowed at all, but spotted with very many such marks or spots as are on the back side of the Horse-tongue Leaf. The Pulps (both the former and the latter) as also the Seed, are much like the former.

VI. The third, or Pear furled Musk-Melon. It has many long Viney Branches, upon which grow corneled Leaves, like that of the Vine, as also great.
Salmon’s Herbal.

Lib. I.

grown there of long Tendrils, clasping and climbing, and taking hold almost of any thing they touch. The Fruit grows upon slender foot Stalks, and is diffi- 

cult to separate from the green Leaves of the Plant, in April. It is often eaten for a 

VII. The fourth, or Sugar Musk-Melon. It bears long trailing Stalks or Branches, lying upon the Ground, with long small clasping Tendrils, like those of the Vine, or Arabick, and also Leaves like unto the Common Cucumber, but of a greener color: the Fruit is round, with eight or nine Leaves, growing upon slender foot Stalks, and round like a Cucumber, and of the same bigness, being of a 

The Fruit is big, round ribbed, and very large, sometimes as large as Our Great Common Garden Pumpkins, and almost of the same shape, both of the first kind, and of the second round kind, growing in the ribbing hereof, and when it is ripe, it is in its kind of a whitish yellow color, and of the thickness of Our Common Pumpkins. The more solid Pulp, as also the soft 

IX. The Places. They delight to grow in hot Countries, as Spain, Italy, Africa, the Coasts of Barbary and Egypt, in several parts of Asia, and the East and West Indies, yet they thrive and 

come to perfection here in England, being Haf- 

banded with Care; and the last grows plentifully in Carolina, an English Settlement in America, and in 

other parts of that Continent.

X. The Times. They are sown in the latter end of March, and in April, and their Fruit is ripe in 

August, from the beginning of the Month to the 

end thereof.

XI. The Qualities. The Fruit and Seed 

are cold and moist in the second Degree, cleaning, and 

very grateful and refreshing to the Stomach and 

other Bowels.

XII. The Specification. The Fruit and Seed 
cool in Fevers, and admirably repels Lufi.

XIII. The Preparation. You may have there- 

from, 1. The more solid Pulp. 2. A Liquid Juice 

of the Fruit. 3. An Emulsion of the Seed. 4. A 

Diftilled Water of the Fruits.

The Virtues.

XIV. The Liquid Juice of the Fruit. Given 

from one Spoonfull to two mixt with some of the 

Diftilled Water, and sweetened with Syrup of Clov- 

es, and intermixed with Sugar and Saffron, it cures the 

heat of Burning Fevers, and by repeating it at 

day distances of time cures it: it also much 

abates Lufi, and takes away the Potency of Gene- 

eral.

XV. The more solid Pulp of the Fruit. It is used 
to be eaten as a Sallet, the outward Kind being first 

pared off pretty thick, and also being freed from the 

inland Soft Silthy matter: it is then filed and 

cut into Pieces with Pepper and Salt, and by some with 

Sugar only, by which way, it very much cools and 

refreshes the Stomach, more especially if a Glass of 

Wine be drank after it.

XVI. The Emulsion of the Seed. It cures the 

hot burning &c of Fevers, quenches Thirst, cools 

the Stomach and Bowels, softens the Belly, cleans 

the Skin, Ureteres and Bladdern, provokes Urine, 

causes the Stomach, takes away the heat and binding 
of Urine, helps such as make bloody Water, and 

rephales Luft, (being long used) after a regular 

manner.

XVII. The Diftilled Water. It has all the Virtues 

of the Liquid Juice of the Fruit, and of the 

Emulsion of the Seed: and may be taken from four 

or eight Ounces sweetened with some proper 

Syrup. Used as a Topick, it cools Inflammations, 

helps blood-flux and flux Rheumatick Eyes, and 

clears, softens, and whitens the Skin, removing 

Scabs, itching, Scurf, Morphew, black and 

blew Spots, Tanning, Sunburning, and other dermatals 

thereof: and this more especially if a little Juice 

of Melon, or very sharp white Wine Vinegar, be 

mixed with it, (but is not then to be used to the 

Eyes.)

Chap. CCCCLXXXV.

Of MELON-WATER:

Or CITT.

I. The Name. It is called in Arabick, Batek, &c. Bath, of the Egyptians, Chute, Abdolovis, Chajar, and is thought to be the 

Dulhaba Scorpionis: in Greek by Aitos (who first 

named it in that Language) Aiprox, or Aiptos, 

(wich with the Greeks did sometime signify a 

Cucumber.) In Latin, Anguria, Cucumis, or Ci- 

tulum, a Ciderus color & forma: also by some 

Cumulus Cucumber, to distinguish it from the Cucum- 

ber, in English, Water Melon, and Cirtul, or 

Turky Melon.

II. The Kinds. There are several sorts of this 

Plant, but the three following are chief, viz. 1. 

Anguria or Citrulum vulgaris. The Common 

Cirtul, Water Melon, or Turkey Melon. 2. Anguria 

Egyptii, the 

Egyptian Citrl or Water Melon. 

The Descriptions.

III. The first, or Common Citrul, Water 

Melon, or Turkey Melon. The Root spreads under 

the Ground, with several Ramifications and Threads 
or Threads adhering to them, and the same runs on 

at the root do. In its form and manner of growing, it is like other Melons and Cucumbers, trailing and 

lying upon the Earth, with its Vine-like Branches: 

the
the Leaves of which are hairy, longer, and narrower than in any other, and more divided into several parts, having small Claspers and yellow Flowers: but the Fruit is greater than a Mark-Melon, and something near the fashion of a Pomegranate, with a smooth greenish Bark or Rind, which will grow yellowish in time, having some like thineon. The Pulp or inward Substance is watery, in some sweet, in others a little tart, or acid, but in the whole very pleasant and delectable to the Taste. The Seed is contained therein, and is smaller, rounder, blacker, and harder Shell'd, than that of the Ground.

IV. The second, or American or Carolina Water-Melon or Citruls. As Rost in like the former, and the whole Plant varies but little from it in its Stalks, Branches, Leaves, Blossoms, and manner of Growing: But the chiefest difference is in the Fruit, which is as great as a middle-sized Alber or Pomegranate, some of which are a Foot or sixteen Inches long, and thick in proportion to that length, having a Discolored Rind, variably spotted and striped with white Spots upon the green: the inner Pulp of which in some is white, in some reddish, and in some almost a purplish Color, very watery, and of a most pleasant and delectable Taste; but some is watry, yet it is of firmer Substance than the former, and will keep after it is ripe for some Small time. The Seed within this is like the other, but larger, greener, redder or brownier, and more smooth or thinning.

Citruls: or, Water-Melons American.

V. The third, or Egyptian Citrul or Water-Melon. This in its Roots, Stalks, Branches, Leaves, and Flowers, differs but little from the former, but its Fruit is much longer than those. For some of these are so great, as Beslerus says, that about six of them will load a Camel, and one or two of them a Man: the outward Rind is yellow, the inner Meat or Substance very little and almost empty, filled in the middle with much Water which is very sweet, and much defir'd and drank by the People of the places where this Fruit grows; with which some mix Damasc Rory Water, others mix and Antherope to perfume it, and offer it as a great thing, for the Entertaining of their Friends: The Seed is not in great Quantity, but smaller than the Seed of the former, in other things there is but little difference.

VI. The Places. The first grows throughout Turkey, and in all Asia, as also in Spain, the West-Indies, and other hot Countries. The second grows peculiarly, in America or the West-Indies, and in a very great plenty in Carolina, both North and South. And in Virginia, and other places of the Floridian Comonwealth. The third is a Native of Egypt, as Prosper Alpinus says in his Book of Egyptian Plants, and Bellonius in his Observations.

VII. The Times. They all are Planted of the Seed in the Spring time, viz. in March and April, and Flower in June and July, and the Fruit is ripe in August, or about the same time in which the others are ripe.

VIII. The Qualities. The Fruit and Seed, are cold and moist in the second Degree: The Seeds being reckoned one of the four cold Seeds. They are Altheifer, Dungruck, Nephelester and Antistomographick, even beyond all the other kinds of Melons.
The Viridines.

X. The Pulpe of the Fruit, or Sallet. It is usually eaten raw, being pated from the Kind and cut into slices, or pieces. It cools and refrigerates admirably, quenches thirst, refreshes the Spirits, abates the heat of the most burning and malign Fevers, cleanses the Bowels, provokes Urine, takes away the heat and Kalding thereof, and gives ease in the Strangury. People in the West-Indies, eat of this Fruit very literally, and the even without measure, (because of its pleasantness) yet it has never been known once to Surfeit: It is good for hot, dry, and wounded Bodies, and such as are grown feble and weak by Long Sicknes, and the intense heat of Fevers.

XII. The Juice of the Fruit. It may be drank Plentifully, and has all the Virtues of the Pulpe afore enumerated; it prevails wonderfully against the hot intemperance of the Stomach, Liver, Splen, Reins, Womb, and Blood, quenches thirst, and takes away the dryness and roughNeath of the Throat and Tongue.

The Emulsion of the Seed. It takes away the Febritick Dilatemon of the Blood: it gives ease in the Strangury, abates the heat and boiling of the Urine, and cures Piling of Blood: and reproceeds Loos, (being used for some time) in an admirable manner. It has been given also with good success in a Virulent Gout, for it cleanses the Ulcer, cates the pain, and induces the healing.

XIV. The Distillate Water from the Fruit. It is used as a Cordicrwick, and so it is in an especial manner, being mixed with Juice of Lemon, or choice Vinegars and inwardly taken, it abates the heat of all Fevers, and has the Virtues of the Juice of the Fruit, but in a weaker Degree: mixt with Spirit of Wine in an equal proportion, it is an excellent thing for Cloudy, Dim, Weak, Sore, and Rheumatick Eyes, it strengthens the part, removes the matter affliction, and stops the definition.

CHAP. CCCCLXXVI.

Of MERCURY, Herb English: OR, GOOD -- HENRY.

I. THE Name. It has no Greek Name that I know of, but it is called in Latin, Botum Mercurius and in English, Good Henry, also Herb-Mercury: which abounds from other Herb-Mercuries, we call it English Herb-Mercury.

III. The Kinds of English Herb-Mercury. It is a Plant of a Singular Species, and not at all referable to the Mercuries, tho’ it has obtained that English Name, some Authors account it a Species of the Wild Arachis; others a Species of the Lapaun or Becks: I am of a contrary opinion to both those, and think it a singular Plant of its own Kind. But from those Opinions and conceptions of what kind it may be, it has obtained several Conformable Names: as, Bonum unlaflus Trigre, Ramica genus Herbip, Lapaun Sylvesiris secundum genus Dalechampii, Atriplici species Gefari, Atriplex canas Sylvesiris Lamelae, Lapastum unlaflum Baltham, Teo bon Dobasti & Lobelli, & Bonus Heavricus Mathihi, Brunfelis, Trigre & aulron: with us in England, English Herb-Mercury, and Good Henry.

The Descriptions.

IV. It has a great, thick, and long Root spreading out into many parts or divisions, and of a yellow color within like the flax painted Buck. From this Root spring forth several thick, flat, broad, and long, dark green Leaves, upon long foot Stalks, pointed at the ends, and double pointed at the bottoms, in shape something like Arrow, or Wike Robin, or to the Leaves of Medow Sorrel, but very much larger. From among these Leaves spring forth several thick, flat, green Stalks about two feet high, full or thick fit with Leaves like the former, but growing less as they approach towards the tops. On the Branches, and their several Tops or Heads grow as many spiked Heads of Flowers of a greenish color, growing in clusters, and thin fit together: in which is contained the Seed, which is flat, and much like that of the Arab. The whole Plant is Bilt in feeling, and often times overgrown with...
Chap. 486. English Herbs. 705

English Herb Mercury.

with a greyish or whitish green Duff, as if it was covered with a fine Meal, like unto Arach, for which reason, it is, as I suppose, that some have accounted it a Species or Kind of that Plant.

V. The Places. It is commonly found growing in untill'd Land, by Hedge sides in Orchards and Gardens, and ditch sides in some Fallow Grounds, and among Rubbish, near common Ways, old Walls, Pales, and other like places, in most Counties of England.

VI. The Times. It Flowers in June and July, and the Seed is ripe in July and August, or some little time after.

VII. The Qualities. It is Temperate in respect of heat or coldness, dryness or moisture, Sublative or Cleansing, and Emollient or Loosening, by reason of its Farns and Flippery sides.

VIII. The Specification. It heals Green Wounds, and cleanses and cures old and painful Ulcers.

IX. The Preparations. You may have therefrom, 1. A Liquid Juice of the Herb or Root. 2. A Cataplasm of the Herb or Root. 3. An Ointment or Oint. 4. A Salve.

The Virtues.

X. The Liquid Juice. Mixed 3 or 4 Spoonfuls of it with as much, or half as much Honey, and given inwardly, it loosens the Belly and Purges away Cold, glairy and flamy Humors; it

openst obstructions of the Lungs, and is good against Coughs, Cold, Wheezing, shortness of Breath, difficulty of Breathing, and Ulcers of the Lungs: but then the Honey ought to be clarified, and mixed in equal quantities with it: and so applied to Green Wounds it heals them: and digests, cleaves, incrusts, and dries up old and rotten Ulcers.

XI. The Cataplasm. Applied to Green Wounds or simple Contusions it quickly cures them: and applied to old and running Sores, it refills the Putridity, cleaves them, and afterwards wonderfully confluates and heals them.

XII. The Ointment or Oint. It is a singular good Vulnerary, healing simple Green Wounds at a few times Dressing: and if they are Compound or Complicate, it causes the Putridity in a very short time, then cleaves, incrusts, and heals them. It heals also old Ulcers and Filthily's, Kited Heels, and other Difficility of like Kind: and applied to the Gout from what cause soever, whether hot or cold, it cures the Pain and cures it.

XIII. The Salve. It is made of the Herb being Boiled in Water, or in Broth, made of Fat Pork, or Bacon, or Fat Beef, or Veal, being drest up with Butter, Vinegar and Pepper, and so eaten, it makes the Belly soluble, and cleanses the Putridious Humors.

C H A P. CCCCLXXXVII.

Of MERCURY Herb French.

II. The Kinds. There are two principal Kinds hereof, viz. 1. Merycurius vulgaris, vel Herrensis, The Common or Garden French Mercury, which is twofold, viz. a. Merycurius vulgaris Male, The Common Male French Mercury. b. Merycurius vulgaris Femina, The Common Female French Mercury. II. Phyllonum, Phyllonum, & Euphorbiom, Euphorbiom, Phyllonum, & Euphorbiom, in Latin, Phyllonum, and in English, Menthony Mercury: and this is twofold, viz. 3. Phyllonum, Phyllonum, Phyllonum, & Euphorbiom, Phyllonum, & Euphorbiom, Phyllonum, & Euphorbiom, Female Childs Mercury. 4. Phyllonum, Phyllonum, Phyllonum, & Euphorbiom, Phyllonum, & Euphorbiom, Phyllonum, & Euphorbiom, Male Childs Mercury. Of all which in order.

XXX The
with small green Hanks, which are the Flowers, and are made up in turn, like Small Baskets of Grapes, which give no Seed that ever we could finde, but abide in that manner a great while upon the Stalks without shedding. The

Roots both of the Male and Female perish every Year at the first approach of Winter, and spring up again of their own Sowing. Where once they are sown, their Seed, the Ground will never want them afterwards, even of both sorts, so admirably they entrench.

V. The third, or Female Childs Mercury. Its Root is white, hard, and Woody, of the bigness and length of one Finger, persifling every Year, and rising again from its own Seed, or the Seed of the Male Kind, in the Natural place. From this Root rises up a branched Square Suck, full of Joints and Branches, but weaker than those of the Male following, and more full of Leaves, higher also, and more bushy: at the Joints always stand two short woody Leaves, somewhat longer, and narrower, than in the former Common Kinds, and not denteed (or but very seldom) about the edges, of an Acid and Saltish taint: at the Joints of this Female come forth long Foot Stalks, of Seeds and Flowers, which are longer than those of the Male Kind following. These Flowers which are in a Cluster as it were, are small, pale, and Moddy, rarely bearing any Seed, but when they do, it is contained in little round Heads, and is small, and round like the Male Kind, sometimes two, and sometimes three or more, growing in a Cluster together. This and the Male has a stronger smell and taste, than any of the other Mercuries.

VI. The
The Virtues.

XII. The Liquid Juice. Taken to 4 or 5 Ounces in Broth or Drink, Sweetened with a little Sugar, it purges Choleric and, in Women, Water and Women’s Humors. Hippocrates commends it wonderfully for Women’s Dis-eases, and he applied it to the Womb, to ease the Pains of the Women, and he gave it to promote the Couerse in Women, and to expel the Afterbirth. He drank the Juice into Sore and Watering Eyes, and applied it for Deafness and Pains in the Ears. It is good against Agues, and cleanses the Blood and Lungs of Flagm, but with some little Offence to the Stomach. Snufled up the Nostrils, it purges the Head, Brain, and Eyes of cold, sharp, and flat Rheum, stifling them, and is very good against Carvagia, and is a Stomachcure, and a Stomachcure, and is very good against Carvagia, which fall upon the Lungs. Bathed upon Warts, it is laid to take them away.

XIII. The Decoction in Water, or Mutton or Veal Broth. It has all the Virtues of the Juice afore declared, but much weaker, and therefore may be given to 8 Ounces or more. If it is made with Myrrh, and Pepper, it is good against the Strangury, and other Difficulties of the Bladder. It purges also the Stomach and Bowels, and is a Stomachcure, and very weakly than the Juice. And used as an Elixir, it purges the Head, Brain, Eyes, &c.

XIV. The Powder of the Seed. It may be given to a Drop, or a Drop and a half, either in the Decoction, or Distilled Water, and so it helps the Yellow Jaundice. The Seed of both Male and Female, boiled in Water or Wine with Wormwood, and the Decoction drank, is laid to cure the Jaundice perfectly, in a most admirable manner, and that in a very little time.

XV. The Lotion. It is made of the Liquid Juice mixt with Vinegar. Being applied to Sores, Itch, Tetturs, Ringworms, and other like Breakings out in the Skin, it cures them.

XVI. The Cataplasm of the Leaves. Applied to Warts it takes them away, as also other Deformities of the Body. It is Digestive; being applied to Tumors or Swellings in any part, it is also Digestive, where the Swelling will not come to subside, and will speed the Swelling which is the cause of the Tumor, and ease the Inflammation, by cooling and easing the Pain.

XVII. The Clyster. It is made of the Liquid Juice, and of the Decoction of the Leaves in Mutton Broth, or of each equal parts. Exhibited X X X 4

warm.
warm, it evacuates from the Belly all sorts of cold, sharp, acid, Salt, or other evil Humors, which are apt to offend the Bowels, and cause Belly aches; and other vehement and sick Pains, and works as well in this manner, as if a sufficient quantity of Senna had been infused in the Decotion. But it to the Clyster, 4 Quarters of brown Sugar be added, it will work so much the better, and the more powerful.

XVIII. The Liqüidated Water of the Herb. It has the Virtues of both Salts and Decotion, but acts in a much weaker manner. But if white Sugar Candy is diffolved in it, it will make a good Collyrium for weak, sore, and running Eyes. And if a few Grains of Scammony in fine Powder be diffolved in it, and used as an Everhine, it will notably purge the Head and Brain, of thick, gross, clammy, flat, sharp, and acid Humors, and therefore may be profitable against Colds, Catarrhs, Apoplexies, Epileptics, Pulses, Vertigo's, Megrims, Head-aches, Lethargies, and other like Difficulties of those parts. If sweetened with white Sugar and taken to 6 or 8 Quarters in a Morning Eauage, it opens the Body and purges off gross, Vicious, and Melancholy Humors: And Authors say, if it is mixed with Mann, and May Dew, taken off 8e Buffes (for which reason some Writers call it Balsamum) it will purge Choler, also.

CHAP. CCCCLXXXVIII.

Of MERCURY Herb Wild: or,

DOGS—MERCURY.

I. THE Names. It is called in Greek, Ῥυκάλη & Ρυκάλε, Cyno & Cynocrambe, which is Cyno Balsam, but for what reason is hard to determine, for that it has no agreement with, nor is any thing akin to Sallbar, or Col-leton: it might properly enough have been called Mercurealis Cinnam, (properly ignobilisatem): but some Authors have rather called it Mercurealis Syphilis, as Cardue, Lonicera, Thalia, & Vran-ge: it is the Cynocrambe, Cynocraerj, Dono-er, Ephedr, Lobeli, & Mercurialis Mercurealis Cinnam, & Mercurealis Magna Balsami, (these two last thinking Cynocrambe, to be wholly im-proper:) in English, Wild Herb Mercury, and Dog-Mercury.

II. The Kind. The Principal of the Wild sorts of Herb Mercury, are these three following, viz. 1. Mercurealis Syphilis vulgaris, Gymnecomia, & Syphilides, Mercurealis Montana Syphilis Balsami, Mercurealis Syphilis vulgaris Mat, The Common Male Wild Mercury, 2. Mer-curealis Syphilis vulgaris Vertica, Mercurealis Montana Syphilis Balsami, The Common Female Wild Mercury. 3. Gymnocomia Legitima Diofcri-
V. The third, or True Dogs Mercury of Bathtunims. It has a white, long, and vivorous Root, spreading in fair round about in the Earth. The Plant itself is tender, small, and lappy, and Springs up like unto the same Common French Mercury, with a round, green, crested Stalk, about a Foot or more high, fit with many Leaves, and branching forth from every Joint; from which come forth the first, two or three small Leaves, and somewhat round like unto Chick-root; after which, springing forth two others, from the same Joint, which are much larger and broader; and from these the remaining likewise come afterwards several other Leaves, smaller than the first two; and this proportion it holds, not at one Joint alone, but at every Joint through out the whole Plant, and the lowest Joint almost of the Stalk and Branches, up to the top. From whence come forth three or four small, whitish green Flowers, with many Twigs, in the midst of them, which turn into small, hard, round Seeds, like unto those of the Common Male French Mercury, but something longer, which are green at the first, but of a blackish ah color when they are ripe.

VI. The Fourth, or Coddled Wild Mercury, &c. Its Root is blackish and thready, perishing every year; which lands up a round jointed Stalk, about two Feet high sometimes, branching it self, from whence in many places, whereas continually grows but one Leaf, upon a very flander rough Foot-Stalk, most like unto those of the French Common Mercury, but longer pointed, and something smaller at the Stalk, not so finely, but as it were groly indented about the edges, being thinner, longer, and of a leathew green color. From every joint with the Leaf, from the middle upwards, and at the places where the Branches also, come forth one long brown foot-Stalk, as small and fine almost as a Horse hair, bearing one Flower thereon, and sometimes two or three, somewhat close togeth, hanging downwards, and composed of six Leaves apiece, some thing like to those of Hallow Root or Cassis Fumitory, but greater, of a fair Gold-yellow color, which are sometimes also as Balsam eyes, found of a pater color; two of them which stand like Wings at the sides, are larger than the other two which flind under them, which are small and round, the lowest is longer than the other two small ones, and broad at the end; the uppermost ends in a sort crooked Horn or Head, like a Spur, behind t, the bottom on the inside is whiter than the rest, which have sometimes red spots in them. After these Flowers are past, small, long pointed Pods come up in their places, which hang downwards, and are fringed as if they were all the length of them, in which is contained, long, and somewhat fad the Seed of dusky color, which is very difficult to be gathered, for that even before it is through ripe, if it be but very lightly handled, or but just touched, the Pods will break, and more or less themselves, little, as the Husk or Pods of some certain Pulses will do, and the Seed will leap forth of its own accord, with such a kind of violence, that it is not to be caught; yea for the most part, the very breaking of the Branches by the wind, will cause the Pods to break open, and that their Seed on the Ground, where the rivulet may be best gathered or picked up, if looked after at Time. The taste of this Herb is pungent and waterish while green, as Common Eyes, and much the fierrer when dried; yet Label Eyes, it is Venemous; but whether there be any danger in taking of it inwardly, is uncertain, we knowing nothing of it by experience, but what vulgar hear-say has delivered to us.

VII. The Places. The first and second of these are found growing Wild in several places in Kent and elsewhere, but the Female kind is more seldom found than the Male; Gerard says, he found it in many places about Green-hulle, Swainfcome Village, Great Yar, and Southwell in Kent, also in Hampfed Wood, four Miles from London, and in all the Villages thereabout. The third is not found Wild with us, as it is in Spain and Italy, but is only Nursted up in Gardens. The last grows in the shady Woods of France, Germany, and Italy, it has also been found by the shady Woods side of the Mountains and Vallyes in Wales, by one Mr. George Bowes, but is also Nursted up in our Gardens, for its rarity, where in shady places, it grows and flourishes very well.

VIII. The Times. The first three Flower in the Summer Months, as June, July and August; all the Summer long sayes Gerard, until extreme Frost comes and slips them. The same Flowers about the middle and end of August in the Fields, but in our Gardens in June and July, and particularly after its Flowering it yields its Seed, which cannot be gathered from the Plant, without very much care.

IX. The Qualities, Specification, Preparations, and Virtues of the three first of these, are said to be the same with those of the French Mercury in the former Chapter, Easy that we shall say no more of them here.

X. As to the Coddled Mercury, or Nett me rager, Authors say it has a stronger Punging Quality, but it is by Vomits, and therefore it is thought that Lonicera and Tragac, did rank it among the Thymomyces, giving it such a Name, as nearest particularizing of their Natures and Qualities, and for this reason I suppose it may be that Label and Pena, accounted it Delterious or Deadly, tho’ at the same time they say, it want not its pungre, as to its other Virtues: And Camerum in herbs, says that the Distilled Water of the Herbe, is applied by some, to places pained with the Gout with good Success.

CHAP.
Salmon's Herbal.

Lib. I.

CHAP. CCCCXXXIX.

Of MILK--WORT Common.

OR,

CROSS--FLOWER.

I. THE Name. It is called in Greek, 

Ψήληνας & Ψήληνος; in Latin, Polygala; 

Polygala recentiorem Lobelij, Aaronella Grenerir. 

& Vis erwits: in English, Milk-Wort and Coarse 

Flower.

II. The Kinds. There is 1. The Land or Field 

Milk-wort, of which in this Chapter. 2. The Sea 

Milk-wort, of which in Chap. aps. Following. Of 

The Land or Field sort, we shall give you the five 

Descriptions entailing, viz. 1. Polygala marina; Polygala 

vulgata major Chaff, Our Common greater Milk-- 

wort. 2. Polygala minor: Polygala vulgaris minor Chaff. 

Our Common small Milk-wort. 3. Polygala Repens Lobelij, & alorum, Creeping Milk-wort. 

4. Polygala Montisfica; Polygala foetida acutioribus 

Banhini, Oenothera tertia purpurea Lachemane 

Bauhini, French Milk-wort. 5. Polygala affinis 

Banhini, Oenothera squarrosa Lachemane, 

Baltard Milk-wort.

The Descriptions.

III. The first, or Common Milk-wort. It has 

a Root which is hard and Woody, with several Fibres 

adjoining to it, endures all Winter, and besides 

MILK--WORT Greater.

long. From this Root Spring forth five or six 

hard, slender, and flexible Stalks, about a Foot or 

more high, thick, wiki with somewhat long, 

narrow Leaves like those of Dryer-wedd, or 

small Hyssop, the Flowers grow at the tops, in 

long Stalks, thick for together, something like to 

those of Poenitory, but fragrant, and of a fine illumed 

reddish purple color, and thinning withall, Gerard 

says, they are fashioned like a little Bird, with 

Wings, Tail, and a Body eafe to be discerned 

by both as will observe the same, which being past 

away, small, flat Pouches succeed, like those of 

Ears Pogaster, but leffer, having usually two 

Seeds in them, which are long, blackish, and 

hairy.

VI. The second, or Our Common smaller 

Milk-wort. This in its Root, Stalks, Leaves, 

Flowers, Form and manner of Growing is like to 

the former, yet somewhat hard or Woody, and 

not so many Stalks rising up from the Root, 

which have also Flower, and smaller Leaves on 

them. The Flowers are also alike, but smaller, 

and vary as much, or rather more in their 

color, being some of a blerwth purple, others 

purple and white, fome all white, others 

reddish, or of a was color, or over-worn red, &c. There is also another for here, 

whole lower Leaves which spread on the 

Ground, are many, and rounder than in any 

of the former, but those which grow on the 

Stalks are long like the reds, the Flowers of 

which are only white, without mixture or 

variation.

V. The third, or Creeping Milk-wort. This 

small Plant has a number of Stalks, fall of 

Branches, creeping, or lying and spreading on 

the Ground, not above a fpon long, let thick by 

couples
MILK-WORT, or PCELER.

Couples with very small Leaves, like those of *Hernia* or *Rapure-wort*. The Flowers are of a whitish color, standing among the Leaves, at the tops in whorls, encompassing the Stalk, one above another.

VI. The fourth, or French Milk-wort. It has a Base which is much like the first and second Kinds, being small, long, and white, from whence springing up several upright Stalks, a foot or more high, having several longer and narrower Leaves on them, than those of the two first sorts, and set without order. The Flowers grow one above another, in longer Spikes, than in the second smaller Kind, and not fully like them, but of a reddish color. The Seed which follows is small, and contained in long coromans Hawks.

VII. The fifth, or Ruffet Milk-wort. Its Root consists of small, long, and white Fibres. This small Plant spreads it self much, with many weak, slender, round Stalks, upon the Ground, a foot long or more, set with several small Leaves without order, in fashion something like unto *Myrtle* Leaves, but not so much pointed. The Flowers are very Beautiful, standing in a small Spike, one above another, with Leaves among them, consisting of six Leaves apiece, of a fine bright shining purple color, after which comes small Seed contained in small Husks.

VIII. The Places. Gerard says, that these Plants or Milk-worts grow commonly in every Wood, or Fermil Paffure, and that he had found them, where ever he had Travelled. The first grows also in Germany, and *Amure*, and parts thereabouts. The second is more frequent with us, and is found in Barren and Utherd places, Hedges and the like, as well as in Fermil and

Partial Grounds. The other three in France, Germany, and several other places.

IX. The Times. They all Flower from the beginning or middle of May, and continue flowering a Month or more, Gerard says, till August, and perfect their Seed not long after.

X. The Qualities. They are all hot and dry in the second Degree, highly Abberitive, and with all Cathartic. 'Tis more than probable, that these Milk-worts, nor any of them, can be the *Pecylion Diffusorides*, because that, as *Diffusorides* says, breeds Milk in Womans Breasts; whereas these do rather the contrary, diminish the flow, which is manifest from its Cathartic or Purging faculty, for as much as all purging things are imitical to that Nature.

The Virtues.

XI. The Infection in Wine. Geyser who calls it *Amurello*, because of its bitterness, says, that a handfull herof steeped all Night in Wine, and drunk in the Morning fasting, will purge Choler effectually by Stool, without any danger, and this he had made tryal of upon himself.

CHAP. CCCCXC.

Of MILK-POT Sea-

OR,

GLAUX.

I. THE Name. It is called in Greek, Γλαύξ, (from Γλαφ or Γλαφ, which is Milk:) in Latin, *Glauca*, from the Greek Name, and not a *Glaux Color* as some have it; and in English, Sea Milk-wort, and *Glaux*, also Black Salt-wort.

II. The Places. Authors have several sorts hereof, but the following three are chief, viz. 1. *Glaux Maritima Major*, *Glauca Latin folio Thuringia. Baudhi*, *Palmaris*. 2. The Greater Sea Milk-wort. 3. *Glaux Maritima Minor*, *Glauca exquis Maritima Communis*; 4. *Donatus*, *Lobeli*, *Laydeneil*, & *Tabernamentum*, 5. The Lesser Sea Milk-wort. 6. *Glaux Maritima Venta Alpine*, *Glauca in Maritimi*, *Derychno corniger Chaffi Bambos*, *The Venetian Sea Milk-Wort of Alpinus*: but *Baudhier* would have this last, to be of the Family of the *Trofols* or *Laren*, because they are in some things alike, yet with *Alpinus* we think them to be differing Plants, and that this comes as near, or more nearly to the *Glaux Diffusorides*, than any other.
MILK-WORT Sea Greater.

The Description.

III. The first, or Greater Sea Milk-wort. It has a small Root which sends forth down right with several Branches or Arms, and some Fibres adhering to them: from this Root grows up several weak Stalks, which spread themselves upon the Ground, and raise their Heads upwards, belted with several Leaves like Leaves,

yet a little larger, and of a grayish green color on the upper side, and more grayish underneath. The Flowers are set with the Leaves at the Joints of a purple color; after which come small Buttons, with Seed in them. The Branches as they spread and lean upon the Ground take Root again, by which the Plant very much increases. Bounarius says, that there is a great Variety observed in this Plant, it sometimes having much larger Leaves, and sometimes Leaves much narrower.

IV. The second, or Lesser Sea Milk-wort. This latter sort, in its Roots, Stalks, Branches, Leaves, Flowers, and manner of growing, differs little from the former, but in the smallness of the Stalks and Leaves, some of the Stalks creep on the Ground, some stand upright, being tender, and small, and belted with many little thin Leaves, like Tribulus Syphæaris, or Herniaria, growing along the Stalks by couples, between which grow the small purple Flowers, which being pale, little Bollars, or Seed Vessels succeed, and its Root is small and Fibrous, taking hold of the upper Face of the Earth, as well as running much down right, and by its Fibres spreading abroad it much excretes. Bounarius says, that this latter sort, has its Stalks thicker bored with Leaves, than the former greater sort, especially upwards, the lower being taken away, leaving the Stalks bare as if they had great Joints.

V. The third, or Venetian Sea Milk-wort of Alpinus. The Root is long, slender, woody, and divided into several Branches. From which spring up four or five slender Stalks a Cubit or more high, set at equal distances, with several long and narrow Leaves, green on the upper side, and white underneath, and at the Tops four or five Flowers standing together as it were in an Umbel for form and sight, being very like unto the Boffard Scorpion, like Paved Seaw of Corsica, but of a whitish blush color, which are succeeded by small, short round Pedals, having small, round Seed within them, toffing a little sweetish.

VI. The Ploceir. The first grows in many places in Germany, as also in Scotland, from which last place Bounarius says he had it, but with us in Gardens. The second grows very plentifully in moist places and Salt Marshes near the Sea, from whence it has been taken and Planted in Gardens: and is found in many places upon the Ebray and Kentish Shores: Gerard found it between Whitstable and the Isle of Thanet in Kent, and by Gravesend, in the same County, by Tilbury Black-hope in Essex, and in the Isle of Sheppey going from King's-Ferry to Shoreham-House. Bounarius says, that this latter sort is found growing near the Sea and Salt Lakes, but that the former greater Kind, is found growing on Hills as well as near the Sea. The third Kind grows as Alpinus says, in the Salt Marshes near to Chio, a City of the Venetians.
CHAP. CCCCXCI.

OF MILLET.

I. THE Names. It is called in Archaic, Hararome, Gypsum, and Greek: in Arabic, Barab, Narsin, and Marabes; Galenic: in Latin, Milium (à Milliorum summum derivatum: Alius: Akine, as Vurnum thinks, but both Dioscorides and Galen make Auloe, to be Panicum: alfo Papilio, & Papilia: in English, Miller.

II. The Kinds. Authors make three several Species hereof, viz. 1. Milium vulgare album, Common white Millet. 2. Milium vulgare nigraum, Common black Millet. 3. Milium indicum Muhdolt, Milium Turricum, Milium Sorocentica Fuchij, Melises Inde- neti, Sorgho, & Sorgum Italorum Lobelis, Panicum Indicum Gafferi; Panicum Difco- ride & Pung Tran: Indian, or Turkey Millet.

The Descriptions.

III. The first, or Common white Millet, it has a bushy Root which spreads a round in the Earth, and perifhes every Year after Sowing times, as the Roots of other Grains do. From this Root rise up several hard jointed tall Stalks, full of a white Pith, yet fofi, and a little Hairy or Downy on the outside, with long and large Seed like Leaves at them, encompassing one another: at the tops of the Stalks are a great number of white Silk, yellow long Spriggles, like Feathers, bowing down their Heads, for all along with white Seed, included in a whitish Husk, which being taken out, are of a finifmg, pale, yellowish or whitish color, something hard, and a little larger than the Seed of Hare-men.

IV. The second, or Common black Millet. This in its Roots, Stalks, Leaves, Head, and manner of growing, differs very little from the former: having that it is somewhat left with us, and that the Juba or Taf: is brown, and the whole Plant or Head more loose and large, the Seed and Grain is also somewhat bigger, and of a blackish finifhing color.

V. The third, or Indian, or Turkey Millet. The Root of this hathes out more than the others, and perifhes every Year after Sowing as the others do. This Plant is in all its parts...
larger, or greater, and higher than the former, sitting to be five or six feet in height, or more. The stalks are full of joints with long large leaves at them. The Julia or Tui flanks upright, not bowing down its head as the other, on which grows the Seed, which is as big, but not as flat as Lentile; concerning round, either white, yellow, red, or bluish colored, hard and shining.

VI. The Plants. All these Grain came first to us out of the Eastern and Southern Countries, as Turkey, Barbary, Syria, the East-Indies, Spain, Italy, &c. and now they grow plentifully through all the West-Indies, and in most of our English Plantations. They delight to grow in a light and loose Mould, provided it is light and well watered, for they soon overpower the Ground, and they thrive both in a moist and Rainy Seallon. They grow as Calendula Saws, in great plenty in Cornfields, Italy.

VII. The Times. They are to be Sown in April or May, and not before, for they cannot endure the Cold: and in the hotter or more Southern Countries, the Grain will be ripe in August or September.

VIII. The Qualities. The Grain is temperate in respect to heat or coldness, and is thriving in the second Degree. It has a sufficiency of parts, Acidive, Alkermes, Diuretick, and Antifibri- tick.

IX. The Specification. It refines in Confections and abates the heat of Fever: Stops Fluxes of the Bowels and of the Womb.

X. The Preparations. You may have herefrom, 1. The Grain, and its Mode. 2. The parched Grain. 3. A Distillation or Syrup, called Syrupus Ambrosi. 4. An Emplastr. 5. A Distilled Water. 6. Aftes of the Stalks. 7. A Powder of the Flowers.

The Virtues.

XI. The Grain, and its Mode. Made into Bread or Cakes, or Puddings, and eaten, it refines in Confections, and Strengthens the Stomach and Belly: Milk thickened with its Flower and given daily, stops Diarrhues and other Fluxes of the Bowels: Berth made of choice Beef, and thickened with this flower hereof refines the Tone of the Stomach and Intestines admirably.

XII. The parched Grain: eaten alone, it stops Vomiting: being applied in Linen Bags as hot as it can be endured, and applied to the Stomach and Belly, it gives ease to the Belloch and Cholick, and helps the Griping of the Guts, Stitches, Pleurisy, and other Ills of like Kind.

XIII. The Decoction, or Syrup of Ambrose. Take Millet a Pound, Boil it in Water 2 Quarts, till it is broke, and then strain out by pressing : to 4 or 5 Quarts hereof add White Port or Lisbon Wine 2 Ounces: mix them. Let it be given to the Patient as hot as it can be endured: it prevails against Favers and Agress, chiefly Tertia, is Diuretick, and yet strongly provokes Sweating, and quenches Thirst, the Sick being well covered down in a Bed, but it ought to be given in the declension of the Fit.

XIV. The Emplastr. It is made of a mixture of the Flower and Tar, in a just confidence. Being applied to the Bittings of any Venenous

BEAST, it draws forth the Poison, and cures the Life of the Patient.

XV. The Distilled Water from the green Plant, Robot or Emplastr. Being taken to 4 or 6 Ounces at a time, it is a singular preservative against the Stone, Sand, Gravel, and Tumours in the Urines, Uterus, and Bladder.

XVI. The Aftes of the Stalks. Being drank, or rather the Lixiviation of them, they are good against Kernels under the Ears, and in the Throat, and to abate Swelmos or Spongious Swellings. The Aftes mixed with an equal quantity of the Aftes of a red Sponge, and with an eighth part of Pepper in a Powder, and made up with Wine 2 Pints into a Cake, and baked under hot Embers, and eaten, two or three Ounces at a time, is an excellent thing against the Kings Evil, especially being taken in the Wear of the Moon.

XVII. The Powder of the Flowers. The red Flowers in Powder, given to a Drum in red Sestination Wine Cures the Reds in Women, so also the Powder of the white Flowers given in the Same Dose and Vehicle Cures the Whites, and they both of them, or either of them, cure all sorts of Fluxes of the Belly.

MILLEFOLLE, see Yarrow, Chap. MILLE-MOUNTAIN, see Flick Wild, Chap. MILT-WASTE, see Split-Wort, Chap.

C H A P. CCCCXII.

Of MINT, Garden.

1. T H E Names. It is called in Arabick, Ambrosia, in Greek, by the Ancient Greenes, Mentha; but by the Later Greeks, Mentha (from σμήνος σμήσος τέκμαν, and μετα, odor, θέρα), because it has a sweet or pleasing Smell: in Latin, Mentha: and in English, Mint.

II. The Kinds. There are several principal Kinds of this Plant, as 1. Mentha Horstera, Garden Mint, of which in this Chapter. 2. Mentha Sophieina, Wild Mint, of which in Chap. 492. 3. Mentha Aquatica, Water Mint, of which in Chap. 496. 4. Mentha Montana, Mountain Mint, or Camomile, of which we have already Treated, Chap. 104. and 105. 5. Mentha Catara vel Mentha, Cats Mint, or Ncp, of which we shall treat (God willing) in the Chapter of N. Following.

III. The Species of the Garden Kind. Authors have given us many of the Garden Production, but these following are chief, viz: 1. Mentha Rec-}
The Descriptions.

IV. The first, or Our Common Spear Mint. It has a siringy Root, with many Fibres adjoining, spreading far abroad under Ground, as all the rest do. From this Root spring forth several round Stalks, having longer and narrower Leaves denoted on the edges at thereon, than those of the next sort, growing also something lower and smaller, of a pleasing green color. The Flowers stand in spiky Heads, at the tops of the Branches, being of a pale blush color, the smell is strong but very pleasant and grateful to the Sense.

V. The second, or Our Common red Garden Mint. The Root is much like the former and spreads like it, running and creeping under the Ground, so that when it has gotten place, it is difficult to be extirpated or rooted out. From this Root rises up several square brownish Stalks, with somewhat long and round pointed Leaves, dented (as the former) about the edges, of a dark green, and sometimes of a reddish color, standing by couples at the joints, and of a very sweet and pleasing smell. The Flowers are reddish, and stand by Spaces about the tops of the Stalks.

VI. The third, or Bawm Mint, or Orange Mint. This has a Root very like the others also, which sends forth square Stalks a little hoary, as are also the Leaves, which are rougher, broader, and rounder than the second Kind, which stand on all sides the Stalks, one against another, two at a joint, and then crofs against them at the next Joint, so that they reprefent a Crofs, from whence came the Name. The Flowers stand in spiky Heads, of a purplish color, somewhat deeper than the first.

VII. The fourth, or Bawm Mint, or Orange Mint. This in its Root, Stalks, and manner of growing, is much like the second Kind above described, the chief difference between this and that.
Salmon's Herbal.

The Virtues.

XIV. The Liquid Juice. Dioscorides says, that if it is mixed with Vinegar and taken, it will stop Bleeding; and I have found by Observation that if it be taken to stop the heat of the Blood, to exterminate mixt with a Syrup of Mint, and a few Grains of Long Pepper, it is not only externally Stomachical, but also provokes Vomiting or Bodily Laxity exceedingly, and to kill long, round Worms in the Stomach and Guts.

Mixt with the Tincture of Pepper Pomegranate, it stops the Hiccough, Vomiting, and Fainting, and allays the Harris, and is the best thing to use when it is said that it stops the Coughs in Women; but I have found by great Experience, that in the contrary way it provokes them, facilitates the Bowels and drives away the Alit Birth, as also of the Dead Child. Dose from an Ounce to 4 Ounces, either alone, or mixt with a Glass of Wine, or with its proper Syrup: as an Embitter, it Purges the Head.

XV. The Essence. It has all the Virtues of the Juice, besides which, being Diluted with its proper Syrup, or mixt with a Glass of Wine (from one Ounce to three) it prevails against all cold and moist Distempers of the Breast and Lungs, as Loughing, Stiffness at Heart, Pain of the Stomach, want of Appetite, Indigitation, Coughs, Cold, Rheums, thorns of Briskness, difficulty of Breathing, Heartburns, Wheeling, &c. Basted upon the Footcheck and Temple; it calms their Pains: and is good to wash the Heads of Young Children, to take away all manner of breakings out thirteen, as Scutell, Morphew, Pimple, Sores, Scabs, &c. Taken with 30 or 40 Drops of our Stomach Tincture, or with 3 or 4 Drops the Cold Oil of Mint, it is very effectual against the Fomentation of Venereal Distempers. Taken to a 3 or 4 Ounces, it stops Bleeding at Nose, and provokes Vomiting admirably: Dropt into the Ears, it calms their Pains.

XVI. The Syrup. It is Stomachic, and Refreshing, good against Coughs, Cold, Headaches, Wheeling, Affluence, and other Distempers of the Breast and Lungs. Dose not 4 Spoonsfulls in a Glass of White Port or Lisbon Wine Morning and Night; so taken it opens Obstructions of the Reins, Unctures, and Bladder, gives ease in the Stomach, and expels Sand, Gravel, Stones, and Turbacious Matters, and is much more powerful for their Intensions, being taken mixt with an equal part or more of the Juice or Essence.

XVII. The Decolled or Infusory. They have both of them the Virtues of the Liquid Juice, Essence and Syrup, and may be taken from 4 to 8 Ounces at more, Morning, Noon or Night, in Syrup. They are sovereign with Syrup of Mint: the strongest of the two (because by its Decollement it losses many of its Volatile parts) and it ought to be made in some Generous part of Wine, as White Port or Lisbon, in Affluence, Barcelona, or Conny, &c.

XVIII. The Powder of the Leaves and Heads. It is very Stomachic, and may be given from half a Dram to a Dram, it flats up Laxity and gives ease with Conserve it it stops Vomiting of Blood. It is good against Pain and Graving at the Stomach, and provokes Appetite: taken after Eating, it helps Digestion, expels Wind, and is good for such as are troubled with the Spleen.

XIX. The Decolled or Infusory Oil. It is good against Pains and Aches in any part, proceeding from Cold, and taken internally a Spoonsfull or two at a time, it is good against Coughs, Colds, Wheelings, Asthma, &c. and open all Obstructions of the Lungs, and if given in time is preventive against Strictures in the Bladder, &c.

XX. The Ointment. It cures Wounds and Ulcers, old and running Sores, and is good to Anoint any old Pain or Ache in any part of the Body: it is an Excellent thing to use in the Plague of Piles, as also against Feces in Ass: and put up the Fundament (being melted) in a Syrup, it is good against a Tumor and Dismall of the Left. Heayden Rollen.
XX. The Balm. It is a thing singular for Woman and Uterus, and the interior to the Belly瘸s made of any other Wound Herb, except only Angelica, which I take (by my own Experience) to be one of the greatest of all Vegetables from the Earth. One or twice drawing, and Contused Wounds, is cured to Digest immediately, suppures Apetites, cleanses, incartrates days, and heals them in a very short time. It is profitable against old running Sores and Ulcers, it digests and cleanses them, and strengthens the part, refills the Defluxion of Humors, and induces their speedy healing; infected boils heater into Fibrins, it learns the Colonies, and in time diffuses it, refills the Brest, days, incartrates and heals them to admiration.

XXI. The Cataplasm. The green Herb beaten, and made into a Cataplasm with Earl Honey, and applied to the top of the Nerve, it is good against the Brings of Mad Dogs, and of other Venomous Creatures. Applied to the-Head or Temples, it eases the Head-ach. The Green Herb made into a Cataplasm with Willow Bark, and applied to blenched Eyes, it is said to Cure them. Made into a Cataplasm with the Stems of Angelica, Cori-

sage, and Grisenheds, and applied to a first degree of Putridity, it is said to Allays in the pains of the Joints, and the Gout. Applied warm to Knecls in the Throat and Neck, and recent Tumors of the Kings Evil, it diffuses them. Applied to places afflicted with Leprosie (mixt with Vinegar) it is said to Cure it, more especially if the Juice and Essence be also taken inwardly.

XXII. The Distilled Water from the white Plant when in flower. It has admirable Secomadick, and Flips Vomiting, having all the Virtues of the Juice, Essence, Syrup, and Infusion, but is to be taken in much greater quantity, as from 4 to 6 Ounces, and with Syrup of Minc, it is said to Digest immediately, and incartrates days, and heals them in a very short time. It is profitable against old running Sores and Ulcers, it digests and cleanses them, and strengthens the part, refills the Defluxion of Humors, and induces their speedy healing; infected boils heater into Fibrins, it learns the Colonies, and in time diffuses it, refills the Brest, days, incartrates and heals them to admiration.

XXIII. The Distilled Water from the white Plant when in flower. It has admirable Seconadick, and Flips Vomiting, having all the Virtues of the Juice, Essence, Syrup, and Infusion, but is to be taken in much greater quantity, as from 4 to 6 Ounces, and with Syrup of Minc, it is said to Digest immediately, and incartrates days, and heals them in a very short time. It is profitable against old running Sores and Ulcers, it digests and cleanses them, and strengthens the part, refills the Defluxion of Humors, and induces their speedy healing; infected boils heater into Fibrins, it learns the Colonies, and in time diffuses it, refills the Brest, days, incartrates and heals them to admiration.

XXIV. This is a singular Secomadick, and Cordial, good against Nauseousness, Vomiting, Indigestion, want of Appetite, Fainting, Swooning, Palpitation, and Sicknefs at Hearts; and is a most excellent thing to be given to Children against Coughs, the Fallling Sicknefs and other Diftempers of the Head, Stomach, Heart, and other Bowels. Dose from 4 Drams to 40 to Elder People, mixt with Syrup of Minc, but from a Scropel to a Dram, being given to Children.

XXV. The Distilled Oil. It is a powerful Medicament against Stone, Gravel, and Tarrarous Matter in the Bladder, Uterus, and brought to the Stomach, it gives prompt cefs in the Strangury, strengthens the Stomach to a Miracle, stops Vomiting, caufes a good Appetite and Digestion, relieves in Consumptions, stops Coughs, and Diftempers of the Skin, takes away Horridæs, Wheelings, and obftructions of the Lungs, cures Affwma, and is a potent thing against Fainting and Swooning Fits, Palpitation, and Sicknefs at Hearts, Apoplexies, Convulsions, Palpitations, Leitnernet, Coughs, and other Diftempers of the Head, Brain and Nerves; It cures Putridities and other Wounds of the Nerves and Temples, gives cefs in the Gout, Siftrites, Cramps, and other like Pains of the Muscles and Joints. It provokes the Terms in Women, facilitates the Birth, brings away the After-Birth, and Dead Child, and is a potent thing against the Cholick Vapors and Hyperick Fits, caufes Fainting, powerfully provokes Luit, helps toward Consumption: and in a word, it is one of the greatest Vegetables Productions that ever Nature produced. Dose from 3 to 12 or 20 Drops in any fit Vehicle.

XXVI. The Chymical Balm. This is a pecu- lar thing, and is thus made, Take choie Oil of Minc by Expression, a Duzen, Balm of Fern, and of Thistle, of each 1 Quans, chymical Oil of Minc, 1 Quans, Melt and mix them well together in Boile, or in a Small Heat, and keep it for use. It has all the Virtues of the Chymical Oil beforegoing, besides which it is an excellent thing for the Lungs, as also for the Reins and Bladder, to provoke Urine, ease the Strongyulus, expel Stone and Gravel, and to heal Ulcers in the Reins and Bladder. If prudently given, it is an excellent thing against a Violent German. Dose from 5 Scropels to half a Dram, in any proper Vehicle Morning and Night.

XXVII. The Spirituals Tinctures. It drops Vo- miting, eases the Pain of the Stomach upon the spot, and cures the Cholick, after a singular manner: It has all the Virtues of the Juice, Essence, Infusion, and Chymical Oil, being a most admirable Cordial, and provokes against Convulsions upon the spot. Dose from 1 Dram to 2 or 3, mixt with a Spoonful or two of the Syrup.

XXVIII. The Acid Tincture. It is more Stoma-

bic than the former, drops Vomiting, creates a good Appetite and a strong Digestion. It is a potent thing against the Plague, or Petrifaction, Spoted and Purple or Scarlet Fever, and against all sorts of Burning and Malign Fevers whatsoever, taking away the Fever in less than 24 Hours time. It may be thus used: Take Min Water a Quart of this Acid Tincture almoft an Ounce, Double Red-Headed Sugar, enough to make it very pleasant and drinkable, and of this the Sick may drink at pleasure.

XXIX. The Oily Tincture. It is profitable against the Stone, Gravel, and Tarrarous Matter in the Bladder, Uterus, and brought to the Stomach, it gives prompt cefs in the Strangury, strengthens the Stomach to a Miracle, stops Vomiting, caufes a good Appetite and Digestion, relieves in Consumptions, stops Coughs, and Diftempers of the Skin, takes away Horridæs, Wheelings, and obftructions of the Lungs, cures Affwma, and is a potent thing against Fainting and Swooning Fits, Palpitation, and Sicknefs at Hearts, Apoplexies, Convulsions, Palpitations, Leitnernet, Coughs, and other Diftempers of the Head, Brain and Nerves; It cures Putridities and other Wounds of the Nerves and Temples, gives cefs in the Gout, Siftrites, Cramps, and other like Pains of the Muscles and Joints. It provokes the Terms in Women, facilitates the Birth, brings away the After-Birth, and Dead Child.

XXX. The Balsam of Peru. They have all the Virtues of the Juice, Essence, Tincture, Spirit, and Chymical Oil in perfection, and may be given from 30 to 80 Drops, yes to an 100, in a Glist of Wine 2 or 3 times a Day.

XXXI. The Essaries. It has all the Virtues of the Juice, Essence, Tincture, Spirit, Chymical Oil and Powders, with that preference, that it is more Excellent than the last, and operates in somewhat a less Dose, being one of the greatest Stomadicks in the World; Dose from 30 to 60 Drops in a Glist of White Lisbon or Canary, or other fit Vehicle, as the Physician shall advise, and 30 or 60 as need shall require.

XXXII. The Balsam of Peru. It is admirably strengthens the Stomach and other Bowels, by abso-
Salmon's Herbal

Lib. I.

Abating the Proctemical Acid which affects the
is good against Swells, Gluttony and Drunkenness,
and gives ease to the Stomach, cleansing the reins,
Urines, and Bladder of Stones, gravel, sand, or
Purulent Mucilage, which may any ways obstruct
them. Dose from 1 to 2 Grains or as much as a Glass
of Poyce Water. It carries off the Remnants of
Blood and Humours, and the clyster or many
Difficulties by Urine, for which reason it is of
extraordinary Life in Fevers.

XXXIV. The Althee. Take Powder or Elixir
of Mint & Dranum, mixers of Cleer's Dressing;
Powder of Angelica 2 Drums, Acid Vitriol of
Ceramicus 4 Drums, min item. Dose from 6 to
8 Drops in any proper Vehicle against the Cholick,
obstructions of the Terms in Women, Hypochondria,
Fits, Vomiting, and weakness of the Stomach. It
is profitable also against Convulsions, Fainting, and
Swooning Fits, Sickneys at Heart, and a Comptitative
habit of Body.

XXXV. The Sour or Salt. It is made of the
green Herb dried small, and made grateful with the
bitter White Wine Vinegar, a little Salt, and a sufficent
quantity of distilled Water. It is acute and grateful to the Stomach, causeth
Appetite, and is used as Sweet for Lamb, when
in Seafon, and some other Meats.

XXXVI. Observations, In ancient times, the
use of Mint was forbidden to Soldiers, not for any
hurt it did them, but because it did too much incline
to Venery, and thereby took away, or abated
their Courage and Valor. It is also further obser ved,
that a Lotion made of the Juice, Ejuice, or
Decolion, by mixing with them a little of the
Acid Vitriol, and Honey of Robe, that it curseth
the Scrofula in the Gums, and Sore Mouth and
Throat. And a Gargansion made with the Ejuice,
Dcelolion, Powders or Elixir, by mixing
with either of them, the Spirituus or Acid Vitriol
of Corisander Seed and Raisins, or by infusing both two
things in them, is an admirable remedy against a
Stinking Breath, by gargling the Mouth and
Throat therewith, and also oftentimes holding it
in the Mouth: and it caueth the Uvula or Falate
of the Mouth when down, to return to its place
and strength again. And an Elixir made with the
Juice or Effusion, two parts mixt with the
Distilled Water one part, and the Acid Vitriol half a
part, is an Excellent thing against the Megrim,
Head-ach, Vertigo, Lethargy, &c. by purging the
Head of cold gross Humours. Being smudg'd up the
Nose, and held in the Mouth, it is good against
a Stinking Breath, which proceeds from rotten or
corrupted Teeth.

Menthae - in English, Wild Mint and Horse Mint.

The Kinds. There are several sorts of this
Wild Mint, as 1. Menthae Menthae, Mentha Spicata, Herba, &c.mentha agrestis

XXXVI. The Saltish, or Saltish, or Horse Mint.

The Description.

III. The first, or Our Garden or Manured
Wild Mint, it Root is creeping, and much like
to that of the Garden Kind. From whence springing
up square Stalks, which are hoary and a little hairy
also, on which grow larger and rounder Leaves than
those of the Garden Kind, of an azure white
color, and covered as it were with down. The
Flowers stand at the tops of the Branches in spiked
Heads of a pale purple color, the small of which
is heath and stronger than those of the Garden
Kind.

Wild MINT.

CHAP. CCCCXCVIII.

Of MINT Wild; or

Horse MINT.

I. THE Name. It is called in Greek, Ἡλικιαν
Spicata, &c. in Latin, Menta Spicatiarum, Mentha agrestis.

IV. The
The second, or Our white or party colored Wild Mint. This is much less, and better smelling than the former: its Leaves are partly green and partly Milk white; and sometimes its Leaves are forth of one, wholly white; but more commonly, all green: the Roots, Stalks, Flowers and other parts, are like those of the former but lefer. This is also Nurft up, and found growing in many of our English Gardens. It is the Menthaeum alternum Delenaei.

V. The third, or Long Leaved Wild, or Horfe Mint. This has square bronchial Stalks, and somewhat broad, but longer Leaves growing on them than the left, nothing at all hairy, but rather of a dull green color. The Flowers stand at the tops of the Branches, in round Tufts, of a pale purpliſh color; and the finall of the Leaves and Branches, is something more pleater than the other.

VI. The fourth, or Mountain or Hungarian Wild or Horfe Mint. It has a pretty hard, thick, strong and memonibour, from many fibrous springing forth from it, more like to Nep than Mint. From which spring up several square Stalks, on which grow by couples at every joint, somewhat large Leaves, like as on the others, which are more green than the left, and deemed also about the edges. The Flowers are whiter than the former, hanging about the Stalks, at several spaces, and ending in small long Spikes. The whole Plant much resembling Commea Specus-Mint, and is of a hot and sharp taste, smelling very like to the other Wild Mints.

VII. The fifth, or Tuberous or Knobbed Wild or Horfe Mint. Its Root is something reddish within, and brownish on the cut fide; and is full of several tuberous Heads joined thereto, which being separated will grow into Plants. From this Root spring up square hairy green Stalks, full of Jointes, with two Leaves set at every Joint, which are long and rough, derrned about the edges, somewhat hoary, of a whithlin green color, and of a strong finell. The tops of the Branches do end in Spikes of hoary Leaves, among which, at certain diſtances, the Flowers stand, with two Leaves at a space of a, whithlin color: after which follows small black Seed.

VIII. The sixth, or Wild or Horfe Mint with Joined or Kneet Root. Its Root is something thick, and fet with Joints or Knees, at certain joints, growing forth Fibres at the same time, and rising above a foot high, being something hard, rough, and square, on which grow at the Joints, two long dark green Leaves, being flat in hanging, but a little wrinkled and derrned about the edges. The Flowers stand at the tops of the Branches in short Tufts or Spikes, like unto Nep, of a pale purpliſh color; after which come small, round, sweet infiding Seed, like in items to the whole Plant.

IX. The seventh, or Hairy Wild or Horfe Mint. This has square hairy Stalks, springing forth into many Branches, higher and greater than the Common Sort of Wild Mint, on which grow hairy long Leaves at the Joints thereof, and many purpliſh Flowers at their fertal tops.

X. The eighth, or small round Leaved Wild or Horfe Mint. The Stalk is square, hairy, and reddish, much about a foot high, having two Leaves at a Joint, somewhat long and round, soft, hairy, and derrned about the edges. Of a ful green on the upper side, and hoary underneath, from the Joints springing forth some Branches, set with the like Leaves, and round Heads of Flowers at the tops, of a purpliſh color; the smell of the Plant is hearty, and of a strong conjunctive.

XI. The Places. These are all of them Wild by Nature, and grow in moist and watery Places, as in Meadows near unto Ditches which have Water in them, and in Grounds many times overflowed with Water, as in Fenny Grounds, &c. but the two first are Nurft up in our Gardens, and so are also the others in many Places.

XII. The Time. These Flower, when the Garden Mints do, viz. about the latter end of July, or beginning of August, and springing up again the next year from their old Roots, by which they also very much encrease.

XIII. The Qualities, Specification, Preparations, and Uses are exactly the fame (if not more powerful) with those of the Garden Kinde described in the former Chapters, to which I refer you.

CHAP. CCCCXXCVI.

Of MINT Water.

I. The Nature. It is called in Greek, Μένθα in Latin, Syrphum, Mentha aquatica; and in English, Water Mint.

II. The Kinds. Of this there are two Sorts, viz. 1. Mentha aquatica rubra, Syrphum rubra major; Syrphum Mentha Lobelia; Beyond-Sea Apothecaries call it as Tragen Sagra, Ballemart, as also Balfam, Utter in Berta Suyttenfagi Sagra, Aquatica five Syrphum Mentha sola rubra Lobelia, Syrphum agrile aquaticum Deferi, Syrphum Sylphria Lagenanm, the Red Water Mint, or Water Mint the Greater.

The Descriptions.

III. The first, or Red Water Mint. It has a creeping Root, running and spreading in Muddy and Watery Places, From whence springing forth many square brownish Stalks, Branched forth almost from every Joint, with a Couple of somewhat broad, but pointed and derrned Leaves, of a brownish or reddish color, and of a strong sweet Mint like smell. The Flowers are small and of a purpliſh color, standing at the tops of the Stalks or Branches, in loose round Tufts, one above another.

IV. The
IV. The second, or Water Mint. It has a Root like the former, which sends forth a square reddish hairy Stalk, and sometimes a little hairy, of about a foot in height, on which grow oft, hairy, round and somewhat long Leaves, two always at a Joint, denoted about the edges, on the upper side of a dark green color, and grayish or hoary underwise. From the Joints with the Leaves come forth long Branched Stalks, with purplish Flowers at their tops, standing in round Heads. The whole Plant is of a strong sweet Mint-like smell.

V. The Places. They both grow by Ditches and Water sides, and in wet and plathy places, as also in Past Grounds, where they very much delight.

VI. The Times. They flower late in the Summer, viz. about the beginning of August.

The Qualities, Specification, Preparations and Virtues, are the same with those of Our Garden Mint, declared in Chap. 453. And probably may exceed them in many respects.

CHAP. CCCCXCV.

Of MOLY:

OR,

ONION--GARLICK

I. THE Names. It is called in Greek Μωλυ, καλάλη, Πτέλλη, vel miros. Hipp. I. c. 2. Alliun habens caput simplex, non in ramos modo.
IV. The seventh, or Indian Moly. Its Root is white and great, covered with a dark Coat or Skin, which encroaches but little under Ground. It has such like Leaves as the former, but shorter and broader. It rises up a short week Stalk almost flat, not having any Flowers upon it, but a Clutter or Head of greenish, Italy Bulbs, included at the first in a large thin Skin, which being opent, the Bulbs thereof are flat. Having close one unto another upon its Stalk, of the bigness of an Acorn, which being planted will be a Plant of the same Kind: but belies that Head, it bears small Bulbs above the Ground, at the bottom of the Leaves, next the Stalk, like unto the former.

V. The third, or First Bulbed Hungerian Moly. Its Root is not great, but oblong on the out side, very like unto the Root of Serpents Moly, described in Sel. VII. following, increasing much under Ground, and swelling from. It has three or four broad and long, green Leaves, folded together at the first, while the other is entire and divided, which carried up with the Stalk, standing thereon, one above another, which is not above a Foot high. At the top of which does grow a few lad reddish Bulbs, and between them on the top of the Stalk, a few flowers of a pale-purple color. After which Flowers, black Seed entire enclosed in roundish Heads.

VI. The fourth, or Second Bulbed Hungerian Moly. It is a Plant, and increased with a blackish purple Coat or Skin. It has narrower green Leaves than the former: the Stalk is about the same height, at the top a great Clutter of small Bulbs on the Heads of the small Stalks, are redder, and more pleasant to behold. The Stalk is lower, and its grifer winding Leaves, which twine themselves like Serpents (whence came its Name) are smaller, and of a whiter green color. It bears among its Bulbs purple or pell red Flowers, bolder, but more Beautiful, whose smell is nothing to strong as some others.

VIII. The fifth, or Three Cornered Moly. Its Root is oblong on the out side, and very like the yellow Moly. It has four or five long, and something broad, pale, green Leaves, flat on the upper side, and with a ridge down the back of the Leaf, which makes it seem thin, or curled. The Stalk rises up a Foot and half high or better, and is triangular or three cornered also, bearing at the top, out of a thinning Husk, several white Flowers something large and long, almost Bell fashion, with stripes of green down the middle of every Leaf, and a few Chives tip with yellow in the middle about the Head; wherein, when it is ripe, is enclosed, small black Bulbs. Root, Leaf, and Flower have a Garlic smell, but not very strong.

IX. The seventh, or Daffodil Leaved Moly. Its Root is sometimes knotted, but more often bulbous, having in the Knobs some marks of the old Stalks to be seen in them, and of a Garlic smell, by which the Plant may be known. It has many long, narrow, and small black Leaves. Root, Root, Leaf, and Flower have a Garlic smell, but not very strong.

X. The eighth, or Yellow broad Leaved Moly. Its Root is in which, two for the soft part joined together, which quickly encroaches and smelt with a strong Garlic smell the scent, as both Flowers and Leaves also. It has but one long, and broad Leaf, when it bears no Flowers, but when it bears Flowers, it has two long, broad Leaves, yet one always longer, and broader than the other, which are both of the same color, and near of the bigness of a Tadpo Leaf. Between those Leaves grows a slender Stalk, bearing at the top a Tuff or Umble of yellow Flowers out of a skimmy Husk, which pass three ways, made of six Leaves apiece, laid open like a Star, with a greenish back, or out side, and with some yellow Threads in the middle, after which follows black Seed, like as in the others.

XI. The ninth, or Purple Manganese Moly. It has a Root which is oblong, of a strong Garlic smell, but quickly pervades with the extremity of our cold Winters, which it will not endure without defence. It has two or three Bulbs on the top of the former Yellow Moly, but not so broad, nor so white. The Stalk has not so many Flowers thereon, but more springing, and of dull purple color, is like the former, and increased with a blackish purple Coat or Skin.

XII. The tenth, or Purple or broad Leaved Spanish Moly. Its Root is small, and bulbus or round, with manylying adjoining, from which other small Bulbs flow. It has two broad, and many pale, or green Leaves, like unto the Yellow Moly, at Sel. X. above; but in this they encompass one another at their bottoms; between which rise up a strong round Stalk, two Feet or more high, bearing at the top out of a thin Husk, a great many large, large Flowers, upon long foot Stalks, consisting of six Leaves apiece, spread open like a Star, of a fine dilated purple or pell color, with several Threads of the same color, tips with yellow, standing about the middle Head: between the Stalk and the bottom of the Leaves, some small Bulbs grow, which being planted, will soon spring and encrease. Neither the Root, Leaf, nor Flower, have any Garlic like smell in them.

XIII. The eleventh, or Purple Naples Moly, its Root is white, round, and bullous, quickly encroaching of the other Moly. It has a more Garlic like smell than the other parts of the Plant. It has three or four small green Leaves, growing upon the Stalk, after its springing up, which bears a round Head of fine purple Flowers, made of six Leaves apiece, but so closing together at the edge, that they seem like unto small Cups, never laying themselves open as the others do.

XIV. The twelfth, or Silver Cupid Spanish Moly. Its Root is small and round, white, and in a manner transparent, at least so shining as if it were so, and therefore nothing so much as many of the other sorts. It has two or three very long Stalks like Leaves, which rise up with the Stalk, or rather dyes away when the Stalk is risen up, to be about these Feet or more high, having a round Head of white Flowers, standing close at the lift, but after-wards spreading much one from another, every Flower standing upon a long foot Stalk, being of a white Silver color, with stripes or lines on every side, and shaped small and hollow like a Box or Cup. The Seed has scarcely been observed with us, because it Flowers so late, that the Winter hinders it for the most part, from coming to perfection.
This Plant has no ill smell at all, but rather pleasant, and not to be relished.

XV. The eighteenth, or Late ripe Pine Apple Moly. Its Root is small and round, and shining like the leaf, and very tender, not being able to endure our cold Winters, which commonly cause it to perish. It rises up with one long green Leaf, below low and round unto the end, towards which, on the one side, breaks out a Head of Flowers, encased in a thin skin, which after it has fix Root for a good while, (the Leaf in the main time, rising higher, and growing harder, becomes the Stalk) breaks, and shews a great Head, or Bush of Birds for Flowers, which are thick thrifty or crowded together, flagged very like to the form of a Pine Apple (from whence came the Name) of the bigness of a Half Nut. After this Head has fixt in this manner a Month, or thereabouts, the Flowers flower themselves, which are of a fine dilated or whitish purple color, with several stipples in every one of them, and of the fame Cup fashion with the former, but not opening so plainly, so that they can’t be distinguished to be open, without good observation. It flowers so late in Autumn, that the early Frosts do quickly spoil its Beauty, and Fruit cause it to rot.

XVI. The fourteenth, or Discomides his Moly. The Root of this Small Moly, is transparent within, and covered with a thick yellow Skin, of the bigness of a Half Nut, or somewhat bigger.

which finds forth three or four long, narrow, grnfy Leaves which are Hollow, and a little bending downwards, of a whitish green color, among which rife up a slender weak Stalk a Foot and half high, bearing at top out of a thin skin, a Tuft of Milk white Flowers, very like unto those of Rampion, which are growing in a few white, and then pas away, for the most part without yielding any Seed; the Plant nor its Roots, small little or nothing of Garlic.

XVII. The nineteenth, or Spanish Moly of Discomides. This is its Root, Leaves, Stalks, Flowers, and manner of Growing is altogether like unto that left described, saving that this is later, larger, and more monstrous, as having its Roots much as big as those of the former. But it items not to be pleased with the cold of our Winters here in England, nor can it at all endure them, unlike very great care is taken of its timely bedding, for otherwise it quickly perishes.

XVIII. The fourteenth, or Sweet smelling Moly of Montpellier. This is the sweet and perfumy of all the rest, having four or five small green Leaves, almost as fine as Herbs-Hairs, or like the Leaves of the Esther-Grass. The Stalk is about a Foot high, bearing about five or fix or more small white Flowers, laid open like Stars, made of six Leaves, splay, of an excellent sweet smell, resembling Methyl, if Flowers late in the Year, so that the preceding Summer is over mild, or the Autumn be early cold, it looks much of that very sweet smell, which it will have, if those Seasons be hot and dry; besides it must be carefully looked after, and timely loaded in a warm place; otherwise, it will not endure with us in the Winter time.

XIX. The fourteenth, or First broad Leaved Hungarian Moly of Clusius. Its Root is white and flat, without or round, bearing several small Bulbs growing thereto. It is several long, and somewhat broad Leaves, which from the former Root. Its Stalk rises up about two or three Feet high, with three Heads, threee, but naked or bare from the middle to the top, where it bears a round Tuft of purplish flowers, after which comes blackish Seed in three cornered Husks.

XX. The eighteenth, or Sweet smelling Hungarian Moly. Its Root is white and flat, or round above, or round below, with some little Bulbs growing thereto. It has a very sweet smell, and in its form and manner of growing, very like to the last, but with fewer Leaves and Flower Stalks, which bear at their tops, a Tuft of pale colored Flowers upon longer foot Stalks, hanging down their Heads, of a pretty fine, thin, pellucid, sweet smell, which slides not long, but quickly Vaniishes. The triangular Heads that follow, bring forth blackish Seed, something like to that of Pinks or Gillflowers.

XXI. The nineteenth, or Purple round Headed Mountain Moly. Its Root is white and flat, or round above, or round below, with some little Bulbs growing thereto. It has a few long, narrow, green Leaves, set on the Stalk like unto the others, and at its top, a large Tuft of delicate purple Flowers, which grow on short foot Stalks, never fully opening themselves, and having a strong Garlic like smell.

XXII. The twentieth, or Purplish Headed African Moly. Its Root is flat, or round, from whence spring up but one Stalk sometimes (and sometimes two or three) of about three Feet in height, with a few somewhat broad and long Leaves, pointed at the ends, and a little hairy about the edges. The Tuft at top of the Stalk consists of purplish Flowers each of five Leaves which grow upon long foot Stalks.

XXIII. The twenty first, or Italian white Moly with a triangular Stalk. Its Root is small and hollow or round of a flushing purple color, smelling like Garlic. This small Plant has but one or two long, hollow Leaves, but somewhat broad, and ending in a point. The Stalk is triangular or three cornered, growing, as having in Flowers three Feet high, with several small, white Flowers at the top.

XXIV. The Places. These Moly are peculiar to several Countries of the Earth, viz. England, France, Germany, Hungary, Italy, Spain, Turkey, &c.
but they all or most of them grow with us in our Gardens, being Nift up, and carefully look
after, but the most of them are hardly enough to en-
cure the cold of, our Winters.

XXV. The Times. They Flower for the
most part in the Summer time, viz. in June,
and July, and their Seed is ripe in fame little
time after.

XXVI. As to their Qualities, Specification, Pre-
parations, and Virtues, they are altogether the fame
of the Garden Garlickin (to whom I think no
fall out so powerful) which we have declared in
Chap. 307. Sec. 8. &d. 22. aforgoing of this Book,
so that no more need to be said of them in this
place.

CHAP. CCCCXCVI.

OF MONEY-WORT.

Or,

Herb TWO-PENCE.

I. THE Names. It was unknown to the Anci-
ext Greek and Latin Writers, Modern
Latin Authors call it Numularia, from the form
of its Leaf, being round like Money; also Cen-
tumbarum, Centumbaris, and of Gfesor, Centi-
morhis, from its wonderful effects in curing many
Diseases: and of Brooms-fellos and others Serpen-
teris, either because Serpents hate it, and by under
it, or for their being hurt or wounded, they heal
and cure themselves therewith by eating it; in
English, Money-wort, Herb Two-Pence, or Two
Penny Grave.

II. The Kinds. There are three sorts of this
Plant, viz. 1. Numularia vulgaris, Numularia
Major, Common Money-wort, or the Greater
Money-wort. 2. Numularia Minora, The Lesser
Money-wort. 3. Numularia sordida purpurascens,
Numularia Minor Flos purpureascens, Numulario
Bisnema, The smallest Money-wort, or Money-wort
with purplish Flowers.

The Descriptions.

III. The field, or Common or greater Money-
wort. It has a small, tender, and threadly Root,
which spreads and diversifies itself for about
under the Ground. From which Root spring
torth several long, weak, and slender Branches,
lying and running upon the Ground, two or three
Fifh long, or more, for on both Sides with
Leaves, two at a Joint, one against another,
at equal distances, which are almost round but
pointed at the ends, smooth, and of a good
green color. At the Joints with the Leaves from
the middle forward, come forth at every Joint
sometimes two yellow Flowers, and sometimes
but one, standing each on a small foot Stalk, and
condifling of five narrow, sharp pointed
Leaves, with some yellow Threads in the mid-
dle, which being put, small, round, Heads of Seed
follow in their places.

IV. The second, or Lesser Money-wort. This
in its Root, Stalks, Branches, Leaves, Flowers,
Seed, and manner of Growing, is fio like the for-
mer greater Kind, that it needs no further Defcrip-
tion, and differs only from it in this, that it is
every ways and in all respects much better
than it.

V. The third, or Smallest Money-wort, or
Money-wort with purplish Flowers. The Root of
this is like to those before described, but much
better. From which rise up, very many small,
slender, creeping Branches, spreading and running on
the Ground, in the fame manner that the other
do, which here and there put forth Flowers, and
take Root again. The Leaves are small, and
round, standing by couples one against another,
as several Joints, and a little pointed at the ends.
And out of their Bloods as the field Joints, spring
forth slender foot Stalks, bearing at their tops pret-
ty little Flowers, much smaller than any of the
former, of a whith purple, and sometimes of a
purplish red color, condifling of five little Leaves,
standing together in the manner of a little Bell
Flower; after which come small, round Heads,
(smaller much than any of the former) in which is
contained small Seed.

VI. The Places. The two first grow in moif
Grounds, and by Hedge-sides, near to Ditches and
Streams, and other watery Places, and sometimes
in moif Woods, in many places of England, the
first is more plentiful and common, almost every
where. Gerard says, he found it on the Thames
Bank, on the side opposite to White-Hall, and
almost in every Country where he had Travelled.
The third, Gerard says, he found it in the Bifhoprick
of Durham, and in two or three Places in North-
shire: It grows also on the Bogs upon the Heath
near Darlast-wood in Essex.

VII. The Times. They all of them Flower
from May, then June and July, and the third in
August also; and their Seed is ripe not long
after.

Z. 2. 2. 9. VII. The
Salmon's Herbal. Lib. I.

VIII. The Virtues. Money-wort is cold in the first Degree, and dry in the second. It is Astringent, V本nulery, and Pectoral.

X. The Specification. It stops all sorts of Fluxes of the Bowels and Womb, heals Wounds and Ulcers, and prevails against Contumacy of the Lungs.

X. The Preparations. You may make therefrom, 7. A Syrup of Oils or Saffron. 8. An Ointment or Balsam. 7. A Cate

The Virtues.

XI. The Liquid Juice. It is very Astringent, bleeding, and drying; and is good to stop all Fluxes of Blood in Man or Woman, whether it be a Diarrhea, Dysenteria, Listeria, Hepatick Flux or the overflowing of the Courties in Women; it stops also all sorts of Bleeding, whether outward or inward, as Spitting, Vomiting, or Piling of Blood; restores the Weakened of the Stomach by strengthening it, and stops Vomiting; healing all excoriations or Ulcers thereof, as also of the Lungs, and of all inward parts. Dose 2 or 4 Spoonfuls at a time either mixed with Honey, or in a Glafe of Red Port, or Red Flavon Wine, Morning and Night.

XII. The Effence. It has all the Virtues of the Liquid Juice, and may be given in the same manner, from 2 to 4 Spoonfuls before which, it is an excellent thing to heal all Simple green Wounds, and to digest, cleanse, incant, dry, and heal all sorts of old Ulcers, not yet become cancheth, Stopping the Fluxion of sharp and moist Humors which attend them, causing them either to spread, or to be long in curing.

XIII. The Infusion or Decotion in Water or Wine. These have the Virtues of the Juice and Effence, but nothing near so powerful, and therefore may be taken Morning and Night, from 4 to 6 Ounces, seasoned with a little of the Syrup.

XIV. The Syrup or Lobech. These are made of the Juice, the half of them with fine Sugar, the latter with Clarifled Honey. They have all the Virtues of the Liquid Juice and Effence, besides which, they are excellent against Coughs, Colds, Hoarseness, Wheezings, Shortness of Breath, diffi-
culty of Breathing, Excoriations and Ulcers of the Lungs, spitting of Blood, &c. Dose from an Ounce to two Ounces, every Morning and Night, an Hour before Dinner, and last at night going to Bed.

XV. The Powder of Herb or Seed. Drunk in Water in which red hot Iron has been quenched, it stops Fluxes of the Bowels and any old Sores or running Ulcer waffed therewith, it cleanse, days and heals it in a short time: so also the dry Powder betwixt upon the same pretty thick every time it is drunk.

XVI. The Ointment or Balsam. They cleanse running Sores and old putrid Ulcers, it incrustes, dries, and heals the same; and are of especial use for Green Wounds in any part of the Body: Applied to the Gout it eases the Pain in a short time, and doth strengthen the parts afflicted, so to prevent a new flux of Humors to the same.

XVII. The Catechism. The Flowers and Leaves flamped and laid upon Wounds and Ulcers, cure them; but it is much more effectual being flamped

and boiled in Oil Office, with an addition of Rosa, Wax, and Taperine. Authors say, that there is not a better Wound Herb than this, no not Tobacco it self, nor any other Herb whatsoever.

CHAP. CCCCXXVII.

OF MOON-WORT.

THE NOME. This plant was not known to the Ancient Greek or Latin Writers, tho' some would have it to be the Gerat Linonis: some to be Tragion Fenandum Dofoworllo, which growing on the Mountains, has the Leaf of Scopoladewr, or Spleen-wort, but I think erroneously. All our Modern Authors call it Lunaria minor (zalofis Lane, Grofentis made fapatis: ) Cofer calls it Lunaria perennis, or Tana: it is the Rose Lunaria gel pecariorum Tobornamentum: and is called in English, Moon-wort.

II. The Kinds. Authors make several kinds of this Herb, as, Lunaria minor, the Lesser Moon-wort, of which in this Chapter, and it is thought by some to be Homoetis altera, (Selenites) because they make, Lunaria major, to be Hieronymus, or, Mules Fern, in Chap. 255. Alfo, Vista Lunaria, Balbomach, or Satin Flower, whichfee in its order. 3. Lunaria minor ramifera Cofer, a small Branched Moon-wort, but this latter being really a Stranger in England, and Native of Sicily, we shall say no more of it in this Place.

The Descriptions.

III. The first, or small Moon-wort, has a small and Filius Kent, from which rising up annually but, but one dark, green, thick, and flat Leaf, standing

Small Moon wort
upon a short foot Stalk, not above two or three fingers breadth, but when it comes to flowering, it then bears a small, slender Stalk, or about 4 or 5 inches high, having but one Leaf growing from it, which is much divided on both sides, sometimes into 5 or 7 parts, or more on a side, each of which parts is small next the middle Rib, but broad forwards, and round pointed, re- forming therein an half Moon, (from whence came the Name) the uppermost parts or divisions being less than the lower. The Stalk rises above this Leaf 2 or 3 inches, bearing many Branches of small, long Spikes or Tongues, every one of them almost like to the lispky Head of Aderis-Tongue, of a brownish color, which whether they are to be called Flowers or Seed, is tactually determinable. These Spikes after they have continued a while, resolve into a many dust. Sometimes this Plant is found with several cach like Leaves, as the Leaf above described, with so many Branches or Tops arising from one Stalk, each divided from the other.

IV. The Flower. It grows on Hills and Heath, yet where there is much Gras, for therein it delights to grow. Gerard says it found him growing about a Brook in Somersetshire in many places, especially at a place called Coreg, two miles from Brotun, in the next Clofe to the Church Yard: on Cock- Heath, between Losses and Lomin, three miles from Almighty, in Kent; as also in Fore Grounds by Clothifier, in the Ground of the then Mr. George Soyer called Miter-wood; it grows likewise on the Side of Black-Heath, near the Stile leading to Eblon Heaths, as about a hundred Paces from the Stile: and in Lushford near to a Wood called Fairt by Law- bom; in Nottingham-fhire by the Welf-wood by Gringerly, and at Wefton in the Lefkay by the Welf Side of the Town: in Bithypford at York: near up to Welfhead, in the Clide where formerly Sir George Saul’s Hutfo hudland, called Heath Hall, and in many other places.

V. The Times. It is to be found only in April and May, for in June and the following Months, when the hot Weather comes, it is the most part withers and dies away.

VI. The Qualities. It is cold in the first Degree, and drying in the second, Allsthefue, Allthefung, and Venerary.

VII. The Speciation. It fopps fluxes of Blood of all forces, whether inward or outward, Vomiting, and other fluxes of the Body, washes the Womb, and heals all sorts of simple Wounds, whether inward or outward, Ruptures, Fractures, & c.

VIII. The Preparation. You may have therefrom, 1. A Juice or Essence. 2. A Decocation or Infusion in Wine. 3. A Salve or Ointment. 4. An Od. 5. A Cataplasm.

The Virtues.

IX. The Juice or Essence. They are more excellent things for all Wounds whether inward or outward, they stop the Whites in Women, as also the overtopping of the Terms, and all sorts of Fluxes, of the Bowels as Diarrhoea, Dysenteria, and Lien- teria, as also the Hepatic Flux, and all other fluxes of Blood, whether, by Vomiting, or by Urine, as also inward Fluxes of Blood, made by Wounds. They stop Vomiting, Gangrene the Stomach, and other Vilecers, and relieves the Tone of the Bowels being hurt. Dole from 2 Ounces to 4, in any fit Vehicle.

X. The Infusion or Decoction in Wine. They have all the Virtues of the Liquid Juice or Essence, and may be given Morning, Noon, and Night, from 3 to 4 or 5 Ounces, swinwened with Syrup of Red Roses, or of Cowslip Flowers.

XI. The Balsam or Gentian. They are excellent for healing of Green Wounds, digging, cleansing, Incarnating, and drying, or healing of old, rotten, putrid, and running Sores and Ulcers, bringing them to a speedy Cure: They are good alfo to confolc late Ruptures, Fractures, and Dislocations, being duly outwardly applied, the Juice or Essence being also taken at the same time.

XII. The Oil by Infusion. It is an excellent thing against Burtings and Scaldings however made, and being timely applied, profectly takes over the Fire, eates the Pain, and in a short time after cures the same.

XIII. The Cataplasm. It is good against Ruptures, Caulings in any part, Infammations, and con- solidate Fractures and Dislocations. And timely applied, it dispuces many Contusions wherefore, prevent Infammation and Apothemation, and speedil- ly relieves the part.

C H A P. CCCCXXVIII.

Of MOSS Ground, or Land.

I. The Names. Moss is called in Greek, Μοσος, in Latine, Mufcus, which is Byron Phileus; in English, Mufkus.

II. The Kinds. There are three General Species of this Plant, viz. 1. Bysb or Mufius, Mufcus Ter- restris, Ground or Land Moss, of which in this Chapter. 2. Bysb Arboreus, or tree Moss, of which in Chap. 493. 3. Bysb_selectus or Subulatus, Mufcus Marinus, Sea Moss, of which in Chap. 500. following.

III. The Species of the Land, or Ground Moss.
1. Mufcus Terrestris vulgarifimus, vel Terrestris Lobeli & Dodonaei, Mufcus Hertfordius Tragi Baum- hini, Our common Ground Moss. 2. Mufcus Terre- stris vulgaris alter Gerards, Mufcus dentatus fumus Baumhini, Mufcus montanus Turbenamontani, Our other ordinary or common Ground Moss. 3. Mufcus Terrestris foiparatus, Mufcus foiparatus Lobeli, Selgae tertius Thibli, Reafm Moss. 4. Mufcus Chamae, fev Lycopodium, Lobeli & Da- donaei, Mufcus Terrestris, Matthioli & Tragus Se- lutanei Species altera Thibli, Mufcus Urfinus Geff- zeri, Glib Moss, or Wolfs Claw Moss, greater and leffer. 5. Mufcus dentatus major & minor, Mufcus Terrestris aloratus, Mufcus Lolithomasis Clowi, Touched or Dented Moss, greater and leffer. 6. Mufcus Fenestra major & minor, Winged Moss of greater and leffer. 7. Mufcus spicatus repens, Creep-

The Descriptions.

IV. The first, or Our common Ground Mufs. Its Roots are very short, which are fitted in the Earth, from which the Herb forage up very thick, together

along, being made of many short yellowish, green, hairy Leaves: at the joints of the Branches, grow in several places, two or three small, round, long, yellowish, feby Heads, like
Chap. 498. English Herbs.

Herbs. 727

IX. The fifth, or Winged Mofs greater and leffer. Both these Mofs need also but one Description, not differing but in the largeness and multitude of their Branches one from another: they creep on the Ground, and Root as they run: their Stalks and short Branches are thick set with fine yellowish, green Leaves like Wings on both sides, from whence it took its Name. They grow in Woods, as also upon the Rocks and Stones.

X. The seventh, or Creeping Mofs with Spiked Heads. This grows near to, and under Trees, creeping far abroad, with thick and long branches, which send forth many fine Leaves, set close together, in manner of long spiked Heads, one sort being green, and another white.

XI. The eight, or Branched Mofs greater and leffer. The greater Branched Mofs grows thick and close together like a Turf, or Heathcock of high Grass, whose Stalks are 4 or 5 Inches long, spreading into Branches of 2 or 3 Inches a piece, and close into others again, all which are covered with very fine Hair like Leaves among which grow forth small naked Stalks of an Inch long, with small yellow round Heads like Wheat Corns. The lesser sorts hereof has its Stalks shorter, and its Leaves are so small that are they scarcely to be discerned.

XII. The ninth, or Heath Mofs. It grows much on dry heathy Grounds, and being a small sort of Mofs, it riseth up with several hard Stalks of small short Leaves, and at the top many others set thick and round like a Turf.
Salmon's Herbal. Lib. I.

XIII. The tenth, or Rock or Star like Mois. It is a small Mois which grows upon Rocks and Stones, and secretly riseth above an inch in height, having many small, pale green, short pointed Leaves, set at the tops of their small Stalks, in manner of a Rose, spreading forth like a little Star.

XIV. The Eleventh, or Cup Mois, or Cup like Mois. The Leaves of this Mois is like Liver-wort, creeping upon the Ground, and are of a yellowish, yellowish color, as are the small yellow Leaves like Cups, upon both sides of the middle thereof, resembling a Fir-tree Branch, from whence it took its Name.

XVIII. The fifteenth, or Fern-like Mois. There are several Kinds of this Mois, some bigger, and some fitter than others, all of them rising up with several Stalks, some blackish, some reddish, and some Leaves on them, much like Liver-wort, but in some more finely cut or jugged into several parts than in others; on the tops of the Branches of the lefier sort, hang small, round, pointed, crooked Hairs.

XIX. The sixteenth, or Maidenhair Mois, or Golden Maidenhair greater and lesser, as Gerard calls it. There are three Kinds of this Mois, v. One that has many short Stalks thick covered with short, but somewhat hard, rough, Hair-like Leaves, growing in two Grounds. 2. Another which is in each part, and the Leaves not rough or hard at all. 3. Another which is the leaf sort, and the Leaves smooth: These two fall grown upon old Walls. Gerard says, that the leaf sort Kinds have Stalks about an handfull high, covered with fine Hair; having very thick together, of an obscure yellow green color, out of which Stalks springing up sometimes very fine black Stones, and fourfold black, upon the tops of which hang at it were little Green like White Corns: Its Roots are also very fnder and exceedingly fine. The second differ only in magnitude from the former, and this may have Threaps upon its Branches. 3. The third which is the very leaf of all (and judely the leaf of Plants which grow) has only three or four of these hairy Threads close to the Root.

XX. The seventeenth, or Hoary Cran-like Mois. This small Mois has many small Hair-like Leaves, next the Ground, like unto the Common Mois, among which ruffe up, rough Stalks, three or four inches high, in some places bare of Leaves, and covered in the rest, with many such like Leaves, as are growing on the Erica Cors fol. but without order, on the tops of each colored Bands a Hoary Cran.

XXI. The Eighteenth, or Hoary Coral-like Mois. This is all of a hoary white, growing about a foot high, whose upright Branches are thick, solid, and without Buds, divided into many Ramifications, each of which is like unto a Stag's Horn, and sharp or small at the end.

XXII. The Nineteenth, or Coral-like Mois with reddish Horns. The Mois grows among the common or, common Ground Mois. And is a delicate sight to behold, the pale, green, ordinary Mois to grow on the ground; and this Mois being all other, to grow out from among it, parted like Coral in many Branches, hard or tough in bounding, but the ends or tops of them are all of yellowish or reddish color, like small, hard, or ring Horns.

XXIII. The twentieth, or Mountain Coraline-like Mois. This is a small low, whisht, dry Herb, with small hollow Stalks, a few fanners or hard at all, but finely cut and divided into many parts, much resembling the true Coraline; this it oftimes found upon dry Rocky Grounds.

XXIV. The twenty first, or Rocky Coral-like Mois. This grows on Rocky Hills among other Mois in Naples, and Semois fays, whose Branches are many, and each ending in a two forked like Horn, something like the double forked Horn of a Stag, being hollow and white within, and green without a bit of an it early fall.

XXV. The Place. They most of them grew upon barren, heathy, dry and rocky, or rocky Grounds, according as is exprest in their several Descriptions. But the Majori Capitibus, viz. the sixteenth
sixteenth Species, is seldom found but in wet woody Grounds, upon Bags and Moorish places, yet sometimes it has been meet with in shady dry Ditches where the Sun does not come. Gerard says, he found it in great abundance in a shadowy Dutch upon the left hand near unto a Gate which leads from Hengford-Heath towards High-Gate.

XXVI. The Times. They all fourth chiefly in the Summer Months.

XXVII. The Qualities. They are cold in the first Degree, and dry in the second, Altringent, Repercussive, Vomiting, Diuretik, Stomachick and Neprilistic; and of them all, the first, fourth, and eleventh, viz. the Common-Moss, the Club-Moss, and the Cup-Moss, are said to be the most singular and effectual.

XXVIII. The Specification. The first and fourth are good against the Strangury, to provoke Urine, and break and expel the Stone. The Cup-Moss effectually helps the Chin-Cough in Children. The Club-Moss is said to recover Liot or Picket Wincs, with them are good to heal Wounds and old Ulcers, to stop all kinds of Fluxes of the Bowels, as also Fluxes of Blood.

XXIX. The Preparations. You may have thereon, 1. A Decoction in Wine. 2. A Powder. 3. A Castigation.

The Virtues.

XXX. The Decoction of the Common or Club-Moss in Wine. Being drank for some time is said to be drying and Altringent, to stop Fluxes and Bleedings of all sorts, and is a singular good thing to break Friable Stones in the Reins or Bladder, and to expel the fame, as also Sand, Gravel, or Tartarous Matter affetting those parts; it opens their obstructions, provokes Urine, and gives ease in the Strangury. The Decoction of the Cup-Moss in Water or Whey, effectually eases the Chin-Cough in Children, being taken for several days together.

XXXI. The Powder. Made of any of the Mosses and given to a Daim, it has all the former Virtues, and outwardly applied it stops Bleeding upon the spot, and dry's up old Sores and putrid running Ulcers. The Powder of the Cup Moss given to Children for several days together, Morning, Noon, and Night, it certainly cures them of the Chin-Cough; more especially if it is given in the Decoction.

XXXII. The Castigation. Moss bruised and boiled in Water, and applied to any Inflammation, or pains arising from a hot caule, allays the heat, and eases them; and therefore it is applied by many to places afflicted with the Gout, and that as it is said with good success.

XXXIII. An Observation. Club-Moss being hung in a V e t t of Wine, that has lost its Vigor, and is become flat or pricket (so much as is convenient for the height of the V e t t ) is said in short time to recover it again: for which reason Brunefelsear called it Weinbraut, or the Wine Herb.

ERATUM.

CHAP. CCCCXCIX.

Of MOSS Tree.

I. T H E Name. It is called in Arabic, arbex, and Unces; in Greek, Ἄρβης, or, Κρίς, in Latin, M u s c u s arboreus; and in English it is called, Tree-Moss; and if it grows upon Oak Trees, then Oak-Moss.

II. The Kind. There are several Species of this Moss, viz. 1. M u s c u s arboreus vulgaris, M u s c u s L e g a n s, or, Oak-Moss. 2. M u s c u s Arboreus vulgaris fict Germainus, Knobled or Armed Tree Mosses. 3. M u s c u s Quercinus fumulatus, Fennel like Oak-Moss. 4. M u s c u s Quercinus vel L u c i u s fruticosus capitatus, Oak or Oak-Moss with hollow Heads. 5. M u s c u s quercinus vel patarens, after furtens, Tree-Moss, with broad horned Leaves. 6. M u s c u s aridis cattartis, Crucly dry Mosses, or dry Liver-wort or Lung-wort. 7. M u s c u s Palmarinus, Lichen Arbor. 8. Moss Lung-wort, or Tree Lunge, or Oak-Lungs, of which we have already discourse a large in Chap. 456. following.

The Descriptions.

III. The first, or Common Tree-Moss, or Oak-Moss. This generally grows on all Trees, and is nothing else but a number of Hans or small Threads, proceeding from the branches and Branches of them, in some stature, in others larger, all for the most part hairy, or of a yellowish grey color, which borne neither Root, nor Stalk, nor Flower, nor Seed. Some
times this Moss is of a reddish color, and sometimes blackish, which is the worst of all.

OAK MOSS.  

IV. The second, or Knobbed or Kneed Tree-Moss. This is of a grayish color, hanging from the Trees, with a large spread Brush of Hairs. It is long, and sometimes half a Yard long, with several small hoisted Points like Heads, growing upon them towards the lower end, which are hollow, and grown so as if they were string together, some being longer, and others shorter than the rest.

V. The third, or Fennel-like Oak-Moss. This usually grows upright on the Boughs, and the elder Arms and Branches of old Oaks, and sometimes on

OAK-MOSS Fennel-like.

OAK-MOSS Branched Flowering.

Beeches also, being covered with a small bristful Dust into their Bark, and from thence sends forth several slender, blackish, bristled Stalks about two Feet high, with a number of moss fine grayish Fennel-like Leaves, which grow in a sort of clusters: the tops whereof stand small, round, hollow Vesicles, a little rough or hairy about the Stains, which quickly fall away, without any Seed following them.

VI. Johnson upon Gerard thus describes this third sort. There is oftentimes found upon old Oaks and Beeches and such like sorts of Trees, a kind of Moss like Oak-Moss, (called also Oak-Moss's Branched Flowering) having many slender Branches, which divide themselves into other lesser Branches, on which are placed confesfully, very many small Threads of a greenish ugly color: upon the ends of which tender Branches sometimes there comes forth a Flower, to shape like unto a little Buckler, or hollow Mushroom, of a whith color tending in yellowness, and garnished with the like Leaves of those of the lower Branches.

VII. The fourth, or Tree or Oak-Moss with hollow Heads. This has hollow Stalks, with broad flat Leaves, somewhat hairy on the edges. The Heads are also hollow with a blackish Stile or Petal in the middle of them, and sometimes encircled about with a dentected Verte. This has several short Branches spread divers ways, and is wholly of a greenish ugly color.

VIII. The fifth, or Oak Moss with broad hoisted Leaves. This is of a whiter ugly color, branching it self into many thick and broad parts, like unto the Horns of a dog, bearing at the top of them, certain small Vesicles, of the shape of Clouds or Chink Peals at biggies. This Moss does sometimes grow Luxurios footing greater from the bottom to the top.

IX. The sixth, or Crusty dry Moss, or Dry Liverwort or Lung-wort. This does not much differ in form and color from the Moss of or Tree Lung-wort, of which we have already treated in Chap. 35th, but in its being dryer, or more dry or harder: it grows as well on Trees as on the clift Rocks and Shingles made of Oak, and also sometimes upon Stones and Rocks on the Ground, and sometimes upon the very Common Moss it self, as it has been found sometime growing in Windor Park.

X. The Flowers. The first has been found growing upon Trees in many Forrests and Woods throughout all England, as also through the whole Collec-

LI. Salmon's Herbal.
XII. The Qualities. They grow and flourish all the year, and are in a kind of vigor, even in Winter; in the middle of Frost and Snow.

XIII. The Specification. The Virtues which the Ancients attributed unto Mufs, are wholly to be understood concerning those which grow upon Trees; and each Muf does much partake of the Nature of the Tree on which it grew, or from whence it was taken. As of that the Oak is more binding, and better against Fluxes of the Bowels, Cancers, &c., than those of the Cedar, Larch, Beech, Poplar, Fir, or Pine Trees; and is more powerful than any of those against Vomiting, and Fluxes of Blood in ancients.

XIV. The Preparations. You may have therefrom, 1. An Infusion or Decoction in Wine. 2. A Powder made of the Substance of the Mufs. 3. The Oil or Ointment.

The Virtues.

XV. The Infusion or Decoction in Wine. Being drank it is good against Reaches and Vomiting, settles a troubled Stomach, and assuages the Hiccough, comforts the Heart, and calms deep Sleep as Soporific affirmeth. It stops all Fluxes of the Bowels, and all internal Fluxes of Blood, whether of the Lungs, Reins or Guts; and stops the over-flowing of Woman's Courts being taken inwardly, and outwardly used as an Injunct on the Worm with a proper Worm Syringe.

XVI. The Powder. It has all the Virtues of the Infusion or Decoction afore declared, and may be given from a Scruple to a Dram, made up into a Balsom with a little Astringent or Venice Trecate, or given in any other proper Vehicle. It stops all inward Bleedings being given as aforesaid, or in any Striket red Wine: And it strops any outward Bleeding of Wounds, &c. being outwardly applied dry, either alone, or mixed with wine Beer, in fine Powder. And is said to be available against all Dropsies being taken in broach Driek or Wine for some time together.

XVII. The Decoction Oil or Ointment. The oil is made by boiling in Oil Olive, etc. The screw is boiled in Hogs Lard. Being applied to the Temples or Forehead, it wonderfully eases the pain thereof which comes from a hot Caule: and strops the defluxion of heat sharp Rheums and Humors flowing thence to the Eyes and other Parts. The Ancients much used this Tree Mufs in their Ointments, against Latitudes, to strengthen the Nerves, and comfort Joints and Guts which have been weakened by hurts, blows, and affluences of Humors.

XVIII. The Qualities, Specification, Preparations, and Virtues of the seventh Species, viz. of the Mufs or Three Long-voit, called by some Oak, Lange, you may see at large in the aforesaid Chap. 458. from the, & 12. in latter. Physicains use it against the most Invertente Confumations, and that with good success, and indeed against most Difficulties of the Lungs, as Colds, Coughs, Stiffnishes, Wheezings, Hoarfe, throrrh of Breath, difficulty of Breathing, as also against all sorts of Fluxes of the Bowels. And Shepherds give it to their Cows for the same purposes, mixt with a little Salt, and that with good success. It is probable also, to be put into Leprocy, to stop a Consumption of Humors upon old Ulcers and running Sores in any part of the Body, as also Ulcers in the several parts of Man or Woman, the time being waiteth thereon two or three times a day.

C H A P. D.

Of MOSS Sea.

I. T H E Names. It is called in Arabic, Tha, Sulfur & Thuléth, in Greek, Biber ophthalmo, or in Latin, Mucus Marinus: and in English, Sea Mufs.

III. The third, or Southernwood-like Sea-Mufs. It grows up from blackish, brown, and Fihers Roots, with many fine short Leaves like Fennel, of an herby green color, among which comes forth, an herby Stalk, with such like Leaves on it, and being several Sowels Emergence to the Stalk.

IV. The second, or long Fennel-like Sea-Mufs. The Leaves of this Sea-Mufs are long and fine, like unto those of the Perula, or Fennel Giant, growing from Seats of almost a foot long, and in dividet into many Branches. It springs from Stones, Rocks and the like.

V. The third, or Southernwood-like Sea Mufs. This springs up also from Rocks with thick Stalks and Branches, having thern fine cut Leaves, some thing like unto Southernwood, but much bigger, and of a brownish red color.

VI. The fourth, or Neapolitan Sea Mufs. This likewise grows from some Stone or Rock, and rises up with a Stalk of about 4 inches or more high, with several Branches on them on both sides, and they again divided into higher, all of them plentifully hers with very fine Leaves, as small as Camomill Leaves, or finer then they, if of any of the two be finer. it being handled at first, easy to be bendet, green below at the lower part, and purplish above, and without Transparent, if they be intercepted to the light. This is not so brittle as Coralline when it
is dried, and grown more rough by the dryness: it has a very soft taste, and being soaked a while in Water, grows pliant and soft again.

VII. The fifth, or Venetian Colbus-like Sea-Moss. This grows on Rocks in the Sea, which by the often agitation of the Water, is broken from it, and carried to the Shore, not having any Root, but being made as if it were a Tart of small Sticks put together, which being dry, much refines the Root of Colbus Indicus, but others: and being mifsted new again, opens itself into form, being full of Salt, much like to fresh Sand.

VIII. The Earth, or Soft Sea-Moss. This is like unto those Mosses which grow upon the Ground or on Trees without any Roots, or Shells of several Shell-Shrubs, being a soft Herbc, composed wholly of sallow white Hairs without any Branch or Stalk, and is often found white than reddish or grey, but seldom or never green. There is another small sort hereof, found growing on the Stones by the Sea side, as also sometimes on Weal, and is heicous sometimes call’d by the Sea on the Shore among the Alga, or Sea Wrack, of several sorts growing something like to the former or Ground Moss, but that it is white, and a little fishy and badling.

IX. The seventh, or Red Sea-Moss, or Red Dying Sea-Moss. This is a small sort of Moss, and much like to the fourth Species, or Neapolitan Sea-Moss, it is furnished with a greater flour of stiff Stalks, but fewer Branches, and with a See or small Leaves on them like unto Fenstrum, of a reddish color, but with some whitish Mixed together. This is used by several Dyers to stain and strike a deep crimson color, or a reddish purple, which will last long.

X. The eighth, or Silver Feather-like Sea-Moss. This most beautiful Moss grows on Rocks in the Sea, upon the dry Shells of Eels, and is oftentimes found unwarfed among the Alga, or Sea Wrack, or Sea-Weeds, when cast upon the Shore, growing up with many Stalks, and spreading it itself out into many particular Branches, made as it were all of Hair like other Mosses, but very much resembling several sorts of Feather, as if pure a white Silver-like color, that it is to be wondered at, that ever any thing should become so white by Nature, or be made so white by Art.

XI. The ninth, or Golden Feather-like Sea-Moss. This is a Moss of excellent form and beauty, Branching it itself out into several Sprigs, resembling the natural form of small long Feathers. The Branches are filled with Leaves on both sides like Hair, and both Stalks and Leaves are of a most shining Gold color, beautiful to behold, and have a great resemblance of the Spumna Auriflora, Cialis, which we call Feather-Grass.

XII. The Places. The Descriptions shew that most of them grow upon Rocks, Stones, and Shells in the Sea, and on the Shore: Some of them growing out of the Ground except the first: some of them are found in the Seas and on the Shores of other Countries, and former or molt of them on our own Coasts.

XIII. The Times. They grow and flourish all the year long, and live Summer and Winter very much alike.

XIV. The Qualities. They are cold, and dry in the first Degrees, are Astringent, Anodyne, Vapory, and Naphractic.

XV. The Specification. They cool inflammations, gives ease in the Gout, kill Worms in the Body, Stop fluxes, Bag Vomiting, redness, Inflammations of the Eyes or other parts, Stop fluxes of the Belly, prevent against Sand and Gravel in the Kidneys, and Blisters, and all swells, dry and heal old running Sores, and foul partit Ulcers.

XVI. The Preparations. You have therefore only, 1. A Decotion in Wine. 2. A Pouder of the whole Body of the Moss. 3. A Cepalysm.

The Virtues.

XVII. The Cephalysm. From a Scrupule to a Dram in some fit Vehicle, it is said to kill Worms in Children; but ought to be made of the fourth and fifth Kinds. The Pouder of the fourth Kind is said to be very effectual for Watertan Red Eyes, if mixt with White Wine, and put into them. And the same Pouder taken with Vinegar Stops Vomiting and strengthens the Stomach. The Pouder of the fifth Kind, or Venetian Sea-Moss, is good to cleanse the Blood, and make it strong or outward, and being given to a Dram in Wine, it expels Sand and Gravel from the Kidneys, and gives ease in the Stomach.

XVIII. The Virtues of the sixth Species, or Silver Feather-like Sea-Moss. Applied Pustules-wise with Vinegar, it cleans the Pustles of the Scopem or also dissolves scumulit Stewings or Kernels in the Neck and Thorax, or other Parts. The Decotion in Wine, given to fix or eight Quaees at a time, or this Pouder given to a Dram at a time in White Port or Lisbon Wine, abundantly provokes Urine, and are profitable against the Dropes: they cleanse the Reins, Urines, and Bladder, from Small Stones, Gravel, Sand, and other Tartaceous Matter. The Pouder may be given in Wine as aircue, or in Diluted Water or aulYum, or Holy-Water, or of Sea-Holy, or of Purify, or of Hydrogin, mixt with an equal proportion of Juice of Leucon.
Chap. 501.  English Herbs.

II. The Kind. It is supposed to be a Species of the Cudweeds, but forms to roth a firmer Plant of its own kind, and is the Helichrysum of Dioscorides. But Parkinson gives us three other sorts of it also.

The Descriptions.

III. This Plant has a long Root, of a considerable thickness, and is furnished with several Fibres or Strings, springing from the sides thereof round about, from which rising forth slender stalks something short and woody, divided into several small Branches, upon which do grow many, sometimes a round, of a white color, and much jagged, not much unlike to those of Southernwood. The Flowers stand on the tops of the Stalks, joined together, of a yellow color glittering like Gold, in form resembling the stam Flowers of Tulips, or the middle bottom of the Camomill Flower, which being gathered before they be ripe or wither, remain beautiful for a long time after. For which cause of long lasting, the Learned Image of Helichrym or Gold were used to wear Garlands thereof. For which reason Polyolony King of Egypt, did much observe it as a Petig. Thus Gerarde.

IV. Parkinson thus describes it. Helichrymum or Golden Flower of Life, has a Root which is small and Woody, spreading under the upper crust of the Earth, lasting long in its own Natural place, but very shallow, with few color, and Whits inside, unless they be mild, or well defended. From this Root rise up many short, round, white Stalks, a Root and half high, on which at certain distances stand many fine flat Leaves, and one Leaf cut into many thin and small parts, almost as small as Fennel, but of a grayish color, like into the Cudweeds or Cottonweeds, (whereof certainly this is a special Kind) At the tops of the Stalks stand many round thorns, of a pale gold color, in an Umble close together, yet every Flower upon its own Stalk, and all of an even height, which will keep the color (being gathered and kept dry,) for a long time after, and are of an hot quick fashion.

To this Parkinson gives us also the Descriptions of three other Plants, (which he will have to be Species of the same kind,) and which we here deliver you, as follows.

V. Helichrysum Citrimum, Candy Goldlocks, or Golden Flower. It has two or three small, slender Branches, which are white, and set here and there very scantily, with few, long, and narrow hoary Leaves, having yellow Heads of Flowers at the tops, made into Umbels or Tufts, not so round and even as the former, but long-nos, one above another, the Heads being made as it were of Scales, body and not so closely set together, as in the next following; which when they are full ripe do put into Down, and are blown away with the Wind, having a small redshill Seed at the end: but wilt abide a long time, as at the others in its beauty, being gathered in its due season.

VI. Helichrysum Orientale, Oriental Goldlocks, or Golden Flower. Its Root does not every Year, but lives long, especially in the Southern and Eastern Countries, where it grows on old Troughs, but with us, in our cold Climates, it requires much care and diligence to keep and preserve it. It is a beautiful Plant, and much like to the former Cicut Rhyn Lath described, but grows up higher, with many more Branches, and more hoary, white and woolly, having also long and narrow white Leaves, but somewhat broader, and thicker set on the branches. The Tops of Flowers or Umbles do like the single angel of longer and larger Heads, more saty and other comfits together, of an excellent pale yellow color, and shining, with some yellow threads or thrums in the middle.

VII. Helichrysum Cirrimum, Chryzomea, Serratus Cirrimum, Gold Turfia, Gold Calidrome. Its Root is small and black, and the Plant is somewhat like to the Candy Goldlocks, at Sect. 5. above, having hoary Stalks, and Leaves having composed on them, being long and narrower than those of Cicut or Candy. The Tops of the Stalks are divided into many parts, each bearing a small, long, yellow Head or Flower at the top, with some yellow thrums in them, which Heads being many, are differently set together, like a lape or staved Umbel, keeping their color long before they wither, and when they are ripe, base than, small, redshill Seed, like Marron Seed, but before the whole Plant is well Leaves, and Flowers, as Roots, is of a strong, and sharp, but pleasant flavor.

VIII. The Places. They all grow in Hot Countries, as in Barbary, Carly, Bras, Provence, France, and in Spain: where they grow in unkind Grounds, and in Burnt Meadows, as also about the Banks of Rivers. With us they only grow in Gardens, and are very carefully to be looked after in Winter.

IX. The Time. Polldly in their Native Countries they may Flower in the latter end of the Spring or Summer Months, in Spain, and in Spain; but with us, they all Flower in the end of August, or rather in September, to the time called Midsummer.

X. The Qualities. They are hot and dry in the Second Degree, incite, stimulate, and are Diuretic.

XI. The Speciation. They are (chiefly the 3d and 4th) peculiar against the Strangury, Congestion of the Blood, and Biting of Serpents and other poisonous Creatures.

XII. The Preparations. You may have herefrom, 1. An Infusion or Decotion in Wine. a. A Powder of the Herb and Flowers. b. A Spiritual Tincture of the same. c. An Acid Tincture.

The Virtues.

XIII. The Infusion or Decotion in Wine. It heals and dries, and is profitable against Cuthulis, provokes Urine powerfully, and gives ease in the Strangury: comforts a cold Stomach, and helps Di- gestion. It is good also against the Biting of Serpents and other Venemous Creatures, and being drank dissolves congealed Blood.

XIV. The Powder of Leaves or Tops or Flowers. It has all the Virtues of the Infusion or Decotion, and may be given Morning and Night, in half a Dram to a Dram, in a Glass of Generous Wine. Disperses says, that the tops thereof being drunk in Wine, are good for such as can hardly make Water, against Biting of Serpents, and Plays of the Huckle Bones, by which I suppose is meant the Sciatica: and being taken in sweet Wine it dissolves congealed Blood.

XV. The Spiritual Tincture. It is good against weak-headed of the Stomach and Bowels, expels Wind, and prevails against the Colic and Griping of the Guts: remedys the Head, Brain, and Nerves, comforts the Bowels and Wind, and admirably provokes Urine. Dose from one Dram to three Morning and Night, in a Glass of Wine, or some other proper Vehicle.

XVI. The
MOTHER of TIME, see Time Wild, Chap. 5.

CHAP. DII.

OF MOTHER-WORT.

I. THE Name. I do not find that this Plant was known to the Ancient Greeks, or Latins: Our Moderns call it Carduus (from comforting and strengthening the Heart) and might very well be called Matricaria Herba and Matricaria altera (from its curing of Difficulties of the Woman.) The prime Matricaria, being that which we call Parthenium, or Heathermint. And in English we call it Mother-wort, from its curing Fits of the Mother.

II. The Kinds. Most of our Botanists have made but one Species heretofore, and a singular Plant of this Kind: But Mr. Bay has added many more, and they being all Strangers to us, and not probable to be met with all here, we shall wholly pass them by. That which we shall here Describe is Carduus vulgars, or Matricaria altera, Our Common Mother-wort. Thefe, viz. 1. Carduus Griffo, Culled or Criped Mother-wort. 2. Carduus Americanus annua Nepeta foliis, Annual American Mother-wort with Nep or Cat-mint Leaves. 3. Carduus Americanus minor Nepeta foliis, The Kift American Mother-wort with Nep or Cat-mint Leaves. Thefe 3 fahr, are the chief of which he has added, besides which he has enumerated about seven other Kinds, all which being Forests (as the Plants themselves are) to our design, we shall pass them all over.

The Descriptions.

III. Our Common Mother-wort has a Tender Root which fends forth and is compofd of a great Number of small Fibres or long Tender Strings, which are of a dark yellownish or brown color, taking Strong hold in the Ground, and pr?fes not, but with abides the coldness of the Winter. From whence rifes up a strong fquare Brown, rough, strong Stalk, rising to be fometimes three or four Feet high, and spreading into many Branches, on which grow Leaves on each side upon long foot Stalks, raw at every Joint, which are fometimes broad and long, and as it were rough, or crumpled, with many great Veins which show themselves thereon, of a fad green color, and deeply divided in about the edges, and almost torn or divided, from the middle of the Branches up to the tops of them, which are very long and fmall, grow the Flowers round about them in flances, in fmall pointed, rough, hard Heads, which are very purple or red, than in any of the Bermas, or in any Horne-bound, but in the fame manner, form, and roughnes of those of the Horne-bound are, after which come fmall, round, blackbeth Seed in great plenty.

W. Gerard has another kind of Description of this Plant, which fomething better pleafes me, and it is this: Its Root is compofd of many fmall Strings, which fends forth a Stalk four fquare, thick, hard, and about two Cubits high, of an oblong, or over- worn red color. The Leaves are fomewhat black like those of Nettles, but greater and broader than the Leaves of Horne-bound, deeply indented, or cut in on the edges. The Heads are hard and pricking, which do encompass the Stalks like Whorls, or little Cornets, out of which grow purplifh Flowers, not unlike to those of Dead-Nettles, but lefer. The whole Plant has a better Taffe and rank Smell.

V. The Places. It grows among Rubbish and by the Sides of Walls, and Hedges, and Hanks of Ditches, in many places beyond Sax. And Perkin- fon fays, he never knew or heard that it grew with us any where but in Garks where it had been once Sown or Planted. But Gerard fays, that it joys only in Rubbish, Stones, and other bare Places, and has been found in some Places about Oxford, I may fay in Travelling about England, have fometimes found it growing Wild, in several Places.

VI. The Flowers. It is Fowithy, Flowers, and Seeds from June to September, yielding a plentiful quantity of Seed. The Root endures all Winter, through the Leaves and Stalks die away and perish.

VII. The Species. It is hot and dry in the Second Degree, Alkaline, Allegring, Diuretick, Voltimor, Cardiach, and Hyfterick.

VIII. The Syropification. It prevails against Painings and Sweatings, as in Hyfterick Fits, Com-
villous, Cramps, and Pains, opens Obstructions
of the Stomach, provokes Urine and the
Toue, and helps to effect the Birth, in Women in
Labor. 

IX. The Preparations. You may make there-
from, 1. A Liquid Juice or Essence of the Herb

2. An Infusion or Decoction of the Juice. 3. A
Powder thereof. 4. A Spirituous Tincture. 5. A
Distilled Water.

The Virtues.

X. The Liquid Juice or Essence. It may be given
from one Spoonful to three in a Glass of Canary,
or other Generous Wine, against Paintings, Swoon-
ings, Pains at Heart, Convulsions, Pains, Lethari-
ges, &c. Given in a Pennyroyal-Water, or in its own
Distilled Water, it is good against Vapors and
Hydrick Fits. Given in white Port or Lisbon
Wine, it facilitates the Birth of Women in Labor,
Induces the Terms, provokes Urine, and gives ease
in the Stomach.

XI. The Infusion or Decoction in Wine. It
has all the Virtues of the Liquid of the Essence, but
more weak, and may be given Morning and Night, from four to eight
Ounces, according to the condition of the Pa-
tient.

XII. The Powder. The Powder has all the former
Virtues, and may be given from half a Dram to a
Dram, or Dram and half in a Glass of Generous
Wine, Morning and Night: It cures the Breat
and Legs of cold Flegm, and eases it to be easily
expectorated, and kills Worms in the Stomach
and Belly.

XIII. The Spirituous Tincture. This is much more
Coriol than any of the former Preparations, and
therefore more effectual against Dileases of the
Nerves, Heart, and Stomach; it warms and dries up
cold Humors, disperses and digests them in what
part of the Body ever, and gives great relief in
Cramps and Convulsions.

XIV. The Distilled Water. It has the Virtues of
the former Preparations, but in a weak Degree, and
is chiefly used as a Vehicle, to convey the former,
or other Preparations in relating to the same
Dileases.

CHAP. DIII. Of MOUSE EAR.

I. THE Names. This Plant is called in Greek
Mousis, in Latinus, Pipifera, Myositis, O
Auricula, in English, Mouse Ear. They are
called Pipifera from the hairiness of their Leaves
and Stalks.

II. The Kinds. They are manifold, as 1. Ppi-
ifera minor vulgaris erecta; Pipifera major repetita.
(So called in respect to the eighth Kind.) Hebdoma-
Lacacum. Our common small creeping Mouse Ear.
2. Polifella media vulgaris erecta; Polifella major quam
rundum (so called in respect to any eight Kind, as
at present) Ladiuella Syperbifera repetita Cernaria in
erota. Our common upright Mouse Ear. 3. Pilof-
fella altera erecta. The second or other upright
Mouse Ear. 4. Pilifella minus. The smallest
Mouse Ear. 5. Auricula Minor. Cat's foot, My-
fitis Scorpioides hispana, Affinis Myositis Lobatii;
(refering it to the kinds of Chickweed) Blew
Mouse Ear with a turning top. 6. Myositis Scorpi-
oides repent, Heliotsoneum minutus, Small
creeping blew Mouse Ear. 7. Pilifella Amer-
icana, Pilifella Americana adornata, Pilifella Indica
adorata, Sweet Indian or American Mouse Ear. 8.
Pilifella minor, Pilifella Montanum, Pilifella Minor
Mountanum Vales albo & Vales purpureus. Graphani-
Montanum Vales albo & purpurea, The lesser
Mouse Ear, or Mountain Mouse Ear, with
whites and purple Flowers, or Cats-Foot; or
Mountain Cat's Foot with white and purple Flow-
ers. 9. Pilifella Rosae, Graphanum Rossum,
The Rose Mouse Ear, Rose Cat's Foot, or Cotton
Rose.

The Descriptions.

III. The first, or Our common small creeping
Mouse Ear. Its Roots are small with some fibrous
Fibres, whence sprouts forth a long creeping Herb,
routing upon the Ground, and rooting with small
springs from several Points, about the manner of
the Strawbery Plant; as or from which grow upon
the Ground many small and somewhat short Leaves
set in a round form together, bellows in the middle,

where they are broadest, of a hoary color all over, as
well above as below, and very hairy, which being
broken do yield a white Milk, or milky Juice from
among those Leaves springing up two or three small
hoary Stalks, about a Spant high, with a few smaller
Leaves thereon. As the top of which stands usually
but one Blossom, consisting of many pale yellow Gazelli-
broad at the points, and a little dented in, set in
3 or 4 rows, the greater outermost, and the smaller
inward,
Salmon's Herbal.

Lib. I.

Inward, very like a Dandelion flower, and a little reddish underneath about the edges, especially if it grows in a dry and not mossy ground, which often they have Blood long in Summer, do turn into Dew, which with the Seed is carried away with the Wind.

The second, or Our common Upright Mouse Ear. This is very like the former: the chief difference between them consisting in this, that the Leaves are broader and greener on the upper side, and somewhat hairy underneath, fatter in handling, and not so much hairy; the Stalks of Flowers standing more upright and higher: this Plant, if its Stalk or Leaf be broken, does give a white or Milk-like Juice to the former.

The third, or second, or other upright Mouse Ear, which Gerard calls Pilosella major, or great Mouse Ear. It has a small, tough, andpremium Root, whence shoots forth a few hoary and hairy broad and long Leaves, lying upon the ground, among which rises up a slender hairy Stalk, bearing long and narrow Leaves thereon, and at the top two or three small, pale, yellow Flowers, like in fashion to the former, which turn into Dew as they do.

Gerard has this Description of it. Its Roots are hard, round, and full of Strings. It has great and large Leaves greater than the common Creeping Pilosella, or Mouse Ear, thickest and fmallest of all. The Stalks and Leaves are hoary and white, with a folken Miftiness in handling, and feel soft as Silks, Pleasant and fair in View. It bears three or four four or five Stalks somewhat hoary, and about a Foot in height. The flower is borne first at the tops of the Stalks, like unto the small Dandelion or Pillfated Flowers, of a yellow bright color.

The fourth, or Smallest Mouse Ear. This is in all things like unto the second Kind, or Our common upright Mouse Ear, before described at Sect. IV. and is fmalter by half than the fmaltest common Kind, both in Leaf and Flower, but creeps not by Springs as that does.

The fifth, or Blown Mouse Ear with a turning top. It has a small and threads Root, from whence rises up, upon it but one Stalk, (stillly any more) which is round, hairy, and about half a Yard high or better, as the bottom of which growth some what long and broad hairy Leaves, very like-upright, until for roughness, as for flipt and color unto the Wild Borage Leaves. The Stalk is sometimes Branched, and sometimes not, with several such like Leaves, but growing longer and longer thereon, as they come up to the tops of the Flowers, which turn upon themselves inward like unto a Scorpion Tail, or the Herb Heliotroperm: The flowers consist of fivell Small flowers spikes, which are round, and of a pale blin color, very much resembling the Flowers of Bugloss, or Wild Borage, with a yellow foot or Eye in the middle, and stand all on one side of the Stalk and Branches, after they are tall, there come in their places, small rough flat heads, in which the Seed is contained.

The sixth, or Small creeping blew Mouse Ear. This is very like the left Kind, but that it is smaller, and most commonly has smaller Leaves and Flowers on the Branches, which do not stand so upright, but trail or creep more on the Ground. The Flowers also stand not on one side only, but on both, and open by degrees. The turning tops, which are like the left do grow up, and dilate themselves, and the Flowers are of a more color, but none of them are more purple, with a yellow Eye in the middle.

The seventh, or Sweet Indian or AmericanMouse Ear. This Plant has a lofty Root creeping under Ground, not growing deep, with many ivory adjoining thereto, from whence shoot forth several Leaves and a somewhat long Leaves, set with very somewhat Flowers. The hairy Stalk which rises from them, grows to be about half a Foot high, at the top of which stands seven or eight green Flowers, like those of our common Mouse Ear, but of a deeper yellow or orange color, swelling very sweet like Musk.

The eighth, or Leffer Mouse Ear, or Mountain Mouse Ear with white and purple Flowers, or Cans-foot. This Mouse Ear may be accounted for a certain Kind of Mountain Cudweed, or Cottonweed. Its Root is composed of several small blackish Fibers, Threads or Strings, from which spring forth many small, white, hoary Leaves, lying upon the Ground, sometimes like unto the Leaves of the small Mouse Ear, but smaller than them. From among which rises up a small Stalk of about half a Foot high, biforced and three with few Leaves; at the top of which comes forth a Tuft of small Flowers, set close together; in some of a pure white, in other of a purple or reddish color, in some of a fine red or Nut, and in others of the hoary purple mixed together. This Plant for its beauty is much commended, but with scarcely all but Winter with us in our Gardens, unless the Season be mild.

The ninth, or Rose Mouse Ear, or Rose Cudweed, or Cotton Root. Its Root is small, long and threadsy. And from the same springing up such like woody Leaves as in the former, growing upon small Short Branches, scarcely an Inch high, in those like unto Dry Leaves, but lefter and round pointed. At the top of every Stalk or Branch, stands one Flower, composed of two rows of small white Leaves, and open like a Star or Rose, whence came the Name, having a round Head in the middle, made of many yellow Threads or Threads, which falling away, a small round Head rises up, full of small Seeds.

The tenth, or Cudweed, or Rose Cudweed, or Cotton Root. Its Root is small, long and threadsy. And from the same springing up such like woody Leaves as in the former, growing upon small Short Branches, scarcely an Inch high, in those like unto Dry Leaves, but lefter and round pointed. At the top of every Stalk or Branch, stands one Flower, composed of two rows of small white Leaves, and open like a Star or Rose, whence came the Name, having a round Head in the middle, made of many yellow Threads or Threads, which falling away, a small round Head rises up, full of small Seeds.

The eleventh, or Cudweed, or Rose Cudweed, or Cotton Root. Its Root is small, long and threadsy. And from the same springing up such like woody Leaves as in the former, growing upon small Short Branches, scarcely an Inch high, in those like unto Dry Leaves, but lefter and round pointed. At the top of every Stalk or Branch, stands one Flower, composed of two rows of small white Leaves, and open like a Star or Rose, whence came the Name, having a round Head in the middle, made of many yellow Threads or Threads, which falling away, a small round Head rises up, full of small Seeds.

The twelfth, or Cudweed, or Rose Cudweed, or Cotton Root. Its Root is small, long and threadsy. And from the same springing up such like woody Leaves as in the former, growing upon small Short Branches, scarcely an Inch high, in those like unto Dry Leaves, but lefter and round pointed. At the top of every Stalk or Branch, stands one Flower, composed of two rows of small white Leaves, and open like a Star or Rose, whence came the Name, having a round Head in the middle, made of many yellow Threads or Threads, which falling away, a small round Head rises up, full of small Seeds.

The thirteenth, or Cudweed, or Rose Cudweed, or Cotton Root. Its Root is small, long and threadsy. And from the same springing up such like woody Leaves as in the former, growing upon small Short Branches, scarcely an Inch high, in those like unto Dry Leaves, but lefter and round pointed. At the top of every Stalk or Branch, stands one Flower, composed of two rows of small white Leaves, and open like a Star or Rose, whence came the Name, having a round Head in the middle, made of many yellow Threads or Threads, which falling away, a small round Head rises up, full of small Seeds.

The fourteenth, or Cudweed, or Rose Cudweed, or Cotton Root. Its Root is small, long and threadsy. And from the same springing up such like woody Leaves as in the former, growing upon small Short Branches, scarcely an Inch high, in those like unto Dry Leaves, but lefter and round pointed. At the top of every Stalk or Branch, stands one Flower, composed of two rows of small white Leaves, and open like a Star or Rose, whence came the Name, having a round Head in the middle, made of many yellow Threads or Threads, which falling away, a small round Head rises up, full of small Seeds.

The fifteenth, or Cudweed, or Rose Cudweed, or Cotton Root. Its Root is small, long and threadsy. And from the same springing up such like woody Leaves as in the former, growing upon small Short Branches, scarcely an Inch high, in those like unto Dry Leaves, but lefter and round pointed. At the top of every Stalk or Branch, stands one Flower, composed of two rows of small white Leaves, and open like a Star or Rose, whence came the Name, having a round Head in the middle, made of many yellow Threads or Threads, which falling away, a small round Head rises up, full of small Seeds.

The sixteenth, or Cudweed, or Rose Cudweed, or Cotton Root. Its Root is small, long and threadsy. And from the same springing up such like woody Leaves as in the former, growing upon small Short Branches, scarcely an Inch high, in those like unto Dry Leaves, but lefter and round pointed. At the top of every Stalk or Branch, stands one Flower, composed of two rows of small white Leaves, and open like a Star or Rose, whence came the Name, having a round Head in the middle, made of many yellow Threads or Threads, which falling away, a small round Head rises up, full of small Seeds.
The English Herb.

It is powerful against the several Jaundice, Stone and Gravel, and gripings of the Bowels, the Dropsy, obturating parts of the Spleen, stops the overflowing of the Terms, or any Flux of Blood: is good against Coughs, or Ulcers on the Lungs, and Contaminations prevails against Quaran- Agues, cures Green Wounds, as also Ulcers in any part of the Body. The first is what we in- tend here, and next to that is the second kind, and the third.

The Virtues.

The Liquid Juice of the Herb. It may be taken from an Ounce to 2 or 4 Ounces, Morning and Night, in a Glass of warm Wine, it is most proper against the Diffick it is given for. It is good against the yellow Jaundic, and cures the Diffick tho' of long continuance, but it is more powerful in this case, if a quarter part of the Black Tincture of Muri be mixed with it. And if a few Grains of Salt of Tartar be dissolved in it, it is a special remedy against the Stone and Gravel and other Tar- tarous Matter best in the Relais, Lillers, and Bladder. And also given in the Decotion of Catarrh and Scurvy, it is said to be effectual against the Dropsy: and to ease all Tor- tions and Gripings pains of the Bowels.

The Efficacy. It has all the Virtues of the Liquid Juice, and may be taken from 1 Ounce to 3 in the same manner. It contributes to the curing of Green Wounds and Ulcers, inwardly taken, and outwardly applied, by way of Ilosion. It gives ease in the Colick and Griping of the Guts, and is of singular use in curing a Diarrhea, Dysenteria, Listeria, and Hepatic Flux. It stops Fluxes of Blood either at Mouth or Nose, as also piling Blood, and the overflowing of the Terms in Women. Taken to 4 Ounces or more, before the Fit of Colick, or Aague, it keeps the Fit Back, and less- ens it, and by the constant use of it for some time, it takes it quite away and cures it.

The Decotion in Wine. It has all the Virtues of the Juice and Efficacy, and may be given from 4 to 8 Ounces, sweetened with the Syrup of the same Plant: outwardly applied, it is an incomparable thing to cleanse, incantate, dry, and heal up old Ulcers. The Powder of the dry Herb being fried upon the same, after washing with it.

The Powder of the Herb. It has the Virtues of the Juice and Efficacy, and may be given from half a Dram to a Dram and a half in Syrup of the same, and that Morning and Night. It is said to ease the Pain of the Stomach, tho' never so intense, to stop Vomiting, and to Strength- en it.

The Syrup of the Juice. Being made with double refined Sugar, or Clarified Honey, it is an excellent thing against Coughs, Colds, Head- aches, Wheezing, Asthma's, Phthisicks or Ulcera- tions of the Lungs, and indeed is prevalent against a Tuber, Firing, or Contagion of the whole Body, and most other Distempers of the Lungs, and Throat or Breth; it is also said to be good against Ruptures or Bartellen: Dose two or three Spoonsfull Morning and Night, in a Glass of Spyritick red Wine, or other proper Vehicles.

The Balsam or Ointment. They cure simple Green Wounds at the firstintention, diges- tion, incantate, dry and heal old running Sores, and gargle, or curing Ulcers. It gives ease in the Gout, and other Pains, being duly applied to the parts affected.

The Catalpa of the Green Herb. Being laid to any simple Green Wound, it apparently conglutinates the Lips thereof: it also is prevalent against simple Contusions, and either prevents or cures the Tumor, if any arises, and reduces it to its natural color.

The Distilled Water. It is available against all the Distempers afore named, in the Juice, Efficacy, Powder, Decotion, or Syrup, but must be given in much greater Dose, as to 8 Ounces of more, sweetened with the Syrup; and if a little of the Spirituous Tincture is added to it, it will heal Sores and Wounds which are outward, being wallished therewith, and Temps, or Cloths wet therein being applied.

The Spirituous Tincture. It takes away the pain of the Stomach, eases the Belly, and strengthens all the Viscera: it mixes with the Powder to the thickness of a Catalpa, and applied, it is singular good to stay the Malginitiy of spreading, burning, or oting Canker, Sores, and Ulcers wherefoever, as well in the Mouth, as in the secret parts of Men or Women.

The Acid Tincture. It is good against the Purgate, and all Sorts of Burning and Maliglous Fevers: It quenches Thirst, stops Vomiting, strengthens the Stomach, curtes a good Appetite, and a strong Digestion, and kills Worms in the Bowels whether in old or young. Dose 40 Drops or more in any thing the Patient drink.

The Oily Tincture. It is prevalent against the yellow Jaundice, the Cholick, Gripings of the Guts, the Stone, Sand, Gravel, and Tar- tarous Humors in the Relais Utters and Bladder, and prevails against Contusions, and the Pain, and is a potent thing to give present ease in the Stomach. Dose from 20 to 30 Drops, Morning and Night in a Glass of White Pom Wine.

Note. The Juice of Aspera Ear, is said to be fo powerful to hinder Iron or Steel, that if any edge or pointed Tool, shall be often quenched therein, that it will cut all other Iron, Steel or Stone very easily, without turning the edge of point.

CHAP. DIV.

OF MOUS TAIL.

T H E N A M E S. It is called in Greek, Mosai φυτον, and in Latin, Coriander, Malabar, Coriandrum, Sinar, Sinarum, Cholinum, Coriandrum, Cuminum, Coriandrum, Coriandrum, Coriandrum, Coriandrum, Coriandrum.

Habits. It is a singular Plant of its Kind, but enumerated both by Athanaear, Lonicerae, and Parkinson, among the Herbs, because it is, as they say, in Taste and Property like them.

5 B
Salmon's Herbal.

The Descriptions.

III. It has a small, hoagy, Viscous Root, from whence springing up many small, grisy Leaves (for which reason it might have been placed as well among the Graffen) which Leaves are very full, smooth and hard; from among which springing up several small, slender Stalks, with small, long, blackish green, fseed Heads, like unto a small Plantain.

Mugwort.

Head, but smaller, having white Flowers on them, which quickly fade and fall away, after which there is found very small blackish Seed in the long Heads, which then in some are a little crooked, and in others straight, resembling a Mouse Tail, from whence it took its Denomination or Name.

The Virtues.

X. The Juice or Essence. Syringed up the Nodiris it stops an Hemorrhage, or Bleeding at the Nose: and given inwardly from a Spoonful to two Spoonfuls, it hysteresis inward Bleeding, Spiritus or Vomiting, Pilling Blood or the Bloody Vomiting, it may be given in Alkant, or some strong Bodek Syrupick Wine.

XI. The Decoction in Wine. It has the fame Virtues, but much weaker, and may be given Morning, Noon, and Night, from 4 to 8 Ounces, sweetened with Syrup of Cowfry.

The Names. It is called in Greek, Artemisia; in Latin, Artemisia (from Artemisia the Wife of Mars by King of Caria) formerly it was called Parthenium, quass, Virginia, &c. Meaden-wort; and as Apennine fays, was also called Parthenium, which is indeed the proper Name of another Plant, viz. Fetterbur. But some think the Name came from Artron (one of the Names of Diana) because it is chiefly applied to Women Diseases; and in English, it is called only, Mugwort.

III. The Virtues. There are four Species of this Plant, usual with us, viz. 1. Artemisia vulgaris, called by some Aier Herburem, Our common Mugwort; and this is common almost in all Countries. 2. Artemisia minor, The leaf of or fmall Mugwort. 3. Artemisia Montana, Artemisia truncata, Montana, Five Mountain Mugwort. 4. Artemisia Virginiana, Virginia Mugwort.
in the Ground, but both Leaf and Stalk die, and perish every Year, the Root remaining all Winter, and flowering out anew the next Spring. From this Root spring forth dreary Leaves, lying upon the Ground, very much divided or cut to deeply about the edges, something like unto Wormwood, but

much larger, of a sord or dark green color on the upper side, and of a very heavy white underneath. The Stalks, which grow in June to be purplish, and in some to be deeper colored, rise to be sometimes three, four, or five feet high, on which grow such like Leaves as the below, but something smaller, branching forth very much towards the top, on which grow very small, pale, yellowish Vessels, like Buttons, which fall away, after which comes small Seed, enclosed in small round Heads. The whole Plant has a reasonable good smell, and is more easily propagated by slips, than by the Seed.

IV. The second, or Lesser, or small Mugwort. It has a Root much like the former, but smaller, from whence spring forth Leaves like unto the former also, (the whole Plant being like it) which Leaves are divided or cut in on both sides, as that green on the upper side, and whith a white underneath, but much smaller than they. The Stalk likewise, (for many times it has but one) rises up, of a sord color, and is so great, but bears the Flowers, yet pale, the smell of the whole Plant is like the last.

V. The third, or Fine Mountain Mugwort. It has a Root which is long and black, spreading it itself on the Ground, from whence springs up a Plant, not much unlike the former, having several square branches Stalks, or Branches, about a foot and half long, on which grow such like Leaves as much for form, but longer, narrower, and much more crumpled or jagged on the edges. The Flowers are small and pale, like the aftergoing, and the smell of the whole Plant differs very little.

The fourth, or Virginia Mugwort. It has a Root much like the Common English Kind, and the whole Plant very much resembles it, in its divided Leaves: but it rises up something higher, and spreads it self larger out, and its jagged or deeply cut Leaves are somewhat bigger.

VII. The Places. The first grows plentifully throughout all England, as well as in other Countries by the Way sides, by Ditch sides, on Banks and, and by Brook sides, or Water courses, almost in an infinite number of places, as and in the borders of Fields. The second is also found in some of those places but not so frequently. The other two are only Nurtled up with us in Gardens. The left according to its Title or Name grows very plentifully in Virginia, and other parts of Florida.

VIII. The Times. They all Flower and Seed in July and August, or in the end of Summer.

IX. The Qualities. Mugwort is hot and dry in the second Degree. Aperitive, Laxative, Tonic, Apoplexy, Diuretic, Digestive, Nephritic, Hydrie, and Emmenagogue.

X. The Specification. It is prevalent against Vapors and Fits of the Mother; it powerfully provokes the Terms, brings away both Birth and After-Birth, and expels the Dead Child; it is good against the Pulsus, as alfo Cramps and Convolutions, it cures the Stomach, as also the Poyson of the Black Poppy, or the over much taking of Opium.

The Virtues.

XII. The Liquid Juice of the Herb. Being taken every Morning Falling, and every Night at Bed time, from two Spoonfuls to four, in a Glass of White Port, or Lisbon Wine, or in Madera Wine, it provokes the Terms powerfully, and facilitates the Birth of Women in Labor, bringing away the After-Birth, and curing all the swelling, it is good to expel a Mote, when the Woman has gone beyond her Time, as also the Child when it is Dead. It expels Vapors, being duly taken; and I have cured Hyperbic Fits, and was admirably, but then in these two last cases, it ought not to be given in its own Distill'd Water, or in fair Spring Water.

XIII. The Infusion. It has all the Virtues of the Liquid Juice, but more Powerful, and more Stomastic: it opens all obstructions not only of the Womb, but also of the Reins, Uteres and Bladder, provokes Urine admirably, gives ease in the Stomach, and expels small Stones, Sand, Gravel, and other Muscular or Tartarous Matter from those Parts: if any one is poysoned with the Juice of the Black Poppy, or has taken too large a Dose of Opium, this is laid to be a preeminent. Dose from one Spoonful to four, in a Glass of Glycerine Water.

XIV. The Infusion or Distillation in Wine. They have all the Virtues of the Juice or Infusion, but must be given in larger proportion, as from 5 to 6 or 8 Ounces Morning and Night; and it may be sweeter'd or made pleasant with double refined Sugar. If the Distillation is made in Water,
it may serve as a Bath for Women, to fit them, or to allay their Stings; it bathes the Womb, cures the Ofbrurations thereof, and causes the Cowls to come down, and alfo facilitates the Birth; and if it be, as a Bath, it not only opens the Obftrurations of the Womb, but also takes away the Inflammation thereof, if any be. If the Deceafion is made with the addition of Agrimony and Camomil, whether in Wine or Water, it has an Anodyne power and quality, for if any part which is pained, if the Nevers are hurt, or are troubled with the Cramp, and they be bathed and fomented hereafter, as hot as it can well be endured, it gives prefent cafe and relief.

XV. The Powder of the Herb. It has the Virtues of the Juice, Effeéce, and Decolation, and may be given from Scruples to 3 Drains in Generous Wine, or other proper Vehicle. If it is given to three Drains in Wine, Authors fay, it is the leaft, and a certain help for the Siftica. But I fuppofe it ought to be given Morning and Evening, with a Contraconta for fifteen or twenty days, taking now and then, a proper Purge between whites. When it is to be given in large quantity, it ought to be given in a Mifs of hot Water Gralf, or Button broth, or in three or four Spoonfuls more, of Syrup of Choe Gillifemum, or of Violets.

XVI. The Baffam or Ointment. They cure Green Wounds excellently well; they being applied to Wens, or Gums, or hard Knobs, or Kernels which happen about the Neck and Throat, it eafe their pain and cures them away, and they are faid to be more effectual, if some fmall Daffs be added to the Composition: I am fure, they will be then the better for the curing of Wounds and Ulcers.

XVII. The Caquatam. It is made of the Green Herb, and is of fuch a nafter to difpaffe the Fluxion, and cure a filple Contufion. And if it is applied to the Joints and Limbs of such as are very much wearied with Travelling, it eafe and gives them much relief, as People fay: and that they fell feel no wearines, in their Journyng.

XVIII. The Poffary. It is made either of the Raw Root, either whole, or beaten into a Mafs in a Mortar: or of the Juice, mixed with the Power of Myrrh, enough to bring it into a Body, of fuch a Confequence as may be formed into a Poffary. Being put up the Womb, it induces the Tones which have been flopp; and if a Woman is at the time of her Labour, it fcatters the Birth, and afterwards brings away the After Birth.

XIX. The Diluted Water. Thou poftibly it has the Virtues of the Juice, Effeéce, Decolation, and Powder; yet it is weak in its Operation, and may be given (diluted with Syrup of Violets) to half a Pint or more: but it is chiefly used as a Vehicle, to convey the other Preparations in.

XX. The Spiritusous Tincture. It is of excellent use to be given to Women in Labor to facilitate the Birth, as alfo after Delivery, to prevent After Pains, and to caufe a full and compleat clearing. The fame want of which thing is a great many Women fuffer much, incur many Weakneffes and Diſtempers, and are many times ruined by it. It is good alfo, against the Colick, as alfo Torsions and Crampes of the Bowels; Dose 2 or 3 Drains are to be given at a time in a Glafs of Wine.

XXI. The Acid Tincture. It prevails powerfully against the Poyfon and Maladigty of Poppons and Toxops: it refifes the Storaces, Rops Vomiting Muddle, and caufe a good digiflion. It alfo vapors, opens all forts of Obftrurations of the Bowels, and makes the kids and Children: It likewife cleanseth the Blood of Variouf Meinlage. Dole from twenty to fifty Drops or more, according to the Quantity of the Vegetable it is taken in: it may be given in Conary, or other Generous fort of Wine, true, three, or four times a day.

XXII. The Olty Tincture. If it is inwardly given from half a Dram to two Drains, it gives prefent cafe in the Colick, and Grangings of the Guts, as alfo in the Strangury, poveritiously provoke Urine, and cleanseth the Urinary parts of all Kinds of Heterogeneous Matter; is good against Fits of the Mother, and many times cures the Palline (if not in old People) as alfo inward Convulsions of the Stomach and Bowels. In the Pallie, it ought to be Anointed also outwardly Morning and Night on the Back Bone from the Vertebra of the Neck, to the Anus almost. Anointed likewife up on the part afflicted with the Siftica, it has been foun to give cafe; and many times a cure.

C H A P. DVI.

Of MUG WORT Sea.

I. T H E NAME. It is called in Greek, Agvisophyto: in Latin, Artemisia Marina: and in English, Sea Mugwort.

II. THE KINDS. It is a singular Plant of its own Kind: but is thought by some good Authors to be a Species of the Marigalls, and therefore being a Sea Plant they call it Artemisia Marina, as Gerard: and Artemisia folio Lavenite, as Clapham, because it has a kind of Lavender like Leaf, Label and Tohermenmanton calls it alfo Artemisia Marina: Others taking it to be a Species of Wormwood, of the Sea Kinds, have call'd it, Absinthium Mariniathum latifolium, as Comarrus, and he thinks it to be fo: Odonius calls it Absinthium Anguillifolium, et alio, Narrow Leaved Wormwood, and narrow Leaved it may well be thought, in regard to the Common Wormwood. But Porling calls it Absinthium Mariniathum folio Lavenite, or Lavender Leaved Sea Wormwood.

The Descriptions.

III. Gerard thus describes it. It has a woody Root, from whence rise up many Branches, bandling rough in differences one from another of a difcolor, bright with Leaves not much unlike to that of Sea Purslane: thefle Leaves are of two sorts, for some of them are long and narro, like thofe of Lavender, whereof Chaffus called a Artemisia folio Lavenite, others of them are more divided, about the middle divided, and the fame as the Rib, about the lower parts of the Stalks, and towards the Tops of the Branches, they are narrower and thinner, and cut with green and deep parts, thick and fprawling, and a yellow color, as well to the top of the Plant in. The Btorus are many and yellow, which folding away, there follow a就想 Seed like unto that of Our Common Wormwood. It yields a plenteous fmall like unto Abrus Marinum, and in Taff is somewhat Suflih or Barklih. As to the Taff I fear that Gerard is a little out, I have fome-
MUGWORT S. I.

Sometimes tafted of it, but could obferve no fuch
Satifhion as for all that I know of it, the Taffe
may vary, according to the differing places in which
it may grow.

IV. Parkifon Deleires it thus. It shoots forth
many flender, weak, and brittle Stalks,
which are at first very few, and in a very few of the leaves
bending a little downwards, whereas do grow diverse
hearty, white, long Leaves, fome few broader than
Lavender Leaves, having sometimes some cuts or
divifions at the bottoms of them, which are cut feld
from, and in a very few of the leaves near the
Ground. Those which are fet on the Stalks
are fuller, and sometimes are cut or divided at the ends,
of a reasonable veft feer, between
Lavender and Southernwood, and of an
unpleafing fcent. The fowers grow after the
fame manner of those on the Common Worm
wood, and of a yellow color, and the Seed is moj
nocielt thereeto alfo.

V. The Place. It grows about the Sea Cofts
as on thofe of the Venetian Gulf, and likewife
in the ifland of Chio. It has been found growing
also about Eyn in Suffolk, and Winchelfael Cathie,
and at Portmouth, in the ifle of White, as Gerard
fays.

VI. The Time. It Flowers in July and August,
or towards the latter end of Summer, in which
time it perfects its Seed.

VII. The Qualities, Specifcations, Preparations
and Vertues, are flid to be the fame with thofe
of the Common Mugwort; in the former Chap-
ter, and thither we refer you. Some have it to be
the manner of the Common Wormwood, but
that it can hardly be, because it wants much of
that bitterness, Astringency, and Somatick prop-
perty.

CHAP. DVII.

Of MULLEIN Common.

OR,

HIGTAPER.

I. THE Name. It is called in Greek, \textit{verbascum},
from \textit{verbas}, to burn, and \textit{co}, as,
\textit{Flamma a Flame}, for that it ferved as a Wick to
put into Lamps to burn, from whence fome of the
Latins called it \textit{Cardellina regia}, and Candentaria,
because in the Ancient times, they ufed to dip
the Stalks hereof in Suet, Tallow, or Wax,
to make Candles, Tapers, or Torches of it. It
is called \textit{allo} in Latin. \textit{Thujas, Thule},
\textit{Tulips, Taffus barbatus, Verbascum}, and \textit{Lanaria:}
and in English \textit{Mullein, Hightaper or High Taper},
because it was ufed fometimes as a Taper or Torch
at Funerals.

II. The Kinds. There are three Principal Kinds
of this Plant, viz. I. \textit{Verbascum vulgare, five}
Taffus barbatus communis, our Common Mullein,
of which in this Chapter. II. \textit{Verbascum Natan},
\textit{Taffus Natus}, Baffard Mullein, or Baf Mullein,
of which in Chap. 508. III. \textit{Baffaria, Moth}
Mullein, of which in Chap. 509. following.

III. The Kinds of the Common Mullein. There
are 1. \textit{Verbascum Maj, Verbascum Mai Latifolium},
\textit{Verbascum album vulgare, Taffus barbatus commu-
nis}, our Common white Mullein, which is the
Male white Mullein. 2. \textit{Verbascum Fempo Le-
bef, Verbascum album Fennins, Verbascum folia}
longifolius Mai quaranum, Pflumus alter Lobelii,
\textit{Verbascum Lychnus Matthioli, Verbascum Candens}
\textit{Floric Bachchi, Verbascum album Fennins Giffords},
\textit{Verbascum augifius Dodonei, our white Mullein
with long Leaves, Female white Mullein. 3. Ver-
basum furminis flore alterius palliti, Taffus barbatus
maximus alboratus meridionalum flore albo, Sweet
white Mullein.

The Description.

IV. The first, Our Common white Mullein,
which is the Male white Mullein. \textit{In Red} is long,
white, and woody, perifhing every Year after it has
born its Seed; from whence fpringing up many fair,
tall, white, woody Leaves, lying nixi the Ground,
longer than broad, pointed at the ends,
and in the manner afo, the Stalk
rife up to the four or five Feet high, covered over
with fuch woody Leaves as the leaft, but taller,
that no Stalk can be feen, for the multitude of
Leaves thicke, up to the Flowers, which come forth
on all fides of the Stalk, without any branches for
the most part, and are many fet together in a long
Spire, in some of a gold yellow color, in others
more
Leaves, lying upon the Ground, like unto the Common Male white Mullein in the former Section, but that they are somewhat narrower, and not so freely forming larger; from among which, springs up, a round, hard, woody Stalk, about three Feet high, set with the like Leaves, as those which grow below, but slender unto the middle third, where it begins to grow Flowers; and in some Plants and Places, to divide it self into Branches, wherein grow many Flowers; sending round about the Stalks or Branches, thick sets together, consisting every one of five round pointed Leaves, of a whitish color, and in some Plants and Places more yellowish, with a few yellow Threads in the middle, which being pull away, round, hard, Seed Vesicles come in their places, very like unto the Seed Vesicles of Fox-Gloves, or Finger Flowers, but not so long, as which is contained very small and brownish Seed.

VI. The third, or Sweet white Mullein. It has a Root like the former, from which spring up white, narrow, and woody Leaves, like the other, but longer, narrower, and more indicated about the edges, and not so many growing below on the Ground. The Stalk is stouter, and rises higher than the former, having greater Flowers growing at the top, much greater also than these, and of a white color, wherein functions some reddish tinge are to be seen: in other particulars, it differs not from the former.

VII. The Places. The last grows plentifully in Florida in the West Indies, and 1 Law it grows in great plenty in the Southern Carolina. It grows by Way sides and in Lanes, as also in the borders of Fields and Pastures, Ploughed Fields, Cowfields, and in dry sandy Ditch Banks, and other uncultivated places in most parts of England. The two last grow also in many places in England, but not so universally and plentifully as the first.

VIII. The Times. They all Flower about July, and from July to September, and bring forth Seed, the second year after their Sowing.

IX. The Qualities. Mullein is Temporare in respect to heat or cold, and dry In the first Degree: Aperitive, Altringent, Felicitis, Hylteric, and Nepturic.

X. The Specification. It prevails against Coughs, Cold, Obstructions of the Lungs, Asthama, Flues of the Bowels, the Strangury, cures Agues and the Piles, and gives cafe in pains of the Gout.

XI. The Preparations. They are manifold, as,

The Virtues.

XII. The Juice or Essence. Taken from a Spoonful to three Spoonfuls in a strong Brandy or Spiritick and Wine, it cures Diarrhea, Dysenteria, Lumbago, and the Hepatic Flux, and is good against a rupture of Barthomois: they cure Caires, and Dislocations of the Limbs, and used as a Gargle, heat a sore Mouth and Throat, and being drunk Morning and Night for 10 Days together, it cures the Gout. The juice or essence of the Roots, made before it beas. Steamed, and taken in a draught of Alburne, or three or four times
Chap. 507. English Herbs.

The Decotion in Wine or Water. — It is pro-
fitable for those which are Butten, and for such as
have Cramps and Convulsions, and likewise for such
as are troubled with an old Cough. Being used as
a Gargle, it cures the Tooth-sach. The Decotion
of the Root in Red Wine or Water, is good against an
Aigu, as also the Bloody Flux, more especially, if
Gale of red hot Seed or Iron has been often
quenched therein. The same opens obstructions
of the Reins and Bladder, and is good against the
Strangury. It is of great force to dissolve Tumors
on Swellings, and inflammations of the Throat.
The Decotion of the Herb in Water, Country Peo-
ple give to their Cared, when troubled with a
Cough, or by reason of a Looeffel of the Bowels
having a falling out of the Intestinal sennation or
Fundament.

XIV. The Compound Decotion. Take Leaves
of Mullein two parts, Camomil Flowers, Matrimom,
Sage, and an Ounce of all the above Decotion
in Wine. With this take Morning and Night
where the Veins are Swolen, or the Nerves are con-
trolled, or where the Cramp commonly afflicts, it
gives relief; and a dose of the same, in Powder
form, is used for a Cough, and the same is used
in a Wine made of Mullein one part, and red
Seed or Iron one part, which, being taken as
is stated before, is said to eafe the Throat.

XV. The Powder of the Roots. Given to a
Drain in a strong or Spiritick Red Wine, Morning and
Night, it stopp all sorts of Fluxes of the Belly.
If it is rubbed over a place of a flux, it will take
it away in a short time, but it does no good to
such as are smooth, as was said before of the
Juice.

XVI. The Powder of the Flowers. It is an ef-
fectual remedy, for such as are afflicted with Belly-
aches, and such as are troubled with the Colick,
roth periodical. It may be given from a Drain
to a Drain and half, Morning and Night, in any
proportion.

XVII. The Eure. Take Seeds and Flowers
dried of Mullein, of each three parts, white Robin
two, parts, Camomil Flowers, and Caraway Seeds
each a part, and put them up into a Chess-
Dish, or some Earthen Dishes, and let it in a
Clofe-Stool, and let the person who is troubled
with the Hemorrhoids or Piles, or feces, take it
fit up over it, to receive the Eumes up the Body, it
gives much eafe and relief; and is also very pro-
fitable for such as are troubled with a Tooth-ache, which is a deare to
go often to Stool, and can do nothing.

XVIII. Tafpline, Hony of Mullein. Take Juice
of Male Mullein, Juice of Celandine, of each
one part, Clarifed Hony, two parts, and them
by Degrees, till the Tafpline are conjoined,
adding (if the Physician shall fo prcfcribe)
Vifitiole and Alum burnt a sufficient quantity,
Ink enough to make a thin body that they mix
well, had again to a conftime of an Ointment ac-
cording to Art. The simple Tafpline (without the
Vifitiole, Alum, and Ink) being taken three times a
Day, an Ounce or Ounce and half at a time stops
Carthes powerfully, and is good against the
Falling-Sicknees. That with the Vifitiole, Alum,
and Ink, is good to cleanse old Sores, Ulcers,
Fihthas, take away a Calous, and confume proud
and dead Flifiehs.

XIX. Tafplinentia, an Ointment containing the
Powers, Force, or Strength of Mullein. Take
Juice of Mullein, Hogs Lard, of each equal quan-
tities, mix and heat and grind them together in a
Stone Mortar, keep it in a convenient Vessel nine
or ten days, then heat it well twice, once more with
fresh Juice, until it be green, and another time
without Juice, first culling away what is thin and
discolored, then keep it close covered for use. It
heals hard Tumors, and eales their pain;应用
on the Belly, it stops a Looffenee and a Bloody
Flux, so alfo given in a Clyfter. Adminiftered on
the Crown of the Head and Surfaces, as also on the
Nape of the Neck and Stomack, it stops Ca-
tarts, and is an excellent thing against Coughs
of the Lungs. And it has been found by ex-
perience to cure the Hemorrhoids or Piles.

XX. The Infufion or Decotion Oil. It is made
by an Infufion or Decotion of the Flowers in pure
Olde, often repeated. It is very powerful
against the Hemorrhoids or Piles, being often
repeated on the part afflicted.

XXI. The Ointment. It is made of the bruised
Flowers, the Tolt of an Egg, Juice of Leeks, and
Granne of white Bread, beaten together into the
form of an Ointment. Applyed in a Juice, it gives
when they swell, and their pain are most vehement,
it gives wonderful eafe upon the spot, and in a short
time cures them.

XXII. The Cataplysion. 1. Make of the Leaves
and Seeds boiled in Wine, and laid upon any Dif-
location, after it is fit, it eales all the Pains and
doubles the Swelling. 2. Make of the Leaves and
Seeds of the Leffin white Mullein boiled in Water,
and applied to the Gout, it gives wonderful eafe,
and doubles the Tumor. 3. Make of the green
Leaves beaten in a Mortar, and applied or bound
to a Horse Foot, when it is very much pinched
with a Nail, or Thorn, or Splinter, it eales the Pain,
and heals it in a short time.

XXIII. The Diffufled Water of the Flowers.
Taken to a Quarter at a time or more, Morning
and Night for some days together, it is said that
there is not a better remedy found out for the hot
Gout. Drapped into the Eyes, it takes away the
watering of them, and alleviates the redness of the
Face, called in Latin, Ocula Baffe, or the Eye,
if it be washed therewith often, more especially
it if a little Camphorated Spirit of Wine be added to
it. This Water is also used against creeping and
burning Sores or Ulcers, or any other deformity of
the Skin.

XXIV. The Spirituous Tincture. It cures a
be-
Salmon's Herbal. Lib. I.

CHAP. DVIII.

OF MULLEIN Bafard or Bafe.

I. THE NAME. It is called in Greek, μολυλίνα; in Latin, Verbsiwm vulgaris, Verbsiwm nigrum, Verbsiwm laciniatum, Verbsiwm divitie Matthioli, Verbsiwm Bracifolium Loddig., Vel overflow Laciniatum Matthioli, Verbsiwm Saffouæ corollae Camerarii, Jagged Mullein, or Jagged Bafe or Bafard Mullein. To these we may add 4. Ethiopia, Verbsiwm Ethipicum, Verbsiwm Laciniatum, &c. in Lactum, Sclarea, Argentae, Ethiopian Mullein Jagged and not Jagged, which Verbsiwm will have to be a Kind of Clary: but we thought it very proper to be enumerated among the Bafard or Bafe Kinds of Mullein, it being none of the true Kinds in the former Chapter, nor yet of the Mullein in the following Chapter, and would seem to be much more a Mullein than a Clary.

The Description.

III. The first, or Our Common Bafe or Bafard Mullein, or Common Black Mullein. Its Root is pretty large, long, and Branched and Fibrous, which

MULLEIN Bafe or Bafard Common ;

MULLEIN Black Common.

perishes after Seed time. Its Leaves are nothing woolly or hairy, but of a dark green color, somewhat large, longer pointed, and stouter denting about the edge. The Stalk or Stalks rise up almost as high as the Common Mullein, and sometimes parted at the top into a few Branches, bearing long, feathery Heads of Gold-yellow Flowers, and in some tending to purple, like the other, with some Threads in the middle, which are reddish in some and purplish in others, with Seed following them like the true Kinds in the former Chapter. The whole Plant has a stronger smell than that in the White Kinds.

IV. The second, or Sweet Bafe Mullein, or Black Sweet Mullein. Its root is something great and long, with several Fibres adjoining to it, which perishes not, but abides many Years. It has four or five Leaves lying upon the Ground somewhat long and broad, ending in a long point, somewhat hard, and

MULLEIN Bafe or Bafard Sweet ;

MULLEIN Black Sweet.

as it were crumpled, of a dark green color, without any manifest dents or wrackings on the edges, but only unevenly waved, from among which rises up a round, hard, green Stalk, and sometimes two, about three feet high, oftentimes without any Branches, and sometimes again divided into two or three, on which grow many yellow Flowers, smaller and thicker set together, viz. two or three at a place, than in any other, and yielding pretty sweet, which for the most part fall away without giving any Seed; and when it does bear Seed, it is very small, and contained in small round Heads.

V. The third, or Jagged Bafe or Bafard Mullein. Its Root is much like the former, and it has large and long Leaves unevenly cut on the edges, somewhat like the Leaves of Horsetail Poppy, of a dark green color, and a little hairy without. The Stalk is small and green, but high, and unevenly Branched, bearing smaller yellow Flowers, and more sparingly set than in the two former Black Kinds, and having after them Seed much alike. Lobel fons, ilc
the Flowers are set under the Stalks, as Sage or Wild Clay are, of the same form and color.

VII. The fourth, or Ethiopian Mullein, Ligged and not Ligged. Their Roots are Woody, and perish as soon as they have set their Seed, which is chiefly in the second Year after they begin to Sprout and Springing up, for the first and second, and then run up to flowers. Each of these have divers very large Leaves spread upon the Ground, every one near a foot long, and almost half a foot broad, ending in a point; in the ear, very much turn it on the edges on all sides, and denied therefor, and in the other smooth and not dented or jagged: both of them are of a whitish, green color, with much white hairiness, or wooliness upon them, very like the White Mulleins, which grow wild abroad in our Country, or beyond Sea, for they are of a yellowish-white, hairiness, and are nothing so pleasant to look on as that. In the middle of these Leaves rises up a brown figure, strong Stalk four or five feet high, set full of fuch like Leaves as grow below, but much taller, and fitter full up to the top, all brown and woolly as the roots. This Stalk, towards the top, is divided out into several Branches, on which also grow divers smaller Leaves like the former up to their tops, which Branches spread far, and take up a great compass or Circumference of the Stalks and Branches, as for distances are set two foon Leaves, and with them round the Stalks several large white, hooded or gaping Flowers, and some fay they are of a pale, blackish, green-color, after which comes the Seed, two Seeds, small like to gather in one Seed Vojel, which are brownish, and thofe of the not jagged.

VII. Gerard describes the smooth, and not jagged, Kind thus: It has a Root which is black and hard, and of a Woody Substance, from which springs forth many very broad hoary Leaves, spread upon the Ground, very soft and downy, or rather woolly like those of our Common white Mala Mul- lin, but firther, thicker, and thinner, and all wood of woolly-hair, which Weel is so long, that one may put his Fingers the same from the Leaves, even as Weel in pulled from a Sheep Skin; then among which Leaves, rises up a four foon downy Stalk, set with like Leaves but smaller: which Stalk is divided at the top into several Branches, for about and orderly placed at equal distances, with many Flowers like those of Arch-Nogel, of a white color, tending to blueness, which being paff, there follows a three cornered brown Seed.

VIII. The Places. The flowers grow in many places of England, Kent, and Surrey: The second is sometimes also found growing Wild in our Country, but not commonly to be met with, unless carefully looked after. The third Kind, is found near the Knees of an old Church, by the Lake at Bath in England. The fourth Disporiferous fays, grow upon Mount Ida in Phrygia near Troy, and in Maf- nis a Province of the Moen, and has of late been gathered upon Mount Ida in Greece and Phrygia, which are near the Sea: but also grows naturally in Ethiopia, from whence it took its Name; it also grows in Meroe, an Island in the River Nile; from some of these places it is very frequent to us, and grows here in our Gardens, Gerard fays, he had it growing in his Garden: I have also seen it grow Wild, upon some of the Southern Parts of the Continent in Florida, where it is in abun-

X. The Qualities, Speculation, Preparations, and Vertues, of these Malleins, are the fame with those of the Common Mallein in the former Chapter to that no more need be faid of them here.

XI. Observations. A Decotion of the Golden Flowers of the Black Mallein in Lyn, is said to dye the Hair of the Head yellow, and to make it fall, and induce their healing. A Decotion in Vinegar alfo, is very probable to stop the bleeding of Green Wounds, and to hæl them; and it is made with Rue, it is a Remedy against the Stinging of Scorpions. The Decotion of the Leaves and Flowers in Wine or Water, is good against Dysentery. A Decotion of the Black Mallein joined with Thyme and Lungs, and for such as Spit, is Corrupt and rotten Matter. A Decotion made by the Leaves of the Iced, is said with good Success against Sore Throats and Blisters. A cup of Wine, with this things helps the apertury or roughness in the Throat, and is said to be probably against the Scutaria. An Electuary or Liqueur, made of the Root with Honey and Flowers, has also the fame Vertues, and cures the purulent or rotten Matter in a Pleasure.

C H A P. DIX.

OF MULLEIN Moth.

I. T H E Name. It was unknown to the Greeks and therefore has no Greek Name: but it is called in Latin, Blatta from Blatta, a Moth: her abjulla Blatta in fe contrabat unde nomen accept, as Pliny fays, lib. 25. cap. 9. And in English, Moth Mallein.

II. The Kinds. Authors have made of twelve or thirteen Species of them, more or less, as many of them are perfectly foreign to us, and not at all to be come by: we shall here omit them, and give you only the Description of each, as other ab or Wild in our Country, or are commonly Nurt in our Gardens; and they are the following seven, viz.: 1. Blattaria lutea oblonga, Sweet yellow Moch Mallein. 2. Blattaria lutea minor cornutus. Our Common yellow Moch Mallein. 3. Blattaria flavo albo, White Moch Mallein. 4. Blattaria flava albo, fome Hippomene, The greater yellow Moch Mallein. 5. Blattaria lutea purpurea, Purple Moch Mallein. 6. Blattaria lutea purpurea, Purple Flowered Moch Mallein. 7. Blattaria lutea purpurea, Purple Flowered Moch Mallein.
The Descriptions.

III. The first, or Sweet yellow Moth Mulllein. It has a long Branched Root, pretty thick with some Fibres adhering to it, which abides all the Winter, and loses many Leaves, which few or none of the others do. It has many hard, prajish, green Leaves lying on the Ground, somewhat long and broad, little or nothing fr am about the edges, but pointed at the ends. The Stalks are two or three feet high, with some smaller Leaves on them, branching forth from the middle upwards into many long branches, furthered with many small, pale, yellow Flowers, having a pretty fucet small, stronger in the others, which pas away, very rarely giving any Seed.

IV. The second, or Our Common yellow Moth Mulllein. It has a Root pretty thick and long, with several Fibres coming from its sides, which perishes every Year after Seed is taken. It has many long Leaves as our fourth Species at Sef. VI. following, but narrower, and roundly darted about the edges: The Stalk is usually single, and without Branches: and which towards the top, green faith like Gold yellow Flowers as those are, but ferrer, with the like purple Threads in the middle. The Seed Vesicles are single, and the Seed small, both so like to that fourth Species following, that they cannot be distinguished.

V. The third, or White Moth Mulllein. The Root of this is like the last or Common yellow Mulllein: but the Leaves of this are of a little frether green color, and rather darted about the edges. The Stalk rises as high as the former, and has new and then some Branches about it. The Flowers hered are pure white, as large and great as those last described, or somewhat larger, with the like purple threads like fies creeping up in the middle, as are in the Common yellow: and the Seed is like the same; in all other respects, it differs nothing from the former.

VI. The fourth, or Greater yellow Moth Mulllein. This is a Spanish Kind, whose Root is not great or full of Fibres, but perishes almost every Year, after it has given Seed, except the Winter is very mild. It has longer and greener Leaves than the first Kind, and rounder sorts at the ends than the second Kind. The Stalk is stronger and higher than it else, on which besides the Leaves, grow towards the top, many Gold yellow Flowers, consisting of five Leaves, or, as all the rest do, not so thick set as the first Species, but a pretty deal larger, with some purplish threads in the middle, formed somewhat like unto a Lily: after which comes in their places, round Heads, two or three, or more sometimes together, but most usually one, in which is small daisy Seed.

VII. The fifth, or Cloth of Gold Moth Mulllein, or yellowish purple Flowered Moth Mulllein. This abides longer in its Root than some others, tho' in a hard Winter it will perish like the left. The greatest difference between this and the second Species, consists, first in the Flower, which is a of a yellowish purple, or the ground yellow, over-shadowed with a bright crimson color, which is very pleasant and delightful. Secondly, The threads in the middle are not so purple, as in the second Species, but near unto the color of the Flower. Thirdly, It seldom bears Seed, which that Kind for the most part does.

VIII. The sixth, or Purple Flowered Moth Mulllein. Its Root is long, thick, and blackish on the out side, abiding many years, and much encrusted by the Sowing of its own Seed. Its Leaves are broader, shorter, and of a pleasant green color, than the third Species or white Moth Mulllein, and without any darts on their edges for the most part, yet pointed at the ends: The Stalk rises not so high as that, but is sometimes Branched, bearing flowers like Flowers of a fair deep blew, or purplish color, tending to redness, the threads in the middle of the Flower being yellow. The Seed Vesicles are smaller alike than those of that third kind.

IX. The seventh, or Blew Flowered Moth Mulllein. This blew Kind is in all respects like unto the former purple Kind, growing only in the color of the Flower, which is a of a bluish Violet color, and is not much inferior either in the greatness of the Plant, or in the largeness of its Flower, unto the said purple Kind, and endures many Years in like manner.

X. The Flowers. The three first have been found growing Wild in several Places of England, as on Black-Heath in Kent, and near Ipsford, and in other places; the fourth kind grows only in Gardens with us; and so does the third sometimes the third sort also.

XI. The Times. They all Flower in the Summer time, as in July and August, and yield their ripe Seed not long after.

XII. As to their Qualities, Specifiactions, Preparations, and Verses. Authors have said nothing, but what Pleas to us, yet as they are so generally common, which is, to gather Moths to it whereby ever it is laid. And what Commeration also says of the full first Species, That the Direction of its Flower Leaves open Obstructions of the Bowels and Mefersick Veins.

C H A P.
Chap. 510. English Herbs.

CHAP. DX.

OF MUSHROOMS.

OR,

TOAD-STOOLS.

I. The He: Names. This Plant is called by the

Arabians, Vater, and Heteri: in Greek

Mushra, Pl. Salius, and Latine, Fungus, Pl. Fungi:

in English, Muskrom, Pl. Mushrooms, Toad-

Stools.

II. The Kinds. There are several Species of

Mushrooms, some of which we have already

Treated, or shall hereafter Treat of, in their par-

ticular and proper Chapters, viz. 1. Such as grow

upon the Earth, or Terra, Earth Balls, which see in Chap. 258. aforesaying. 2. Cap-

ite Terra, Lap: Crepitus, Fist: Balls, which see in

Chap. 306. aforesaying. 11. Such as grow upon

Trees, as 3. Auriculo Fades, Fungus Sambucinis,

Jews Ears, which see in Chap. 404. aforesaying.

4. Lichen Arbusum, Palmaria Fungos, Mufin

Palameron, Tree Lungwort, which see in Chap.

458. aforesaying. 5. Fungus Arbusum: Fungos igni-

arios, Fungus incendiaris, Touch-Wood, or March-Wood, of which in Chap.

following. 6. Agaricus, Agarick, or Mushrom

of the Larch Tree, which see in the Third Book of

this our Botanologia, or History of Plants. Of all

or any of these, we have nothing to say in this

place. Those which we shall Treat of in this

Chapter are the Eung? Trees, or Mushrooms of the

Earth, which we divide into two Clases, viz.

1. Fungi Effulents, The Edible Mushrooms. II. Fun-

gi non Effulents, The non Edible Mushrooms,

which are Eaid to be Perimutif and Doleterof, Dan-

gerous or Deadly. Now because there is a great

number of both thefe Kinds, to avoid as much as

may be tedious, we shall forsake the enumer-

ation of them here in particulars, and give you the

Names, as we shall Treat of them, or Defcribe them,

in the order following.

The Descriptions.

I. Of the Edible, or Wholsome Mushrooms.

III. The General Description. Our common Korts

of Mushrooms have small, someth, round Heads,

standing upon thick short Stalks, and are for the

most part white, yet in some the upper Skin is

brownish or yellowish, but generally more yellow,

after they have been long and are decaying, most of

them are somewhat flat, and hollow underneath,

with a yellow or rufhie-like Salphine, running direcly from the Center or middle of the

Head, to the edges round about. Their Salmine

generally nice and spongy, easily yielding to be

broken between the Fingers; but perfift a little hard.

The Tuft and Reffil is according to the Soil and place where they grow. Chlafos, the

Handegaer, Germans, and others, do esteem these

muff, which grow in the Woods, and chiefly these

under it Trees, and next to them, those which

grow under Oaks: But doublefifs, thofe which grow

in the open Air, in Champan Fields and Meadows,

are not only safer from danger, but of better reliff

than thofe which grow in Woods and under Trees,

especially with us in England; and heerewith

agrees Horace in his Satyrs, lib. 2. Sat. 4, ver. 20.

and 21.

--- prode puto naenis fungis

Natura eff: simile sole creditur.

Mushrooms Wholsom.

IV. 1. Fungus aequus, Spongia fuscula clavatula, The

Honey Comb Mushrom. Some of this Kind grow

bigger than others, and some more Topped or Spear,

and some are parted or it were all into sundry

divifions, making it feem like an Honey Comb, and

its Head many times refeembles a Mulberry. These

are not dangerous as Gerard fays: and Chifon ac-

knowledged them as one of the chief or principal

Kinds of Edible Mushrooms, and Conimacarian fays, that the

Germanis are much delighted with them.

V. 2. Fungus atrifuscus & purus. These are higher

than any of the reft, and fmall without, But good

of the Kind.

VI. 3. Fungus Pyramidalis, Spear or Pyramidal

Edible Mushrom. Its out-face is of a whifh-

brown color, in more Sceple fomewhat longer,

than fome others, and as good as any of the for-

mer, being the greateft of the fourth fort of Chlafos

his Edible Mushrooms.

VII. 4. Fungus Georgii, St. George's Mushrom.

It is round, somewhat fift and whifh, having a fit

moft fiftly on the Edges: They are called by this

Name, because they Sprout up much about that time

of the Year.

VIII. 5. Fungus Populalis, growing under Popu-

lar Trees and Elime Trees. It is covered either

more in the Woods, and fome jagged about the Edges,

being longer and fomewhat Slender, and fome of them

fatter, and longer than others.

S C 2

IX. 6.
Salmon's Herbal.

IX. 6. Fungus, Pericr. Fungi, Cup Mutilatus. They grow out of the flood Ground, into which they are so firmly, that they can scarce be got up without breaking a sticking to the Earth by certain small Fibres, scarcely to be discerned, and spreading them upon the Ground without any Stalk, but of the Bread, and belong of their Fists, the Brims or Edges whereof are either plain or cramp'd, or corner'd, and containing many Mines within the hollows, three or four ounces of Rain Water, especially the greater of them, which by reason of the thick Skin, or fhy Substance thereof, corrupts not, nor yet the Water contained therein, for a long time, being able on the moist, and reddish within.

X. 7. Fungus Maliformis, The Woman Mutilious: it is somewhat flat on the Head, a little curled in like a Napet. They are of a antiquated fpace, being brownish, greenish, or yellowish Guilt.

XI. 8. Fungus Taraffinus, The Tuberous Mutilious. It is not Pist within, but round in the Bully, and sometimes turn on the Edge, of a pale brown color, spotted with white.

XIII. 10. Fungus Caproni, The Goats Mutilious: they differ not much from some of the Last, but in being yewerous, and browne underneath.

XIII. 12. Amorini, Anemone vulgaris Tragio, Boletus Cordis; Mutilous of the Woods. It is always round and white. Spotted with yellow brown spots. Four of them bigger than others: those growing in the Beech-Tree, are redder than others: some chafe for eating, the pale fpace, rather than the redder.

XIII. 12. Fungi Caproni, The Goats Mutilious: they differ not much from some of the last, but in being yewerous, and browne underneath.

XIV. 11. Fungi rubri, Red Mutilous. They grow in Woods about the beginning of Summer, and for their redness above, are called Red Mutilous, who both the Stalk and the under parts be not full of firrishes.

XV. 12. Amorini, Anemone vulgaris Tragio, Boletus Trago: These are the Fungi Species, or kind of Mutilous, which are said to be the most Common both by Lobel and others.

XVI. 12. Fungi Villig, Fungi hirsuti ceratini, The Hairy Mutilous. These are round, and a little flat above, are all hairy, and of a blush color: some of them will else be blackish, and some will likewise grow two together.

XVII. 14. Fungi obtusius, Fit Mutilous, because they grow in the Fit Trees. They are hard, but otherwise much like the last, of which some are mixed with white, pale, and brown, and some fantastical, or many blackish with purple Lines underneath.

XVIII. 15. Fungi ungulati, Cerrii ungulati, Goats Head Mutilous. They are cut in on the edges into such parts, that they very well resemble a Goats Head, being broad above, and white beneath, and are more turn on the edges, when it grows old, when it is new springing, or it is not young.

XIX. 15. Anemone Pothii, Egizania. These have their Stalks sometimes bigger in the lower parts than the upper Bole is; and are much discolored with brown, green, and brownish, as in some, the upper part of the Bole being brown, and without any Lines underneath.

XX. 17. Fungi Lulici, Milky Mutilous. These are of 30 delicacy a Table, that they are callable; and of a reddish raw: it is fine at the Head, and of a reddish color, yielding a forcet Milk when it is broken.

XXI. 18. Fungi Regulares, Kimly Mutilous. These are great, white, and round, sometimes being a Table in the form, and may be given to such as are sick, without any danger.

XXII. 19. Fungi Augularis, Languis Cephalaphi. It grows on the Bolles of Chethnut Trees, or near them: its head is something red: and its Stalk is red, but not so red, as that of the true Bolles.

XXIII. 20. Bolites Veneris, The true Bolles. This is white as an Egg, one of the same form when they fall springing: but after two or three days, the white Skin or Boat breaks above, and then yellow like the Tail of an Egg, which then grows greater, and into the form of a Mutilous (the white Skin falling away by little and little) being raised somewhat higher in the middle, and so much of a gold yellow color, that it seems deeper colored, than Saffron it self, but left yellow underneath, with as many leather-like Lines or Scabbors, as in other Mutilous. The Stalk likewise is yellow, and an under thine: when it grows old, it breaks in to three or four parts, and loses the freshest color above, becoming more pale, and underneath almost white. These ore of so delicate a Taste, that those who are accustomed to feed on Mutilous, define them rather more any other kind, nor can they easily be satisfied with them. They are accounted by all Hands to be very wholesome, and yet it is said that Claudius Cerin, has been known to dye them. It might chance indeed after the eating of this Kind: but the question is, whether the Mutilous wore the cause of such Death, or that there might be some other cause thereof going before, or unknown, and which effect is it: It is good to try the Salty on the right Horle. Claudius says, That some of these being dried, and served up, as a Dish at Table, that they formed unto him, as if they had been colored with Saffron.

XXIV. 21. Fungi Pericini, Fungi Sali, Swines Mutilous. They are somewhat pointed, of a fine yellow color, spotted with white spots, and underneath with blackish spots, or Feather-like Lines or Disgions and the upper part in some will be red. But Cephalaphus, says, that such spots, some were of a brownish yellow above, and of an Ash color underneath.

XXV. 22. Scaronius Cephalaphi, These grow in Meadows, the Head being broad, and the Stalk very long and of divers colors.

XXVI. 23. Fungi Quercicini, Disseccatores, The Balfon or Tethyst Mutilous growing among Oaks. Its Head is white, and like unto the common form in the Stalk, but the top is brown and green: as is spotted: but the chief matter of difference is in the Stalk, which has about the middle of it, or higher, a certain hollow Dith, like as the Tethyst has, being rough and brown about the brims, and the upper part of the Stalk is at one knocked, and blackish next to the Ground, with some hairy Fibres thereon.

XXVI. 23. Fungi acris vel Piperitii, Fungi Piperitii, Some, The Pepper tilled Mutilous, as Cordus on Disseccatores calls it. It is white in color, and talls thorny and bar like Pepper.

XXVIII. 23. Fungi Prumati Cephalaphi, It is a very small Mutilous, of an Aftelcolor and very sweet in fmalte.

XXIX. 25. Fungi lamini vel cornu, Barba Hieri, The Branched Mutilous. It is spread out large into many Branches, being in some yellow, in others reddish, and in others of a pale color, which they call the Goats Head. The outer edge or Cutup of that which is yellow, and has white spots upon it.

XXX. 27. Fungi Digitatii minor & minor: Fungi Digitatii, as the Botanists name it, in the Mutilous. It is of a large Size, and parted as it were into long whish bingers, one of which will suffice a Man for a Meal.

XXXI. 28.
full of bluish spots, or Divisions, found much in Wales.

XXXVIII. 5. Fusconi, Fungi Fusconi, The Toads. Multiform. *It is of a brown color, and round like an Helmet, or more yellowish, but fombed, or else more flat and reddish with some Spots.*

XXXIX. 6. Fungus Ruber Cornus. The small red Multiform. *It is very small and round, not exceeding the Nail of one Finger: reddish above, and very yellow underneath. It is called also Fungus Eirencis.*

XL. 7. Boletus mutatus, Fungi Bolleti sordidus. The Multiform which is like to the true Bolteus. *It is about half an inch broad, piring a little at the top, of a yellowish color, with a long Stalk, and of the big- nes of ones little Finger. This is also called, the Boltei Multiform.*

XLI. 8. Fungus Mycorcus, The Fly-hlane Multiform. *Of this there are two or three sorts, some of them being greater and broader than others, some much redder and spotted with white Spots, all which grow in Woods which have been Stield. They are said to kill as many Pies as it and feed on them, as well when they are dry, as when they are fresh.*

XLII. 9. Fungi Leptcales alicus. *These are found in Staid Woods about Hospit. One whole Stalk is larger below than above, and the Head is round and of a pale yellowish color, but no bigger than the bottom of the Stalk.*

XLIII. 10. Fungus Lethalis niger, The black Deadly Multiform. *This Kind is frequent with us, and is of a blackish color, much rent or torn on the edges, and bunging lank about a small long Stalk.*

XLIV. 11. Fungi Ltehales Earii, Fungi Lehales edulis minime. *These are of divers sorts, because they are so like to some of the Edible Kinds, have distinction many which have gathered them, and are often laden with nettles to such an extent. Of which some are reasonably small, others very large, and most of them are of a beautiful Aspelt, either yellowish or reddish, or more red, and as it were foamed over.*

XLV. 12. Fungi abietes biffius, Multiforms growing under Fir-Trees. *These are like to the Edible ones which grow in the same place, and have no other distinction, but that these are burnt underneath, for which reason they are rejected to be eaten.*

II. The Non-Edible or Poisonous Multiforms.

XXXIV. 1. Prunell, Fungi Prunell, The Plum-tree Multiform. *Some grow under the Trees in the beginning of the Year, of differing forms and largeness; and some grow much together, from one and the same Root, as it were, with little or no Stalk at all; some are round fashioned; none are Gendered, some larger, and some smaller than others, all of them being mixt with colors; pale, yellowish, and brown together.*

XXXV. 2. Fungi Funeraria, Funicaria, The Dung Multiform. *became found growing among Droses. It is of a round Stalk, somewhat thin, white, and covered as it were with Meal all over, having brown Spots underneath.*

XXXVI. 3. Fungi Coriari, Fungi Acelle, Multiform growing under Htle Trees. *It is sometimes of a whitish red, and as it were smoothed over; it is round, and four-cornered.*

XXXVII. 4. Fungi Cornoles, Fisch colored or Coal-like colored Multiform. *It is full of round yellowish Spots above, and pale yellow underneath*
or Border about. The lower part for an Indian birth upwards, is a pale yellowish color, as higher, it is yellow and red mixed together, casting it of another, then yellowish, and above it red and yellow mixed again, and then yellow to the very edge, but mixed with several families Sper, pole or yellowish underneath. This is delusive being given to Men, but dried and made into Powder, it is said to be life to be given to Cattle.

LXI. 15. Fagus rotundili & alii magni. They are large, round, and oblong, full of black Sepals from the Center to the Circumference, both above and below, but those which are above are greater, and not straight as those below, and a little crooked, the edge also is fairly dentated about.

LXII. 14. Fagus Hacketensis; The Hackety Mushroom. It is small, dented in like manner about the edges, and of a black Chaffy color, but not striped above, and has been found about Hackety.

L. 15. Fagi Ligni. Those grow on rotten Boards and Timber, which if, or are set into the Earth, and are small like a green big hay, having few Seeds within them.

L. 18. Fagus Capitata Terra firma, The Mustard much like to a Fales Ball. It is round, like a Fales Ball, of a brownish color above, and of a dark red underneath, which when they are broken are of a bleached green color.

L. 19. Fagus Crysta vel Scitula firma. Those are some of them like Brinellia Mat, many growing together; and some of them broad like Shields, with their Brows turn'd up.

L. 20. Fagus cancellata, Lupi crepuscular effusorum Columna. It has a small flying Root, differing from all others, and is a round white. Fagm it frifen, which afterwards breaking open, divers reddish Branches do arise from it, which do all join together, making round Arches of belly-netted Bars, or Latife in as it were, separated one from another. It has a very flaming small, from whence came the Name. It is much eaten by Hogs.

L. 21. Fagi Astrabuli Tuba fibulae, Mushrooms like to Jews Ears. These grow upon the Arms, Bifet, or Stocks of Trees, which are rotting or dead, or at their Roots, or upon old Branches. They are very much differing, yet none of them are of the hardness of Touchwood: Some of them are like unto Jews Ears, either white like yellowish, crumpled, and of a thinish substance like them.

L. 22. Fagus multicolori, Fagus multiplex. This Grows like the Common Mushrooms very many together, on general Stalks, differing in骊menous, substrata, and redifes one from another, and all rising from one and the same Root: They grow either on the rotten Arms of Trees, or dead rotten Bifets of Trees, lying upon the Ground.

L. 23. Fagus Pratensis argenteus, The Silver colored Shrub-like or Branched Mushroom. It grows like a Shrub with many Branches, which are of separate subatufs that they seem as if they were made of pure Silver, if they were shining without. This has oftentimes to Stalks, or if it has one, it rise not above half on each long, and grows on the rotten Bodies of Trees, which lying upon the Ground.

L. 24. Fagus Cynere fornis, Artichoke-like Mushroom. Its Stalk is like unto other Mushrooms, but the Head is made of Scales, like unto an Artichoke, of a faint yellowish color. It is found growing in Kent, near Alford, also on Brontly-Green, and at Warborne in Romney-March.

Of MUSTARD Garden.

T H E Names. It is called in Arabic, Carde, in Greek, Sinapi, Sinapis, Nunu Ariyolphane & Athenaei: in Latin, Sinapi, and Sinapia: and in English, Mustard.

II. The Kinds. There are three Genrsk Kinds of Mustard, viz. 1. Sinapi Sarium vel Communis, Common or Garden Mustard, of which in this Chapter. 2. Erythros, or red, Hedges Mustard, of which in Chap. 512. 3. Thiofis, & Thiofis, Treacle Mustard, of which in Chap. 513. following.

The Descriptions.

IV. The first, or Garden Mustard. It has a Root which is rough and white, running deep into the Ground, into many small Fibers adjoining one to another, whereof the Fibers when ripe rise up with great rough, long, divided, Leaves, of an over-norw green color, like to those of the Turnen or Gerden Voyd) but rougher and thicker. The Stalk is round, rough and hairy, and divided into two or three feet high, divided into many Branches, on which grow many small, pale, yellow Flowers, in a great length, which turn into small, slender, long, rough Vets, in which is contained small blackish Seed adhering to redness, of a sharp, sharp, biting Taffle.

V. The second, or Common broad LeaVd Mult. It has a Root small, long, and Woody when it bears Stalks, and persists every Year. Its Leaves are long, large, and broad, and very much jagged, with narrow and white edges, much like to Th cheered Leaves, but finer, and not so rough: The Stalks are round and faint, and grow sometimes to be four, five, or six feet high (according to the goodness of the Soil) spreading; therefore out into many Leaves from the middle up to the top, looking such as Leaves as the former, but smaller, and towards the top, growing long and narrow, growing on short foot Wiki. Upon these Branches grow small,
described, but only it is lighter, and grows not so high; the Stalks are more white, its Flowers are yellowish like the former, and its Pods are rough and crooked, in which are contained whitish Seed, which is also very sharp and biting. The third three Kinds of Mustard, just now described, have been so briefly treated of by all Authors, that it is hard to give the true differences of them, and a matter of more difficulty than could have been expected in a thing so commonly known and used as Mustard is.

VII. The fourth, or Wild Mustard. It has a Root which is long, not very large, but tuberous, from whence rise up Leaves like those of Shepherds-Purse, but larger, and more deeply toothed. The Stalk is round, rising up to be about two feet high, (but the whole Plant is lower than any of the former;) it is spread out into branches towards the Top, and its Spike is furnished with small yellow Flowers, made of four Leave sepices, after which follow the Pods, which are small and slender, wherein is contained brownish or reddish Seed, lighter than any of the former, and not full out so sharp or biting.

VIII. The Places. The first is not found Wild with us, but grows only in Gardens. The second and third, grow also in Gardens, but are oftentimes found growing Wild in the Borders of Fields, and in low Hills and Furrows: the last only grows Wild. Johnson upon Gerard's say, that our Common Mustard, and the other two sorts, viz. the three first Kinds, grow Wild in many places of this Kingdom, and might all three be found on the Banks of Ditches, about the back of Old Street near London, and in the way to Kingston, in which last I have for several years together found them growing.

IX. The Times. They are all Annual Plants, and may be Sown in the beginning of the Spring: they come to perfection in the same Year they are Sown, they Flower in July; and their Seed is ripe in July and August.

X. The Qualities. Mustard Seed (which is part of the Plant which is chiefly used) is according to Galen hot and dry in the Fourth Degree; it is Aperitive, Alheative, Attractive, Analodyne, Carminative, Coemetic, Digestive, Deforative, Diuretic, Inulsive, and Suppurative: Cephalick, Neuralick, Nematick, Pectoral, Nephritick, Hydratrick, Anginaick; Purrick, Alexipharmick, and Spermatozemic.

XI. The Specification. It is found by Experience to be of usefull use, to provoke the Terms in Woman, provoke Urine, and give life to the Stomach, Stone and Gravel: it Cures Hypochondrie, fits, pains of the sides and Spleen, Tooth-Ach, Kings Evil, Gout, Cramp, and Convulsions of the Bowels; and prevails also against Agues, Epilepsy, Lethargy, Cins, Vertigo, expels Poytons of all sorts, is good against Impotency in Men, and removes Scabibnfts, and other Defections of the Skin.

XII. The Preparations. These are all of them taken from the Seed; and considering the exceeding usefulness of it, they are not many neither, being these few following, viz. 1. A Poudre. 2. A Confitent. 3. An Infusion. 4. A Congeda. 5. A Spiritus Tinctura. 6. An Acid Tincture. 7. An Oily Tincture. 8. A Saline Tincture. 9. A Spirit. 10. A Distilled Water both from the Seed alone, and from the Leaves alone: also from Seed and Leaves together. 11. An Oil of the Seed by Expression. 12. An Erhine.
The Virtues.

XII. The Powder of the Seed. Given from a Scruple to 2 Scruples or a Dram, mixt with some proper Syrup, or in Wine, or other fit Vehicle, it provokes Urine, and the Terms in Women, is good against Epileptic, Lethargic and Hypertick Fits, the Nervils, Temples, and Forehead being rubbed with the Continemt, for so it alays the Vapours, and quickens those dull Spirits, which were alway it were, or almost dead; for by its Inferable and Sharp Particles, it pierces to the Brain, and purges of it the Recomdions which offend, by Sweating, and drawing down the Cahem, and makes the Head and the Wine, and the it drawing little vilecid good keeps all is good. It may be given to a Head, and from the it two Ounces, or in a large Bowl, with a Cannon Iron Bullet by rolling it up and down upon the Seed. It is used as a general Suce both for Flesh and Fish, and is indeed a very wholesome and excellent thing, and has all the Virtues of the Powder aforesaying: being given as a Medicine, it may be taken from a Dram to two or three Drams in a Glass of Wine, and so it is profitable against Convolutions, the Palsey, Macrim, and all fortes of Poyfon, it refunds the Malady of Malarious, the Venem of the Scorpion, the bitings of Vipers, Mad Dogs, and other Pofitaneous Creatures.

XV. The Infufion or Decoction. It is common- ly made in Wine, and has all the Virtues of the Powder, being given from 2 Ounces to 4. It provokes Urine universally, given in the Strange- ers, expels wetty Humors from the whole Body, and evacuates them by the Rains and Bladder, and fo has been found of admirable use in curing the Droops. It powerfully refills Poyfon, not baffling the Vitality thereof to fhin the Spirits or Vital parts, to the overthrow of Life; but immediately Mufers or overcomes it, it taken in time. Taken an Hour or two, before the Fire of Augus, it fo warms the Blood and Spirits, that it keeps back, and fellers the cold Fit, and fo thereby aclers the court thereof, and at length curers it. Made into a Gingle with some of the Continemt, it helps the weaknecks or hanging down of the Livuls, commonly called the Palate of the Mounth, and as an Apo- phlegmatift draws Humors from the Head, Brain, Jaws, Teeth, Almoes, and cuts away at the Neck, whereby it prevails against Leuthage, Catar, Palse, Convolutions, and Sturnous Sve- lings about the Neck and Throat, commonly called the Scare Evils. The Infufion prevails against Impo- lency in Men, and flits up bodily Luft in Wo- men, and is admirable against Wind in the Bowels, and Pains and Svelettes in the Sides.

XVI. The Confitution. It diffufes, rarifies, and draws out Thorns, Splinters of Bones, or other things out of the Flesh. Applied to the warm For- head, and Temples it warms and quickens the Animal Spirits, and is good against all cold and sleepy Difculties of Head, Brain, and Nerves. Applied to Scrophulous Tumors or Kernels in the Neck, and about the Throat, it is field to Diffolvere Difculties them. Applied upon the pains placed in a Sclatica, as also in the Gout, and other Joint Difculties, it cures or relieves the Pain, and diffolves the Humors abounding in the part. It cures Pains in the Stile, as Svelettes, Spleen, &c. pains in the Back and Loints, Shoulders, and other parts of the Body; it makes many times a Tooth a little bitter (if mixt with Leaven) and by drawing the Pains to the place from the inward or more remote parts, it many times cures the Diflafe, or diverts it to the outward places.

The Spirituous Tintlure. It is an excellent thing against the Palsey and Gout, and has all the Virtues of the Powder, and Infufion aforegoing, and may be given inwardly in a Dram, in a Glass of Cider or other Generous Wine, two or three times a Day; and outwardly it may be bathed on the parts affected. It is an incom- parable Suce, warming and comforting the Tone, and gives presert cafe in all eurterm pains and griefs of the Stomach and Bowels, proceeding from an Acid Humor.

XVII. The Acid Tintlure. It prevails against all internal Poisons, is good against loathing, Vomiting, and other weaknes of the Stomach; it caufes a good Appetite, and a strong Digestion, and keeps the face red, and makes it good color in the Face. It opens the obstructions of the Vifera, allays Vapours powerfully, and by a continual ufe of it for some time, it cures Flies of the Mothors, it may be given in a Cold of Ale, Beer, or Wine, fo many times at one time as to make it Pleasantly Acid, and to be taken, two or three times a Day, or in all that the Patient drinks. It is much better in Wine than in any other Vehicle; and I am apt to believe (from my own great Experience of it) that it is one of the left Remedies against the Scoury in the World, and for which it ought to be esteemed as a Jewel.

XVIII. The Only Tintlure. It is good against the Colicke th'o' not fo eftrem, as also against the Stone, Gravel, Sand or Tartarous Mucilages whether in Reins or Bladder. It provokes Urine power- fully, caufes the Stomaguen, induces the Terms in Women, and facilitates the Birth of a Woman in Labour, and Faces away the After-birth: and being powerfully ufed, it not only caufes a due Clearing, but also prevents After-pains; it has all the Virtues of the Powder and Infusien, and may be given from 12, to 20, or 25, or more Drops, according as the exigency and occasion may re- quire. Outwardly anointed upon any part, it eathes all pains proceeding from a cold caufe, and is of

752

Salmon's Herbal. Lib. I.
Chap. 512. English Herbs.

fingulæ uæ against the Palpæ, Trembling, Num- 
bedness, Convulsions, Cramps, and other like 
Diseases of the Nerves and external parts.

XX. The Sainfoine. It is a good diffusive 
and attractive, is producible against Spots, Freckles, 
Sunburnings, Tumours, and other discolorings of the 
Cutis: It is excellent against Scurfy, Mor-
phew, Lues, Leprous, and all good against Scabs, 
Lich, Pimples and other Breakings out, and cleanses 
the Face and Skin from all other Deformities 
therof.

XXI. The Spirit. It comforts the Head, Brain, 
Nerves and Heart, revives the Spiritus Animal, 
Vital, and Natural, Diffuses all congestiones of the 
Blood and Humors, makes them thin and 
fluid, and to run freely in their Vessels; and is pro-
ducible against Alltrums, and most Diseases of the 
Stomach and Lungs, causing a free and easy 
respiration, and is a powerful thing against 
all sorts of Convulsions in young or old, as 
also the Palpæ, or other like Difformities of 
the Nerves. Dose from one to two Druns 
in a Glass of Wine, Morning, Noon, 
and Night.

XXII. The Distilled Water. It has the Virtues 
of the Powder, Infusion, Tincture and Spirit, 
but nothing near so powerful, and may be given from 
two to four Ounces, in a Glass of Wine. It pro-
volves the one, and gives ease in the Strangury: It is 
good to make a Gargle for a sore Mouth and Ulcers, 
and ufed outwardly in a Wault, it is a Cohemetick 
and is good against all Distemperies of the Face 
and Skin, cleansing and drying them from their 
Deformities. If it is Distilled more from the Herb 
when in Flowers, it is good, and may be ufed to all 
the purposes aforesaid, but it is not full out to 
prevail, as that which is distilled from the 
Seed.

XXIII. The Oil of the Seed by Expressio. 
Schroder says, It is good in cold Diseases of the 
Nerves: it certainly cures pains arising from 
a cold and moist caufe, is good against Palpæ, 
and Convulsions, and strengthes the parts which are 
weak.

XXIV. The Erbium. It purges the Head admir-
ably, of cold, moist, vitious, and pithous Hu-
mers, is good against Cataracts and distillations of 
Rheum upon the Lungs, clears the Eyeight, and 
drags off Humors which fettle upon the Amigda-
lates and parts adjacent belonging to the Throat, 
and being often ufed is of inguinal uæ against 
the Kings Evil, because it attracts and draws 
away much of the Mortiback Matter causing the 
Disease.

CHAP. DXII.

OF MUSTARD Hedge;

BANK-CRESS.

T. H. E. Name. It is called in Greek, Βάκκος, 
used in health as well as in feaft, called by the 
attribute, facultet, peculiar of it, also Sauronum Chamae-
plion Dofcoëtas: in Latin, Eryfimum. & Erio 
Plinij, lib. 28. chap. 10. good ob aromaticas fac 
truta in gelani: in English, Hedge Mustard and 
Bank-Cress.

II. The Kinde. Authors have made many Species 
of this Plant: there are but three which we Hall 
take notice of in this Work, viz. 1. Eryfimum Vulgar, 
Horiobusana Venina Brun-
fezis, Sino, or fepulchrum Angulare, Eryfimum vul-gare Brumis. Our Common Hedge Mustard. 2. 
Eryfimum Verum, fique, Autism, Erio alter Mut-
bonis, Laphamontici, Cofmetick, & Lobelius, Cle-
oni Cylind. Hewit, Angulare, Eryfimum vul-
gare Buchani, Our Common Hedge Mustard. 2. 
Eryfimum Verum, fique, Autism, Erio alter Mut-
bonis, Laphamontici, Cofmetick, & Lobelius, Cle-
oni Cylind. Hewit, Angulare, Eryfimum vul-
gare Buchani, Our Common Hedge Mustard. 3. Eryfimum alterum filipus Bruce Bau-
man, Eryfimum secundum Tehernmontanus, Eryf-
imum Laifolium Parkinam, Our breed Leved 
Hedge Mustard.

The Description.

III. The first, or Our Common Hedge Mustard, 
Its Root is slender and Woody, running down deep in-
to the Earth, oblong all Winter, and Sprunging up 
again every Year. From this Root, it usually Springs 
up, with but one broad green Stalk, tough or 
hermic, easy to bend, but not to break, spread out 
into several Branches, and sometimes with divers 
Stalks, set full of Branches, on which grow long, 
rough or hard ragged Leaves, very much cut in or 
turn on the edges into many parts, some bigger and 
smaller.
four ffer, of a dirty or Jall greeen color. The
flowers are small, and of a yellow color, confis ting
for the most part of four small Leav es, which grow
as the tops of the feveral Branches in long Spikes.
Flowering by degrees, in that continuing long in
Flower, the foit Stalks, or Branches will have small
round Seeds at the bottom, greaing upright, and close
to the Stalks, while the top Flowers yet show their
felter: in which Cod or Pods, are contained small
yellow Seeds, which are sharp and strong, as the Herb
it felf alfo is.

V. Thefecond, or True Hedg Muftard. In Rowl it is small, and perifer after Seed time; but by fowing it felf, it never fifts to be in the Ground where
it once has Seeded. From this Row fpring up
divere large winged Leav es, of a fadder green
color than the former, and foliage fmalier than the following third Kinds, which are cut in
on both fides into feveral parts, but fmalier,
resembling the divifions of some of the Leav es of

True Hedg Muftard.

Dandelfon, or rather, like to Rocket Leav es, each
part or corner looking downwards, the end divifion
of the Leav being larger, albeit waft, but sharp
pointed, and unevenly dilated upon the edges. From
among these Leav es rife up fometimes two, fometimes
three Stalks, and fometimes hat one, or is
moft waft, which is round and about half a Yard
high, bearing on them a pretty many of thofe like
Leav es, but fmalier, the Stalk or Stalks, spread
themselves out into Branches towards the top, from
all which come forth very fmall yellow Flowers, con-}
XI. The Liquid Juice or Essence. They are made of the whole Plant when in Flower. They are very good for such as have the yellow Jaundice, the Flegm, pains in the Back and Loins, as also for Torments and Gripings in the Belly, and the Colic, or for such as have taken Poison; being given internally from two Spoonfuls to four, in any proper Vehicle, or given by the Mouth in double that quantity, in a sufficient quantity of Mutton Broth.

XII. The Decoction of the whole Plant in Wine or Water. It has the Virtues of the Juice or Essence, comforts and warms the Stomach and Bowels, and is good to heal Excorations of the Guts; especially being used Clyster-wise. Old running Sores and Ulcers, Fifhfula’s and eating Cancers in the Mouth or other parts, being wafted therewith it induces their healing.

XIII. The simple Syrup or Lotion of the Juice of the Plant. It is made with Honey or Sugar, by gently boiling them together, and desafturing the mixture. It is inclining and cleansing, and cures an Expectoration of Vesicles, or tough, or Salt Flegm from the Stomach and Lungs, making it easy to be spit forth; and indeed it is a very good thing in most Difficulties of the Lungs, as Hoarse, Wheezy, Venemous Coughs, Asthma, or Difficulty of Breathing, and shortness of Breath: as also for such as have utterly lost their Voice, with a kind of thinking of the Spirit, it being taken every day, four or five times a day or oftener, for some reasonable time.

XIV. Syrupus de Erytimo Compotus. The Compound Syrup of Heig Mulb. Take Heig Mustard, the whole Plant, with the Flowers gathered when in Flower 6 Handsfuls, Leaves of Burget, Galberry, Maiden-Hair, of each 2 Handsfuls, of the Cordial Flowers, Rosemary, Betony, of each half a Handsful, Rapiens divided, Roots of Elecampane, Cala-foot, Liquorice, of each 2 Ounces, Aniseeds half an Ounce, Water, Hydnorcul, of each a Pound and half, Juice of Hedge Hydrastis ported 8 Ounces: Digest a whole Day, afterwards Boil in Balance, prefilling the Liqueur strongly, to 4 Pounds of which Clarified Liquor, add Sugar Candy a Pound and a half, and make them into a Syrup in Balance according to Art. It is a very good Pelcoral, and cures the Expectoration of Vesicular Flegm, or other putrid Matter out of the Lungs, curing most Difficulties of that Vesicles, as Asthma’s, Hoarse, Wheezing, phlegmons of Breach, splitting Blood, Ulcers in the Lungs, Venemous Coughs, 

Defe an Ounce and half or more at a time, twice a Day, either alone, or mixt with some proper Vehicle.

XV. The Powder of the Seed. It is held to be a special remedy against Poison, being inwardly taken from half a Dram to a Dram or more, mixt with Honey, or in Syrup of Green Ginger, or of Citrus Fruits; it is also prevalent against the Colliek, and other inward Pains, and Torments of the Stomach and Bowels: it provokes Urine and the Terms, gives ease in the Stomach, facilitates the Birth, and forces away the After Birth, given in a Glass of White Port or Lisbon Wine: made into a Liqueur with Hog’s Flegm, it cures coughs of cold putrid or corrupt Matter, out of the Breast and Lungs, is prevalent against Coughs, Catarrhs, Asthma’s, and other like Distempers of those parts, and has all the Virtues of the Juice, Essence, Decoction and Syrup, afofoeing.

XVI. The Carpathian. It is made of the Seed bruised and mixed with Honey. Applied, it is singularly good for pains, in the Hips, or Huckle Bones, called the Satyric, the Gout, and all other pains of the Joints, as also for Fifhfula’s hollow Ulcers, running Sores, and eating Cancers, in Mouth or Throat, or behind the Ear, as also for the hardness or swellings of Women’s Breasts, or in the Teflices or Stones.
The Descriptions.

III. The first, or Treacle Mustard with broad flat Poonches. It has a small and Fibrous Root, which perishes every Year, from which rises up a hard round Sallack, about a foot more or less high, which then is parted or spread out in some Branches, which are long and brittle, having several soft green Leaves, somewhat long and narrow, set thereon, evenly but not cut in on the edges, bendeth towards the ends, and somewhat round pointed. The Flowers grow at the tops of the Branches one above another Spike fashion, after which come large round Poonches, parted in the middle with a Furrow, having one blackish brown Seed on either side, somewhat thicker and larger than in any of the other Thalpeis, sharp in Tafte, and smelling something like Garlic, especiably that which grows in the Fields, where it is natural; but that which is nurst up in Gardens is

left acute in its Tafte, and not of so Gallicke like scent.

IV. The second, or Greater Treacle Mustard. It has a Root long and Fibrous like the former; from whence rise up several pretty large Leaves,

Greater Treacle Mustard.
Chap. 513. English Herbs.

pointed at the ends, and unevenly wavy, and sometimes dented unequally all round the edges, which are larger, smoother, and broader than the first. Those which grow upon the Stalks, or Branches, are longer, narrower, sharper pointed, and come from the Stalks at the joints without any foot Stalk, having at their lower end two sharp points, and divided into two parts, not much unlike to the Narrow Land Arrow-Head. It rises up with one or more Stalks about 3 feet high, on which grow the said smaller Leaves, with the Flowers on the tops of the said Stalks or Branches, in long Spiked Heads, growing one above another, small, and of a white color.

The Seed Vessels are round, containing brownish Seed: the whole Plant is of a strong unpleasant Taste and Smell.

V. The third, or the Greater Mithridate Mustard. Its Root perishes after Seed time, but abides the first Winter after Sowing. This grows higher than the first, spreading more, and having longer Branches: its Leaves are also smaller and narrower, and sometimes unevenly dented about the edges. The Flowers are small and white, and growing on long Branches, with much smaller and rounder Seed Vessels after them, and parted in the middle.

**Mithridate Mustard Smaller.**

on the edges, and some not, they growing still shorter and shorter, also very narrow, and very sharp pointed. The Flowers are small and white, and grow one above another, at the tops of the several Branches, making each of them a long Spike: these being past away, the Seed Vessels appear, which are bread at the Head, and not much unlike to those of Shepherds Pot, but a little larger.

VI. The fourth, or the Greater Treacle Mustard with Throughwax Leaves. Its Root is long, white, and Fibrous: from which spring forth Leaves which by upon the Ground, and are small and somewhat round, like to those of Balf, but yet a little cut or natch on the edges at the bottoms, where they are smallish, and a little dented about the other part, of a greyish green color, every one upon a small foot Stalk, among which rise up a round Stalk of Stalks a foot high, more or less, purplish at the bottom, and sometimes spotted, on which grow single Leaves at the joints one above another, at certain distances, which encompass it at the bottom, in the manner of Thorough-wax Leaves, and whereas likewise come forth, other smaller Leaves upon short Branches, on which at the tops of the Stalks, stand several small white Flowers, which break forth out of reddish Blacks, after which small flat Vessels appear, like unto those of Shepherds Paste, parted in the middle, as is usual in most of the Thorough-wax, on each fold whereof lie small flat yellowish Seed. The whole Plant is more mild, or less sharp than any of the former. There is, another of this sort something lesser, which has a few Leaves lying upon the Ground, of a greyish green color, not much unlike to the Smaller Mouse Ear, or to the Ground-
Salmon's Herbal.

Through-branch, but much inferior; those which grow up higher upon the Stalk, which is scarcely a foot high, but few set therein, are still smaller, pointed at the ends, and broad at the bottoms, encompassing it like the bell: the flowers are small and white, and the Seed white, but somewhat sharp pointed.

VIII. The fourth, or American Thalapi rarely bearing Seed. Its Root is hard, with many Fibres adorning ther-in, which taaes sharp like the Creedens. This Plant Branches from the Root downtown somewhat thick, set with flat green Leaves, some-thing long, not very broad, and sharp pointed, not notched, dentied, or parted on the edges. The tops of the Branches or Stalks are without Leaves, but shored softly with small yellowish Flowers, confiding of four Leaves, which endure only one day, falling away for the most part, without bearing any Seed, or if any yet very sparingly; so that on the whole Plant, there will scarcely be four or five bucks of Seed gathered any year, which are flat and little long, like those of the Manured Wood, in which contained a sharp tailed Seed.

IX. The seventh, or Candy Tufts, with white and purple Flowers. Its Root is small and hard, and Perishes every year, after giving its Seed. It is but a small Plant, and seldom rises above a foot and half high, having small narrows, long, and whitish green Leaves, notched or dented with three or four notches on each side, from the middle to the point-ward; from among which, rise up the Stalks, Branched from the Bottom almost, into divers small Branches, at the top whereabout stand many small Flowers, put thick together in an Umble or Tuft, making them seem to be small, round, double Flowers, of many Leaves, when as every Flower is single, and stands apart by itself, of a fair white color, in some Plants without any spot, and in others, with a purplish spot in the Center or middle, as if some of the middle Leaves were purple. In others again, the whole Flower is purpish all over, which appears beautiful in a Garden. The Seed is contained in many small and flat Seed Vellips, which stand together in an Umble, as the Flower did in, which are contained, somewhat reddish Seed, like unto some of the other sorts of Thalapi, or Turkel Muffard.

X. The eighth, or Spanish Tufts. The Root of this is much like the former; from whence come Leaves (before any Stalk springing up) which are a little toothed or finely dented about the edges; the Stalk is about the height of the former, but spreads not it self out so much into Branches, but carries an Umble of purpish Flowers like unto the former, after which comes the Seed, which is of something a pater yellow color.

XI. The ninth, or Great white Candy Tucole Muffard. Its Root is small and robust, and abides many Years, not dying annually as the others do. From whence springing up, several About and small Stalks, bearing a few long and narrow sharp pointed smooth Leaves, set one above another up to the tops, where grow Umbles of white Flowers, in broad round Tufts, somewhat larger than in those of the former Kind at Selt. IX. foregoing. The Seed Vellips are greater also, with a Pointed in the middle of them.

XII. The tenth, or Ivy Leaved Tucole Muffard. Its Root is small, long, and robust, perishing every Year; which sends up many weeds, slender Stalks, lengthing downwards, or rather creeping upon the Ground, fiercely rising it self above a Span high, or not much higher, these Stalks are differently set, with small broad Leaves, thick and sharp, broad at the bottom, covered about the middle, and pointed at the end, somewhat resembling Ivy Leaves. The Flowers are small and white, growing Spike fashion at the tops of the Stalks or Branches: which being past away, small Seed Vellips come in their places, which are parted at the ends, and contain small Seed, sharp and but like the other Thalapi.
Chap. 514. English Herbs.

Strangers to us) but a long, white, creeping Root, with many Fibres, answering to it, which white all Winter, and perishes not; but creeping along under ground, it sends up in several places many fruitful Stalks, which are staked, and PR on south green Leaves, somewhat broad, and not very long, a little pointed at the end, and round at the bottom, conning them; but those which grow at the foot of them have each of them a flour feet stalk, and are all of them uncowly denied about the edges: the tops of the stalks are lighted into four branches, all of them rising in an equal height, with many small white Flowers set thereon, consisting of four Leaves片子, and forming a large Umbel or Top, where after they are pale, come forth small round seeds Veltis, divided into two parts, like some of the former Thalipes, with a small Pomet at the end, in each part of which is contained one seed, which is but and tharly, as are also the Leaves.

XIV. Flowers. The fifth and first have been found growing Wild in several parts of England, as half a mile from Hatfield by the Rivers side under an Hedge, as you Travel from Hatfield, and in the street of Frankton on Surye side. The second and fourth are also Natives of our Land, and have been found growing Wild in several places; these four kind kind Grows in Cornfields, upon Ditch Banks, and in Sude, dry, and Barns Gardens, and in Stony and polluted places. The fifth and fourth of them Gerard says, he found in Cornfields between Choudro and Goosefield in Surrey; as South-east in Kent, and by the Path which leads from Harfey (near London) to Wallat-Griffis, and in many other places. The others he says were also found growing Wild in England in several places, which he collected, and placed in his Garden. The fifth, sixth, seventh, eighth, ninth, and tenth. Twelfth, grow with us only in Gardens, as do also the fifth four: The tenth, Lobelia grows in Portland, and about Plimouth, and upon other rocky places, on the Sea Coasts of England. This says Johnson, is a little creeping Herb, having small, red, Venetian Stalks, about a Span high, its Leaves are thick and fat, and look like a Pat, and the white Flowers and small seeds do in shape and taste resemble the Thalipes. The eleventh, delights to grow more in the open Sun upon Hilly Grounds. It has been found growing in the Field of England, upon Dunghills and such like places. Gerard says, he found it by the City Walls of Wait-Cleef, also in a Field near Camber, and at East-End, and Edward, not far from London.

XVI. The Times. They all of them Flower from May, through June and July to August, and their Seed is ripe about a Month later. The seventh, eighth, ninth, and tenth, Flower about the end of June or beginning of July, and their seed is ripe not long after. The eleventh Flowers for the most part early, sometimes in April, but usually in May, and the Seed is ripe in July. The twelfth Flowers about the end of May, through June and July, its Seed ripening in the mean Season.

XVII. The Qualities. Treacle Maffard (the four first kinds are chiefly used, and of them the third Species is principal, and that which is always used in Venice Treacle and Maltbraz) is hot and dry in the end of the third Degree, or beginning of the fourth; Parkinson determines it to be absolutely hot in the fourth Degree, and near unto Crest. It is Astringing, Attractive, Aperitive, Alkali-fire, Inclining, Comminutive, Digestive, Diuretic, Stomachick, Nervous, Nymphick, Hydriotic, and Acholiphamick, for that its Seed is an Ingredient in Maltbraz, and Treacle as acre-

Chap. DXIV. Of the MYRTILL.

1. T HE Name. It is called by the Arabeans, As, As, & Alors in Greek, Musfrag, &c.vides. Petra fays, sit vacuam volans, proper annuum Myrtilla aborti gravam, in jias hicca recensitibus; etiam A Myrtill Arbennicque pulvis uirtus Pat. Myrtilla Als Myrtilla in water, ab albo Mynyla, et in pyn, redolens; in Lain, Myrtillus, Myrtillus, & Myrtillus in English, the Myrtill.

II. The Kinds. There is the Myrtill Tree or Tree, of a considerable Magnitude, of which we shall not treat in this Chapter, but refer you to the proper place, in the Second Book of this Work. What we shall discourse of here, is a small Bully Plant, fearfully removed from the degree of an Herb, and is called Myrtill Nobile, also Myrtillus, from the smallness of the Plant being compared with the Myrtillus Arbor. This also is an inhabitant of our Gardens, for which reason we give it a Place here. There are two Kinds of it, viz.

2. Mytilla minor foliis actibus, Myrtill Nobilia alter, The other Noble Myrtill, or small roundish or Round Myrtill.

The Descriptions.

III. The fifth, or Prime Noble Myrtill, or sharp pointed Myrtill. It has a Branched Woody Root, fpread.
spread out into many Arms, with several Fibres adjoining to them. It is a little low bushy Plant rising up to be two or three Foot high, which spreads it self out into many Branches from the main Stock, whereby it looks like a small Bush, every Arm or Branch, and long of which, are thick set with small, fine and green, narrow, shining Leaves, with smooth edges, and a little fleshy pointed at the ends.

very much in shape resembling the Leaves of Murr or Herb Mallice, but at a little deeper, or freer green color, which abide green Summer and Winter, even through the whole Year, as all the Arms of Myrles do, which is of a very sweet and odorous Scent, very much gratifying that Sense, for which reason it is called Myrilles Nobles, The Noble or Excellent Myrtle. The Flowers are white, and very sweet and not differing in form, from the Flowers of other Myrles, but grow not plentifully on the Branches, in our Country, by reason of the coldness of our Climate: The Flowers being past away small Berries succeed, which when ripe, are in warmer Climates of a black color, but seldom come to perfection in our Country, by reason of the coldness thereof, how well it ever flourish or defend.

V. The second, or other Noble Myrtle, or Box Leaves Myrtle. This grows in its Roots, Stalks, Branches, and in all other parts like the former, in respect to its magnitude, placing of its Leaves, deep greenness of their color, thick growing of the Branches, and thick setting of the Leaves therein, that is might be thought, by the beholder, to be the same with the former, without good heed to, and observation thereof, by comparing the one with the other, but the Leaves of this are a little broader and somewhat rounder at the ends, not very much unlike to the smallest Leaves, of the smallest sort of Box, now called Dutch Box, by which alone, it appears to be a differing kind from the former, and in nothing else. The flowers are like the first, and grow in spring, and the fruit small, and beautiful. Allspice of the Plant, are full as much and pleasant, and altogether the same with that just before described.

VI. The Thistle. Thistle Myrtle grow naturally in Spain, Portugal, Italy, and other hot Countries in great abundance. These here with us are Nurrit up in Gardens, or put into Pots, which may be removed into flower, and taken care of, that as soon as cold Weather begins to come, they may be sheltered from the same. They are a pleasant delightfull Plant, and great Ornament to a Garden, as being among the Number of the most deifiable evergreens.

VII. The Qualities. The Noble Myrtle is hot and dry in the beginning of the second Degree, and of fine, thin, and Volatile parts, as well as Earthy. It is Obstinate, Affrighting, Drenching and Vulgar, Poison and Nephrilical, Hysterick and Aknephiphile.

VIII. The Specification. It suffits Poisons, stings the Terms and Whites in Women, provokes Urine, gives ease in the Sennæ, Stops all sorts of Fluxes of the Bowels, and heals Wounds and Ulcers.

IX. The Preparations. You may have from the Leaves of Fruit, or both, 1. A Liquid Juice. 2. An Infusor, Juice. 3. A Decoll in Wine. 4. A Decoll in Water. 5. A Syrup.
The Virtues.

X. The Liquid Juice or Essence. They stop all effusions of Blood in what part forever, whilst inward or outward. They stop all排血 of Blood, the bloody Flux, and all other Fluxes of the Female and male Sexes, and cause a sweet Broth, where it is fasted or fasting. Do it, 5, or 3 Spoonfulls Morning and Night in a Glass of Red Port Wine.

XI. The Infusion or Tincture. It has all the Virtues of the former: and may be given Morning and Night, from 1 Dram to 3 Drains in a Glass of Generous Red Wine, Mulled and sweetened with white Sugar. It is a most admirable thing for the Cure of many Sorts of Fluxes, either simple or virulent, Universal being first premised: for it not only stops the Generosa, but also strengthens the parts, they have been much weakened through the long continuance of the Diseane.

XII. The Decoction in Wine. It has all the Virtues of the Essence and Tincture, whether Liquid or Infusion. It cures a bleeding Brain, both inward and outward. Polypus in the Nose and Sinews, and Joints, it takes away their weakness, and admirably strengthens them. And so it helps to consolidate broken Bones, and restore Strength to Joints that have been dilated. A Decoction of the Berries cures a Scald or Scabby Head, and cleanses it from Scurf and Morpbus, being often washed therewith: it also keeps the Hair from falling, and makes it grow black and glossy, and being dried, it is said to cure Ruptures or bathenfections.

XIII. The Decoction in Water. It is good for any one to fit in, who are afflicted with the falling down of the Fundament, as also for Women to fit in, who are afflicted with the falling down of the Womb. It makes also an excellent Injunction to call up the Womb with a Womb Spurt; 2, 3, or 4 times a Day, to stop and cure the over-flowing of the Whites, it cleanses and very much strengthens the parts.

XIV. The Syrup made of the green Leaves, or Juice of the Fruit. It is a most excellent thing against spitting or pitting of Blood, excretions of the Lungs, and other Bowels, Ulcers of the Reins, and Neck of the Bladder: stops the most vehement Coughs and Catarrhs, and all other Universal plagues against the most obdurately Althems, causing an ease expellation of the Morbid Matter: and being constantly taken for some considerable time, it is said to consolidate Ruptures in Children. Do it 2 or 3 Spoonfuls Morning, Noon and Night, in a Glass of Red Port or Barcelona Wine, or alone, drinking a Glass of the same Wine after it, but in a Vehement Cough, the Patient must be often taking of it, or licking it, even as often as the Cough is violent upon them, or troubles them.

XV. The Powder of the Leaves or Fruit. It may be given in a Glass of Red Port or Barcelona Wine, or in the former Syrup, either with the Syrup alone, or mixed with any of those Wines, Morning and Night from 2 Scruples to a Dram and half, or more, for all the purposes and is said to equal, for the Essence, Juces Liquid or Infusiate, Decoction or Syrup are given for this, tho' I do not think it to be of equal power with the Juces or Essence. Strewn upon bleeding Wounds it stops their bleeding; and put upon old rotten or putrid Sores and Ulcers, it destroys the putridity; cleanseth them, incarnates, dries and induces their healing. Put upon a Whitlow, or Follen, which is laid open, it cures them. And applied to the Grouny, Privy parts, and Anemias which itch, or are affected with a flaming Sweat, it dries them, and takes away the ill Smell.

XVI. The Lotion. Take a red Port Wine, a Quarter of the Infusiate Juice 2 Ounces, or for want of it, of the Liquid Juice 6 Ounces, of the Syrup 3 Ounces, Powder of Red Alum half an Ounce mix and disolve. It is good against moil, running, and fretting Sores and Ulcers in any part of the Body, and indeed it has been found by experience to cure all Ulcers which are hard and difficult to be healed: it is particularly against Ulcers and Weals and other breakings out in the Skin: as also to Foment hot withall in the falling down of the Fundament; it heals Whitlowes and Fellenors on the Fingers ends, and Ulcers Rotten in Children's Feet: it heals all sorts of Ulcers in the Mouth, Throat, and Private parts: and put into the Eyes takes away the Inflammation, Watereing and Secretions, and cleans the Eyes, and other Cloud or Film, which is beginning to grow over them.

XVII. Myrtidanum. This Fling. lib. 14. cap. 10. lib. 15. cap. 29. & lib. 23. cap. 9. Myrtidanum, or Wine of Myrtle Berries, which according to him has almost all the Virtues ascribed to all the former Preparations: it may be made of the Leaves as well as of the Fruit, by heating the green Leaves in a Wooden Mortar, then adding Red Wine in a sufficient quantity, and therewith they press out the Juice, and to make a Wine thereof by a gentle fermentation: But new Wine ought to be chosen, that which is new from Bordeaux, or Grape called Muft, and is yet unfermented. If it is made of the Berries only, they ought to be thoroughly ripe: and so they ought to be if the Leaves be burnt with them.

XVIII. Myrtidanum Aphrodisia. The Excecrutking growing upon the Myrtle. It is often found upon old Myrti. It has all the Virtues of the Myrtle and Myrtle Berries: and it is said to be of greater force to dry, bind, stop Coughs, Bleeding, Fluxes, &c. than either the Leaf, Juice, Essence, Powder, or Berries of the Myrtle: And you may make yourself all the foregoing Preparations, and give them in like manner, for all the same intentions and purposes.

XIX. The Lostoned Oil. It is good to diffuse and give the to the Headboils or Piles, being anointed thereon, it diffuses also Swelling in the Tiefles, as also Tumors in other parts of the Body, and is good to heal Weals, Boils, Fimplets, and other breakings out in the Skin, and gives ease to the Gout, and other pains of the Nerves and Joints.

XX. The Balsam. It heals fimple Green Wounds at a few times dressing; cleanseth old putrid Ulcers, incarnates, dries and induces their healing, Ap.
Salmon’s Herbal. Lib. I.

Chap. DXV.

Of NAEL-WORT; or, PENNY-WORT.

II. The Kinds. This Plant learns to be a Species or Sort of Sedum, or Houtsko; and thereof Authors have given us many Kinds, some of which, because they are total strangers in our Country, we shall pretermit, and desist to you only these foliowing, which are found to grow either Wild, or else Nursed up in our Gardens. 1. Umbilicus Vulgaris, Cystichon, Terra Umbilicus, Scutellum, Horus Veneris; our Common Navel-wort, Wall Penny-wort, or Kidney-wort. 2. Cystichon altera, Mathioli, Umbilicus alter, Spotted Navel-wort. 3. Cystichon alter minor folio Subtracte, Cystichon minor Montana altera, small Navel-wort, with roundish Leaves. 4. Cystichon alter Flora, Adchem, Cystichon; small Navel-wort, with purple colored Flowers. 5. Cystichon Scutellum latifolium ferravisse guttis albis, Sedum Montana, cal Sedum Seratun, Flora rubra, Maculate, spotted Navel-wort with Saw-like broad Leaves, The Princes Feather. To these may be added, 6. Cystichon palustris, Myrtyl, Navel-wort, Penny-wort. Columns and Buds, refer this to the Rumex or Crowfoot, for it has no affinity with the Cystichon, but only in the roundness of the Leaf, the former of them call it Rumex or Aqueus Umbilicos folio, and the latter Umbilicus or Aqueus Cystichon folio, in the North of England they call it White Root, and in Norfolk, Black-wort. 7. Umbilicus Veneris Officinale, Umbilicus, Myrtyl, Umbilicus, Umbilicus, Umbilicus, Umbilicus, Umbilicus, Umbilicus, Umbilicus, Cystichon folio, Wild, Penny-wort, or Ivy-wort, this is likewise no more a Cystichon than the former, but Gerard has placed it among the Species. 8. Umbilicus maris, Cystichon marinus, Helictis, Pusillus Marinus minimus, Cestipitis, Sea Navel-wort. Neither is this a Species of the Cystichon, but for the Name it has no place in this Chapter; but that of Cestipitis is the more proper Name. Some will have it to be the Androsace Daphnoides, but that plant was, is scarcely now known.

The Descriptions.

III. The first, of Our Common Navel-wort, Wall Penny-wort, or Kidney-wort. It has a Root
which is round, something like unto the full Root of an Orchis or Dog Stone, most uniformly smooth, but sometimes ragged or knobbled, glossy without, and spotted with black Fibers (not at the bottom of the Root, but) at the top of the Root, or foot of the Stalk, more resembling the Root of an Orchis then the Root of a Houlleek. There are many other kinds, flat, and round Leaves growing from the Root, every one having a long foot Stalk, suffused underneath, about the middle thereof, sometimes a little uneven named a sort of a pale green color, and sometimes bollon on the upper side like a Spoon or Sumer, from among which rise up, one or more tender, smooth, bulbous Stalks, half a Foot high, with the or three or four Leaves on them, not usually round, as those below, but something long, and divided at the edges; the tops are sometimes divided into long Branches, bearing a great number of Spotted Leaves, about a long Spike, one above another, which are bollon and like a little Bell, of a whith green color. After which come small Heads, containing very small brownish Seed, which falling on the Ground, will plentifully Spring up before Winter, if the Season be mild.

V. The fourth, or Spotted Navel-wort, with Saw like broad Leaves, called by some the Prince Feather. Its Roots are small regressing, which spread under the Ground, and shoot up again, with broader Heads round about the Mater Head. This kind of Navel-wort, or Houlleek, is composed of Heads of larger, broader, and thinner Leaves, than any of the former, of a smaller green color, somewhat unevenly inclosed about the edges, and not so close set together, but spreading forth into several Heads, like as the former sorts, also not so plentifully. From the middle of the middle of which the Heads, rise up brownish or reddish Stalks, set with smaller Leaves round about the middle thereof, and then branching forth into several Sprigs, with several small reddish Flowers, confining of Fine Leaves opposite; the inner sides of which, are of a pale red, somewhat whithish, spotted with many small blood red Smaller Flowers, and Faint Points, with some small Threads in the middle, flandering about a small green Head, which turns into the Seed Vessel, parted four ways at the Head, in which is contained small blackish Seed.

VII. The fifth, or Water Navel-wort, or Penny-wort. This is called by the Husband Men in some places Sheep-Bane, because it kills Sheep which eat thereof. The form of the Leaf is not much unlike to the third Species before, but it is not of a fithy thicken Hex like it, nor are the round edges of the Leaves so even as that. It has a small brownish Root, and is a creeping Plant, lying and creeping upon the Ground, and taking Root almost at every Joint: from every Joint of which rises forth a Leaf, round, and as it were Scotch, being about from Sculpia, round the edge of it, it stands upon a pretty long foot Stalk, which is fisted to the lesser side of the Leaf, about the middle thereof. And from most of the joints with the Leaves, comes forth a Flower, flandering also upon a long foot Stalk.

VIII. The seventh, or Ivy Leaf'd Navel-wort, or Ivy-wort. Its Root is small and Fibrous, which stands forth a small Herb creeping upon the Ground, with slender fibrous Branches, all about, taking hold of Walls, or any thing it meets, shooting out again at every Joint small Fibrous Roots into the Earth, all along as it runs. At the several Joints grow small broad Leaves, cut in on the edges into corners, somewhat like unto a corner'd Ivy Leaf, each spreading upon a small and springing foot Stalk; at the Joints likewise come forth several small Flowers upon slender foot Stalks, furnished like unto a Sheep Draggon, or Fluellen Flowers, with a Tail or Spur behind it; mixed with yellow, whithish, and purple colors, and the Spars as it were, enfolded ever with such a purplish color edge, which being put away, in their places succeed small round Heads, containing within them small blackish Seed.
Navel-wort.  

Matthioli, because he first for it forth, being first to him from Py's in Italy, but it no ways agrees with the Andreae Basileae. This is a Sea Excertesence, formed like small round Sauowers, boughbough in the middle, like unto a Navel, and born up by small, smooth Root-Stalks, about two inches long, every one by its self, spring- 
ing from some Stone, Rock, or Shell in the Sea, or Salt Lakes, being of a pale greemish Adb color, whilst growing under Water, but afterwaords grow as white asmo as Coral, or the like, and of a Stony Substance.

XII. Gerard Describes it thus. Sea Navel-wort has many round thick Leaves, like unto little Sun- 
cers, set upon small and tender Stalks, bright, 
shining, and smooth, of two inches long for the most parts, upon the Surrounded Stems of Cockles, or the like, every small Stems, bearing upon its end or point, one little Buckler and no more, resembaling a Navel. The Stalk and Leaves are set together in the middle of the Leaf, upon which it was called, Umbellus Marinus, or Sea Navel-wort. The Leaves and Stalks of this Plant, whilst yet in the Water, are of a pale Adb color, but taken forth, they presently grow white and hard, as Sea Moss called Corallina, and are of a Saltif Tofe.

XII. The Places. The first grows very plentifully in many ports of England, but especially in all the Weft of this Land, upon Stone and Moll Walls, upon Rocks also, and in Stony places upon the Ground, at the bottoms of old Trees, and sometimes on the Bodies of them which are decayed and rotten. It has been found to grow plentifully in North- 
hampton, almoft upon every Stone Wall about the 
Town, as alfo at Bristol, Bath, Wells, and other 
Places, upon Stone Walls. The second, third, 
fourth, and fifth, upon the Pyrenean Hills and 
Alps of Switzerland, on Rocks, Mountains and 
Stony places in Germany, Hungary, Austria, and other Countries, where they grow upon the Rocks, and among the very Stones, where there is scarcely any Earth for the Roots to fix in, or to nourish them: but with us they all grow in Gardens very well, if they be Planted in shadowy places, and not in the Sun. The sixth or Water Navel-wort 
grows and creeps upon the fortunes of the Earth in 
Swamps and other moist places, it grows on the 
Bogs upon Hauntled-Heath, and on many fuch 
moff and rotten Grounds in other places. The 
seventh, or Ivy Leaf'd Navel-wort, grows usually in divers places of England Wild, as at Hasfield in 
Hartfor-shire, and in other places which are shady, in which it delights to grow, as alfo upon Thatch 
Houses in the North parts, as it is laid, and most 
abundantly in Lancashire, it alfo grows in many 
Gardens throughout the Kingdom, and if it is 
planted near any Wall, it will run up the fame to 
a considerablie height. The luff will not grow but 
in the Sea, as the name thereof imports.

XIV. The Times. The first Flowers sooner than 
any of the others, as at the beginning of May, and 
the Seed ripening quickly after, then is fall, so 
that about the end of May usually, the Leaves 
and Stalks are withered and gone, until September, 
that the Leaves Spring up again, and so abide all 
Winter. The second, third, fourth, and fifth 
Flower about the beginning of June, and through 
the whole Month, and sometimes in July, accor- 
ding as the Seafoors fall out, and their Seed is ripe 
in August. Thofe Heads which bear Stalks, fin- 
ally perishing together, and the others which bear 
not, abiding all the extremity of Winter. The 
fixth Flowers in the beginning of Summer, and its 
Seed ripens not long after, the Plant is fell being 
green all Winter. The seventh Riddom Flowers till
Chap. 516. English Herbs.

765

the end of July, and in August, and continues many times blooming, till a frothy stool comes and nips it, and the Seed is soon ripe after the flowers are withered and gone.

XXV. The Qualities. The fire first are cold and moist in the second degree; Ablative, Diffusive, and Reperceptive, Anodyne, and Diuretic. The sixth, is hot and dry in the fourth degree, and has all the other Qualities of Water Crosswise. The seventh is cold and moist in the second degree, and has all the other Qualities of the first five.

XVI. The Specification. The first five cool Inflammations, and prompted by Humours, provoke Urine and cleanse the Urinary parts, yet heal ulcerated Kitchens: They give ease in the Gout and Sciatica, and are profitable against Scrofulous Tumors, as also to cure Green Wounds. The seventh has the like Specific Vertues, besides which, it is said to cure the Whites in Women.

XVII. The Preparations. You may have from the first and the seventh, 1. A Liquid Juice. 2. A Decoction in Water or Wine. 3. A Syrup of the Green Herb, or Juice. 4. An Oil or Infusion or Decoction. 5. An Ointment. 6. A CATAPLASMA of the Green Herb. 7. A Distilled Water.

The Virtues.

XVIII. The Liquid Juice. It cools, repels, cleanses, and eases pain. It is effectual against all Inflammations and unnatural Heats, whether inward or outward. Inwardly taken to a Spoonful or more in a Glass of Barley Water or Broth in which a little of the Juice of an Orange or Lemon is sweetened, it cools the heat of Fevers, quenches Thirst, refreshes a failing Stomach, cools the heat of the Liver and Bovels, opens obstructions and cleanses the Reins, Ureters, and Bladder, and takes away the heat and swelling of the Urine. The Juice of the Ivy-wort, taken to 2 Spoonfuls Morning and Night in Red Wine cures the Whites in Women.

XIX. The Decoction in Water or Wine. In Water it has all the former Virtues, and may be given Morning and Night from 4 to 8 Ounces. In Wine, it more effectually cures inward Ulcers in the Reins or Bladders, made with Water, and mixed with white Porto Wine when drunk, it provokes Urine, and is available against the Dropsy; and in the Hemorrhoids or Piles, it gives present ease, the parts being fomented hot therewith. The Decoction in Water is good against heat, redden, and Pimplies in the Face, as also Ambiens Fire, the parts being well bathed therewith, Morning, Noon, and Night; and being drunk, it admirably cools the heat of the Stomach and Liver.

XX. The Syrup of the Green Herb, or Juice. It has all the Virtues of the Decoction and Liquid Juice, but more so powerful as it: mixt with Syrup of Limon, it is good against Fevers, quenches Thirst, and comforts a weak and fainting Stomach. It heals all excoriations of the Lungs, excretions of the Bowels, and other inward parts. Mixt with the Distilled made in White Wine, it powerfully provokes Urine, and is profitable against the Dropsy.

XXI. The Oil by Infusion or Decoction. It is made with Oil Olpeina, or of Lardice Oileum. It cools inflammations admirably, eases the pain of the Piles, and curing Chillblains: and being applied, it gives ease in the Gout and Sciatica.

Anointed upon Scrofulous Tumors in the Neck and Throat, it eases the pain, palliates, and abolishes them, anointed upon Chillblains, it takes them away.

XXII. The Ointment. It has all the Virtues of the Juice and Oil, outwardly used. If to every Ounce of it two Drams of Stearmary in fine Powder is added, it will be a most effectual thing for the cure of all running Sores and Ulcers, and will heal ulcerated Kitchens and Scrofulous tumors. And above all things, it will digest, draw, cleanse, and induce the healing of tumorous Ulcers, beyond most other Topick Medicaments, being skilfully applied. It also quickly cures ulcerated Hemorrhoids or Piles; and is an excellent thing against redness, Scurf, and Pimplies, Scars, and other like Deformities of the Skin.

XXIII. The Cataplesm of the green Herb. Being immediately applied upon a simple Contusion, it dissolves it, or repels the present afflux of Humours. It eases pains of the Gout and Sciatica, abates the inflammation and Tumor in the Testicles and Penis, giving in a little time ease and relief.

XXIV. The Distilled Water. It is Cosmetick and good against most Deformities of the Face and Skin, taking away, Heat, Redness, and Inflammation. Inwardly taken being sweetened with the Syrup, it abates the heat of Fevers, cools the Stomach, Liver and Bladder, gives ease in the Strangury, cleanses the Reins and Bladder, and takes away the heat and swelling of the Urine. Doth from 2 to 4 Ounces, or more, Morning and Night. It is said also to heal Ulcers of the Reins and Bladder, being duly taken for some considerable time.

CHAP. DXVI.

OF NAVEW; OR,

Long TURNIP.

I. THE NAME. It is called in Greek, Βιον Βοιωτια, in Latin, Napus and Bovius, in English, Navew, or Long Turnep.

II. THE KINDS. We may very well take Navew to be a Species of the Turnep, for the Sweet Garden Kind, eats like it, and full as well or rather better and sweeter, being deert like the Common Turnep. This Plant is either 1. Green sorts, Bovius usque Napus Horanaffis, feminine, Napus dulcis, Garden Navew, or Sweet Navew, or Navew Gentle. 2. Brown sorts, Bovius agricollis, Napus Syzygris Doc- donis & Langunifus, Rapum Syzygris Tragi, Na- pus agricollis Turner, Wild Navew.

The Descriptions.

III. The Garden Navew, or Navew Gentle, is like unto the Turnep, in its Stalks, Leaves, Flowers, and Seed, as also in its shape and manner of growing, but the Leaves of the Navew are much smoother; it also differs in the Root, for the Turnep is round, almost like a Ball, but the Root of the Navew
Navew is long, and much stretched out in length, whereby it seems to be degenerated from the form of the Common Turnep. This Garden Navew, or Navew Gentle is also of two kinds, viz. The greater and the lesser. The greater is long and great, almost as large as the short Carrot, but few for the most part of an uneven length and roundness; to the very end where it ends from its sides several small long Fibres. The smaller in its growth and appearance above Ground, is in all things like the former, differing only in its Root, which is very much lesser, for it is somewhat round with its length, and is about twice as big as a Mans Thumb, some bigger, some lesser, both these are so like to the Common Garden Turnep, in stalks, Leaves, Flowers, and Seed, that they are hardly to be known at all.

Navew Gentle, or Garden Smaller.

The Root is likewise some what Tuberous, round and long, half of the bigger of a Mans Thumb, or somewhat larger, with several Fibres springing from it towards the bottom. Its Leaves are long, smooth, and not Hairy, and more deeply jagged than the Garden Kind. The Flowers are also yellow, and the Seed in small Pods like the former, but more but, sharp, and biling. Whosoever says Lobel has seen or known the Garden Navew, or Navew Gentle, will even upon the sight of this, judge it to be the Wild Sort, it is so like thereto.

V. Note. There is a difference between Banias, and Banium, (for Pliny by a mistake makes them but one Plant) for Banias is truly the Nature, of which we treat in this Chapter; whereas Banium, is a kind of Daucus Petrofflini et Coriander folin, of which opinion are Banhtus et Delachampis. Galen likewise puts no difference between Przob, Gongyle, Rapun, a Turnep; and Wuss, Banias, Natus, Navew, (i.e. the Garden Kind) because there is but little difference in their form, manner of growing, greatness of the Root, and sweetness also: but there is really a difference between the Plants, which is chiefly determined by the Root, which is much longer than any Turnep, and thinly even so thick
XII. The Essence of the Same Root. It has all the Virtues of the Juice, and may be given two Spoonsfulls as a time in the same manner, or in a Dill of strong Must Broth, or Gally Broth: This does moreover strengthen all the Excitaments of the Bowels, Reins, Bladder, &c. and is good for healing of a Gonorrhoea.

XIII. The Syrup of the Juice. It is singular good against Wickers in Children, and provokes water fully against a Cough, and softening of the Lungs, causing an ease Expiration. It has all the Virtues of the Juice; besides which, being long used, it reduces the Voice to such as had left it.

XIV. The Decollion of the Root in Water. It has the Virtues of the Juice, Essence, and Syrup, but may be taken from 4 to 8 Ounces, several times a Day: it powerfully provokes Urine, and gives cafe in the Strangury, expelling the Mucus from the Reins, Uterers and Bladder. Being taken for some time, sweetened with fine white Sugar or Clarified Honey, it cures an habitual Cystitisens of Body, and within, it heals Excitaments of the Bowels.

XV. The Sallet of the Roots. It is made either by boiling, baking or roasting, and then being convivial and small as a Knob, it is dressed with Salt, and Butter, adding if you please a little Juice of Oranges or Lemons. Being thus eaten for about five or six Weeks together, with only a little white Bread, and forbearing all other Food whatsoever, whether Flesh, Fish, Eggs, Cheese, &c. and only drinking either the Decollion of the Root or new Milk, for the whole time; I have known it cure several times, the most intractable Rheumas, improved all hope or expectation: and all this it does purely by sweetening all the Juices of the Body, destroying their acritates.

XVI. The Catalphism of the Roots. Being made of the green Root by beating it in a Mortar, and applied to Kibel Heeds, it cures them. Being made of the Roots Baked or Roasted, and applied to the Tumors of the Teffities or [Reet], or Sweltings in any other part of the Body, it heals the Inflammation if any, cures the Pain, and in a short time Jackie the Tumor.

XVII. The Sallet of the Saff Sprouts out of the Ground. It is eaten raw, as other green Vegetables: it purifies and cleanses the Blood, strengthens the Stomach, Liver, Spleen, and Lungs, opens Obstructures of the Reins, and frees them from Tartarous Matter powerfully, with all provoking Urine.

XVIII. The Expressd Oil from the Seed, of both Kinds. It facilitates the Birth, prevents or gives ease and takes away the After-Pains of Women in Childbed: and given to young Children against the Worms, it kills and drives them forth. If the Oil is washed well with fair warm Water, it becomes sweeter and safer, and is then good to anoint the Skin withall; it allays Inflammations, and takes away roughness of the Skin, and other Deformities thereof.

XIX. The Infusion in Wine, of the Seeds of both Sorts. It gives prefent cafe in the Collick, and Gripings of the Guts; opens Obstructures of the Reins, cleanseth them of Tartarous Matter, gives cafe in the Strangury, provokes Urine, and powerfully refuits and expels Poison, whether the Poison is taken inwardly by the Mouth, or by the Biting of Serpents, Mad-Dogs, or other Venemous Creatures: for which reason the Seed is always part into the Composition of Trisials, and other Counter Poisons.

XX. The Seeds of the, of both Kinds. It strengthens the Stomach, cures a good Appetite and
and Digestion, causes the Calick, provokes Urine, gives pell in the Stomach, and induces the Coughs in Women. It is good against all sorts of Pains, and is ever an Ingredient in Venice Tonic, viz. the Seed of the Bartsal Tinct., and both Pigheres, and Pliny lay, that the Seed of the Garden Barts is put into Antidotes, not the Seed of the Wild: and yet that the Wild is certainly the stronger and the more effectual, it kills also Worms in Children. Dofe from half a Dram to a Dram or more in any Vehicle, Morning and Night.

XXI. The Oil of the Garden Root, by Inflammation or Derrfion. It allays Inflammations, dries up Tumors, and is profitable against Chills and Colds, being anointed therewith.

XXII. The Wine made of the Juice of the Root of Nepher Gent. The Root is to be Ground in an Engine or Mill, and the Juice to be preffed forth, which is to be put into Wooden Ears or Vessels, and left to Ferment, as Wine or Cider, are. The Fermentation being over, and the Liquor grown Fine, you will have a noble delicate Liquor for drinking, very Pleasant beyond Cider, and much stronger and not much Inferior to Wine. This Wine if well made, by reason of the Strength of its Body will keep many Years.

CHAP. DXVII.

OF NEP; or, CAT--MINT.

I. THE NAME. It was unknown to the Greeks, so far as we can Learn, the Linnæus called it Nepeta, Mentha Holars, Mentha Cataria, and by some is simply called Catarr, and Catarr, also Herba Guttiria: we in English called it, Nep, Nephe and Cat-Mint.

II. THE Kinds. Authors make many Kinds hereof, but the following Six are Principal, viz. 1. Nepeta major Valga, Herba Guttiria Mattith, 2. Nepeta Cordis Or Tragi, Catarria, & Mentha Cataria Lobelia, Common Garden Nep, or Cat-Mint. 3. Nepeta Media, Catarria Media, the middle Kind of Nep, or Cat-Mint. 4. Nepeta minor Camerarij, Mentha Cataria minor Baskini, Catarria tenuifolia Hifpanica Clofhi, Our small Nep or Cat-Mint. 5. Nepeta Peregrina tansifolia, Mentha Cataria Peregrina tansifolia Lobelia, Mentha fexis tansifolia Tabernemontani, Nepeta Peregrina Biffer, Catarria altera Gerardi; Square Nep, or Cat-Mint with broad Leaves. 6. Nepeta Peregrina angustifolia, Mentha Cataria angustifolia minor Baskini, Mentha Cataria Peregrina angustifolia Lobelia, Catarria folio longore Dodecan, Saffora Roman Gerardi, Square Nep or Cat-Mint with narrow Leaves. 6. Mentha Cataria minor Alpina, Nepeta minor Alpina, Small Mountain Nep, or Cat-Mint.

The Descriptions.

III. The fifth, or Common Garden Nep or Cat-Mint. Its Roots are composed of many long Strings and Fibers, softening themselves strongly in the Ground, and abide with green Leaves thereon all the Winter. From this Root grow forth a hard four square Stalk, or Stalk, with an hoariness on them, a yard high, or more, full of Branches, bearing at every Joint, two broad Leaves, for form and largeness somewhat like the Nep, but longer pointed, fatter, wider, and more hoary, and mecked also about the edges, which have a strong sweet smell, not offensive to any, but very pleasing to Cats.

Nep: or, Cat-Mint Common.
Nep; or, Cat-Mint small.

VI. The fourth, or Strange Nep, or Cat-Mint with broad Leaves. It has a long slender Root, spread out into many Branches with several Others adjoining to them. Each Root springs up a square hoary Stalk, spreading into Brances on all sides, from the bottom almost to the top, set with two Leaves at every Space, which are broader than those of the next Kind following it, not much, but longer than our first or Common Nep, dissected about the edges, and of a hoary green color. The Flowers stand in the spaces about the tops of the Stalks, both of a pure white color, like in form to those of our first Common Nep, but larger, after which comes the Seed, which is also black like it: The smell of the whole Plant, is like to a stronger and purer, and more pleasing than that of our said Common sort.

VII. The fifth, or Strange Nep or Cat-Mint with narrow Leaves. This is a Species of the same Kind with the former, and is like it in its Root, Stalks, Branching out, former, Seed, color, form, and manner of growing, and differs from it in nothing but in the Leaves, which are smaller and narrower than those are.

VIII. The sixth, or Small Mountain Nep, or Cat-Mint. This has a small Virgious Woody Root, which sends forth a Plant smaller than our third Kind or Small Nep foregoing. It has square hoary-stalks of about a Foot high, spreading themselves forth into Branches, on which grow slender Leaves, than those of the former small sort, but they are somewhat broad, about the square, and hoary underneath. The Flowers are small and white, set or placed Spike-fashion at the Tops of the Stalks and Branches, like into those of the Common Kind.

IX. The Places. The first grows about the Borders of Gardens and Fields (as Gerard first) near to rough Banks, Ditches and Corners Ways, and is delighted in moist and watery places, from whence it was brought into Gardens. Parkington says, that the first and second grow Wild in some Countries, but are not much with us only in Gardens, as all the rest are. The third, fourth, and fifth grow naturally in Spain, from whence they were brought to us in their Seeds, and in some of the cold parts of our Climates, grow here to be Goodly sort of Plants. The sixth grows in Italy, about Naples, from whence the Seed was brought thither.

X. The Time. They all come forth in the Spring Season, Flower in July and August, and their Seed is ripe soon after.

XI. The Qualities. Nep or Cat-Mint is hot and dry in the third Degree, Aperitive, Abstinence, Aperient, Anodyne, Carminative, Digestive, and Traumatick; also Cephalick, Neuropick, Stonick, Hepatick, Coritial, Purgative, Emmenagogue, Sudorific, Alexipharmick, and Analeptic.

XII. The Specification. It provokes the Terms in Women, huffens and facilitates the Labor, tops Caraths and cold thin Rheums, expels Wind, gives ease in the Colic, cures Affluence of difficulty of Breathing, as also Cramps, Convulsions, and all cold and moist Distentions of the Nerves.

The Virtues.

XIV. The Liquid Juice. Taken one or two Spoonfuls at a time in a Glass of choice Comely, or other proper Wine, it cures such as are inwardly Blisters by any Blow, Fall, or other Accident. It expells Wind out of Stomach and Bowels, gives ease in the Collick, and being constantly taken for some time, it provokes the Courtes in such Virgins as never had them, and brings them down in such Woman as have had them. Elzef for some time, it also takes away Sterility or Breasmen in such Women, in whom it is caused through a coldness, over-moisture or slipperynes of the Wind, and other weaknesses of the parts: Given aff to Women in Travel in a Glass of White Lisbon Wine, it hastes and facilitates the Birth, brings away the Miseries, and prevents, or cures After-Pains.

XV. The Essence. It has all the Virtues of the Liquid Juice, besides which, it prevails against all cold and moist Difficulties of the Head, Brain and Nerves, is probable against Apoplexies, Vertigo, Migrains, Epilepsies, Leucorrhæa, Catarrh, Piles, Convolutions, and other like Diseas of those parts. Do as a Spoonful or two, every Morning Lithing, and every Night going to Bed, in a Glass of Generous Wine. It also expels Pethon, whether inwardly received, or externally by the Stinging or Biting of any Venemous Creatures, Vipers, Scorpions, Biting-Stings, Mud-Dogs, &c. If it is profently given in a proper Vehicle, and a Cataplasm of raw Garlic be also applied forthwith to the Wound.

XVI. The Infusion in Wine. It has the Virtues of the Juice and Essence, but not nearly so powerful; yet it is a singular Cordial, defends and clears the Heart, eluors the Spirits, and is profible against delirious and violent Headaches, as Eatings, Swellings, Vapors, Hysterick-Fits, &c. Give it as a Spoon, or two Ounces, at time of the Paresty.

XVII. The Powder of the Leaves and Heads of Flowers. It has all the Virtues of the Juice and Essence, but it acts with that speed which they do: yet it seems to comfort the Stomach and Bowels after a wonderful manner: it provokes Appetite, and eases a good Digestion, is a singular Pallier of Wind, and drops Fluxes of the Belly. It is also good against Coughs, Cold and Catarh, or thin distillations of Rheum, which distress the Lungs. It also warms, dries and strengthens the Womb, and is said strongly to provoke Lull, and induce Conception. Do one Dram at a time in Syrup of Citron Peels, morning and Night, drinking a Glass of Brong Wine after it.

XVIII. The Syrup of the Juice or Green Herb. It is a most admirable Pectoral, and is said taken sometimes in the Day time with a Liquorice Stick it prospages a Cold, and causes an easy expectoration of the viscid phlegmatic matter lodg’d in the Stomach and Lungs. It is good to cure an Affections or difficulty of Breathing, Ruffling of the Stomach, Heartburns, Whooping, Throatness of Breath, and a continual distillation of Rheum, which is very obnoxious to most of the Young. It may be taken particularly morning and Night, and as often in the day time as need requires.

XIX. The Lotion. Take of the Essence’s parts of Rosmary or other Generous Wine a parts, Spirit of Wombl Syrups a part, mix them. Being used as an Infusion up the Womb, with a proper Womb Syrups it cleanses, warms, comforts, dries, and strengthens it, takes away its flattering, and makes it apt for Conception, and if this Lotion be fat in a Copper or Earthen Pan over live Charcoal in a Clofe-Stood, so hot that the Fumes thereof may be received up the Womb, it does also the same things, takes away the over flowing moisture of the Mother, dries up the Wind, and cures the Pains of those parts, and by the frequent use thereof takes away those causes of Sterility or Barrenness. It is also good to walk the Head, to dry up running Humors, and cure the Scabs thereof, and is effectual for the like effects in other parts of the Body. Bathed or Fomented on the Piles, it cures their Pain, and in a short time dries them.

XX. The Ointment or Balsam. They are good Venerables being applied to moist and running Sores and Ulcers; they strengthen the Nerves, or any Limb or Member weakened through Cold, or moisture, or blows, or any over-Drawing; and applied to Ulcerated Piles, they dries the exterior Tumor, cures the Pain, and in a short time heal them; the same thing they do, being also applied to Ulcerated Kibles.

XXI. The Poultice. It is made of the Green Herb, with its Tops or Heads of Leaves, and a little Wool. Being put up the Uterus, it cures the Pains of the Womb, draws down the Vapors, prevents all the Mother, preserves the Terms, and in a Woman with Child, if it is near the Moments of Deliver, it hastes the Birth.

XXII. The Cataplasm. Applied to the Fumative in the Hemorrhoids or Piles, it gives instant ease tho’ the pain be never to Venerable: applied to the Joints it also cures the pains of the Gout, proceeding from a cold cause, or an accidental weaknesses of the parts.

XXIII. The Distilled Water. It has the Virtues of the Juice, but very much weaker in its effects, and may be given to 6 Ounces sweetened with the Syrup allgoing, otherwise, it is used for the most part as a Vehicle to convey the other Preparations in. It is a very good Stomachic.

XXIV. The Spirit. It is a great Neuritick and Cordial, good against Pains, Colic, Convulsions, Tremblings, Numbness, Vertigo, Leathargy, Carus, Fainting and Swooning Fits, Vapors, Fits of the Mother, and the like Nervous, Cardiack, and Deftempers. Do one to two Drams distilled with the Syrup at сил 18 aforegoing.

XXV. The Distilled Oil. It has all the Virtues of the Juice, Essence, Infusion, and Spirit aforegoing; it provokes the Terms powerfully, brings away the Birth (when ripe) momentarily, and prevents and cures After-pains upon the spot; it has not one equal for the Dificates of the Head, Brain, Heart, Nerves and Womb. Do from 6 Drops to 12, 20, 30, or more, according to Age, Strength, and Neuritick, drop them first into one pouder Sugar, mixing both very well together; then give the mixture in a Glass of Wine.

XXVI. The Spirituosum Tinctorium. It has all the Virtues of the Juice, Essence, Spirit and Oil, it is stronger and more powerful than the three first, but weaker much than the Oil. It may be given in the Cobles, Fainting and Swooning Fits, Leathargy, Oil from one Dram to two Dranas, in a Glass of Generous Wine, but if it is given against Vapors, or Hysterick Fits, it will be best to give it a Glass of the Distilled Water, which may be repeated morning and Night.

XXVII. The Acid Tinctorium. This has all the Virtues of the Spirituosum Tinctorium, and more powerful
powerful than it, in expelling Vapors and Hylterick Fits, also Vomiting, Sicknes at Heart, and other Difeases of the Scomach, and exceeds all the other Preparations, in curing Ca- lenatures, burning Fevers, the Plague, and all kinds of Malign and Peffential Fevers, for which it is a kind of Specifick. Dofc fo many Drops as to make the Vehicle it is given in gratefully Acid, and to be repeated as often as need shall require.

XXVII. The Ohy Tintura. It is a powerful Antiparalytick, Neurontick, Hylterick, and Neprhrick, outwardly it is good against the Palifie, Lameflefs, Numbnes, and Trembling, being anoint- ed very well all along the Back Bone Morn- ing and Night, taking some few Drops of it allo inwardly, and anointing withall the parts affected. It facilitates the Birth, and power- fully provokes the Terms in Women. And is a singular Medicament against the Stone, Gra- vel, Sand, Starous Mailage in the Kid and Badder, Strangury, Fallding and heat of Urine, in all which Cases it gives preffent relief. Dofc from one Dram to three Drams in any pro- per Vehicle.

XXIX. Note. The firth Kind is most used, but Lefel fays, the fourth and fift Kirts are more efcffual to all the Purpofes and Intentions, than the firth Kind: And if my Observation may flinge any thing, I am of Opinion, that the third Kind is not inferior in goodnes to any of them all.

NELPHAR, fee Water Lilly, Chap. 442.
NESPITE, see Calamint, chap. 104.

CHAP. DXVIII.
Of the Nettle.

I. The Name. It is called in Arabick, Hum- mure, & Angliar: Seraph calls it Ha- mure Urinis: in Greek, Urtica (a word affiga- & injuncnda eff: ) also Knephy (quad velicett & pange- r: ) in Latin, Urtica, ab Urenio, quod praemi- tum purulofum eam fumes exciet: and in English, Nettle, and Stinging Nettle.

II. The Kinds. There are to be fied four Kinds of Nettles, viz. 1. Urtica Hortentif, Urtica Re- mona, Urtica Betles, Urtica prima Dafforde, Urtica Lecitifas Claff, Urtica Mac, vel Mufcida, The Garden or Roman Nettle. 2. Urtica Syllofifis major, Urtica major, Urtica Urene, Urtica farno- ma, our great common flinging Wild Nettle. 3. Urti- ca media Syllofifis, Urtica arcus vulgaria altera Tragi, Urtica Oggyphytel (a puniceit folhorum) our middle fort of flinging Wild Nettle. 4. Urti- ca minor Syllofifis, Urtica minor, Urtica Exiguus Curna, Urtica arcus minimus, Urtica arcus Lloguanenfis, Matthioli & Tragi, Urtica Cani, vel Canna Plini, our leffer or small flinging Nettles.

III. The Decriptions.

The descriptions.

Nettle Garden.

to many round hairy Branches, rather leaning down, than flanging perfectly upright, sometimes relying to be four or five Feet long, spreading out into fene- ral Ramifications: whereas at the Joints, are two Leaves set together, very rough: and thro it has no sharp Prickles, yet it has a hairy Down thereon, which will fling the Skin egercically, if but touch'd therewith, and raise it full of Blisters, as if it was burnt with Fire: and shant round the edges somewhat deeply. At feral places of the Branches come forth falie Stalks of reddish and yellowifh Flowers, made of threads which full away, without bear- ing any thing effe: but at the Joints with the Leaves in other Places, from the middle of the Branches upward, come forth small, round, rough, green, prickly pellers bigger than Peas, in which are contained feveral flat, smooth, slippery, glitter- ing or flinging Seed, much like to Line or Flax Seed, but rounder and smaller.

IV. The Second, or Great common flinging Wild Nettle. The Root of this perifhes not like the former, but continues all the Winter, with some green Leaves upon it, if the Seafon be not too extremt: It is pale and yellow, and spreads it self, running very deep into the Earth, with long flings and small Fibres. From this Root shoots forth one, 5 s a
Leaves are of a darker color than the former, and sometimes brownish, or red, as large, rough, and fling-ten as the former, but not so deeply dented on the edges. As the tops of the Branches and twigs, from the joints with the leaves underneat, some forth small, long, Branches of Flowers, and Seeds after them, in fashion very like to the Branches of the female Mercury, in which are contained, small, flat, whitish Seeds.

V. The third, or Our middle sort of Stinging Wild Nettle. This in its creeping, springy and fibrous Root, Stalk, Branches, Flowers, Seed, and manner of growing seems not to differ from the former slight described, excepting that this is lower, and smaller, and thinner set with Branches: for this reason, it is thought by many, that it is one and the same Kind with the Greater slight described, and differs nothing from it, saving that it grows not full so great, which may be with respect to the Soil, being poorer, and not so flat and good.

VI. The fourth, or Our Leffer, or small stinging Nettle. Its Roots are smaller than any of the former, and perish every Year, yet twice, or thrice sometimes in a Year, for it has been observed to find its Seed twice in a hot Year, and spring up again the third time of the fixed Seed, which being near Winter, perisheth with the first Frost, but springs up again the next Year. This Nettle is in most things like to the two last, but rises seldom above half a yard high, and is nothing so much branched or the great Kind. Its Leaves also are much smaller, rounder, much sharper reached on the edges, and of a frether or lighter green color, and more sharply stinging than any of the others. The Seed is small, and white like to the others.

VII. The Plants. The first is usually Sown in Gardens with us, as it is also in Upper and Lower Germany, and in most places of France; but in Italy Wild in the Woods. It has also been found naturally growing Wild, time out of mind, both at the Town of Lible by Romney, and in the Streets of the Town of Romney in Kent, where it is fold that Julius Caesar with his Soldiers landed and stand for a time, whilst it is thought the place took its Name, being by them called Romanis, and we for shortness Romney, and also obtained the first produce of the Plant; ever since which time, it is thought that it has continued there, growing, and risings Yearly of its own Sowing. But it has been found growing Wild also in other parts of this Kingdom, as in the Street of Bardney in Lincolnshire. The other three sorts grow in dive Grounds, by Hedges, and on Dutch Banks, by High-ways and Wells sides, and in many other places both rich and unrich, and in Pastures, and in Gardens, and in all sorts of Grounds both rich and poor, good and bad, where it they be suffer to grow a while, it will be difficult to clear the place of them.

VIII. The Times. They come up plentifully early in the Spring, and through all the Summer Months, and they Flower and Seed in July, August, and September, but the smaller Kind more early, because it many times Flowers and Seeds twice a Year, as was before observed.

IX. The Qualities. Nettle is hot and dry in the fifth Degree, and is of thin and subtle parts: now it does not burn and sting, because its external and small prickles are hard and Biff, piercing like a Sting or the fine Points of Needles, for it is once withered, its Flings not at all, because its fine hard Pilkles grow...
Chap. 518. English Herbs.

grow soft and flabby. It is Aperitive, Abstringent, and Diuretic, Pectoral, Nephritick, Hypertick, and Alexipharmick.

X. The Preparations. You may make herewith,

The Virtues.

XI. The Liquid Juice. Taken inwardly to 2 or 4 Ounces or more, according to Age, it will make the Belly Soluble, it opens obstructions of the Stomach and Lungs, helps Wheezing and短带 of Breath, it provokes the Terms, allays Va- por, and prevents Inflammations: it provokes Urine and expels Sand, Gravel and Tumors Matter out of the Reins and Bladder. It kills Worms in Children, expels and takes away Stitches in the side, removes the opprobrium of the Head, and renders the wind more fit to be dischorrized: it fad also to provoke to Vomiting, being taken for two or three Days together it fops Spitting or Vomiting Blood, coming from the Lungs or Stomach, being put into Green Wounds or old Sores, it cleanses and induces their healing. The common Dose is 1, 2, or 4 Spoonfuls at a time, in a Glass of Wine, or other fit Vehicle.

XII. The Essence. It has all the Virtues of the Liquid Juice and Essence, but to no greater end, and therefore it may be given in a Dose, as from 1 Spoonful to 3 in Water, Broth or Wine. It warms the Stomach, heals Sores and Ulcers in the Mouth or Throat, and given with 10, 15, or 20 Grains of Myrrh in fine Powder, it helps most cold and moit Difeases of the Womb. It eases Pleurick Pains, helps the Cholick, expels Wind from the Viscera, relieves the Headache, and provokes a Vomiting of Biting of any Venenous Creature as of Serpents, Mad Dogs, Scorpions, Horsets, &c. and relists the Poisonous qualities of Hemlock, Henbane, Mandrake, and any other Plants, and so bathed upon the various parts it relists them, eases Pain, and Difficulties simple Contusions.

XIII. The Distillation in Water or Wine. It has all the Virtues of the Essence and Powder, but to no greater end, and therefore may be given Morning, Noon, and Night from 2, to 6, or 8 Ounces, made pleasant with a little double refined Sugar.

XIV. The Wine. It is made by a cold Infusion of the Green Herb or Plants in Wine for 3 or 4 Days, and then pressing out the Wine, and repeating this Infusion in the same Wine, 3 or 4 times or more: till the Wine is very strong thereof, and at last pressing it out again after which letting it stand till its fine, the clear is to be decanted and kept for use. It may be made with Madora Wine, White Wine, White Lighter, Sherry, or Canary, as every one likes best. It has the Virtues of the former Preparations, is very Stomachick, and a safe and fine Medicine to open Obstructions of the Viscera, but chiefly the Wine, which it warms, and strengthens very much.

XV. The Lotion of the Juice. To every Pint of the Juice, half a Pound of Honey is to be put, and these are to be met together in Sand heat, or in Balances, and the humidity be evaporated till it comes to the consistency of a Loboh: it opens the obstructions of the Branches of the Lungs, and
takes Coughs, Wheezings, Hoarseness, shortness of Breath, Asthma's, and helps to expelphor cold, cough and impalded Flung in the Lungs or Stomach, and to quiet forth the potherick of a Pleurick, and to spread it that way: it is also good to diffuse the Tumors or Swellings of the Ate, to strengthen the Liver, and reduce it to its place. Drink also mixt with White Port Wine, from an Ounce to 2 Ounces, it provokes Urine and cleanses the Reins and Bladder from Sand, Gravel, Stone, and Tartarish Slime.

XVI. The Elixir. Take of the Powder of the Seed 2 Ounces, of the Leaves in Powder, Myrrh in fine Powder, of each 1 Ounce, Clarified Honey to Ounces, mix and make an Elefor. It has all the Virtues of the Juice, Essence, Wine and Lotion, and may be given from 1 Dram to 2 or 3, in any proper Vehicle: it is an excellent Hydrick, provokes the Terms, lifts up Vomiting, facilitates the Birth, and brings away the After-birth.

XVII. The Powder of the Leaves and Seed. That of the Seed is the Strongest, or more effectual: it provokes Urine, Stone and Gravel, from the Reins and Bladder, kills Worms in Stomach and Belly, eases Pleurick Pains, opens obstructions of the Liver and Spleenic and provokes Luff, it is also a Remedy against the Stingings of numerous Creatures, the Biting of Mad Dogs, the Venom of Hemlock, and other cold Poisons whichflipiche and dull the Senses. It is good against the Lethargy, being taken with a Little Water and being drank or Templings being rubbed ondrew therewith, Dole a Dram or Dram and half in a Glass of Generous Wine. If it is blown up the Nostrils, it is said to stop their Bleeding; and takes away the Polyne, and doth Execution growing therein. Given to Hens in their Meat in Winter time, it is said to make them lay Eggs all Winter more plentifully.

XVIII. The Lotion. Take of Essence or Essence a Pint, of the Distillation, and Wine, of each half a Pint; Clarified Honey 6 Ounces, mix and distill it. It is good against Coughs, Cold, Wheezings, Asthma's, eases and expelation from the Stomach and Lungs, and has all the Virtues of Juice, Essence and Loboch. It is good to gargle with when the Almonds and Throat are Swelled, also gives a great deal of the Tumor of the Uvea, and refines it to its place, heals Inflammations, Sores and Ulcers of the Mouth and Throat, and stops spitting of Blood arising from the Stomach. It is good also for outward Wounds and Sores, they being washed with it thrice a day.

XIX. The Oil. It is made of the Juice by adding Oil and a little Wax, heating gently to the complexion of the humidity. It eases the Gout, and other Pains, and is good for Anoth and benemened Members therewith, to bring them to their proper Activity again.

XX. The Oil by Distillation. It is made of the Juice, or Green Herb bruised and baled to a Crispness in Salts Oil, and then pres forth, returning the Operation three times. Being Anointed upon a place flung with Nuxties, it is said to be a pestilent Remedy, to take away the pain and throbbing.

XXI. The Ointment. It is made of the Green Herb being bruised in a Mortar. Being put up the Nostrils, it stops their Bleeding. Applied to places affected with Scurf, Murphow, Leprosy, Sub-
Salmon's Herbal. Lib. I.

Chap. DIX.

Of NIGELLA; or, FENNEL--FLOWER.

I. The Name. It is called in Arabic, Numa; in Sanscrit, Sahne; or Sahs; in Greek, Mertiadis; in Latin, Melanthium, Nigella, Salviafrida, papaver Nigerum: in English, Black Caraway, Fennel Flower and Nigella; in French, Fleur de Nigelle, or Fleur de Noir. This Plant is called Camumain, or Safflower after Dioscorides.

II. The Kinds. There are two principal Species of this Plant: viz. I. The Garden Kind, which are: 1. Melanthium Hortense Nigella Hortensis; Ficus lepta, Our Garden Nigella with a single Flower. 2. Nigella Cretica latifolia odora; broad Leaved Sweet Scented Nigella. 3. Nigella Cretica tenuifolia odora; narrow Leaved Sweet Scented Nigella. 4. Nigella Citrina Fisse alta simplex; single Flowered white Nigella with yellow Seed. All the former are single Flowered; these following are double Flowered. 5. Nigella Damascena Fisse multiplex; Blue Nigella with a Double Flower. 6. Nigella Citrina Fisse alta multiplex; white Nigella double Flowered. II. The Wild Kind. 7. Melanthium Sylvaticum, Nigella Sylvatica: Wild Nigella.

The Description.

III. The first, or Garden Nigella with a single Flower. It has a long slender Root, with some Fibres adhering to it, from whence springs forth a weak and brittle Stalk, and some times Stalks, about a foot high, full of Branches, beset with Leaves, very much cut or ragged, much reddening the Leaves of Fumitory, but much greater. The Flowers grow at the top of the Branches, of a sulphur yellow color, each Flower being divided into five or six Parts, Leaves and Stalks. These Flowers being soft, weak.

Nigella Garden.
**Chap. 519. English Herbs.**

Nigella blew double Flower'd.

VII. The fifth, or blew Nigella with a double Flower. Its Root is small and yelbou, perishing every Year, as the others do; from which rising forth several Green Leaves, finely cut, and into so many parts, that they are finer than Fennel, and divided somewhat like to the Leaves of Laths-heel, from among which rise up Stalks with many such like Leaves upon them. Branched forth into several parts, at the tops of which, upon each green one fair large Blossom, which consists of three or four veins of Leaves, laid one upon another, of a pale bluish color, with a green round Head, composed with several short threads in the midst, and having five or six such small green Fennel like Leaves, under the Blossom, to bear it up (as it were) below, adding thereby a greater grace to the Blossom, which at the first form sometimes white, but quickly after change. The horrid Heads hereof are like to the Heads in the Wild Kind, which are somewhat rounder and greater, being within them black unclean Seeds, without the least Smell.

**Nigella Wild.**

VIII. The sixth, or white Nigella double Flowered. Its Root is yellow, and perishing every Year, as the other doth. This double white Ni-

**Nigella, double like the Leaves at the left but, of a yellowish green color, and much larger and broader, and very much jagged, being nothing like the fine cut of the former, as you may perceive in the figure. Leaf of this Plant placed near the bottom of the Cut, belonging to that leaf described in Sect. 7. beforegoing. The Flowers are somewhat left, and fever double than the former, and in color white, having no green Leaves under the Flower, as the former has; the Head thereof in the middle, is very white also to that of the leaf described, but not so great, in which it is contained for the soft pale black Seed, and smelling sweet like the Roman Nigella in Chap. 510. Sect. 4. beforegoing, which is the only sweet Scented before this; but the Seed of this is sometimes not so black, but rather a little more white, or yellowish.

IX. The seventh, or Wild Nigella. It has a long slender Root, with many long strings and ki-

XII. The Qualities, Specification, Preparations and Virtues of these, are the same with those of the
Katharina Flower, or Russian Nigella in Chap. 415.,
including, so that we shall say no more thereof
in this place; having that the Garden sweet smell-
ing Russian Nigella, is rather to be chosen than any
of the others, as being very much the finest,
and if that is wanting, then the first Kind in this
Chapter is to be first admitted, and after that the
sixth Species foregoing or white double Russian
Nigella.

This Cat should have come in, in Chap. 130.
Self. 3. But was there over-looks: We have thought good to put it in this place, that it
might not be lost.

Nigella Bastard; or Cockle.

CHAP. DXX.

OF NIGHT-SHADE.

OR,

MORELLE.

I. THE Names. It is called in Arabic, *Hana
erbutoidea;* Hanaerbutochob, & Hana-
erbutochob in Greek, Σάλτοναμαρατινίαν,* Salomon
Hortense vel commune, The Common or
Garden Night-shade; of which in the Chapter.
2. Salomon Lathhale, Salomon Majus, The Hands-
istry Night-shade. 3. Salomon Helianthum, or Win-
ter Cherries, of which we have difcourfed in
Chap. 120. 4. Salomon Lignefum, Dalanon, or
Amarandâtis, Woody Night-shade or Bitter-Sweet,
of which we have already spoken in Chap. 77.

III. The Garden or Common Kinds are,
*Salomon Hortense vel commune, Solanum valvare, Our
Common Night-shade; it is also called Garden
Nightshade, because formerly it was Planted in
Gardens, tho' not now, but it is yet found plentifully in almost all Gardens that not Planted there,
it generally coming up of its own accord. 2. Sol-
aranum Rubrum Major, Salomon purpureum Carth., Solanum rubrum et latum Gepneri, Com-
mon Night-shade red Berried. 3. Solanum mon-
neriferum Bioferri; Matthiol, Geophor, Lucani,
Cijiis, Deducri, Lelibs, Gaffonis, Comornv, Lay-
danis, oloruni, Sleepy Night-shade. 4. Sol-
anum monneriferum antiquum suberum, The true
Sleepy Night-shade of Theophrastus and Pliny.
5. Solanum Nigrum rubrum Virginianum, Red
Night-shade, or Red Weed of Virginia, this re-
turred to the Kinds of Solanum for the ilkens of
the Leaves, altho' much larger, and it is called Ra-
brum, both from the color of the Stalks, and the
color which it gives, with which the Indians color
both their Skirts, and the Barks of Trees, with
which they make their Baskets, and such like
things. 6. Solanum Circaum maior (because in its outward form it is like the Circa
Discofrisia; ) Circa Lutetiana major Lobeis &
Pana. Luxa Sytulefris Triul (from its rough
Heads and Seed like Burns. ) Helaine Sytulefris,
five flexistis major Thays, (for that the Leaves are
dee to Helaine or Paritaries) Osinumum Veracu-
riun Gepneri, Herba Etioo Stephoni Tobeninzov-
toni, Solanglo Solanum dota maior Babiti, The
greater Incants Nightshade. 7. Solanum Cir-
caum minor, Circa minor, Circa Lutetiana minor,
Helaine Sytulefris minor, Solanglo Solanum cir-
ca minor, & Alpina, The little Incants Night-
shade. 8. Solanum fruticosum Americanum, An-
num Planus, Pfendoferum Doboni, Strichmoder-
drom, i.e. Solanum arboreum; Solanum Americ-
num Discopris; Solanum Indica; Circa Indi-
ana, Tree Night-shade, or Tree Witter Cherry.
Discofrisia his Silverwhite, is, Solanum mon-
neriferum, but what his Silverwhite Solanum fa-
sum.
of Baff, elf something like, and a little unseemly spred about the edges. At the Top of the Stalks and Branchers, come forth three or four, or more white Flowers, made of five small painted Leaves apiece, flanding on a Stalk together, one by, or above another, with yellow Points in the middle, compos'd of four or five yellow Threads fit together, which afterwards turn into so many splendid Berris, hanging like those of Ivy, which are green at first, and black afterwards when they are ripe, and are of the bigness of a small Pea, full of Juice, and con-taining within each Berry small whitish round flat Seed. The whole Plant is of a waterish insipid Taste, but the Juice within the Berries is somewhat Vifcom, like unto a thin Bleasins, and is of a cooling and binding quality.

V. The second, or Common Night-shade Red Berried. This is in all respects like the former Common Night-shade, in its Roots, Stalks, Branchers, Leaves, Flowers, and manner of growing; ex-cepting that its Leaves are somewhat harder and rougher, and the Berries when they are ripe are of a yellowish red color, the whole Plant growing also a little higher than the former. In hot Countries its Root bears many Years, but scarcely so with us: it seems that this Plant is hard a degenerate from the former, from reason of our Climate, as it happens in many Fennel Seeds, which being Sown with us, in a short time becomes by transplantation into our Country, changed into our Common Fennel.

VI. The third, or Sleepy Nightshade. Its Root is thick, long, and hard, and of a bronchishe color on the out side. It rises up with several thick, round, soft, Woody Stalks, divided into other Branchers, on which grow many soft, woody, but green, broad, round Leaves, very like unto Quince Leaves, two al-ways set at a joint, one against another, of something hot Taste, as Cludius says. The Flowers come forth at the joints with little Leaves, all along the Stalks and Branchers, 3 or 4 together, round about them, which are long and bulley, ending in a somewhat long and pointed Leaves, of a pale white color, which being pale, green Berries come forth in their places set in woody Hats, which being ripe are of a yellowish red color, and larger than those of the former.

VII. The fourth, or True Sleepy Nightshade of Theophrastus and Pliny. Its Root is somewhat hard and woody, covered with a whitish Bark, not very thick, of an ill Smell, and infipid Taste. It springs up with 3, or 4, or more thick, round, hard, whitish Stalks, about a Tard or more high, spread out into some other Brancher, hard to break, set with somewhat broad Leaves very like unto Quince Leaves, flanding on small foot Stalks, not always 2 at a joint, but many flanding singly at the joints: from the middle of the Stalks upwards, come forth several reddish Flowers together. Leaves a piece, after which follow small flinged and pointed greenish Hats, but red when they are ripe, very like unto Badders of Winter Cherries, but much left, with a red Bitter, within it in like manner, containing within it several small Seeds.

VIII. The fifth, or Red Nightshade, or Red Weed of Virginia. Its Root is white, and green very great with us, but persifles if it is not defend-ed from the Frost in Winter, which usually rots it; but in its Native places, it grows as big as a Man's Leg, (and such loose form of it in Carolina, and Southern parts of Florida) and above a Foot long, which being cut trows but like a Bryony Root, many circles to be seen in the middle. It is a large Plant, and takes its Name of Solomon from the likeness of its Leaves. It rises up with a great thick, round, reddish Stalk, of the thickest of one Thumb at least, and four or five feet high, or more, set with many very large, fresh, green Leaves full of Veins (but without any order,) some greater, and some smaller, and sometimes many of them turning reddish, from the joints where the Leaves stand, in the middle of the Stalks upwards, come forth many small foot Stalked Flowers, which are very small, confining of four Leaves apiece, of a pale red, or blusshe color, divers flanding together as it were in a small long cluster, which afterwards bring forth small blackish round Seeds, 4 usually set in one Hat, which seldom come to ripeness with us in England.

IX. The sixth, or Great Inchanters Night- shade. Its Root is found, very wide, and full of Joints and Branchers, by which it shoots forth and creeps everywhere under Ground, quickly taking up a great compass. It rises up with one or more 5 or 7
Salmon's Herbal. Lib. 1.

round and jointed Stalks, most commonly standing upright, yet sometimes leaning down to the ground, and taking Root again at the joints; it grows about a Foot or half a Yard high, especially if it grows in a moist shady place, with two Leaves at every Joint, each of them growing upon a pretty long Foot Stalk, which are broad, and round almost at the bottom, but very long pointed at the end, something waved about the edges, much like to the Leaves of Nightshade at some times, or rather like to those of Pellitory at the Wall, being of a shining green color on the upper side, and tender, soft and gentle in handling, but a little hairy, and of a dark grayish color underneath. From the middle of the Stalk almost upwards, the Flowers grow in Spike fashion, many set together, one above another, which show to be of a dark brown color, whist if they continue longer, not blown open, but being blown are small Star like Flowers, consisting of five Leaves opeined, darts ever, especially at the brims or edges, with a light flow of blood, with many brownish yellow Threads in the middle, where, after they are fall, small, rough, round Heads come forth, like unto small Burs, sticking to Garments in like manner, in which are contained small shining black Seeds, something like unto the Seed of Parietaria, but differ.

Inchanters Nightshade.

Sometimes unevenly waved on the edges, narrower than any Nightshade Leaves, and very near resembling the Leaves of Capitcum or Guiny Pepper, (whence the Name Pfeudo Capitcum, for it has no thing of the nature of that Plant in it) but smaller, and narrower, falling away in the Winter, and foaming forth again in the Spring. The Flowers grow often 8 or 12 together at the Joints of the Branches with the Leaves, they are white and Star fashioned, but sometimes turning themselves back, with a yellow Pointel in the middle, very like to Nightshade Flowers; when they are full, small green Burs come in their places, which afterwards come to be pleasant round red Berries, of the biggest of small Charries when they are ripe, which with us ripe not till about Christmas, in which are contained many flat, small, white Seede. All the whole Plant, as well Leaves and Flowers as Seede, are without either Smell or Taste.

X. The seventh, or Lesser Inchanters Night-shade. This in its Root, Stalks, Leaves, Flowers, Seed, form, and manner of growing, and indeed in all respects is like to the former, and differs from it only in that it grows much lower in every part, and this, alike it grows in the same Ground or place. These two Plants obtained the Name of Inchanters from Circum the Inchanters, they being something like the Circum Dioscoridas, and not from any Inchanting Power or Virtue that is in them.

XI. The eighth, or Tree Night-shade, which is a beautiful Plant in respect to its green Leaves and red Berries. It has a small long narrow yellow Spring Root, with many Vines adjoining to it: from whence springs up a Woody Stem or Stalk as thick as one Finger or Thumb, and about 3 or 4 a Foot high, covered with a yellow green Bark, spread out into many green Branches, bearing on them many fine green Leaves;
in Gardens. The fuch and feventh grow in moil
and shady places, and some times at the Romos
of old torn Trees in Woods, and sometimes by
Hedge fides, and borders of Fields. The fuch is
thought to come from the Neil-Indies, but it has
been an inhabitant a long time in our English Gar-
dens, where it lives and continues reduly well,
so that none care be taken of it in Extremity of
Winter.

XII. The Times. They all except the left dye
away in Winter, and come up fresh again in the
Spring. The third or Sleepy Nightshade, by rea-
fon it comes out of a warm Country, will scarce-
ly endure, but put off by the extremity of our
Winters, unless be well heated or defended. The
two fuch which dye every Year, and fide of their
own Sowing, fpring not out of the Ground, till
late in the Year, as about the latter end of April
or beginning of May. The fifth fuch, Flower in
Summer Monthes, and continue on till the fom-
tom is well spent, after which their Berries come
to ripeness. The fith and seventh fpring up in
April, are in Flower in June, and give their fipe
Seed in August, then dye away to the Ground. The
Romos abiding falt all Winter. The eighth
Flowers sometimes in June, but generally in
July and August, and the Fruit, is ripe about
the latter end of December or beginning of Jan-
uary.

XIV. The Qualities. Of all these Plants b.
fore defribed, the firft is only, or feldom used in
Physick. It is call'd Yellow Nightshade, and dif-
covered to be a Sand Anodyne, Altemigia, Cofmetick
Diuretics, Reprecipitive, Hydrate, Nephtitics and
Arthratics.

XV. The Specification. It is prevalent again-
St deffaniations of the Throat and Tonsils, eases the
Head and Gout, provokes Urine, and gives cafe in the
Strangury.

XVI. The Preparations. You may have here
from. 1. A Liquid Juice. 2. A Decotion in Water.
3. An Infloated Oil. 4. An Ointment. 5. A Pufury.
6. A Colufion. 7. A Powder of the Bark of the
Root. 8. A Powder of the Seed. 9. A De-
ccion or Fluid of the Root in Wine. 10. A Diluted Win-
ter of the whole herb. 11. A Colufion. 12. A
Lotion.

The Virtues.

XVII. The Liquid Juice of the Herb or Berries.
It is of use to cool vehement inflammations, whether
inwardly given or outwardly applied, being no
ways dangerous as that of the Solomon Sennserum, which is feare-
ful for internal uls. But however the Juice of this
Common Kind by reason of its great coldness,
must be given in due proportion, being first clarif-
d or, it may be given (made up with a little Honey)
for a Spoonful or fomthing more: it cures an
Erupfion by Bathing therewith, and dipping double
Linnen Cloths in it, and laying it over the Sore,
and is good against creeping and corruping Ulcers.
Bathed upon the Temples, it takes away the heat
and Inflammation of the Eyes. The Juice of the
Somniferorum, comes nearly to the Quality of Op-
ium, to procure Sleep, but it is fomething weaker;
drop into the Ear, it prefently eases their pain.

XVIII. The Decotion in Water. It has all the
Virtues of the Juice, but not fall ouf so powerful,
and may give inwardly against Feyes to three or
four Spoonfuls. The Eye washed therewith,
it takes away their heat, inflammation, and cafes
from their rain.

XIX. The Infloated, or Decoted Oil. It is
made of the Juice or brinfed Herb, with Oil
Olive or Oil of Roses, Anointed upon Inflammations,
Shingles, and Flerry breakings out, it cools, cafes,
and heals them.

XX. The Ointment. It is made of the Juice
mixed with Wine Vinager, Oil of Roses and Griffe,
ground together for a confiderable time in a Leaden
Mortar, till it comes to the confistency of an Oint-
ment. It is good to Anoint with in all Heads and
Inflammations, Anodynes, Shingles, Flerry
Puthles, and other like eruptions, in whatsoever
part subfentibly affitted with heat: it eases the
Head-ach, gives relief in Frenzies, the Temples
and Fore-head being Anointed therewith, and cools
Inflammations of the Eyes. And is probable also
against Ringwormes, Tetears, Shingles, Herpes and
all parts running, Heeling, or exftemely redy
caus'd, weeping and moist Filtula's, &c.

XXI. The Perfury. It is made of the Green Herb
and Root beaten together, and formed with Root or
Oleom, and then Baffed into the Juice. Being put
up the Womb, it frops the overflowing of the
Terms, and the Flux of the Whitenss in Women.

XXII. The Coflution. It is made of the Green
Herb, beaten in a Mortar, and brought to a modc-
rate Confitency with Barley lierne. Applied to
the Tefhicles or Cod's, it eases the pain and dif-
cusses the Swelling. Applied to the place of a
Magnum, or other Head-ach, it prefently eases the
Pain: and difcusses hot Tumors in the Throat: It
gives prefent cafe also in the Gout.

XXIII. The Powder of the Bark of the Root.
Taken to a Dram in Wine, it eases pain like Opia-
num, and procurcs Reft and Sleep, but this Difc
is not to be exceeded for fear of danger.

XXIV. The Powder of the Bark of the Root in
White Port or Liens Wine, from half a
Dram to a Drump, so taken, it powerfully pro-
vokes Urine, and is prodcutive against the Droopy,
and takes away heat and Paffing in Pafing; but
it ought not to be taken too long at a time, for a
great quantity, because it is apt to induce a Frenzy:
The remedy of which is (as Authors fay) to Drink
liberally of Warm Horned Water.

XXV. The Decotion of the Root in Wine. Being
bold in the Mouth, it gives cafe in the Toofh-
ach: and Pufury fays, it is good to fatten Toofh
Teeth.

XXVI. The Diluted Water of the whole Herb.
It has all the hot the Virtues of the Liquid Juice,
and may be used in the fame manner, but in a greater
quantity or Dofc: And Authors fay, that the
Water is fifted and frafted to be taken inwardly
and, in that refpect prefer it before the
Juice.

XXVII. The Coflution. Take of the Juice of the
Ros 3 Ounces; Clarified Honey 2 Ounces; Vinager
half an Ouncze; mix them. Put into the Eye, it
eases their pain and frowning, cools their heat or
Inflammations; it strengthen's weak Eyes, and
clees the fight.

XXVIII. The Lotion. Take of the Clarified
Juice 8 Ounces, Red Port Wine 4 Ounces; Clarif-
ed Honey 3 Ounces; mix them for a Lotion. It
eases the pains of the Teeth, cleanses old running
and putrid Sores and Ulcers, and helps Caverns,
and other like Sores in the Mouth and Throat,
they being often waffit and gurgled therewith.
Salmon's Herbal. Lib. 1.

Chap. DXXI.

Of Night-shade deadly, or, DWALE.

I. The Name. It is called in Greek Σολάνον, in Latin Solanum Lathale, Solanum Lathiflorum, Solanum Stalkis, Solanum Delicium; in English Deadly Nightshade, and Dwayne.

The Descriptions.

III. The first, or Deadly Nightshade, or Dwayne. Its Root is grea, growing down deep into the Ground, and spreading great Branches therein;

Deadly-Nightshade

and besides creeping under Ground, rising up in several places distant, quickly spreading over a Ground. It grows sometimes to the height of a Man, but usually it rises up not above 3 or 4 feet high or something more, having round green Stalks, set with divers large Leaves much greater than any of these before, fomiferum, and of a dark green color, set upon very short foot Stalks, among which at the Joints with the Leaves, come forth several long slender Flowers, dented at the brims, of a fomiferum purple color, in a green Husk, growing upon a short foot Stalk, which being fallen away, round Berries fructed, which are at first green, but afterwards when ripe, come to be of a shining black color, like shining or polished Jet, full of a perilous juice, many whitish Seeds being contained within it, the whole Plant has no good Taffe nor Smell, but un£avorious, bitter, and very pernicious, the Berries are a little feverish and infectious, but not pleasing to an acute Palate.

V. The second, or Lesser Deadly Nightshade. This in its Roots, Stalks, Leaves, Flowers, Berries, Seed, Smell, Taste, form and manner of growing, is much like the last, finding that in this the Leaves are lighter,

Nightshade Deadly lesser.

and of a darker green color, and stand upon longer foot Stalks, and the Flowers which are Bell fructed as the others, are not so great and large as they are.

V. The third, or other Sleepy Nightshade, called by Dodonaeus, the other Kind of Deadly Nightshade. Its Root is great, and spreads it self out into many Branches under Ground, with many Fibres adjoining to them. It has an upright Crafting or curved Stalk, with many Leaves thereon, being longer and narrower, than those of the True Deadly Nightshade, and more inclining downwards to the Ground, full of Veins running longwise and Travers e therin. At the Joints of the Stalk, from the middle part upwards, come forth several petals
Other Sleepy Nightshade.

This flower, hanging by very long stalks, being long and yellow like unto a Bell-flower, of a purplish color, each of them set in a large green Hack, dented or cut into five parts at the edges, but not very deep: in which after the Flower is soft, comes forth a round Berry, of a deep blackish purple color, enclosed therein to the middle, and being a Crown like form at the Head of the Berry, which has a Wine like Juice, and many small white Seeds within it.

VI. The Place. The first and second Growth Wild, not only in several Woods in Germany, but also in a great number of places in England, as in the Castle Yard of Bramingham in Suffolk, under the Wall of Epsom College in Cambridge, and in many other places of that County; at Elyford in Essex; at Croydon among the Edges, at the end of the Town; in Hare Park; in the Park of formerly Sir Percival Heart, at Leithbridge in Kent, on the Conv Borens, in Burling Park likewise; also in the Way going from S. Mary Cray, to Epsom Cray, over against a great Field called Wensley. In former Years it was found growing in an Orchard in Lyn-Rogis in Norfolk, near the South Gate, where it bore noble and great Berries as large, as large Black Cherries, of which I remember a little Boy of about 7 Years old, (Jim Taylor by Name, a Gardeners Son there) by eat several of them, by which he was Poisoned, and died in a violent Fever, swelling in the Stomach and Belly, the whole Body being as red as Fire, and all in about 2 Hours time; the number of the Berries, according to the best of my remembrance, did not exceed a dozen, for this Accident sake, the Owner of the Orchard, rooted it out of his Ground. The last grows in the East Countries in Syria, as also in Italy near Trent, but with us only in Gardens, where it is Nursed up by the most Curious. The first is also found plentifully in Holland in Lincolnshire, and in the Isle of Ely, at a place called Waltham in Nissie, near Waltham: it was also found growing near High-Gate, not far from the Pond on the left Hand, as Gerard says: It grows generally in nullif places, near High-ways, near Hedges and in the corners of Woodland Grounds, and sometimes in Marshy places.

VII. The Times. These Plants flourish all the Spring and Summer, They Flower in July, and Augst: and their Fruit is ripe in Augst and September, after which they fade and die away.

VIII. The Qualities. Deadly Nightshade is said to be cold in the fourth Degree, and dry in the third: Antidote, Narcoticke, Reparative, Anodyne, and Destrument.

IX. The Specification. It is prevalent against Inflammations, Scrophles, Anxieties Fire, Ophthalmia, and to cause red, but by reason of its Mortificous quality, is rarely ever given inwardly.

X. The Preparations. You may have herefrom,

1. A Liquid Juice of the Leaves.
2. An Ointment.
3. A Cataplasm.
4. A Diluted Water.

The Virtues.

XI. The Juice of the Leaves. Used either alone, or mixed with a little Vinegar, and Bathed upon the Fore-head and Temples, upon any great Diftemperance, or in a Frenzy, long watching, or in a long Sicklifiers and Weakness, it cools Keft and Sleep. It takes away the Violent pains of the Head from a hot crane, allays Inflammation, and is good against the Shingles and an Erysipelas or Anthos. Fire, and all other Fiery and running Canker, it cools them, and stops their spreading: applied also in the Gout, it eases the pain, and repels the Humors, if in the beginning, but is not proper to be Applied if the Dislate has been of any continuance, left it finds it up into the Stomach, to the Patients further detriment.

XII. The Ointment. It has all the Virtues of the Juice, it cools, allays Inflammations, eases pain, cools Keft and Sleep, being anointed upon the proper parts, and is found to be a very good thing against the Dilemper of the Spleen, being anointed upon the Region thereof.

XIII. The Cataplasm. It has all the Virtues of the Liquid Juice, besides which, being applied to simple Contusions, it represses the flowing Humors, and cures them. It eases the pain of the Gout upon the finger, and in the beginning prevents the influx of the Humor.

XIV. The Diluted Water. It has all the Virtues of the Juice, but much weaker. It may be given inwardly from 2 Ounces to 2 (as Authors say) and without any danger: it is good against Heart burning, and Inflammations of the Phlegm, and being bathed upon the Eye Lids, or put into the Eyes, it is good against Ophthalmia, or Inflammations there: but it is much more powerful for this purpose, if it is mixed with equal parts of the clarified, or filtrated Juice. It cools and removes the Phlegm, to admiration.

XV. Note. This Plant is of so Malign and Deleterious Qualities, that neither its Juice, Roots, Leaves, or Berries, ought to be given inwardly; but the Berries are a certain Poison even upon the finger, as appears by the foul Example of the Boy, before related, who was our next Neighbors Son, and my Play Fellow, my self being much about the said Years: I eat one or two of the Berries at the same time, but by reason of their Lethalness.
CHAP. DXXII.

OF NIPPLE-WORT;

I. The Name. It is called in Greek Λαμπθάνη in Latin A Lampana, also, and is thought to be the true Lampana Dioscoridis: in English Nipple-wort;

II. The Kinds. Some will have this Plant to be a Species of Sambucus or Smithville, others of Hieracium, or Hawkweed; if it is a Species of either, it seems rather to be of the latter. I rather think it to be a peculiar Plant, so generic, or of its own kind. The three following Species we shall describe to you, viz.

1. Lampant Vulperti, Lampant Dioscoridis, Lampan Lobeli, Dobenai, Lopolentet, Thall & Co-

meneri, Pappario Comerifi, Sansia Conitum Giferni, & Sansia generic, Our Common Nipple

wort. 2. Sansia Sambucus Sylvaticus, Ban

bini, Sambucus Sylvaticus, pectoral T-dependent-

ni, Wild or Wood Nipple-wort, Buffard Nipple

wort. 3. Lampant Auftriai Parakhini, Sambia

Jewor Punnocita quadrat Vore purpurae Clothi

IV. In Gerard, the former is thus Decribed.

V. The second, or Wild, or Wood, or Buffard Nipple-wort. This Wild or Wood Kind differs

not much either in Root, Stalks, Leaves, Flowers, Seed, or manner of growing, from the former, being...
The Virtues.

XII. The Liquid Juice. It cools Inflammations, diffuseth Tumors, and is good against sore Eyes, Stings, Stings, and breakings out of the Face and other parts, applied to the Sores Nipples of Woment Breast, it heals them.

XIII. The Ointment made with Hogs Lard, and a little Bees W RC. IT is one of the best things in the World to heal Woment Fore Breasts and fore Nipples being applied; it also heals superficial running Sores in other parts.

XIV. The Cataplasme. It has all the same Virtues of the Liquid Juice and Ointment: besides the acid and corroding Humor, and cures simple Contusions.

C H A P. DXXIII.

Of Oak of CAPPADOCIA:

T HE Nature. It is called in Greek, Aegyptiakos, Alphonse, and in the Arabic Deiram (Osen, the Food of the Gods, from its excellent Fragrance, and for that it seems to give long Life to such as eat thereof, that they might he held to be in a manner immortal.) In Lirene, Ambrosia Marsfia, Ambrosia Hirenn, Ambrosia Sartus Cervaria, Cowberry, Lovel. & Loberry, Artemisia seduca Plant, Artemisia genuss Gersuri, with angelical and Cervaria supplice it is able to be Congo Hippocras; Artemisia monachus Lomanga, in English, Oak of Cappadocia.

II. The Kind. It is a singular Plant, sui generis; I know other Authors make two or three sorts of Ambrosia, but two of them is other Herbs, which have no Relation to this, as the

III. This Plant, or Oak of Cappadocia has a long slender Root, spreading itself farre into many Branches and Branches, from which comes chestone hoary, white, striped, or streaked Stalk, rising to be two feet higher leaf, in any good sort of Ground, which divides or spreads it fell out into many Branches, from the very bottom, on which grow without any certain order, Leaves something large, upon pretty long foot Stalks, very much cut in on the edges, somewhat resembling the divisions of Mugwort Leave, especially the ends of them, but much smaller than them, being all whole or hoary upon the green, and of a very pleasing Smell, not so hot as strong as Borage or Oak of Jerusalem, in the top of all the Branches both great and small, grow the Flowers, which are small, round, yellow, little Bantons, never opening abroad, nor bringing any Seed, but full amoy like Chief. But under the Flowers from among the Leaves, some small sweet Stalks, bearing two or three or four small rough and pointed Heads, without any Flowers before them, in which is contained small, round, blackish Seed, almost like the Kernels in Stones of Raisins or Grapes.

IV. Gerard gives us another description, which being compared with the former, will more excellent declare and set out the Plant: and it is as follows. The Root and whole Plant persives with urin England, at the first approach of Winter. It is at first a fine white, then it grows about three Handfuls high, but in Gerards Garden, it grows to be about three Feet high, yielding many tough, crooked and streaked
Salmon’s Herbal. Lib. I.

V. The Flowers. It grows Naturally in Capado- cia, and it is a Native also (as Bellonius says) in many Places of Asia Minor; but with us, and to like wise thru’ all Europe, it is only Nurt’d up, and found growing in Gardens.

VI. The Times. It seldom Flowers in our Country till Augst, and very rarely gives us any ripe Seeds; for from this Cold Night coming before it Seeds, makes it precipitately dry away and perish, so that for the most part (without very great care) we are to seek out for Seed, from Spain, Italy, and other like Places.

VII. The Qualities. It is hot, and dry in the second Degree, and of thin and subtle parts. It Incites, is Abturrite, Affluent and Percular.

VIII. The Specification. It isops a Fluxion of Rheum or Humors into the Stomach and Lungs, cures Fluxes of the Bowels: and (as Gerard says) cures cough & Coughing, and is good for such as are short Winded, and cannot easily draw their Breath.

The Virtues.

X. The Liquid Juice. It is Atberfive and cleansing, and stops the Flux of Humors into any part, and therefore is of excellent use to strengthen the Stomach and other Bowels, and cure Fluxes of all kinds in those parts. Externally applied to any part, it repels the flowing Humor, cleanses old running Sores and Ulcers, and induces their healing. Dose 1, 2 or 3 Ounces morning and Night in any proper Vehicle.

XI. The Decotion in Water or Wine. It has all the Virtues of the Liquid Juice but not so powerful: it may be given from 4 to 6 Ounces, wrought with white Sugar, or Sugar Candy; and so exhibited, it is profitable against Coughs, Colds, Wheez- ings, shortness of Breath, difficulty of Breathing, and causes an easy Expiration of the pitiful matter lodged in the Breast and Lungs.

XII. The Confection of the Green Herb. It has the Virtues of the Juice and Decotion, and is used as an excellent thing by such as are in Contagions, and have lain under the tedious languishment of an invertebrate Cough. Dose as much as a Chelfman.

XIII. The Powder of the dried Herb. It is given to a Dinn or more in any proper Vehicle against the Bloody Flux, and all other Fluxes of the Bowels: outwardly being plentifully thrown upon old, putrid, running Sores and Ulcers, it cleanses and drys them, replenishes the farther Flux of the Humor, and dispenses them to a speedy healing.

XIV. The Ointment or Balsam. They are Vul- nerary and of great use in heating not only of Green Wounds, but also of old Sores and running Ulcers of difficult cure, for they digest, cleans, incurate, dry, and induce the healing to a wonderful degree.

XV. The Cataplasm of the Green Herb. It repels the Humor and curesimple recent Contusions. According to Dioscorides, it has a property to stop, repel and bind those Humors, which fall into any part of the Body, being outwardly applied, and of the same opinion also is Galen himself.

CHAP. DXXIV.

Of Oak of Jerusalem.

1. The Names. It is called in Greek, Beples in Latin, Botrys also; and in English, Oak of Jerusalem. All Authors call it Botrys, but Dioscoridebs, that in his time, The Cappadocienses called it Ambrosia, and some others called it Artemis- jegra. Gerhard upon Dioscorides calls it Ambrosia altera Species, and the say that in some Apothecaries Shops in Germany, the Seed was taken for Arnica. In the Hortus Eystettensis it is called Artemisia Terecinae: and Concriniae says, the Israels call it Parthenia.

II. The Kinds. Formerly there was but one sort of Botrys known, but now we have found another, growing in Virginia. 1. The first is called properly Botrys (A Forybus: & Seminibus in Botrys formam revindica): from them the Flowers and Seed growing like unto a Bunch of Grapes. Also Botrys vulgaris, but Bunsanus calls it Botrys Ambrosiides vulgaris, Our Common Oak of Jeru- salem. 2. Botrys Americana, which Bunsanus also calls Botrys Ambrosiades Mexicana: it is likewise called Botrys Virginiana, & Botrys Frutic- eus Americanus, American, or Virginian Oak of Jerusalem, or Shrubby Oak of Jerusalem.

The Descriptions.

III. The first, or Our Common Oak of Jeru- stems. Its Root is long and hard after greefing Seed, pervading Terebus. It is a small Endless Plant full of Branches, about a foot and half high, with three, and not many Leaves thereon, which at the first Springing up, are reddish on the underladle, and afterwards grow to be of a yellowish green color, more especially when they grow old, and in the time of flowering and Seeding, which are much cut in on the edges, like unto Groundel, but larger. Gerard says, that the upper side of the Leaf is in a deep green, and somewhat rough or barys: and that the Branches are thick with small Leaves deeply cut in, or jagged on the edge, very much resembling the Leaf of an Oak, which caudelo our English Women to call it Oak of Jerusalem, from the middle of the Branches upwards to the very top, from small, pale, yellow, Flowers like the Bysmum, or young Shoots of the same, which turn into small brownish Seed. The whole Plant is of a very pleasant Smell and of a kind of
Chap. 524. English Herbs.

Aromatich Scent, and whilst it is green is some-
thing changeable in handling.

IV. The Sacred, or American, or Virginian
Oak of Jerusalem. Its Root is small, Fibrous and
and Woody. It rises up also higher than the former,
and its branches are longer and durable.
The Leaves are something like into Wild Arach-
but larger, and much cut in on the edges, give
up to the former. The whole Plant both Flowers and
Seed, is of the iield or our Common Oak; and
which grows in Virginia, Florida, Mexico, etc. it will "ide the Winter Season be-
cause it is nothing so violent as ours; but it will
not endure the Winters cold with us, without much
care in Heating and preserving it; but it will
spring up again of the Seed soon after the next Year, or
some other Plants do. The Smell in here is some-
thing strong, but very pleasant, and comes very
near to that of the former.

V. The Pincers. The soil grows plentifully in
Italy, as also in the Southern parts of France, both
by Water sides, and in dry Sandy Grounds, but with
much care and labor only in Gardens. The Second is a
Native of Mexico, Florida, Carolina, Virginia,
from some of which places, it has been brought
home to us, and planted in our Gardens, or in Parks,
that it may be Had in, and be preferred against the coldness of the Winter.

VI. The Times. They both Flower and Seed in
August and September, and do often times raise
themselves of their own sowing, more especially
the former.

VII. The Qualities. They are hot and dry in
the second Degree; they are both Aperitive, Attem-
perating, healing, Pectoral, Antirrhic, Hyperic,
and affords a great little Conveyance, Mercurets,
or other Wines, and applied hot to the Region of the
Womb, it gives ease in pains of the Mother or,
may be made of the Green Herb, with the ad-
dition of Vithervin and Camomile Flowers, and taken
in the Water of Lillets, or of Bois de Rose, or
Camomile. This being applied hot to the Belly, of
a Woman in Child-Bed, presently gives ease in,
and takes away the After-Pains.

VIII. The spiritus Tincture. It warms and
comforts the Stomach, expels Wind in the Bowels, is
good against Convulsions of the Viscera, and
gives ease in the Colic.

IX. The Acid Tincture. It powerfully opens
obstructions of the Thorax, cuts tough Flegm, and
makes it fit for expectoration, strengthens the
Stomach, cures a good Appetite and Digestion, and
kills Worms in Children. Dose 20 or 30 Drops in
any fit Vehicle.

X. The Liquid Juice. It is a very good thing
against an Althorn, Wheezing, and irruptions of
Breath, being taken with an equal quantity of
Honey Morning and Evening; it opens obstructions
of the Bowel and Lungs, and eases an easy expec-
Portation of the tough Flegm, and other crude
Humors which oppose them; it cleanses all filthy
and corrupted Lungs, curing the putrid Materia to
be spit forth, and if they be exuviated, it very
much conduces to their healing. Dose from two
to three Spoonfuls Morning and Night.

XI. The Essence. It has all the Virtues of the
Juice, and may be given from 1 Spoonful to 3,
with an equal quantity of Clarified Honey, or
with as much Syrup of Viollets, and so to be
taken twice a day as the former. It is an excel-
 lent thing against a Cough or Catarrh, or con-
 tinual distillation of the Drops, it cleanseth them.

XII. The Decoction or Infusion in Wine. If
a little of Liquorice Root be added to it, it will be so much the better; and then
taken from two to three Glasses mixed with a Spoon-
ful or 2 of Clarified Honey, or Syrup of Viollets,
it will have all the effects of the Juice or Essence,
outwardly used as a Gangle for sore Mouths and
Throats, or for old running Sores, or putrid Ulcers
in any other part, it cleanseth them, dyes, and
admirably induces their healing.

XIII. The Powder of the Herb. Taken to a
Dram (in any fit Vehicle) it strengthens the Stom-
ach, expels Wind, gives ease in the Colick, and
flows all sorts of Fluxes of the Bowels, and
threw very thick upon external molting and running
Ulcers, it cleanseth them, corrects the acrimony,
dyes and heals them.

XIV. The Vegetable or Balsam. They are good
Anodynes and Vomitors, digests and heals simple
Green Wounds, and this in a little time, diffus-
ates Evacuant Tumours, digests, drains, and incantes
(where need be) old Ulcers, dry, and disputes them
to a speedy cure, if in places easily admitting the
Operation.

XV. The Fumigation. It is made of the Deco-
ct or Infusion in Water or Wine, which being put
into a Cj, 7 Pan is to be set upon a Cloth, and
running Dishes of thoroughly kindled Charcoal, in a Clofe: Then
A Woman sitting over it, so as the Fumes may be
received up the Womb, it is said to bring down
the Courtes, and to expel the Dead Child.

XVI. The Cataplasm. It is made of the Green
Herb, being heated in a frying-pan, or otherwise,
and covered, with little Common, Mercury, or
other Wines, and applied hot to the Region of the
Womb, it gives ease in pains of the Mother, or
you may make it of the Green Herb, with the ad-
dition of Vithervin and Camomile Flowers, and taken
in the Water of Lillets, or of Bois de Rose, or
Camomile. This being applied hot to the Belly, of
a Woman in Child-Bed, presently gives ease in,
and takes away the After-Pains.

XVII. The Spiritus Tincture. It warms and
comforts the Stomach, expels Wind in the Bowels, is
good against Convulsions of the Viscera, and
gives ease in the Colic.

XVIII. The Acid Tincture. It powerfully opens
obstructions of the Thorax, cuts tough Flegm, and
makes it fit for expectoration, strengthens the
Stomach, cures a good Appetite and Digestion, and
kills Worms in Children. Dose 20 or 30 Drops in
any fit Vehicle.

XIX. The Oily Tincture. It is good against
Convulsions of the Stomach and Bowels, prevents
against Paralytic Distempers, opens obstructions
of the Reins, Ulcers and Bladders, gives relief in
the Strangury, powerfully provokes Urine, and gives
present ease in After-Pains, to Women in Child-
Bed. Dose 20 or 30 Drops.

XX. Syrupus Baryton. Syrup of Oak of Jeru-
salem. Take Oak of Jerusalem, Hedge Mustard,
Nettles, of each 2 Handsfuls, Coltsfoot a Handsful
and Half; Boil them in a sufficient quantity of
Spring-Water till half be consumed, drain out, and
let to 2 Pounds of the Decoction add 2 Pounds, (dose
for 1 Pound) of the Juice of Tarragon boiled in an
Oven in a clay Pan; and with 3 Pounds of white Sugar,
in the to the Confinement of a Syrup, It is a
good Pectoral, designed against Althorns, Coughs,
Colds, Scourges of Breast, Ulcers of the Lungs,
Cholick of Blood, Consumptions, and other like
Intemperies of the Beat and Lungs, consisting from
cold, Damp, Sharp Rheums, and tough Flegm, ob-
structing thefe Parts. Dose from an Ounce to 2
Ounces, to be drunk in Installments with a Liquor-
ous Spirit.

XXI. Nuxv. This Plant or Herb, (as also Oak
of Capadocia) are much used to be laid in Ward-
robes, or Poffices and Chefs, both to kill and
drive away Moths, and by their sweet Smell to
Perfuade the Garments.

5 H

CHAP.
Of OATS Manured and Wild.

I. The Names. This Plant is called by the
Arabians, Chartel, in Greek, Beards, and
Bromos, a Beards, quod Cibum significat: in Latin, Avena; and in English, Oats.

The Descriptions.

III. The first, or Manured Oats. The Root is small and fibrous or Thready, which sends up several tall jointed Stalks, with large Grassy Leaves, somewhat resembling Wheat, bearing at the Tops a large tufted Tops, of many jointed Aglets, hanging down like small ranged Birds, from small

Oats Manured.

The tufted Head is spread in the like manner, having sick like armed Heads, with longer Avas at the ends of them, but small, and not prickly, growing upon small tender threadlike foot Stalks. In these Heads is contained the Grain, which is small and thin, as if it had no Substance in it.

IV. The second, or Common Manured Oats. This Plant grows in all soils like the former, having the Grain being somewhere smaller and whiter, but not so soft encased in the Husk, but is very easily rubbed out with one Hand.

V. The third, or Common Wild Oats, or Wild Bearded Oats. Its Root is small and fibrous or Thready like the first, and this Common Wild Oats, grows both in Stalk and I crown, something like unto the first Manured Oats, but as it rather rises to high, being lower, slenderer, smaller, and softer. The tufted Head is spread in the like manner, having sick like armed Heads, with longer Avas at the ends of them, but small, and not prickly, growing upon small tender threadlike foot Stalks. In these Heads is contained the Grain, which is small and thin, as if it had no Substance in it.

VI. The fourth, or Small Wild Oats. This Wild Oats is very like the former, but softer in Stalk and Leaf. The stalked Tops, consists of many slender long Grassy Bars, Bearded only at the ends, growing upon long slender foot Stalks, and hanging down their Heads, with small Grains in them, like as in that of the former. Of this Species there is another sort, called Avena Tenuissimus Minor Sterilitis, which bears its Oats late, or not till the other be fall.

VII. The Places. The Manured Kinds of both sorts, are Sown in Fields. For both Mans and Horses Food; but the Naked Oats are nothing so frequent as the first Kind, and they delight in a cold and moist Ground, rather than in a hot and dry; They are usually the first Seed which are Sown upon Woodland Grounds after their Stocking up.
up. The Wild Kinds are found in many places with us among Rye and Barley, and the Fourth Kind many times plentifully by Hedge sides.

VIII. The Tomes. The Measured Kinds are Summer Grass, Sowen in the Spring, a Reaped of Cut down in Autumn. The Wild Sorts are ripe in July and August.

IX. Note. The Avena Vefa, so are called a Velcura, because in many Countries they are eaten, being made into Oatmeal, of which they make Bread, Cakes, Puddings, \\&c, and being Malted, are also by some People made into Alore Drink, very good, and exceeding in pleasantness that made of Barley. The Avena nuda, is like unto the former Oat, but differs in that thefe Naked Oats, as soon as they are Thrashed or Rubbed out, without help of a Mill, become Oatmeal, and fit for use, for which reason, in Norfolk and Suffolk they are called Unhalfed or Naked Oats.

X. The Qualities. Oats (according to Galen) are cold and dry, and according to our Opinion in the beginning of the first Degree, Valerive, Affringent and Nutritive.

XI. The Specification. Authors say, they stop the Fluxes of the Blood; and yet made into Water, Gruel, or Milk Porridge, they certify open, and loosen the Belly.

The Virtues.

XIII. The Oat-Head. It is boiled in a Mill. Eaten in any quantity raw by Young Virgins, it gives them the Diffcalts, or all that is called the Green Sticks, causing a fresh and well colored Male to look white, or of a Tallow Complexion, and al most as pale as Death. Make very hot in a Flying Pan, and put into a Linen Bag, and applied to the Stomach or Side pained, it gives Life in the Colic, and takes away Pains and Stitches in the Side; but this ought to be done with whole Oatmeal, or with Oats unshelled.

XIV. The Bread, Cakes, or Pudding. They are made of the Flower of the Oat-Head, according to the usual Method. They stop Fluxes of the Blood, nourish much, and restore in Contumipations. But Puddings made of the Oatmeal, whether whole or Ground, and filled very full with Beef, Suet, Stewed small, and stewed Carrots, or Reifsens of the Sun, always loosen the Belly.

XV. The Gruel or Bruth. If made savory with Salt, and eaten with a good quantity of fresh Butter, it loosens the Bally, and by continuing thereof makes it soluble; it sweats the Juices and Lymphs, and takes away the Acrimony of the Humors; the thicker it is made the more it nourishes, but it made to take with Purging Physick ought to be the thinnest. If Malt is added to it, tho' it loosens the Belly, yet it nourishes much more than the simple Grueil alone.

XVI. The Cream of Oatmeal. It is made by boiling with Water, the Head being continually drawn off; or it is made with the very Cream of the Flower, first boiled with a little Water, then adding Milk to it, it is boiled to a Confection. It has all the Virtues of this, and being good for our Face Breath, but much more delicious and pleasant; Mixt with fine Sugar or Sugar Candy, and so given, it is profitable for such as have gotten a Cold or Cough.

XVII. The Cephalasin. It is made by boiling in Milk, and till it comes to a Confection. It moderately difficules, and that without biting or any Sharpness; it allays Inflammations, and stiffens the part it is applied to. If there be Insanity and applied, its good against the Ileus and Leprosy; it difficules or difficules hard Apotomies, and is provable against a Difficile in Less, or in the Fundament. If the Cephalasin is made of Vine Vinegar, it difficules hard Tumours, Strengthens weak parts, and takes away Spots, Friecles and Mormhow in the Face, or other parts of the Skin.

XVIII. The Meal. A strong Decoction of it made into a Syrup with Hony, is good against an Albusm, as also for Coughs, Cold, Wheezings, shortness of Breath, \\&c. Mixt with Tarantine and Toast of an Egg, it digestes old, running and eating Ulcers, and facilitates their Cure.

XIX. The Ale or Beer. It has all the Virtues of those made with Barley Meal, but this is much pleasant, and is not so headsy; it quenches Thirst more, and leaves more, by which means, those who drink it, Live in good Health and Strength of Body; and pills much better off by Urine, carrying away with it the Recurrences of the Reins, Ulcers and Bladder.

XX. The Decoction of the Oat-Meal. If such as have a Soregine, or Imprecire, in their Hands or Feet, shall daily twice or thrice a day for some considerable time, Bathe them there in, for half an Hour at a time or more, it will at length heal those Chops, Chins, or Riffs: but it ought to be done hot, as the Patient can well endure it. So also if such Hands or Feet be held over the Furnes heekef, it is very profitable for the sacred Purpoe, more especially if the Decoction is made with White Vine Vinegar.

OLLY-SEED, for Gold of Pleasure, Chap. 324.
OCULUS-CHRISTI, for Clay Wild, Chap. 113.

CHAP. DXXVI.

Of OISTER-GREEN, 0 R.
SEA-LUNGWORT, 0 R.
SEA-LETTUCE, 0 R.

I. THE Names. It is called in Greek, \\OLYX; in Latine, Luctia Marinia, Flavec Mariniana Lactuca; in English, Oyster-Green, Sea-Lettuce, and Sea-Lungwort.

II. The Kinds. There are two several Species of this Plant, viz. 1. Luctia Marinia, Flavec Mariniana Lactuca: In English, Oyster-Green, Sea-Lettuce, and Sea-Lungwort.

5 H 2
Salmon's Herbal.

Lib. I.

Oifler-Green, Sea-Lettice, or Sea-Lungwort. II.

The Descriptions.

III. The first, or Our Common Oifler-Green, or Sea-Lungwort, is a Kind of Sea Fucus, or Herby Substance, like unto Liverwort, or Lungwort, althogether without Stalk or Stem, bearing many green Leaves, very uncur or crumpled, and full of Wrinkles, fometh broad, not much differing from the

Oifler-Green, or Sea Lung-wort.

Leaves of cured Lettuce. It grows upon Rocks within the Sea, but more especially among Oiflers, and in great plenty among those called Wall-Plat Oiflers. It is very well known even to Oifler Women, who make use of the said Moss for setting off their Oiflers, that they may Sell the better. It is a tender Herb, with dark green Leaves, thin and crumpled, growing upon Rocks or Stones, and is a kind of Food for Oiflers.

IV. The second, or Oifler-Green, or Oifler-Weed round Leaf'd. It is a delicate Plant growing up from some Rocks or Stones, in or near the Sea, spreading several flat, thick, short and round Leaves, one set on the top of another, and some also growing from the sides, forming Branches of Leaves leaning downwards, each being as it were strung on a Thread, which yet is scarce to be discerned, like in a Country Garland of Field and Corn Flowers, made for the Ornament of Lady's Dresses, so as the whole Plant seems to be made of nothing but fome Leaves, bearing a large yellow Flower at the top, as Bauhini fays. The lower Leaves are somewhat brown, the rest are of a white green, and these

which are new sowing forth are green, and all of them furry and shining, which may be kept between Papers for a long time: yet by long keeping, they will grow rough, and full of Wrinkles, but still tough, and my baste like Coraline, which by steeping in Water will become soft and sounb again, and retain their fift leaf, which is very Salt.

V. Gerard fays, That the Branches of this Bignate Plant, are about a Handsfull or better high, spread abroad on every side, and only consisting of firmely single roundish Leaves, whereof are the same sometimes one, sometimes two, or more such Leaves, so that the whole Plant consists of Branches made up of small round Leaves, fometh together by drums little and very small Threads, the lower Leaves which tick to the Rock, are of a brownish color, while the other of a yellowish yellow green, sounb and shining.

VI. The Flower. They are generally found on our English and Scotch Rocky-Shores, chiefly where Oiflers are bred, and indeed in other Seas whereon Oiflers grow. But the second grows upon Rocks in divers parts of the Mediterranean, upon the Coast of Corfica, and in many other Seas.

VII. The Times. They are in the prime of their Beauty in the end of Summer, and all the time Oiflers are in Season.

VIII. The Qualities. They are cold and dry in the firft Degree, Aperitive, Alterative, Anodyne, Distributive, and Arthritick.

IX. The Specification. They are both good to expell Sand, Gravel, and Smalt Stones out of the Reins, Ureters and Bladder: and the second is faid to kill Worms in Children.

X. The Preparations. You may make from thofe Plants, 1. A Decoffion. 2. A Pickle. 3. A Powder. 4. A Pufon. 5. A Caraf. etc.

The Virtues.

XI. The Decoffion in Water or Wine. Being given to 2 or 3 Ounces or more, well sweetned with Hony 2 or 3 times a Day, it is good againft Coughs and Wheezing, for thefe or other Difficulties of Breathing, and cleanses the Urinous parts of any kind of Taterous Matter lodg'd in them.

XII. The Pickle. Either of them are an excellent Sallet, being Pickled in a mixture made of white Port Wine, Brandy, Vinegar and Water, in an equal proportion: They strengthen the Stomach much, and cure a good Difaffion.

XIII. The Powder. That which is made of the firft fort is much Commended by Learned Physicians against Difficulties of the Lungs, especialy against Inflammations and Ulcers of the Lune, being taken to about a Dram in fair Water or some proper Vehicle. Being given in Red Barcelona Wine, or other Red Apple-Wine, it stops the Terms, and prevents that Diffaffion of the Blood, which is the great Difficulty of Breathing, and cleanses the Urinous parts of any kind of Tatarous Matter lodg'd in them.

XIV. The
Chap. 527. English Herbs.

789

XIV. The Fritillary, the first Kind, or both the sorts, being fixed with Ends, as you see by Clary Leaves, and so eaten, it is laid to be a singular Medicine to cure the Weakness of the Back.

XV. The Cataplasm. Being milde of either of the former sorts, and so applied to places afflicted with the Gout, it cools, cures the Pain, stops the affliction of Humors to the Part, and in some resolvable time cures the Patient.

CHAP. DXXVII.

Of ONE BERRY, or, HERB TRUE LOVE.

T HE Names. It is known no Greek Name:

But the Latin call it Herba Paris, and so it is generally called by all Herbologists, and in English, One Berry, Herb True Love, and Herb Paris. Some have thought it to be a kind of Aconitum, but were deceived, and therefore falsly called it Aconitum Parisianum, and Cordius seems to be of the same Opinion, and therefore calls it Aconitum Parisianum monacomon, they accounting it to be dangerous and deadly; but Matthioli contradicts all this, for that it has been found by Experiment, not to be hurtful but Salutiferous, for which reason Tabernamontanus called it Aconitum Salutaris, which yet I think to be an Improper Name also, for that it is no Species of the Aconites. Some have thought it to be a kind of Alter, or Starchew, and therefore Tragus called it Alter non Articus, but it is no Species of the Starchews: he also called it Uva Lupina, and Uva Conina. Others have thought it to be a Kind of Solomon or Night-flower, but it is no more a Species of that Plant than is it of the two former; but upon this Supposition Penn and Lobel, in their herbalies call it Solanum Triphyllum (from the form of the Leaves and Berry;) and Bauhinus, as leaning to the same Opinion, Solanum quadrifolium lactiferum, both of which so call it very improperly: and I think the first Name Herba Paris, is the fittest we can bestow upon it.

II. The Kinds. There are three Species of this Plant very well known, viz. 1. Herb Paris solani, Herba Paris Tetrathyllum, Our Common Herb True Love or One Berry. 2. Herb Paris Floridiana, Herba Paris Floridiana, et alii, Brasiilia, Herba Paris Triphyllum Brasiliensis, Solanum Tryptophyllum Brasiliensis Baudini, Herb True Love, or One Berry of Florida, or of Brazil. 3. Herb Paris Canadensis radiis rotundis, Herb Paris Floridiana radiis rotundis, Solanum Tryptophyllum Canadensis Cartus, Herb True Love of Canada.

The Descriptions.

III. The first, or Our Common Herb True Love, or One Berry, is a long and slender, foul and crawling under the Earth, discovering it self bitter and thicke, its Tuffe is Spryck or Affrighted, and very unpleasant, and by its Branches and Fibres spreads it self under the upper Crust of the Ground, something like a Couch Earth Root, but not so white, and not much lighter than the Root of the White Wild Anemonys, or Wind-Flower, and almost of an dark a color, being much like thereto in its creeping. This Root flows forth Stalks with Leaves, some of which bear no Berries, and some do, every Stalk being smooth, without joints, and of a blackish green color, rising to about six inches high, if it bears its Berry, but seldom so high, if it bears none. This Stalk bears at the Top four Leaves, set directly one against another, in manner of a Cross, or a Cross-Knot, commonly called a True Love Knot: which are each of them a part, something like to a Night-flower Leaf, but a little broader, and in some places, twice as broad as in others, for they oftentimes vary much, and the the flattened number of the Leaves is generally four: yet sometimes there are but three, and sometimes five, and sometimes six, which are sometimes smaller, and sometimes larger, and that by a quarter or half part, and sometimes they are (as is before said) twice as large. This Plant has been seen sometime to alter or degenerate, and that the four Leaves have not only been twice as large, as the ordinary, but they have also been dented in, both on the edge, and at the points, which have been parted, or forked, and have borne larger Berries, than commonly this Plant is used to bear; all which are of a dark green color, not dented about the edges. In the middle of these four Leaves, there rises up a small slender Stem, about an inch high, bearing at the top thereon, one Flower, which is long open like a Star, consisting of four small and narrow long pointed Leaves, of a yellowish green color, and four other lying between them, lefer than they. In the middle whereof
Salmon's Herbal. Lib. I.

grows a round dark purplish Barton or Head, ex-}

compaled with eight small yellow nearly Chives, or 

Thistles, which three colors make it the more Confu-

cious and Beautiful to behold. This Barton, or 

Head, or rather Berry, in the middle, when the oth-

er Leaves are withered, becomes a blackish pur-

ple Berry full of Juice, of no but evil flavor, nor 
yet, of any secrifith or suffocative Taste, of the 

bignefs of a reasonable Grape, having within it, 

many white Seeds. The white Plant, is almost In-

fiel, without any manifest Taste, and by its effif-

es, in repelling Inflammations and Llamers, it is 

accounted as cold as Nightshade, the no Species 
of that Plant.

W. The second, or Herb True Love, or One 

Berry of Florida, or of Trifol. The Root hereof 

is small and creeping like the former under the 

upper-Craft of the Earth, from which springs forth 

a Stalk of four or five Inches high, bearing three 

such like Leaves at the top, but broader and lon-

ger growing thence. The Stalk rises up about 3 

Inches above them, bearing at the top, 3 much 

rare and round Leaves, which are as it were the 

Husk of the flower flowering in the middle, confifling of three 

white Leaves, having some Venus in them, and are 

about three Inches long, and one broad.

V. The third, or Herb True Love of Canada. 

The Root of this Plant creeps not as the former, 

but grows into a small round Tuberous Subflance, 

having several small Fibers oifling out from the 

fides about round from. This Tuberous Root 

springs up a Stalk, with three large Leelves like 

to the lift, from the middle of which, the Stalk 

rises up, yet few Inches in length, at the top of 

which is one Flower, confifling of fiX Leaves, three 

whereof are green and small, which are as it were 

the Husk to the other three Leaves, growing in the 

middle, which are larger and longer, of a dark pur-

ple color, and in some white: in the middle where-

grow a small round blackJiy Berry, full of small 

Seed, like Nightshade-Seed.

VI. The Places. 
The firft grows in our Woods 

and Copses, as alfo sometimes in the corners and bor-

ders of Fields, and waffe Grounds, in many places 

throughout England. Gerard saith, it grows plen-

tifully in Chaldon Wood, near to Water-Coll, 

fven Miles from Colchester in Essex: in the 

Wood by Robin Beast's Well, near to Nottingham: 

in the Parfinge Orchard, at Redwater in Essex, 

near to Stiffen Water: in Blackbush at a place 

called Morten in Lancashire: in the Moore by Can-

terbury called the Chopper: in Dingly Wood, fis-

ual Miles from Prifon in Aldermary: in Bucking-

fork by Bracton in Essex: at Poeger in Lancashire: 

and in Cottes-Wood, in the North of England. It 

is also here found growing (as Parkinson saith) in 

Hindbury Wood, three Miles from Mondfhone in 

Kent: in a Wood by Chifford in Kent, called 

Longwood: in the next Wood thereto, called 

Efer-Wood, especially on the skirts of a Hop 

Garden botterling therein: in the wood called 

Hornchurch, near to Fentondon Heath, about a mile 

distant from Mondfhone: and in a Wood alfo over-

growing Foot Path, a mile from Mondfhone afore-

named, where it grows in great abundance, not far 

from the Hedge side of that Medow, thro' which 

a small River or Rivulet runs. The second Budih-

nas Elys was found growing in the Woods in Bra-

flea: but both the lecond and the third have been 

found growing in Canada, as Carifia and other 

American places In America. I my self have alfo found 

them growing, in the Southern Provinces of Florida, as 

in the South Carolina, in fore of the Woods adjacent 

to Wabasso and Severus Rivers, &c.

VII. The Times. They fpring up about the 

end of March, flower in April and May, and 

the Berry is ripe not long after, in the end of 

May, or before the middle of June.

VIII. The Qualities. One Berry is cold and dry 
in the fifth Degree. Anodyne, Violentury, and Alex-

plasmatic, and Deftillinf Polyvine.

IX. The Specification. It caufes Rest and Sleep, 
gives cafe in the Colick, expels Polions, and cures 
the Pague or Piblence.

X. The Preparatives. You may have herefrom, 

1. An Efficience. 2. A Powder of the Leaves. 3. 

A Powder of the Roots. 4. A Powder of the Ber-

ries. 5. An Infufion or Decotion of them in Wine. 6. 

An Ointment of Baffom of the Leaves and 

whole Plant. 7. A Gangrene of the Leaves. 8. A 

Diftilled Water of the Leafes and Rootes. 9. A 

Sparaneous Vinifure of Leaves, Rootes, and Ber-

ries. 10. An Acid Vinifure of the fame.

The Virtues.

XI. The Efficence of Herb, Root, or Berry. It is 

Anodyne, gives cafe in the pains of the Colick, ex-

pels Polions, and powerfully reftifs the Pague or 

Piblence, and all forts of Pefliumental and Malign 

Fevers. Particularly it is faid to be an Antidote 

of the Viftion, and other like forts of Polions. It 

is proconfable for fuch as have lain long in a Lingering 

Sickned, and for fuch who have been thought to have lain under the 

Power of Witchcraft, fo as to become half Follifh or 

waning their Scres. Dofe 1 Spofiall in Wine, 
or other fit Vifice, Morning fuffing, and at Night 
gong to Bed, for a Month together.

XII. The Powder of the Leaves. It has all the 

former Virtues, but not fo effectual as the Powder 
of the Berries or Seed, and may be given to a 

Dram Morninftg and Night, in a Spofiall of Syrup 
of Green Peels, or other like Vifice.

XIII. The Powder of the Berries or Seed. It is 

a Poenous thing and perfoins all that the Efficence 
does. Given to a Dram as a time Morning and 

Night in a Glas of Wine makes the Poisom 

Wahrinkel, every Day for 20 Days or more together, it refifts 

fuch to their Healths, who have lain under long, 

lingering Sicknedles, and refcues them to their 

former Health. The Powder of the Leaves are good for the Cure of 

Green Wounds, and to cleanfe and heal old running Sores 

and Fibrif Ulcers.

XIV. The Powder of the Rootes. Being given 

from half a Dram to a Dram in a Glas of Wine 
it gives immediate cafe in the most extrem 

Colick, and other vehement pains of the 

Vifcera.

XV. The Infufion or Decotion of the Leaves, 

Roots, and Berries in Wine. They have all the Vi-

rues of the Efficence and Powders, refift all forts 
of the Polions and malignant Effedtes. Being given 
at Bed-time, they procure Rest and Sleep: Outward-

ly ufed as a Lotion, (with a third part of the 

Efficence being added) they are very effectual for 

the cure of all Sorts of Wounds: They all 

cleanfe, dry, and heal old fibrifh running Sores and 

purulit Ulcers: and are very powfier to dif-

cll all Tumors and Swellings, and specialiy to 

play all Infammations, and to abate those Tumors 

which happen in the Groin, Thelnefly and Privy 

parts.

XVI. The Ointment or Baffom of the Leaves, 

and whole Plants. They are excellent good 

Vulnerefs, Abderfive, Deftillative and Healing: abate 

Infla.
Infusions in Wounds, repels the flux of Humors, and eafe their pain and anguith: and are excellent good against Fomites, Whitlows, and the like happening to the Fingers ends and Nails of those parts. They Suppurate or Ripen Apidemr and make them break, or to be opened in a little time.

XVII. The Convolvulus pfl the green Leaves. It is eflential to cure Bumble Contotions, and to heal Green Wounds, eafe the old and dry running Sores, and puttish Ulcers, acute Infarations, difficult Tu-

mors, and to eafe the Gout, and any other kind of pain in any part of the Body, being daily ap-
pieiy. It also is good against an Ophthamia,

and heals all Infarations and Soresness of the Eye, eafeing their Pain almost upon the spot.

XVIII. The Distilled Water. Being part into

the eyes it cools Infarations therein, eases their Pains, and takes away their Soresness and rednefl, more especially if it alfo Clotheth two or three times double, be dipth therein and applied. But the

Juice or Essence of the Herb, performs this yet more eflentially.

XIX. The Spirituous Tincture of Leaves, Roots and Berries. Being taken from one Dram to two Drams in any proper Vehicle, it alleviates the pain of the Cough, gives eafe in the griping of the Guts, comforts the Stomach, and subdued

sharp Humors, causing Heavines and Melan-

colies.

XX. The Acid Tincture. It may be given to a

pleasing acidity, 3, 4, 5, or 6 times a Day in

Water Grel, or in the whiteat Detraction, of other

like Vehicle against the Purples. Spotted Fever, all forms of Malign and Pneumatic Fevers, and the

Plague it toll; it destroys the malignity and Pois-

on of the Difafe, and in a fhort time secures the

Life of the Patient against all dangers accruing

from the fame.

CHAP. DXXVIII.

OF ONE BLADE.

OR,

MONOPHYLL.

I. THE Names. It fearely appears that

this Plant was known to the Ancient

Greeks. But it may be called in Greek Dianthus,

Chamomills, after the Latin Name Unifolium,

from whence it is called in English, One Blade.

II. The Kinds. This is Planta fagittaria seu

generis, unless you would have Ophionofofam or

Acrania Tugue, to be a Species of it, which no Au-

thor that I know of has yet ever admitted. Dolae

champian upon Dysfodoa, fuppofes it may be the

Cybomyum Plant, in lib. 25. chap. 19. but double

left this is a mifake. Tugue calls this Plant (be

fable Unifolium) Cybelemon Sphortyre: but moft of

our latter Writers call it Amonophyllum, or Unifoli-

um, but Bavhinus referring it to the Lilaion Con-

vollium, calls it, Lilaion Convollium minus, or

Kfier Lilly of Vally, I will not difpute the point

with him, but rather give him his way.

The Description.

III. This small Plant, has a very small Root of

the kinder of a Knob, lying and creeping under

the upper face of the Earth, being several Fibres

or small Threads adjoining to it, which shoot forth

out of the Earth again in several places. From this

One Blade.

Root springs forth one Stalk, which never bears

more than one Leaf, but only when it rises up with

its Stalk, above that Leaf, in order to the bearing

a Head of Flowers, and then it bears another Leaf,

or one more, which are of a bleffed green color,

and therein very like unto the Leaf of the Lilly

Convollum, but something broader at the bottom,

having many Ribs or Veins in it, and pointed at the

end, not much unlike to a Plaimec Leaf. At the

top of the Stalk, grow many small white Flowers,

Star fofola, smelling somewhat fweet, after

which come small reddifh Berries when they are

ripe.

IV. Gerard defcribes it in this manner. Its Root

is small, tender, and creeping for abroad under

the upper face of the Earth. Its Leaf is not much unlike

the great Leaf of Ivy, with many Nerves or

Ribs, like those of the Plaimec Leaf, which single

Leaf does always spring forth of the Earth alone, but

when the Stalk rises up, it brings upon its fide

two Leaves, the latter in fashion like the former.

At the top of which fteder Stalk, come forth two

small Flowers like Pyrola, which being faded away,

small red Berries succeed.

V. The Places. It grows in moif, shady and

Grafick places of Woods and Groves or Copes,

in many parts of England. Gerard lays it grows in

Langford in Diugmorf, six miles from Freton

in Alderneyd, and in Harwood next to Blackburn

likewise.

VI. The Times. Its Flowers about May, and the

Berries are ripe in Summer, and then it quickly

seeds until the next Year, it springing abed

from the fame Root again.

VII. The
VII. The Properties. It is hot and dry in the first Degree, Afflictive, Vulnerary, Sudorific, and Alexipharmick.

VIII. The Specification. It is a peculiar thing for expelling Poisons, proffering the Plague of Pestilence, and all manner of Malign and Pestilential Fevers, and for the curing of simple Green Wounds, old running Sores and Malign and Ulcers.

IX. The Preparations. You may have here from, 1. A Liquid Juice, or an Elixir. 2. A Tincture of the Root. 3. A Sal ammoniac from the whole Plant. 4. An A[c]cid Tincture of the Root, and whole Plant.

The Virtues.

X. The Liquid Juice or Elixir of the Root and whole Plant. It is a potent thing to expel all sorts of Vegetable Poisons taken into the Stomach, and to defend the Heart from their Malignity: It is also a cure for all sorts of Malign and Pestilential Fevers, being given a Spoonful at a time in Cony, made hearty sharp with Juice of Lemons, and repeated as need requires: and so used it cures also the Plague it self.

XI. The Tincture of the Root. Being given from half a Dram to a Dram at a time, in a mixture of Wine and Vinegar, of each equal parts, and the Patient (being in Bed) laid prettily to Swear thereupon, it is said to be a Sovereign Remedy for those that are infected with the Plague, and have a Sore upon them, by defending the Heart and Vital Powers from the Danger of the Malignity and Infection, and expelling the Poison of the Disease: it has also all the Virtues of the Juice or Elixirs.

XII. The Sal ammoniac from the whole Plant. It is a singular good Vulnerary, admirable for the curing of Wounds whether recent, or old; as also for the curing of malign and Invertebrate running Sores and Ulcers, more especially those of the Nerves and Tendons.

XIII. The Acid Tincture of the Root and whole Plant. It may be given to a grateful acidity in any proper Vehicle 3, 4, 5, or 6, times a Day against the Purples, Spotted Fever, Colicure and Plague itself, as also in all other Malignan Fevers, it refits the Poison and Malignity, and permits the Cure to a Wonder.

CHAP. DXXIX.

of ONIONS.

I. THE Names. This Plant is called in Arabian, Bafal, and Bafal'd: in Greek, Λιπανθροβος; in Latin, Cepa, Cepae, or Cepae; and in English, Onion, which seems to be derived from the Latin word Unio, because the Root is single or bare One.

II. The Kinds. Onions are either Red or White: and of both these Kinds, 1. The Red Onion. 2. The long Red Onion. 3. The round Red Onion, or Sweet Spanish Onion. 4. The flat White Onion. 5. The long White Onion. 6. The round white Onion. All which White Onions are almost like to Cold-stones, lying upon the Ground when they are ripe and fit to be gathered. 7. Ajace, or Alfacaria: The Scallion, which is thought to be the Geryon, or Geryon of Theophrastus, these Alfacarias, are laid to be our Let Onions, the lesser sort of which are called Chibols: all the other Kinds are produced from Seed: The First Red Onion is the shortest of all, some of them are red throughout, very large and pleasant to Eat. The Long Red Onion is the St. Onor Onion, commonly called St. Thomas Onion. The Round Red Onion, called the Strasbourg Onion, is red only on the out side, and is very sharp and strong. All this variety of Onion, have one and the same manner of growing above Ground, and the same Form, and therefore One Description may serve for them all, which take as follows.

The Description.

III. Onions have a Root which is in some very great, in some very small, and are either, flat, round, or long, bulbous, or made of many parts. Peels or Coverings growing one upon another, of which the outermost is thinnest, and these more inward, growing thicker and thicker, according

Onion Red Great and Round.
to their remoteness from the first outward Coat: at the lower part or bottom of which Bulb, is a Bough of Fibres or Strings like a Taffet. Some are red on the outside only, others are red quite thord cut: some are white, and these are either small or great, flat, long, or round. Some are very sharp and strong, others milder and more pleasant: and some of these growing in Spain, are so pleasant that they may be eaten as an Apple. All these Kinds of Onions, contrary to the Nature of all other Bulbous Roots, have no off-sorts, or other Roots growing to them, but are every one alone single by themselves, and therefore it seems the Latins, as Columella, did give to the Plants the Name of Unio, from whence as I conceive came our English Name Onion: This Root if it remains on the Ground after Seed time, dies, rots, and perishes every Year. From this Root springing up several green, long, hollow Leaves, seeming half flat: among which rises up a great, round, hollow Stalk, thicker and bigger in the middle than any others else: at top thereof: stands a close round Head, covered in the Bulb with a thin skin which breaks of its own accord, as the Head grows larger and larger, and flows forth as itself as a very large Globular Umbel of white Flowers, which being pull away turn into black Seed. This Head is many times so heavy, that the Stalk cannot bear it, but must be up held by some convenient prop from falling to the Ground, that it may not rot or perish.

IV. Some will have it that there is no Wild Onion. Others that there is, which they make to be an Onion which is long, and has a very long Neck: and this they will have to be the Cape Arafaxides, which is also called by some Gethy- lides, and this is that of which they say Theophrastus makes mention under the Title of Gethy- um, as is aforesaid.
Salmon's Herbal. Lib. I.

V. The Places. All sorts of Onions are Sown, Planted, and Scurf up in Gardens not only in England, but in almost all Countries throughout the World, and they grow and prosper best in a Fat and Rich Soil, which has been well Dugged and Dried, or turn'd up and made stony and Loofe. The Seafition takes its Name from Acaulo a City in Phylissia, where they grew plentifully, and from whence they are said to be brought into all parts of Europe, and from thence Transplanted into America, where all the other Kinds of Onions grow also very plentifully, and come to great perfection.

VI. The Times. Those which are Sown for Store should be Sown in February, or before the latter end of March at farthest, and in the Increate of the Month, and are to be gathered when the Blades begin to Flag towards the Root. Those that are For Seed, are to be Set at the same time, when the former are Sown: This Seed th'o it is perfect in England, it will grow again with us, and produce good Onions, yet it is apt to degenerate, for which reason we commonly make use of Seed brought to us from beyond Sea.

VII. The Qualities. Onions are hot and dry in the fourth Degree, yet not thought to be full of hot or hot as Garlic. They are Astringent, Aperitive, Alkali, very slightly Aromatic, Digestive, Diffusive, Diuretic, Invefive, Emollent and Suppurative: Stomach, Pectoral, Nephritick, Hypnotick, Arthritic, Pruritic, Emmenogogue, Aperitive, and spermagenetic.

VIII. The Specification. They strengthen the Stomach, create Appetite, caufe good Digestion, give cafe in the Strangury, provoke Urine and Urinants Courts, and prevail against Sand, Gravel Stones, or any Tartarious Matter in the Reins, Ureters or Bladder: Cure the Bitings of Mad-Dogs, Serpents, or other Venemous Creatures, as also Coughs, Colds, Hoar-fenes, Wheezing, Asthma, and Tumor of Breath. They ripen Apothem, give cafe in the Gout, prevail against the Lethargy, Cataracts and all cold and moist Diffucies of the Head, being saft as an Elixir, and take out the Fire in Scarlifes, or Burnings by Water, Oil, Fire, or Gun-Powder, &c.

The Virtues.

X. Raw Onions eaten as a Salad. They are of Hurting, Volatile and Subtlie parts, strengthen the Stomach, caufe Appetite, and a good Digestion, caufe pains in the Stomach and Bowels, encreafe Seed, provoke Luft, gives cafe in the Gout, and force away the Urine; and are good against Sand, Gravel Stones, or any Tartarious Matter lodged in the Reins, Ureters and Bladder. They make thin, and fatter grofs and clammy Humors, open Obftrufions of the Vifera, and make the Body soluble.

XI. The Liquid Juice. The Juice mixed with the Pop of an Apple, and applied, provokes the Hemorrhoids. The Juice drop into the eyes, takes away the Dimnefs of Sight; and if used at the beginning, takes away Milks, Clouds, Spots, Fleas, &c. in them. Drop into the Ears, it is good againft Deafness, Noise and Ringing in them, and cleans them from Sifhkins and earthen Matter. A Pofyry imbied in the Juice, and put up into the Worms, it provokes the Terms, and brings away the After Birth. The Head and other parts of the Body troubled with Scabs, Iches, Scabils, Scurf, Morphew, Leproufe, &c. being often wash'd or bathed therewith, it cures them. It stops the falling of the Hair, and cures baldnefs, &c. being often applied. The Juice mixed with Juice of Penny-Royal, and applied to the Gout, gives cafe in the pain, Cloth dipp'd therein, being alfo put upon the time. Broken up with Oil, and applied, it is good againft Burnings with Fire or Gun-Powder, and heals Wounds made by Gun-Shot.

XII. The Infuffion in Water. The Onions being thin fifted and steeped in Water all Night, and the Infuffion given to Children which are troubled with Worms, it kills them.

XIII. The Infuffion in Wine. It may be made in White Port Wine, or White Lichen. It provokes Urine powerfully, gives preuent cafe in the Strangury, and forces away Sand, Gravel, Stones and Tartarious Matter from the Urinary parts. In this Infuffion to a miserable Patient, who had not made Water in eight Days, and in an Hours time after it, they plift above a Gallon, and were cured of their Strangury.

XIV. The Decoction. If it is made frong of the Onions, and in Vetal Broth, it caufe pains and gripings in the Stomach and other Bowels, Strenghens the Stomach, caufe a good Appetite, and makes the Belly Soluble.

XV. The Elixir. It is made of the Juice mixed with Powder of Scarnmony, a Barom of the Scarnemony to an Ounce of the Juice. Smitt up the Nodirs it cures the Lethargy, Cataracts and hidnings of Head and Brain, Migrin, and other cruel and infernate Head- aches, and prevail against an Apoplexy: for it draws away the Morbid Matter through the Or Ectrimerhias, by the Nodils.

XVI. The Lozoffh. It is made of the Juice mixed with Honey and Oil. It cuts through the Os of the Head, and lodges in the brain, it is good against Coughs, Colds, Wheezing, Hoarfenes, Shortnefs of Breath, Asthma, &c. and being often taken, it cured cafe Expiration.

XVII. The Elecytry. Take Tulp of Baked Onions (Baked in their Skins) a Pound, Honey 5 quarters of a Pound, Powder of Elecuante, and of Onion Seed, of each a Ounce; Roce cut small and bruifed, or Powder of Roe a Ounce: mix and make an Elecytry. It has all the Virtues of the Lozoffh, and much more: Powerful to all the Inter- tions: holds which, it expels Poifton inwardly taken, and outwardly applied, it is good against the Bitings of Mad Dogs, Serpents, and other Venemous Creatures. Dole as much as a Cheff- Nia Morning and Night.

XVIII. The Lotion. Take Juice of Onions 4 parts; Wine Vinear 1 part; mix them. It takes away Spots, Marks, Scurf, Morphew, Leproufe, and other Identities of the Skin, being often bathed therewith. Applied in the Gout, with Cold dipp'd in the fame, it gives preuent cafe.

XIX. Roasted or Baked Onions. They ought to be Baked dry in their Skins, once or oftener, till they are perfectly fift. Their Pulp being then taken from the Skins, and dressd up with chole
chose Butter, Sugar, and a little Salt, and so eaten with Bread, Morning Eating, and at Night going to Bed, with an equal Time, as to make a Meal thereof; for 2, 3, or 4 Days running, it never fails of curing the most extreme Cold, eases the Cough, causes easy Expectoration, takes away Asthma, Pains in the Head and other Nervous Distempers of the Head, and restores the Voice to such as had almost lost it, or could scarcely speak fo as to be understood.

XX. The Powder of the Seed. It strongly provokes Urine, gives ease in the Strangury, cleanses the Reins, Uterus and Bladder, of Sand, Gravel, or Terebratous Matter; provokes the Terms in Women, facilitates the Birth, and brings away the After Birth, and being boiled in Red Wine for some time, it very much increases Seed, provokes Lact, and heightens the pleasure of Coition. Dose from half a Dram to a Dram, at Bed time in a Glas of Wine, or other fit Vehicle.

XXI. The Catalyst of Rowe Onions. It is made by boiling the Onions with Green Rice, and a little Salt, and brought in a Concoction with Oracle. Alcohol, or Powder of Elecampane Roots. Apply it upon the Biting of a Mad Dog, Viper, Rattle- Snake, or other Serpent, or in the Inflammation of any Venereal Creature, whilst the Wound is recent, it powerfully draws forth the Venom or Poison, and recovers the Life of the Patient from danger. I gives also prevent ease in the most extreme pains of the Gout, draws it out of the Stomach, if it is flown upward, and in less time after cures the Disease.

XXII. The Catalyst of Roseft in Baked Onions. It is thus made. Take of the Pulp 5 parts, Rice 3 parts, Pulp of Fig and Aristotol 2 parts, Salt 1 part; beat all well together for a Catalyst. Applied very hot, and repeated every six Hours, as long as need requires, it will ripen and break any Apottens, and expel Putrid and Putrescentia Bubos, and other Tumors of the like nature, it is also good for the Biting of a Mad Dog, being presently laid thereon, it is profitable against the Kibles and other putrid Sores of the Legs and Feet, which are hard to heal; and being applied to the Pustules of the Hemorrhoids, it eases the Pain, dissipates the Tumor, if not broken, and cleanses and heals them if Ulcerated. Take a great Onion, make it hollow in the middle, and fill it with Aristotol or Terebratous Powder, and Aristotol in the Pulp, and Root it thoroughly in the Emburse: then taking away the outwardly Skins, let them be beaten together to a Catalyst. This Applied to any Pustules, or putrid Sores, or pustules in the bottoms, it brings them to suppurate, draws forth the Poison or Malignancy, cleanses them, and induces their healing.

XXIII. The Diffusled Water of Onions. It is one of the noblest Nervoticks and Diuretickks in the World. Superiors to Purify Water, Hidroplank Water, or any other Vegetable Water of that Kind, nor does it descend inferior to the Decreation of Hops, or Infusion of Lignum Aphorissiacum. It provokes Urine powerfully, gives ease in the Strangury, and cleanses the Reins and Bladder of Sand, of Grass and Terebratous Muciluge. Dose from 4 to 8 Ounces, either alone, or mixt with a little white Port Wine. It is given with the Powder of the Seed, it will be yet much more effectual.

XXIV. The Spirit. It is exceeding Volatile, sharp and piercing, and a noble Antilconick, Nervick, and Arthritisick, in a cold habit of Body: it ought not to be given to hot Constitution, or in that, it may put all into a Flame, and kindle such a Fire, as may not easily be extinguished. It is a good Stomarick, creates an Appetit, and causes a good Digestion: expels Wind out of the Stomach and Bowels, and gives ease in the Colick: and is a very provoking thing for such as are inclined to a Dyspepsy, or are newly cured of one, because it warms and comforteth the Blood, and strengthens its Tone or Chafa. Dose from 1 Dram to 2, in any proper Vehicle.

XXV. Note. Authors say, that if an Onion be filled, and dipped in the Juice of Sorel, and given to be eaten by one that is sick of a Tertiary Pague, that it will take away the fit, at once or twice if taking it.

CHAP. DXXX.

OF ORCHIS FLIES; OR.

F L I E - F L O W E R; OR.

FLIES-STONES.

I. THE Names. It is called in Greek, Ωρχίς πιάρας; in Latin, Orchis Macaro, Tetricum, Macarusa; in English, Horse-Orchis, or Flies-Stones.

II. The Kinds. These are Species of Fox- Stones, in Chap. 298. aftergoing, of which we gave you nine several Kinds: The rest which are wanting there, we shall supply you withall here in this Chapter, which are the following nine Varieties. 1. Orchis Serpens bisfolis, vel trifolii minor Chelid. 2. Twa Blade, or three Leaf'd white Butter-Fly Orchis. 2. Orchis Spogodes altera, vel secunda Chelid, The White Orchis. 3. Orchis minor cacem experimentis, Candidus, minoris Tryphyle Chelid. The Ifffer Gnat Flower. 4. Orchis Spogodes, fase Tetricum Vul- pinus primus Chelid, The greater Gnat Flower. 5. Orchis Melittis, fase infera Chelid, The Honey Bee Flower. 6. Orchis Myodes minor, vel Myodes primus Chelid, The Ifffer Fly Flower. 7. Orchis Myodes minima, Orchis Serpens tertius Donatoni, The leafly Fly-Flower. 8. Orchis Myodes latius Nar- bonensis Chelid, The great Fly-Flower of Narbon. 9. Orchis Myodes anguliformis Blandin, or minor Te- bernumantoni, The narrow leafly Fly Flower.

The
The Descriptions.

III. The first, or Lesser Two-Blade or Three Leaved white Butter Fly Orchis. From two long Tefliaces or Stalks, with a long Tail at the bottom of its Root, spring up two or three large Leaves, each than those of the Hungarian or greatest Two-Blade Foxtone in Chap. 278. Sect. 4. The Stalk is more than half a Foot high, with *3* or *5* small, long, narrow Leaves thereon, and a small Taff or Spike of white Flowers at the top thereof, thinly set thereon, someday resembling white Butter Fly, with their Wings spread, each being a crowded Tail behind it, full of a sweet or Honey Liquor.

IV. The second, or Warp Orchi. The Roots or Stalks are very pretty, and more roundly Tubers. The Leaves are a little narrower than the former. The Flowers stand in just the same manner and admiss, of the same Fashion, but something greater, and of a brown or yellow color, the Wings being a little inclinate to purple. This Gerard makes the Bumble Bee Orchi.

V. The third, or Lesser Great Flower. It has two length Tefliaces of a mean magnitude, having three Leaves usually standing above the Stalk, with some few leaves once or higher. The Flowers are but small, but much resembling a small Great or Fly, of a yellowish brown color, whose lower part is smaller than the Greater Great Flower following.

VI. The fourth, or Greater Great Flower. The Tefliaces, Root or Stalks are little wider than in the last, and pointed at the bottom. The Stalk by reason is greater and higher, the Leaves also are larger and longer than in the two last, but much smaller upon the Stalk. The Flowers are fewer at top, but larger by much, and their color differs not much, but is rather ruder.

VII. The fifth, or Honey Bee Flower. Its Tefliacous Root consists of two small round Tubers. The Stalk is seldom a Span high. The Leaves therefore are few, narrow and small, but pretty long, turning sometimes inward, some growing upon the Stalk. At top stands two or three Flowers, seldom more, each whereof is in shape much like to the Honey or Hive Bee, that many who have not seen it before, would very believe, it were either a flying or the Carckise of a dead Bee, but that the upper Flowers, which are the Wings, are of a pale yellowish purple color, and the Head yet paler, the body being full and round and of a dark brown color, with some Spots of yellow thereon.

VIII. The sixth, or the Lesser Fly-Flower, or Flheit Fly-Flower. Its Tefliacous Root is a round Tubar and sometimes longer, with Fibres springing from its top. It has lesser Leaves and more ribbed than the Greater Flheit Flflower, in Chap. 278 Sect. 6. The Stalk arises not fully so high, the Flowers in form, are like to those, but lesser, and of a little darker color, both at the bottom and about the middle part, but paler between the Wings, being of a pale color, enclosing thither.

IX. The seventh, or Leafy Fly Orchis, or Fly Flower. Its Tefliacous Root consists of two round Tubers and small. It has three narrow Leaves and Ribbed, growing closer to the Stalk than in the last. Its Stalk is smaller and lower than it, having two or three small Flowers at top like the other, but smaller, and of a brownish purple color, somewhat spotted.

X. The eighth, or Great Fly-Flower of Norway. Its Tefliacous Root consists of two small round Tubers, or a little length towards the upper parts, it has three or four Leaves, which are larger than the left and full of Rib. The Stalk is higher. And the Flowers much larger or greater, and of a yellow color, like some Flies we say.

XI. The ninth, or Narrow Leaf'd Fly-Flower. Its Root consists of two small, round, longish, longiflora Tefliaces, a little pointed at the bottom, with many small Flowers at the tops. It has several Leaves upon the Stalk, as are, eight, or ten, which are at first narrow and very long, and grow upon the Stalk, even to the top thereof, where grow the Flowers which very much resemble a small Flies Fly.

XII. The第十, or Narrow Leaf'd Fly-Flower. Its Root consists of two small, round, longish, longiflora Tefliaces, a little pointed at the bottom, with many small Flowers at the tops. It has several Leaves upon the Stalk, as are, eight, or ten, which are at first narrow and very long, and grow upon the Stalk, even to the top thereof, where grow the Flowers which very much resemble a small Flies Fly.

XIII. The Tumer, They flower from the middle or latter end of April to the end of Mar.

XIV. The Quality, Specification and Preparations of these Fly-Flowers, or Fly-Stalks, are the same with those of Dig-Stalks in Chap. 275, also being, to which we refer you, and therefore shall lay no more thereof in this place.

CHAP. DXXI.

Of ORCHIS Handed; or, PALE CHRISTI.

I. T H E N u m e r. It is called in Greek, ΤΟΧΟΥ, in Latin, Orchis Palmita, Orchis Palmita, Orchis Palmita, a genus, which is also in England Handed Orchis, Finger Orchis, and Palm Christi.

thought good, that they might not be lost; to place them here next following.

1. Serapias, vel Orchis Palmae peltatae latifolii.
   Fenny Orchis, or Marsh Handled Palms with broad Leaves, Chap. 251. Sott. 2. No. 1.

   The Description.

   III. The first, or Great Male Handled Orchis
   The Root is Handled, Palmed, or Fingred, as in the Cut or Figure, flat and broad, two, and two, joined together at the Head, like unto Hands, parted at the bottom into short pieces, as if the Fingers were cut short off by the Knuckles, with some Fibres at the Head thereof also, one of them being firm.

   Orchis Handled Male Great:
   or, Palma Christi.

   the other leaf or Spongy, as in the round Tuberous Orchides, which rise and decay in like manner. It has divers large, broad, and long, smooth, green Leaves, lying on the Ground, among which rises up a round Stalk, with some few Leaves on it, but higher up to the top, where grows a large Head of red purple Flowers, spotted with a deep purple color, each Flower having a Head of the same color behind it.

   IV. The second, or Great Male Handled Orchis with narrow Leaves. The Roots of this are double Handled like the former, parted into three parts below: the Leaves are long, and narrower than the former, thru' which the Stalk rises up, or thru' a Pipe, to be a foot and half high, on which is set a single Head of Flowers of a pale purple color, with a Spur behind, and a small Leaf round each Flower at the bottom.

   V. The third, or Female Handled Orchis. Its Root is Handled or Fingered like the others. The Leaves hereof are long and narrow, spotted diversely with black Spots. The Stalk has likewise some narrow
Salmon's Herbal.

OF ORIGANUM;

ORGANIF, see Origaniun, Chap. 522.
ORBANCH, see Bona Rapa, Chap. 88.

CHAP. DXXXII.

OF ORIGANUM:

OR, 

Bafiard MARJORAM.

I. THE Names. It is called in Ar- 

thic, οργανιον & οργανον; in 

Greech, οργανιον & οργανον; in Latin, Origaniun; 

and in English, Origaniun, Organ, and Bafiard Marjoram.

II. The Kinds. Late Authors make many Kinds 

hereof, but the most used in Physick are these five 

Species following, viz. 1. Origaniun Heracleotini 

varius Latibui, Matthii, Gafferti, Camerarii, 

Ludii, Tubernamontii, & Dubontii, some 

call it by the Name of Ceratium, and some of 

Hispanicum; it is also called, Camii Callinenses 

Planti Bubinii, and is the Culne Diosfodridi, 

Greek Origaniun. 2. Origaniun Oinitis Matthii, 

Gafferti Bubinii & Ludii, and called by 

kom by Name of the italicum, white Greek Origaniun. 

3. Origaniun Oinitis and majus Camerarii & 

Bubinii & Origaniun Cordtiore Gerardi. Tha 

greater white Origaniun. This third has it great a re-

semblance with the former second Species, that 

they are very much suspected both of them to be 

but one and the same Kind, and that they 

differ but in the largeness of the Leaves, which 

may be occasioned by reason of the difference of 

the Soil, or fertility of the Ground in which they 

may grow. 4. Origaniun Vulgar, Origaniun 

Sphyrhxic, Camii Calimci Planti Ruedii & 

Bubinii. Our Common Origaniun. This 

Diosfordridi says (if it is his Wild Kind) was 

called in his time Corni. This is the strongest in 

Scent, and quickest in Taste, and is in Galen Opinion, 

the best. 5. Origaniun Anglicum Gerardi. Our 

English Origaniun.

The Descriptions.

III. The first, or Greek Origaniun. It has a 

long slender Root, with some small Vines adjoining 

to it, from whence rises up several broad, round, 

reddish green Stalks, a Foot and sometimes more 

in height, spreading forth into many other slender 

Branches, on which grow many Leaves by couples 

at the joints. These Leaves are of a whitiest 

green color, more long than round, and short pointed, 

very like unto those of Marjoram, but larger, 

lifter, whiter, and harder, to rougher in handling. 

At the tops of the Branches stand small, long, 

several Stipes or Fers, such like as in Marjoram, 

but longer, out of which most forth small white 

purple Flowers, like the Flowering of Wheat, after 

which comes small brownish Seed. The whole 

Plant rises up with so much higher than 

Marrow Leaves thereon, and a thicke Head of 

bundled Flowers, some reddish, either deeper or paler, 

or blcfs, or else white, the lowest of them being 

spotted, but several of them have sometimes 

Marrow.

VI. The fourth, or Grafted Handed and Hooded 

Origaniun. The Root is like the former, but larger 

Palmed and Fingered, from the Head of which rises 

up a Stalk of a Foot high, having several long and 

Marrow Leaves set thereon, admirably encomposing 

it at the bottom, the Flowers whereof are Hooded like 

the last, but of a delicate pales purple color and 

faintly wildish, but flowering late.

VII. The fifth, or Small Handed Origaniun, 

which has small Flowers. Its Root is small and Handed 

like the others. It is but a Small Plant, and has 

a slender Stalk, with a few long and narrow Leaves 

set thereon, smaller above than those below, having 

a thicke Head, of shining red Flowers.

VIII. The sixth, or Lefted Handed Origaniun 

with narrow Leaves. Its Root is Handed and Fingered 

much like to those beforegoing, but fuller, and 

the lesser divisions of them are longer. The Leaves are 

very long and narrow, and the Stalk grows to be 

about a Foot high, the Flowers at top whereof are 

of a pale purple color, and the whole Spike shorter 

than the others.

X. The eighth, or Clove-scented Handed 

Origaniun. Its Root is Palmed or Fingered, much like 

the others, but has its lesser divisions much longer, 

running down deep into the Earth. The Leaves of 

this Kind are long and narrow. The Stalk is slender, 

with several short Leaves thereon. The thicke 

Head of Flowers is purple, each resembling small 

Flies, and smelling as sweet as a Clove, or 

Clove Gilhbowies; after which some great Heads of small 

Seed.

XI. The ninth, or Handless Origaniun resembling 

Frogs, or Flies. Its Palmed or Fingered Root has 

shorter divisions in one part, and longer in another. 

In a Leaves which grow on its Stalk, are somewhat 

short and broad, encompassing it at the bottom. 

Its Flowers which grow at top of the Stalk, are small, 

with Wings as it were above, and a long small Body 

bending down, and does in some sort resemble a 

Frog, as well as a Fly.

XII. The Places. Those Palmed or Fingered 

Origaniun, grow for the most part in Fields and 

Meadows in many parts of England, and are also 

arbor up in Garden, by the more curious Port of 

Herbists. The Mung or Penny Pafted or Fingered 

Origaniun grow in Marsh, Moorish, or Penny 

Grunds, as their Name does indicate, and of 

which we have already spoken in Chap. 251. Seil. 

10, adjoining.

XIII. The Times. They Flower in April, May, 

and June, but seldom after, except they degenerate, 

or that it has had some hindrance at the time when it ought to have 

Naturally Flowered, which does indeed sometimes happen.

XIV. The Qualities, Specifiation, Preparation, 

and Vertues of these, are the same with those of 

Cynthiarchis, or Dog-Stones in Chap. 256. Sefi. 

14, ad 15, adjoining, to which we refer you.
Origanum Greek.

Origanum Greek white.

Origanum Common, or Wild.

Origanum Greek. scarcely abiding the sharpness of our Winters, the it be as well defended: it differs somewhat from the former tho'' not much, but in the color of the Flowers, which in this is white: in its Leaves which are whiter and larger; and in its Magnitude or Stature, this being much higher. The Heads are also more divided, and separated into smaller Spikes or Ears.

IV. The second, or White Greek Origanum. This Plant is more tender to keep than the former, but of a hotter and quicker Smell, yet very sweet, and has a sharper biting Taffe.

V. The third, or Greater white Origanum. This Plant is more hardy than the last: though it be as well defended: it differs somewhat from the former: its Heads are larger also, and more spread abroad than those; and bear white flowers in like manner.

VI. Gerard describes this third Species thus. It has many thready Roots: from which rise up divers weak and fickle Branches, trailing upon the Ground, yet with fair green Leaves, not unlike those of Penny-royal, but broader and shorter; or at the tops of those Branches stand صفی or Chaffy Ears of a purple color, and the whole Plant is of a most pleasant sweet Smell. The Root of this, Gerard says, endured in his Garden, and the Leaves also green all the Winter long, tho'' some have said that it perishes at the first Frost, as Sweet Marjoram does.

VII. The fourth, or Our Common Origanum. Its Root, says Parkinson, perishes when it has given Seed; it rises up with divers round hard Stalks, on which are set somewhat broader, larger, and rougher Leaves than the former. The Flowers grow at the tops of the Branches, in smaller pitched Heads, and more dispersed than the former, of a reddish purple color, after which comes small brownish Seed.
VIII. The fifth, or Our English Origanum, its Root creeps under Ground, and encreaseth much, dividing from Year to Year, from whence come forth several branches, hard, square Stalks, with small dark green Leaves, set by couples on them, very like to those of Sweet Marjoram, but harder, and somewhat broader. At the tops of the Stalks stand

Origanum English.

Tales of dark or deep purplish red Flowers, which turn into small Seed, like that of the Galian Marjoram, but blacker. The whole Plant fauntly pleasant.

IX. Gerard says, That this fifth Species or English Kind, has a Root which creeps in the Ground is long lasting, and sends forth long, stiff and hard Stalks of two Cubits high, set with Leaves like those of Sweet Marjoram, but broader and greener of a rufes green color. On the tops of the Branches stand Twists of purple Flowers, composed of many small ones set together very closely. Unbleed fashion. This Plant is called byLesson, Origanum Omitis major, and Agytroadanum, and is the Origanum Iraculum Catalaunica.

X. The Places. All these Kinds of Origanum, grow Wild in hot Countries, as Greece, Italy, Spain, Great, Florida in America, and other hot Climates: But with us they are nurst up in Gardens. The fifth or last grows (as well as in Gardens) Wild in the borders of Fields, and low Coples, in most places of England. I found it to grow Wild in many Plantations in the South of Carolina, where it grew spontaneously, and flourished after an admirable manner.

XI. The Times. They bear their Spiked Heads or Flowers about the middle or end of August, or middle of September with us, so that their Seed (except that of the last) does not often come to Maturity in our Country.

XII. The Qualitie. Origanum is hot and dry in the end of the third Decade; it attenuates or makes thin, incites, is something Aperitive, Absorbative, Camative, Digestive, Acrid, Cephalick, Nervousick, Hypnotick, Pharmaceutick, Ermownick, and Aexpirnuck.

XIII. The Specification. It prevails against Poison, the Biting of Serpents, or other Venemous Creatures, Convulsions, the Drople, Obstructions of the Terms, Coughs, Swellings of the Throat, Ulcers of the Mouth, Jaundice, Colick, &c.

The Virtue.

XV. The Liquid Juice. Given with Wine, and Oxymel, it is good against Poison, and the malignity of Hemlock, Hosome, and Opium, or the Root of Clockum Ephemeron, which is Adonias Safforin, that kills in about a Day time. It may be given from 1 Spoonful to 4; given with Pulp of Fig it is good against Ruptures, Convulsions, and Cramps and mixt with an equal quantity of Honey, it Purges downwards black and melancholy Humors. Taken in a Glass of White Port or Lisbon Wine, it provokes the Terms in Women, and prevails against the Drople. Mixt with Honey as aforesaid, it is good against Coughs, Colds, Whezzing, Hoarfrost, and Shortness of Breath.

XVI. The Infusion. It is given from 1 Spoonful to 2 or 3, against all the Distresses above named, in Wine or some other proper Vehicle. Being droped into the Ears, it eases their pain. It is profitable for such as are Ithy, Maugy, or are Scabby: and being taken for some considerable time, is an excellent thing for the cure of the Jaundice.

XVII. The Decotion or Infusion in Wine. These have the Virtues of the Juice and Essence, but nothing near so powerful, and therefore may be given Morning and Night from 4 to 6 Ounces or more, according to the Age of the Patient. They are potent Remedies against all sorts of cold Poisons, whenever; as also against the Biting, or Stingings of Serpents, mad Dogs, Scorpions, Spiders, &c. securing the Life of the Patient upon the spot.

XVIII. The Powder of the Herb and Heads of Flower. This it has the Virtues of the former Preparations; but operates more with that speed which they do, because it requires some time to be digested in the Stomach; but being given in Head or Honeyed Water from a Dram to 2 Drams, it Purges downwards, black and melancholy Humors, is good against the Jaundice, provokes the Terms, and facilitates the Birth of a Woman in Labor.

XIX. The Elixir. Take of the Liquid Juice an Ounce: of the Essence 2 Drums: of the Powder half a Dram, mix them, to be made up the Nigiroth. It purges the Head and Body that way, draws forth
Chap. 533. English Herbs.

English Herbs. 801

forst Pungent Humors, and other kinds of Matter out of the Cavities of the Brain, and therefore is profitable against the Head-ach, Migrain, Vertigo, Lethargy, Apoplexy, Epi-
leptic, and other like cold difficides of the Head; in which being often used, Morning, Noon, and Night, it is Brand to be a thing of great efficacy.

XX. The Distilled Water. It has the former Virtues, but is much weaker than either Juice or Essence, and may be taken from 4, to 6, or 8 Ounces, diluted with double refined Sugar: it will be much more effectual if half a Spoonful of Spoonful of the Spirit is added to it; however it may be used as a Vehiculum to carry the other

XXI. The Spirit Distilled from the whole Plant. It is Cephalick, Neurastick, Cordial and Hyperick; good against Lethargies, Coxs, and all other cold and moist Difficides of the Head and Brain; it is preval-
ent against Pallas, Tremblings, and Numbnefs of any part, Sticks in Heart, Perfit, Swooning,

Pulitation, and all cold and moist Difficides of the Stomach and Worms. Dote from a Draught to 6 in a Glass of Wine.

XXII. The Distilled Oil from the spiaded Heads of Flowers. It has all the Virtues of the former Prepa-

relations, and is one of the most powerful Vege-
tables in the World against the Palls, the universal, being taken inwardly from 3 to 10 or 12 drops in any Antiparalytic Vehicle: and outwardly anointed upon the Spina Dorfi, and parts afflicted Morning and Evening: but by reason of its extraordinary heat, it ought to be mixed with Chemical Oil of Linum in equal parts, and then used; and so is a very excellent thing against Cramps, and Convulsions of the Nerves in what part of the Body foever.

XXIII. The Spiritual Tincture. It has all the Virtues of the Juice, Essence, Spirit and Oil; and is milder, and more fit to be taken than the last of them, unless in an inventer Palls, in which I think, scarcely any Medicine can be too strong. It is a great Stomacick, and this as well as the Oil are potent things against the Colic, whether in the Stomach or Guts: it strengthens the Vifcera, expels Wind, and makes a cheerful Countenance.

Dote from 1 to 2 or 3 Draughts, or more, in a Glass of Wine Morning and Evening.

XXIV. The Acid Tincture. It is a great cor-

rector of all sorts of Poisons of Vegetables or Animals, but more effectually against the Poison of Malignity of the Plague or Pestilence, and refills the utmost force of all sorts of Malign or Pestilential Fevers: it very much strengthens the Stomach, caufes a good Appetite, and a Strong Difgufion, and being used for some time, very admibly reftores languifhing Nature. Dote fo many drops at a time, as to make a Glafs of 

Ate, Wine, or Dint of Broth, pleasantly and pleasantly and

graciously Acid.

XXV. The Oily Tincture. It has all the Virtues of the Oil and Spirituous Tincture, befides which

it is prevalent against Difficides of the Reins, Utre-

sus and Bladder, cleansing them from Sand, Gra-

vel, Stones, and other Tartarous Mucilage obftruing

them. It strengthens the Back, caufes the ve-

nemptom pain thereof, being inwardly taken and outwardly anointed upon the Skin, provokes Urine powerfully, and gives profit reft in the Sera-

gury. Dote from 20 to 40 or 60 drops, in any

Vehicle.

XXVI. The Salicylic. Take of the Powder an

Ounce, of Sal nitre in fine Powder 4 Drams, Honey

3 Ounces and half, mix them, Held in the Mouth

between the Gums and Lips, or Cheeks, it

effes the Tooth-ach, and being rubbed upon the

Teeth, it makes them white, and affafns

them: given inwardly, to a Draught or more, in a

Glafs of Wine, it potently provokes Urine, gives

cafe in the Strangury, and heift and filling of

the Water; and eradicates the Watery Humor in

Dropsies.

XXVII. The Emetic. It is made of the, Juice,

with Onions flock, and Sambuc insufed in it, in a

Copper Vessel for the Space of 40 Days. Dote a

Drain or 2, more or les, according to Age and

Strength, in a Glafs of Wine in the Morning falling.

XXVIII. Note. Galen says, all the forts of

Origanum, are of a cutting, twirling, and attenuating Facility, and heat in the third Degree, and

that the Herapeuticus is of more power or force

than the Orinum, and that the Wild is stronger than

either. It is also faid that the Destruction of Orio-

gum, with Chrest, favoured with Sugar, helps

such as are troubled with the Hiccough.

C H A P. DXXXIII.

of ORRICE Florentine.

I. THE Names. It called in Greek, Θορυβόβοσκα, in Latin, Iris Tuberosa alba, Iris Tuberosa Florentina, Iris alba Florentina: in English, White Orrice, Florentine Orrice, and

White tuberosous Flower of Loure.

II. The Kinds. We have treated of this Plant al-

ready in Chap. 287, afterweing, where we have described three several Species thereof, viz. Iris alba Florentina, the Sweet Florentine Orrice: of whole Root Sweet Powders and Waters are made, and of which they make their Roff-Berry Ale, by putting a little bit of it into each Bottle. 2. Iris Flore palida Florentiana, The Straw colored Florentine Orrice; 3. Iris alba major corne-alis, The white partial-

colored Orrice. To thefe we shall add in this Chap.

4. Iris Ceralis aderifa, vel odorata, Iris Canarius Germanicus, Camerarius his Sweet German Orrice, or Sweet blew Flowered Orrice; 5. Iris Penanatica, Hungarian or Auffrian Flower of Loure, or Orrice. And with thefe, we here give you the Cur, or Figure, of the Sweet white

or Florentine Orrice, which was own-paff in Chap.

287. Sept. 3, above mentioned, which is now here

placed.

The Descriptions.

III. The root of thice, or Sweet Florentine Orrice, has a tewerous Root of a confiderable thicknefs, which

is admirable sweet, and being put into Ale, or Wine,

does give them an admirable Raff-Berry flavour, or Taffe, also being reduced into Powder, makes a

yellowish or Cream white Powder, of a very pleasant

Scent, of which many Sweet Powders and

Pouders are compos'd, and which is generally now Sold

for
Salmon's Herbal. Lib. I.

3. Orrice Florentine Sweet: or Sweet white Orrice, or Sweet tuberous Floral de lace.

Orrice Florentine.

in Perfumers Shops: This Orrice in its form and way of growing is altogether like to the Common Flower de lace, showing that the flowers of this are of a white color, and the Root of an exceeding sweet Smell. The larger description of this Orrice is in the above cited Chapter and Section.

IV. The fourth: or Camerarius his Sweet German Orrice, or Sweet blow Flwered Orrice. Camerarius in his Hortus Medicus Lays, That it has a great thick and heavy Root, which smells as Sweet as the Florentine Orrice. The Stalk is single and smooth, thick and full of Juice. The Leaves are very large and broad, and twice as broad as any of the other Flower de Lucs. The Flower grows at the top of the Stalk, consisting of six great Leaves, of a most bright shining bluen color, united down the middle, with a middle Rib, of a yellowish white color, the three upper Leaves being somewhat yellowish. At the bottom next the Stalk, it is of a white color, with some yellowish strings about the said white, as also about the brims or edges, which very much expresses the Beauty thereof.

V. The fifth, or Hungarian, or Austrian Flower de lace or Orrice. Its Root is tuberosus, and very sweet when it is dry, out-going, or containing in Sweetness, with the fifth or Common Sweet Florentine Orrice it is. It has great broad Leaves, thick and flat, of a purple color near unto the Ground, like to the Dalmatian Flower de lace, which it very much resembles. The Flower is of all the others, the most confusely mixed with various colors, being very Beautiful, so much as it is very difficult to describe every Leaf or Stroke, according to the truth thereof. The three Leaves which stand upright, do cloys or embrace one another, and are of a yellow color. The Leaves which look downwards, are contumely with purple or white streaks.

about the edges, of a pale color, the middle part of white, mixed into a Line of Purple, and has many small purple Lines, strieved over the said white flower, even to the brink of the pale colored edge. This being slightly faultly to has a Smell almost like to that of the Hawthorn Flowers.

VI. The Flowers. The Titles or Names of these Orrice's shew in what Places or Countries they are Native: with us they are only Nurted up in Gardens, where they flourish very well.

VII. The Times. They Flower in July and August, and their Seed is ripe in September, or not long after.

VIII. The Qualities, Specifications, Preparations, and Vertues of these, are the same with the Florentine Orrice, declared in Chap. 287. Sel. 8, ad 17. after Going, to which you are referred.

CHAP. DXXXIV. OF ORPINE; OR, LIVE--LONG.

I. The Names. It is called in Greek, Тοξονιον in Latine, Telephium also (so called from Telephus Rex Albania, whose Woman received from Achilles, and grown almost past Care, were hated herewith) by some Authors, Faberina, and by most CSTRACT: in English, Orpine and Liv-long, because a Branch or Branches of the Plant will live and grow a long time, after they are taken out of the Ground and hung up in any place, more especially if put into a shallow Basin of Water, in which it will spring up regularly, and grow beautifully, even to admiration.

II. The Kinds. These following five Sorts, are the chief, viz. 1. Telephium, five CORTUS major vulgaris (а foliorum CORTUS) Scrophularia medicus, vel Tertia branched; Florida, CORTUS, CORTUS inveris Quedam and Lobelia, a foliorum Fabae filialitudine & craseaceo, Aciathum alterum Cardis, Cuspidem alterum Decifolium Columbae, Anas anglica Cerafer in borris Telephium, Telephium vulgare, Chaffi, Dendesi, Matthisbi, Our Common Orpine. 2. Telephium seu Cortus minor, Cypos marina alterum, Small Orpine. 3. Telephium, five CORTUS major Hispanica, Chaffi & Lobelia Telephium Plautianum Chaffi, The Great Spanish Orpine. 4. Telephium Vobas parparent Lobelia, Scrophularia eu Pericaea major Trai, Aciathum alterum purpureum Facelii, Telephium quinatum Chaffi, CORTUS Montana Caflapini, Rapunzlin Umbellatifolium Columbae (for he did not think it to be a Species of Telephium.) Orange purple Flowered. 5. Telephium minor regens, Dondeci & Lobelia, Cypos Vetrici Chaffi & Comosari, Telephium sectum Chaffi (who thinks it more nearly to resemble the True Telephium or Orpine, than any other.) Telephium sempiterus, Dondeci & Lobelia, Small creeping Orpine, or French Orpine. 6. Telephium legitimus Imperator, Chaffi, Telephium Imperati Comosari, The True Orpine of Imperators.

The
III. The first, or Our Common Orpine. The Roots are manifold, thick, round, and white, with glandular or tuberous Clogs, not much unlike to thefe of the Spanish Kind following, but thicker. It rifes up with several round brittle Stalks, thick fett with fmall, flat, and flaky

Leaves, without any order, and little or nothing denser about the edges, felter than thofe of the Spanish sort, and of a pale green color. The Flowers grow in feveral Tufts, and are white, or of a whitifh color, which after wards bear chaffy Heads, containing within them fmall dulf like Seed. This when it is found growing Wild in Yields and Woods felds, does generally grow fmal ler than when it grows in Gardens.

IV. The second, or Small Orpine. Its Root is long and Fibrous, ftraitling something fweet, like the Rope-wort Root at Camarins fety, and perifhes every Year; fo that if it rifes not of the feld Seed (which it usually does, if it is suffered to fwell it) it must be new Seeded every Year. It has a fmall weak Stalk, fearfly at Foot long, lying about upon the Ground, spread out into feveral Branches, and they again into other smaller ones, feft with fmall thick long Leaves, without any order, and sometimes like unto Purflane. At the tops of the Branches grow many small white Flowers in Tufts, but mo fecond, or flowly fett, than in fome of the other Kinds, confifing of few Leaves apicr, after which come fmall Heads, like to the other Orpines, in which is contained fmall daily Seed.

V. The third, or Great Spanish Orpine. Its Roots are thick, white, and tuberous, bigger and longer than thofe of the first, or Our Common Orpine, which while all the Winter, with the green Leaves on their Stalks, which have not yet flowered. From this Root rifes up feveral weak, round fuffy Stalks, about two feet high, on which are fett, at diftance, two large and thick broad Leaves, very like antric the Common Orpine, but much larger and fometimes ftronger of color, and a little unevenly denrifed about the edges. At the tops of the Stalks grow Tufts or Flowers, larger and more formal, than thofe in our first or Common Kind which confift of fve small whitifh Leaves apicr, which bring fuft away, fmall chaffy Heads, which, with fmall daily like Seed within them.

VI. The fourth, or Orpine purple Flowered. It has a fubcrb Root like the first Kind, but much fmal ler, and very much fuller of Fibres or Strings. Nor does it much differ from our Common Kind, but that the Stalks are more flexible and weak, and the Leaves (which grow without any order) are more finely denrifed about the edges. The Tufts of Flowers at the tops of the Stalks are of a reddifh purple color, confifting of fve small Leaves apicr, like the former. This has been found alfo fmal ler in all its parts, but not otherwise differing, than in that the Stalks with all the Leaves, utterly perifhes every Year to the Root, which every Spring sends forth new Stalks.

VII. The fifth, or Small creeping Orpine, called by fome French Orpine. Its Roots are not fubcrb but fibrous or Stringy, yet do endure with the green Leaves on them, the greatest extremity of Winter, taking only a few leaves of the lower Leaves of the Branches. This Root sends forth feveral weak round Stalks, lying on the Ground, and refting
Salmon's Herbal. Lib. I.

by taking Root again as they do, thick set with thick set Leaves, like unto Pasture, but smaller and smaller upwards, & from among which rise both bare or naked thick, without any, or with but few Leaves thence, at the tops thereof stand small Yuffs of purplish Flowers like the others.

VIII. The Facts, or True Opinion of Imperator Its Root is small and long, of 5, or 6, & 8 inches in length, with tender Branches and small wifiers adjoining to it, or the Hand whereof some Branches of green Leaves, which have not seceded, will remain, the thick whereof have flowered, and seceded away and perish. It is a small Plant and spreads it self upon the Ground, with many small and long treating Branches, a Root or two more long, whereof thick whereof do flower the same Year have thicker, and somewhat longer Leaves on them, and thicker set of others, but those which will bear Flowers, are set separably out with any order to the tops, and are thicker in form, and thick thick and fatter than any of the others before, and of a fair brown green color. At the tops of the Stalks, stand thick clusters of white Flowers of few Leaves spring, after which come small corners. Heads containing small brownish Seed.

IX. The Plants: The bulk of both Fruits, both greener and litter, are frequently found almost in every County of England, the greater 9 be generally Nurt in Gardens, the litter form is found to grow in the shady Edges of Fields and Woods. The second was first brought to us from Padua, and is now planted in many Places in our Gardens. The third Clusius found in Spain, as also in Hungary, and upon the Alps. The fourth has been found under in several Places of Germany, as Tragus, Camerarius, Clusius and others affirn. The fifth was a Native of Italy, and was first thrice by Alphonus Paerson an excellent herbarist of Ferrara. The sixth came from Imperator of Naples, from Corisfas and Josephus de Casa bones, of whom Clusius says, that he received the Seed. These are the Native places of these five first, but with us in England, they are all Nurt up in Gardens.

X. The Times. They do all of them flower thro' the whole Month of July, and their Seed is ripe in August.

XI. The Qualities. They are cold and moist in the second Degree, as being good to heal Wounds and Ulcers, whether inward or outward.

XII. The Specification. They are peculiar for cooling Inflammations in Wounds and Tumors, and of the Pain; They subdue the acidity of Humors in the Bloody Flux, stop fluxes of Blood in Wounds, alloy Vapors, and cure Excoriation and Ulcers in the Stomach, Bowels, Liver, Lunges, Reins, Womb, or other inward parts.

XIII. The Preparation. You may have therefrom, 1. A Liquid Juice. 2. An Essence. 3. A Decoction or Infused Oil. 4. A Cataplasme of the Leaves. 5. A Distilled Water.

The Virtues.

XIV. The Liquid Juice. Used with Vinegar as a Bath or Wash, it takes away Scurv, Morpheat, Leprosy, and all other Deformities of the Skin, and is good to wash with old nithe Sordes, and purify Ulcers, to cleanse and heal them. It prevails against a Quinsy, the throat being gorged there with several times a Day, and outwardly it is being

Bathed therewith double Cloths wet therein, being also bound thereto.

XX. The Essence. Taken inwardly 1, 2, or 3 Spoonfulls at a time, it is good to heal any growing, Excoriation, or Ulcer in the Stomach, Intestines, Lungs, Liver, Spleen, Reins, Uterus, Bladder, or Womb, or other inward parts, being taken for several Days together. It also abates the acidity and the Humor of the Humors, heals other Bowels in the Bloody Flux, and stops all the fluxes of Blood in the Body, as also the bleeding of Wounds outwardly. The Root of these Plants, is said able to perform the same things, viz. The Essence made of the Root: inwardly taken for some considerable time, it wails and confounds Scrophulous Tumors, or Swellings of the Throat, from the Evil.

XVI. The Decoction or Infused Oil. It may be made of the green Herbs, or Root. Or it may be made by heating the Juice and Oil Olive together. It cools Inflammations, gives ease in hot Apoplexy, as also to all Internal Wounds, and is excellent to all Local Scalds or Eruptions within the Body, it quickly heals them. Being bound to the Throat of One that has a Quinty, it repels the Humor, suddenly puts the Patient out of Peril, and in a short time cures it, the Throat being gargled with the Juice or Essence, five or six times a Day. Applied to Ruptures, it is said to consolidate them, especially if the Patient is young.

XVII. The Cataplasm of the green Leaves or Roots. Applied to any simple Green Wound in Hands, Arms, Legs, Feet, or other parts of the Body, it quickly heals them. Being bound to the Throat of One that has a Quinty, it repels the Humor, suddenly puts the Patient out of Peril, and in a short time cures it, the Throat being gargled with the Juice or Essence, five or six times a Day. Applied to Ruptures, it is said to consolidate them, especially if the Patient is young.

XVIII. The Distilled Water. It has all the Virtues of the Liquid Juice and Essence, and may be given to fix Quinces or more, a little defilced with double refined Sugar, mixt with an equal part of Vinegar, it is said to be a regular Comfitet.

C H A P. DXXXV.

OF O X E Y E.

I. T H E N a m e. It is called in Arabick, B i h : in Greek, oikos: in Laine, Buphalbum, & Oculis Evos: and in English, Ox Eye. O EYE.

II. T H E K i n d s. Authors give us several Kinds of this Plant, but those which grow with us in England, are chiefly three following, viz. 1. Buphalbhum uncinatum, Buphalbhum Matthusii millifolius folius, Oculis Oevo virgini, Cachets Diercridis, Chrysanthemon Cordis, Fuckfis, Gefaneriis Turneri, The Common or Ocular Ox Eye. 2. Buphalbhum alatum Caste folio Cornuarii, & Buphalhbum Buphalbhum Noronhe, Cammoll-like Ox Eye. 3. Buphalbhum frut purpuracertetis, Ox Eye purple. Flowered. 4. Buphalbhum africamum termin. Buphalhbum Notani, Ox Eye Fennell Leav'd.
The Descriptions.

III. The first, or Common or Vulgar Ox-Eye. It has a small and slender Root, and fibrous stalks, one of which, if cut, yields, in the second year after the first Sowing, which Yarrow does not. This is the most common Ox-Eye with us; its Leaves are fair and green, divided very much into several other leaves, somewhat resembling Common Yarrow, and so taken to be by many who look but superficially upon it, as being carefully observed, it is found plainly to differ from it, the divisions not being so thick nor small. The Stalks tho' they grow upright, yet are not so stiff or strong as those of Yarrows, and at their tops they bear but few Flowers, larger than those of the Corn-Marigold, but wholly of a deep yellow, and not flowering, after which follows the Seed in the middle yellow Torus. The Figure we here exhibit to you is that which is in Ambleside his Epitome; but the more elegant cut of this Plant, is that which is in Balsiatus his Edition of Matthioli his Discurulis.

IV. The second, or Camomill-like Ox Eye. Its root is tough, long and slender, with some Fibres adjoining to it. The Stalks are weak, fappy, flexible or apt to bend, and green stalks, which grow furnished to be about 2 feet high, with fine Camomill or May-weed-like Leaves, but a little larger, disproportionately growing thereon, as also its Branches, every one of which bear a Flower like unto the former Ox-Eye, or Corn-Marigold, but its Leaves are fewer, yet somewhat larger than those of Camomill, and yellow, the yellow Torus in the middle being of a deeper yellow color, and somewhat hollow without.

V. The third, or Ox-Eye purple Flower'd. Its Root is much like the former. The Stalk also (which in the other is green) is more reddish in this. In the main, the Plant differs not much from the first in the manner of its growing, or in the form of its Leaves and Flowers, save that in this, the Flowers are either wholly purplish, or else purplish in the middle.

VI. The fourth, or Ox-Eye Fenend Leaf'd. It has a long slender Root, which is full of Fibres or Strings, and perishes every year after Seed time. It ripens up with one slender Stalk, with several long thin Leaves, variously divided, and cut into small fine parts, coming nearer to the form of Fenend, than any other, bearing a large yellow Flower at top of each Branch. Leaves and Flowers growing together.

VII. The Ox-Flower. They generally grow in moist Grounds, by Water Courses, and the like in other Countries; but with us they grow only in Gardens.

VIII. The Times. They Flower in June and July, and sometimes in August, the Seed being ripe not long after.

IX. The Qualities. Authors are very short in this part, all that they say of Ox-Eye, is, that it is DifculTive.

X. The Specification. It is said to difcult Tumors, and to be helpful against the Jaundice.

XI. The Preparations. You may have here-from 1. A Powder of the Heads of the Flowers. 2. A Cerot made of the same.

The Virtues.

XII. The Powder of the Flowers. It may be given in White Wine, from a Dash to two Drams Morning and Evening, and so it is helpful against the Jaundice: Or it may be so given immediately after Bathing, as Difcurulis says, and so it gives a good color to the Skin.

XIII. The Cerot of the Flowers. Applied to cold and hard Tumors or Swellings, it softens and diffuses them: and therefore may probably be good against Scrophulous Knores.

C H A P. DXXXVI.

Of O X - L I P S.

I. The Names. They have no proper Greek Name: but are called in Latin, Paradysia inflata calicibus: and in English, Ox-Lips.

II. The Kinds. It is a Species of the Cowflip, and of that sort, whose Flower is without any Hove, or green Husk to contain it, or if it has any, it is a very short one. It is threefold, viz. 1. Paradysia inflata calicibus simplicii, Ox-Lips single. 2. Paradysia fines calicibus dupliti, Ox-Lips double. 3. Paradysia calicibus tripliciis, Ox-Lips with jagged Husks. 4. Paradysia Flora Viridantis, five, Calaminifera, Ox-Lip green Ros, or Fever Flowered. All these we have treated on already in the Chapter of Cowflips, viz. Chap. 157, Sect. 9,
The Descriptions.

III. Gerarde's general Description. This well known Flower by the Name of Ox-Lip, differs not from the Cowslip, finding that the flowers are not so thick thrus together, and they are fairer, or

Ox-Lip.

not so many in number, and smell not so pleasant as the other: (to which we add) and standing noted, or without any green Hove or Hues, to contain them, or if they have any, it is a very short one. See the Figure.

IV. The fifth, or Ox-Lips double of a pale yellow color without Smell. Its Root is long, springing, and very vigorous, from whence spring forth many green Leaves, very like toThose of the Common Field Cowslip, very much of the same shape and make, rough, stiff, and a little Crumpled about the edges, each Leaf standing upon a Short foot Stalk. It has Stalks of Flowers, much like the Cowslip, growing in bunches, at the tops of the foot Stalks. The Flowers themselves are double, like those of the Double Cowslip, one within another, seeming that this has no Hove or Hues to contain them, nor more than the Single Ox-Lip has, but stand bare or naked, and of the very same largeness each of them, having very little or no Smell, but with this

difference; 1. That the Leaves of this Plant are something larger. 2. That the Flowers are also a little larger. 3. And that they are of a paler yellow color.

V. The Places. They are all found growing wild in Meadows and other Parent Fields, thrice throughout all England: from whence they have been Transplanted into Gardens, for delight; but, with such as are Lovers of Flowers, where they thrive, flourished, and grow taller than in their natural places.

VI. The Times. They Flower in the Spring of the Year, at the same time when Cowslips are in Flower, some earlier, and some later, but generally later, or after Primroses, so that their Season may be said to be from the beginning of April to the end of May. But I have seen some of them in Flower almost to the middle of June, tho' not often.

VII. The Qualities, Specification, Preparations, and Virtues of these are the same with those of Cowslips, which we have enumerated at large in Chap. 157. See i. ad 32. aforegoing. They are Singular Cephalicks, and Neuroticks, and therefore must be of extraordinary use in Diseases of the Head, Brain, and Nerves: and for curing pains in the Head, are accounted next to Betony. Experience has taught them that they are probable for the Cure of the Palp, for which reason the whole Tribe of Cowslips (of which there are Species) are called by many People Pallisworts. They are also probable against pains of the Joints, or Gout, (as are the Bear Ears also, which are another Species of Cowslips) for which reason they have obtained the Name Arthritis, as well as Paralysis or Paralysis.

VIII. The Juice of the Flowers. It is commended by some Authors, to cleanse, foment, and whiten the Skin, and to take away the spots, discolorings, and defections of the Face or Skin.

The said Juice drunk Morning, Noon, and Night, from $\frac{3}{5}$ to $\frac{5}{5}$, or $\frac{6}{5}$ Ounces, for some Days in a Glass of Water, Sherry, or White Lisbon Wine, is said to prevail wonderfully against both Pallis and Gout.

IX. The Juice of the Leaves. Snuff up the Nodifis as an Elixir, it purges the Head, Brain, and original of the Nerves, of cold and morbid Humors, which fall upon other parts, and cause Palis, Gouts, Convulsions, Evil, and many other dangerous Diseases.
Chap. DXXXVII. Of PANICK: or, GUINNY CORN.

I. The Name. It is called in Arabick, Da-

chos: in Greek, *Diósé: by Eymor: in Lat-

tine, Panicum and in English, Panick, Guinny Corn, and Indian Corn.

II. The Kinds. There are several sorts of this Plant, as, 1. Panicum Indicum, Panicum American-

num, Panicum Carolinianum; Masso Dietrichs & Galen; 2. Panicum Hylus; 3. paniculatum; 4. Panicum Cornu-

edum Indicum, Blew Indian Panick, 5. Panicum Indicum, Panicula Villofa, Indian Panick with a more hairy spiked Head. 6. Panicum Germani-

icum Panicula minor, Panicum album vulgare, Ordinary or Common Panick, German Panick.

Of the Manured Panick growing with us in Europe, there is but one sort. But the Indian or Guinny Panick is manifold, coming from East India, Guinny, Ethiopia, or Africa, and from America also: One sort has white Heads as big as ones Fift, thick and short, with round white Grains, having an hole or dent in every one of them. Another has a Head or Spike a Foot long, with a bowing top, as hairy as the third sort afore named. Another has a flender Spike a Foot and half long, larger at the lower part thereof, and smaller at the upper part, much like to the fift kind. Another has a half spiked Head, larger than both ones Fifths, and 9 or 10 Inches or more long, whole Stalk is a full Inch in Diameter, of a fine whitish yellow color. Besides all these, there are several other sorts growing in their Native places, too many to be enumerated here, and which to mention would be to little other pur-

pose than to fill up Room. We shall give you in this Chapter the Descriptions only of the five Kinds we have fift Named, which take as follows.

The Descriptions.

III. The fift, or Indian Panick, or Guinny Corn. Its Root is fibrous, consisting of many Threads or Strings; Its Stalk is very tall, as tall as the biggest Indian Maize. Its Leaves or Blades are toothed, like Millers or Maiz, very long and broad, and of a considerable thickness, with a Rib running all along the length of the middle. Its Ear is thick, close, and compact, made Taper fashion, broader or thicker as the lower end, and smaller at the top, or almost a Foot and half in length. Its Grain is much like that in Sect. 4. following, fusing that many of them are contained together in one Harry Head, which is fift to a very great Foot Stalk.

IV. The second, or Blew Indian Panick. It has a fibrous or stringy Root like the former, which sends forth Stalks, growing up to the height of a Man, or more, with spiny and great Fruits, full of a white spiny Fift like to the former, or that of Maiz, which near the Ground are of a shinning purplish color: it spreads it self out into many Branches, with large and long Leaves on them, like to those of the fift, which encompass the Stalk at the bottom, having each a thick Rib running its whole length through the middle. From the Fruits towards the top, as also at the top, come forth four round Panick like Heads, elder set together, than in the next following, and of a bloudy, shinning pur-

ple color, as the Stalk below, or rather much more Orient and frose, full of hairy Hooks, and small, long, bloudy, round Seed, or Grains in them, like unto Naked Oats.

V. The third, or Indian Panick, with a more hairy spiked Head. Its Root is a bush of Fibres or Strings, which sends up a thick, strong, jutted Stalk, four, five, or six Feet high, an Inch and quarter or more in thickness, whose Cen-

trality is filled with white spiny Fift, at the Fruits of the Stalks, and their Branches, come forth long, broad, thick Leaves like to the former,

Panick Indian; or Guinny Corn.

with a thick Rib running through their middle from the one end to the other, which when dry is white like Straw. At the top of the Stalks, comes forth a large spiked Head, almost Corn fashion, round, thick below, and small at top, a Foot or more long, sometimes fifteen or sixteen Inches in length, a little ensuing and bending downward, by reason of its weight: for it is very full of Grain close set together, the which is white or yellowish, and fashion almost like to Gromel Seed, or not much unlike to that of Millet; but the whole Spike is much more hairy than either of the former.

VI. The
Salmon's Herbal.

LI. The fourth, or Ordinary, or Common Panick, or German Panick. Its Root is bulky like to those of the former Kinds, but smaller, and dying every Year as it doth. It grows up with a reasonable strong jointed Stalk, half of a spiny Thistle, but not Danny as Millet is, having therein, something that large Leaks, greater by much than those of Wheat, and very near to the teguments of those of Millet, so that they can hardly be distinguished. At the top of the Stalk comes forth a whith, long, round, flafe Spike, round at the end, jointed, and at it were hairy, with small short Braches, all the length of it, when it is full ripe and opened, it is full of hairy soft Hooks, which include a small white Grain, something less than that of Millet, and not so fining. The Ear grows at top, single, not unlike to the Spike or Ear of that last described, but much ifer.

IVL. The fifth, or Wild Panick. Its Root is small and flender, jointed, Ready Stalks, set at the Joints with long Leaves, like to those of Soucham, but much ifer.

Climates, but in England, it is preferred only in manured Grounds.

IX. The time. They are not to be Sown till April, unless the Year be hot: The second Kind does not often come to Maturity here, but the ift many times will, if the summer be reasonable and warm, and it be Sown in a strong and fat Ground. But they prosper best in hot and dry Climates, and are apt to wither with much watering. The Grain is ripe about the beginning of August, and being full ripe when gathered, may be kept good a long time, if it is carefull preserved from the Weel, or other Vermin which may eat it.

X. The Qualities, Satisfaction, Preparations, and Virtues of the Grain are the same with those of Millet, in Chap. 491. Sect. 7. ad 17. aforesaid, to which I refer you. But Galen says, That Millet is better to all purposes than Panick, because also in Tails, and eather of Digestion, but he says, that Country people feed thereon, as we do of Wheat, being boiled in Milk, and so eaten. He also says, That that which grows in Italy, exceeds in goodness, that which grows in Asia.

XI. Nota. Johannes Lox, Historiar Africae, says, That in some places in those Countries, they make very fine Bread of Panick. It is eaten too, in our fteff Indes, where also we Eet our Dungal Fowls, Ducks, Geese, Turkey, Padgeons, &c. therewith. The Bread made of the Meal or Flower of Panick Rops Fluxes, by reason of its very dryning Quality or Property. A Cataplasm of the Meal or Flower, is flad alfo to be cooking, and drying, Strengthens the parts affected, and recovers a Flue of Humors.

XII. Panick boiled (or Phly fag) in Goate Milk, or in Cow Milk, which for all that I know may do as well, being Eaten twice a Day, Rops Larks or Fluxes of the Belly, but this I fuppofe is to be underfood, whilft the Dileafe is recent.

or Indian Panick at Sect. V. aforesaid. The Tops or fheater like top, is like to the Common Reed, or Ear of the Grass called Ileccion, or Manna Grass.

VIII. The Places. The frft three grow in Guinea, as alfo in the Kaff and Wei Indes, and fountry admirably well in our Plantations in America, but of them the third Species is Principal, and that which is chiefly planted, not only in Guinea, but alfo with us in the Wei Indes, and is Sown in many Places throughout all Europe, where it thrives very well. The fourth grows in Germany, and with us in many Places in Gardens. The fifth grows Wild in the hotter
III. The first, or Common Parnassius Grafs which is single flowered. It has a root consisting of a small blackish fibrous Buff of Threads, containing all the Waste. From the Head of this Root rise up many Leaves, not altogether round, but shaped below like the upper part of a Heart, broad in the middle, and ending in a point, sometimes sharp, and sometimes blunter like the lower part of a Heart, smaller and thicker than Violet Leaves, not much unlike some Ivy Leaves, or Leaves of Araliae, but smaller, and not of so dark a color; yet of a fresh sort of green, every

Parnassius Grafs Common single Flowered.

Parnassius Grafs of Mathiolius, without Flowers.
Parnassius Grass double Flowered.

in another, which makes the flower show double, the leaves of which flowers both the inner and outward are long and sharp pointed, otherwise in its form and manner of growing this Plant is like to the fiirs, but it seldom gives any Seed as the former does.

V. The Places. It is very probable that Parnassius Grass grew formerly very plentifully upon Mount Parnassius, from whence it seems to take its Name, where Cattle feeding became fat and in good liking, as they do when they feed upon Oower Grass, or St. Eve with us. The fiir grows in moit, marshy Ground, in England. It grows very plentifully in Lancashire, and in the North parts of England: at Doncaster, and in Thornton FIELDS in the time County: in the Moors near to London by Cambridge: at Hertford and Durham also in Suffolk, in the Butchers Close thereby; in a Meadow close on the back side of the Parforce Horse at Burton; and at the bottom of Burton Hills in Bedfordshire: in the Boggy Ground below the Red Well of Wellingborough in Northamptonshire; and in the Cattle-Fields of Barnwell upon Teesd, where it is found plentifully; in the middle of the great Town Field of Hock- ingdon, about a Mile from Oxford: in a fallen field next unto Banbury, in the High-way, on the other side of Oxford, and in several other places. The fiird was found growing in Bearhunt in Hants: but with us only in Gardens.

Salmon's Herbal. Lib. I.

W. The second, or Parnassius Grass double Flowered. This second Kind does ensue the former almost in all respects, its Root, Leaves, and Stalks being much alike, foaring that in this, the Leaves of the Plant are something longer, and the flower has a double row of Leaves one with

VI. The Times. They flower about the middle and latter end of July, and the Seed is ripe about the middle or end of August.

VII. The Qualities. It is cold and dry in the beginning of the fiift Degree, Attering, Aperitive, of thin parts, Diuretic, Nephritic, Vulnerary, and Alopathy.

VIII. The Specification. It is prevalent against the Stone, Sand, Gravel, and Tartarous Matter in the Urinary parts, provokes Urine, gives ease in the Strangury, strengthens the Stomach, stops Vomiting and Fluxes of the Bowels; stops Inflammations, stops Bleeding, and cures simple Green Wounds.

IX. The Preparation. You may have therefrom, 1. A Liquid Juice of the Herb and Roots. 2. A Dejection of the same. 3. An Ophthalmick. 4. A Powder of the Seed. 5. A Cataplasm.

The Virtues.

X. The Liquid Juice of the Leaves or Root. Paulus Aegineta says, that Parnassius Grass is moderately cold, of thin parts, and somewhat sweat. The Juice thereof does diffuse and expel Stones and Gravel from the Reins and Bladder, and provokes Urine abundantly. It eases the Tornours and Gripping pains of the Bowels, and heals Ulcers of the Bladder, it helps also against the Biting of any Venenous Bait. It is good to cool Inflammations of the Eyes, and to dry up the running or watering of them. It is also fit to be effectual to ease the Tooth-ach, being held in the Mouth against the Tooth. It is also applied to stop the Bleeding of Green Wounds, hinder or abate their Inflammation, and suddenly to confidate and heal them being outwardly applied. Dole inwardly from 2, to 6, or 8 Spoonfuls in any proper Vehicle.

XI. The Dejection of the Herb and Roots. It has all the Virtues of the Juice, but much weaker, and therefore may be given from a quarter of a Pint to half a Pint or more, sweetened with white Sugar morning and Night.

XII. The Ophthalmick. Take of the Liquid Juice 1 Ounce, Spirit of Witch 3 Ounces; Dissolve it in a fiirt Part of Water, and mix it with the fiirm Part of Sugar, and mix that with the Liquid Juice, and mix it again. It has all the Virtues of the Liquid Juice, as respecting the Eyes: it abates their Inflammation and watering, clears them from Miftinefs,เคล punk, andFilms, and heals Stones or Ulcers of the Eyes. Used as a Gargle it heals a Sore Mouth and Throat, and gives ease in the Tooth-ach.

XIII. The Powder of the Seed. It has all the Virtues of the Juice in respect to the Stone and Gravel in the Urinary parts, Strangury, &c. and operates more forcibly than it. It strengthens the Stomach, stops Vomiting, and cures any Flux of the Bowels, being given in a convenient Vehicle from a Scruples to a Dram, or Dram and half, in the Morning lifting, and last going to Bed.

XIV. The Cataplasm of the Herb and Roots. It effectually stops the Bleeding of Simple Green Wounds; and in a short time coagulates their Lips, and heals them.

Partly Garden Common.

The Descriptions.

Parly Garden Common.

that one would not think them to be Partly Leaves. The Flowers are white and small, growing in Umbels, and the Seed is small, longish, a little furrowed, of a whitish brown color, and hard and sharp in Taste.

V. The second, or Curt'd Parly. This is also a Garden Parly, and is in Taste and Virtue, like and equal to the former. This sort differs not in any thing from the former (for that it grows after the same manner) but only in the Leaves, which are very finely crisp'd or curlied, or folded in, on the edges, seeming like a Ruff, or Fane of curled Feather, whence came the Name.

VI. The third, or Virginian Parly. The Root of this is greater and flunter than that of the Common Kind, and perishes like it. The Plant grows also after the same manner that the Garden Parly does, but larger, having greater Stalks of Leaves, set by three and three, as in the former, but much larger, even as large as Smallage, and of a paler, or yellowish green color. The Stalks, Flowers, and Seed, are also like the first, but still larger, the Seed being those if not twice as big or large as it. The Root ther' it perishes after Seed time, yet endures usually the first Year of its Sowing: The Leaves as they are much larger, so they are also something rounder: and the Stalks grow to be sometimes three Feet high, which spread themselves out into Sandy Branches, on which grow Umbels of whitish Flowers. The Seed when ripe, falls and commonly stays itself, and springing up, bears Seed the second Year after its Sowing, this Virginian Parly is now become natural to our English Climate, and being of as good use as the first, is grown almost as common as it.

VII. The fourth, or Cretick or Candy Parly. Its Root is always single, or but one, of the thickness of a large Thyme, long and covered with a thin Kind or Bark, of a bluish color, which may

\[ \begin{align*}
\text{Parly Garden Common.} \\
\text{The Descriptions.}
\end{align*} \]
be rubbed off with white Fingers, being white under
ments, and of a faire soft Taste, like unto our Earth
Nuts, and is often eaten by the Nativity: it flour
and continues after Sestrians, growing forth a fresh
every year. In its manner of growing, it is very
to our Common Garden Partly, but better in
every part, having Leaves made and cut into such
like Wheat, but finer, and something thicker.
The Seeds are, like, but thinner in our Common
Partly, bearing such like Fae or Umbles of white
Flowers, after which follows a smaller Seed than that
of Partly, but blacker.

VIII. Nota. There is another Species of this
Candy Orifice, but it differs nothing from that last
defcribed, but in the color of its root, which is
reddish on the outside, and not black as the former.
This Flowers and Seeds also earlier than the others,
and its Root is as fit to be eaten. The Country
People in Candy call it Agrinaeolus, i.e. Polliaes
Sylvius, but it has no likeness to, or resemblance
of a Parry.

IX. The Places. The Names of some of thefe
shores where they first came: but they all of them
grow in our Gardens in England, where they thrive
admirably well. They delight to grow in moilt
and watery Grounds, near Fountains and Springs
and other moift places: and Yew thus says, that
Parry's is found growing of it self in many Ferry
Grounds in Germany.

X. The Times. It may be Sown in the Spring,
but it comes slowly up; and in its growing may be
often cut and cropped, till it Spoils it self, yet it
brings forth its Stalk but in its second Year, after
which, it Flowers in June or July, and the Seed
is ripe in July and August, after which the
Root (except in the Candy Kind) dies away and
perishes.

XI. The Qualities. The Leaves and Roots of
Parry are hot and dry in the second Degree, but the
Seed in the third Degree. It is Aperitive, Al-
ferive, Attractive, Carminative, Digestive, Dif-
cutive, Diffusive, Cephalick, Cephelic, Emnetick,
Stomatrick, Nephritic, Hyderick, Emmerick, Angelick,
and Sparramagnierick.

XII. The Specification. It is peculiar against
the Cholick in the Stomach and Bowels, expells
Wind, opens obstructions of the Liver, Spleen,
Reins and Womb, gives ease in the Stomach
provokes Urine, is laid to break and expell the
Stone, Gravel, Sand and Tartarous Slime; is pro-
missible against the Jaundice, Droppry, and Falling
Sicknesses, provokes the Terms in Women, facil-
itates the Birth, and reliefs and expells Pelican.

XIII. The Preparations. Of this Plant the Leaves,
Roots, and Seed are all used: the Leaves are weak-
eat the Roots are in length; and the Seed
which is the strongest of all. These following Forms
may be made of the whole, viz. 1. A Liquid Juice
of Leaves or Roots. 2. An Infusion of the
Seed. 3. A Decoction of the Roots. 4. An Infusion of the
Seed. 5. A Powder of the Seed. 6. A Compound
Decoction from Trages. 7. An Oil of the Leaves,
Roots or Seed by Decoction. 8. A Cataplasm of all
the three. 9. A Distilled Water of the whole
Plant. 10. A Spirituous Tincture of the Seed. 11.
An Acid Tincture of the same. 12. An Oil
Tincture of the same. 13. A Chymical Oil of the
Seed. 14. Petroleums or Powders of the Seed. 15.
An Oil of the same.

The Virtues.

XIV. The Liquid Juice of the Leaves or Roots.
It is comfortable to the Stomach, eases the Bram-
gry, and powerfully provokes Urine and Womem's
Courtes: expells Wind whether in the Stomach or
Bowels, and does a little open the Body, making
the Belly Stale, but not so dry as to expelle the
and opens Obstructions of Lungs, Liver, Spleen,
Reins and Womb; and therefore is mixt with Solubrites,
or things which move the Belly downwards. The
Seed is one of the five opening Roots; and there-
fore the Juice thereof must be provable against all
Diseases proceeding from Obstruction. Doef 4 or
6 Spoonfuls Morning, Noon, and Night, either
alone, or mixt with a Glass of White Port, or
Lisbon Wine.

XV. The Essence of the same. It has all the
Virtues of the Liquor Juice, and more powerful
to the Intestines: better which, it is laid to break
the Stone whether in Reins or Bladder, as also to
expell Stones, Gravel, Sand or Tartarous Matter
from the Reins and Bladder. It eases the pain of
the Stomach, reliefs and expells Poofon, and
is good against the Birtings of Mad Dogs, Serpents,
or other Venerous Creatures: It helps such as
have been hurt by taking of Liquorice: stirs the
Vapors in Women, which eilinates the Head and Eyes,
and is profitable against the Droppy and Yellow
Jaundice. Doef 2 or 3 Spoonfuls or more, Morn-
ing and Evening in a Glass of Wine.

XVI. The Decoction of the Root. It is a power-
ful Aperitive, and opens all Obstructions of the Va-
fers, having all the Virtues of the Juice and
Essence: but as it is a much weaker Preperation,
so it may be given, with a continuance, as from 4 to
8 or 10 Ounces Morning and Night.

XVII. The Powder of the Seed. It may be
given from a Dram to 2 Drams Morning and
Night, against the Stone, Gravel, Sand, and Gli-
tinous Slime in the Urinary parts, and is very
effectual to expel the same; and also to provoke
Urine and the Terms in Women, to give ease in
the Collick, Gripings of the Guts, and After-
pains of Women in Child-Bed: It eases pains in
the Stomach and Bowels, proceeding from Wind,
and has all the Virtues of the Juice, Essence and
Decoction.

XVIII. The Infusion of the Seed. It eases
the Gripings of Infants, and may be given against all
the Diseases before: it is given: Dofe Morning,
and Evening, from 6 Ounces to 8, a little dulcified with
two Reined Sugars.

XIX. The Compound Decoction of Trages. Take
Seed of Parry, Anise, Currenric, Feenel, of each an
Ounce: of the Roots of Parry, of Saxifrage, of
Currenric, of Burnet, of each an Ounce of half:
let the Roots be washed and choppt small, and the Seeds
brushed: let them infuse a Night or two in 2 Quarts
of White Port Wine: after which, gently boil alinge-
ther in an Earthen Vessel close cover'd with an
Alumtook Head, till about a third part is wasted:
then strain out, and let it stand to sette. This
opens Obstructions of the Liver, Spleen, Reins
and Womb, prevails against the Falling-Sicknesses,
and forces away the Mothick Manes of the
Jaundice and Droppry by Urine, curing those Dise-
ares in a short time. Dofe 4 Ounces at a time,
first and last Morning and Night.

XX. The Decoction Oil of Leaves, Roots, or
Seed. It is Anodyn, or an eser of Pain, diffuses
recent Turners, alleviates pains of the Gout, and
takes away black and blew Marks, coming by
means of Bruises, Rises, and the like, and is a
beautify upon Womans Breasts, which are Swelld,
Painful and hard with their Milk, it abate the Tumor,
Diffulces the Humor, and eases the pain thereof.

XWI.
Chap. DXL.  

Of PARSLY. Macedonian.

MOUNTAIN PARSLY.

I. THE NAME. It is called in Greek, 

Apoecismus, or Apouia Macedonius, 

or in Latin, Apium Macedoniacum Petrofelinum; 

& Selium, et Petrofelinum Macedonicae; 

and in English, Macedonian Parsley, Mountain Parsley, 

and Stone Parsley.

II. THE KINDS. What the Macedonian Parsley, 

or Stone Parsley of Desfords was, is hard now 

to determine, by reason he is so deficient in his 

Description thereof; what our Modern Authors 

account for the same, we shall here give you, 
two kinds of which they have Described to 

us, viz. 1. Petrofelinum Macedoniacum quinquifolium. 

The first supposes Stone Parsley of Macedonia, 

and that it was thought to be, by Matthiolus, 

Apoecismus, Lugiunensium, Tubernanuntianus, 

& Callor Duranton, in their times, and still continues 
to be thought of in our Days, and more proper, 

for that the forms of the Roots, Stalks, Leaves, 

Flowers and Seed, so nearly resembles our Common 

Parsley, and the qualities of the Seed are answerable 
to the properties which Galen does appropriate 
to it. 2. Petrofelinum Macedoniacum quatuor Dofe 

champii, The second supposed Stone Parsley of 

Macedonia, this seems to be the Petrofelinum 

Pilatu, and differs from the former, in the form of 

the Leaves, as being finer cut than any of them, 

for which reason as I suppose it is that Buhinus 
calls it Apium Montanum folio tenirure, but agrees 
much with it, in the qualities, sippens and 

ternets of the Seed. Now because these Stone 

Parsleys grow upon Hills and Mountains, they 

may properly enough be called also Oreofelius, or 

Apoecismus Montanum Parsley. 3. But of the 

Mountain Parsley, properly to call there are 

several Kinds, which by reason they are altogether 

of the same Nature and Qualities with the former, 

we shall take the Liberty to Treat of them 
in this place, the chief of which are the three follox 
wins, viz. 3. Oreofelius Apoecismus Macedoniae 

vulgatissimum, Montanum, Apium Montanum vulgatissimum, 

Oreofelius Macedonius, Apium Montanum, Apium 

Chelil, Apium Lugiunensium, Apium Apianum, Dofe 

champi, The more Common Mountain Parsley, 

4. Oreofelius vulgarissimus, Apium Montanum verius 

Callor Persicarmium Chelil, Buhin, Apium 

Persicarum, Apium folio dominico, Buhin, The true 

Mountain Parsley, or the Oreofelius verius Des 

fordii. 5. Oreofelius Persicarum Lugiuneus, 

Apium Montanum Persicarum Apium Montanum 

Nigerum, The Paris, or Black Mountain Parsley.

The Descriptions.

III. The fift, or First supposed Stone Parsley 

of Macedonia. Its Root is somewhat thick, short, 

and white, perishing in our Country, after it has 
yielded its Seed, the not so as it is said, in the 

warmer
Partry Macedonian.

Salmon's Herbal. Lib. I.

814

Partry, somewhat blackish, and farronored or covered like unto Camumin Seed, of a very sharp Taste, almost burning the Mouth, and of a foresh Smell, but fo bitter, that it is the most bitter Seed of all the kinds of Partry. This kind is taken by Dalechamps to be the True Partry of Macedonia, to which Columna refers it.

V. The third, or the more common Mountain Partry. The Root of this Plant is long, great and thick, with a bush of Hairs at the top thereof, being cover'd with Tafie, sharp and Aromaticall: from whence it grows up several reddish Stalks of large spread Leaves, and divided into several partes, facing like a bush upon the Ground next the Root, cover'd like unto Garden Partry, but something larger, and swelling well. From among which rises up a short stalk of about half a yard high; and or these all the Leaves upon it, branching or spreading it sett out towards the top, and bearing thick Tufts or Umbels of white Flowers, after which comes small Seed, like that of Smallage, smelling a little fetid, sharp in Taffe, and bitter withall.

VI. The fourth, or True Mountain Partry of Dioscorides. The Root of this is small, long, and white, not much differing from that of Common Garden Partry: from whence it grows forth next the Ground several Stalks of folded Leaves, and among them, a small Kexie Stalk, in some places, growing tall and high, in others more short and low, according to the Soil in which it grows; bearing a second large spread Leaves, cut and divided something like to those of Hemlock, or Garden Partry, bearing at the top, Umbels of white Flowers, after which comes the Seed, which is long and blackish, not much unlike in Common Seed, being fetid in Swell, and sharp in Taffe.

VII. The fifth, or Paris, or Black Mountain Partry. Its Root is long, white, and thick, swelling and smelling much like to the Root of itself Partry, which is hot, bitter, and unpleasant. The whole Plant does resemble our Common Garden Partry, being thick, and growing on the Ground: the Flowers grow at the Tops of the Stalks and Branches in Umbels, of a white color: after which comes the Seed, which is sharp in Taffe, but smelling very sweetly.

VIII. The Place. The first grows in Camdia and Venice, and the Seed has been brought from thence to us. The second grows (as Lugdunensis saith) on the Rocky Hill of Hungara, and (as Columna saith) on the Hills of Campodonensis and Aquileia: with us they both grow in Gardnas, where they flourish very well. The third, or first Mountain Partry grows near unto Vienna in Anglia (as Claudius saith) and on the Mountains on the Rocks in Germany, and other Places. Dalmatis saith, it grows upon the Hills which divide Sileia from Alburnus: also it is said to be found on other Hills and Mountains in the North part of England. The fourth, or second Mountain Partry, is found on the borders of Fields on the Mountains of Burghely. The fifth, or third Mountain Partry, is found on the sandy top of the Surene Hill near Paris: but these two last grow with us only in Gardnas.

IX. The Times. The two first Flower in the Summer Months, but Seed late with us. The other three Flower also in the Summer time, and yield their ripe Seed soon after.

X. Preparations and Virtues of these Species, are the same with those of Our common Garden Partry, declared in Chap. 559. just alfoe, so that we need say no more of them here.

English Herbs.

I. TH E Name. It is called in Greek,
Siumou's or in Latin, Siumum vel Petroselium Sylvestre, Apium Agryfe vel Sylviae, and in English, Wild Parsley.

II. The Kind. There are several Kinds of this Plant, 1. Siumum or Sifon vulgaris, Sium, or in German, Sifon vulgus, (Go that Sifon and Simon, or Simon, Simon Hypericum, (Go that Sifon and Simon, be hot one Plant, as Cordow does also acknowledge),
2. Small Wild Parsley. The ignorance of many German Apothecaries took the Seed of this to be
Ammum, as Trogus, Gefer, and others affirm, but very Erroniously, and do they called it Amnum
Germanicum; Cypria and Dedosan called it, Petroselium Macedonianum, which is yet as great a Mistake at the former. 2. Sifon
Oleraire Alpin, Sweet Wild Parsley, 3. Cowparsley, or Pois Embruns, Thufeslum Plantis, Apium Syb

C H A P. DXII.

Of P A R S L Y Wild.

The Description.

III. The first, or Small Wild Parsley, Common Wild Parsley. Its Root grows down the Ground into
very way, by which means it takes full hold of the Ground, and shines long. It rises up with a tail
flender Stalk, scarcely able to stand upright without help, thins for with winged Leaves in its Branches,
the lower Leaves being larger, and feveral being set on a Stalk on both sides, each of which is as
small as a small acorn, as the Leaves of our Common Anmm, or Bifhaps, Weed; some whereof will be cut in on
the edges more or less, and some not at all, but all of them dented about the edges. At the
top of the Stalks and Branches, grow feveral Umbels of white Flowers, which turn into small black-
ifh Seed, something like Dill, but a good fmall, but in white, and bitterflh in Taste, rather like to Smalling Seed. This Plant is called Dillage,
or Sweet Scented, to dilgugift from the
former Sifon vulgar, the I am apt to believe, that is not the Sifon verum Diofibitis. Some have thought also that this Herb
was the Sifell Mifliffe, or Hart-wort of Muiffills, but were
mistaken.

IV. The second Kind, or Sien Wild Parsley. Its Root is long, white and fnder, from whence springs
forth a fingle Stalk, about three feet high, with long Fennel like Leaves at the joints, which have
a fower small, between that of Dill and Fennel. At the top of the Stalks and Branches, are feveral
Umbels of white Flowers, which are thin fett. After which the Seed, which is small, black,
of a good fmall, and bitterflh in Taste, somewhat like to Smalling Seed. This Plant is called Dillage,
or Sweet Scented, to dilgugift from the
former Sifon vulgar, the I am apt to believe, that is not the Sifon verum Diofibitis. Some have thought also that this Herb
was the Sifell Mifliffe, or Hart-wort of Muiffills, but were
mistaken.

V. The third Kind, or Jagged Parle, Wild Parle with juggled Leaves, or Wild Milkf Parley. Its
Root breaeds its self out into many long Strings and Vines, and running deep into the Ground, somewhat like unto Mean, or Sifegle, oblong or fquare many
Years. This Kind of Wild Parley, has several
large, well spread winged Leaves, something fefembling fome of Garden Parley; but are divided
into more parts, and each droph hab smaller
Leaves, which look, as if they were cut or juggled into small parts: from among which, rife up a
bollow fhorted Stalk a Yard high, redhish towards the bottom, sometimes with the like Leaves at the
joints, where it Branches or Dillfes, being set
at the top of the Stalks and Branches, thick Umbels of white Flowers, redhish on the one fide, and pale
on the other, and after them flat Seed, somewhat
like unto Parley Seed, but a little larger, oblong, or Tafes, and somewhat Aromaticke. The whole Plant,
and every part thereof, if broken in any part,
yields a Milk fauce.

VI. The Places. The fist was formerly thought to
a Forraign Plant, the Seed being to be had
Salmon's Herbal. Lib. 1.

In the Apothecaries Shops in Germany, under the Title of Amamum, or as some have had it, Aromatum Germanicum, tho' it was no more that Seed than it was Amas Seed; but afterwards, as Gower in Horas flow'd, it was found growing Wild in sundry places in Germany, as it has been found in like manner growing with us, next Hazards, by modo' Ditches, almost every where. The second grows with us only in Gardens. The third is found by Ponds sides, in Ditches also having in them running Water, in mudd and marshy or moonish Grounds, and in Water-Courts, also in most Woods, near the old Stocks of Alder Trees.

VII. The Times. They all Flower in June and July, and the Seed is ripe in some short time after.

VIII. The Qualities, Specification, Preparations and Vertues of these several Wild Parsleys, are the fame with those of our Common Garden Parsley, saving that in the effects, these are, or have been found to be the more potent and operative.

IX. Note. The Root of the third or Milk Kind, as it is found to be hot and dry in the third Degree, by being chewed in the Mouth, it draws away much Rheum or pititious Humor from the Head Throat, Tooth's and parts adjacent, and in an especial manner calls the Tooth's ache. And this Quality, Plain Eyes, the Root of his Thyphlonium is endued withall. The other properties of the other Wild Kinds, are, no doubt to be found in this, and that to no less effect, as well to incite, as to attenuate, be aperitive, and diureticky, forcibly to provoke Urine, and the Terms in Women when flues.

CHAP. DXLI.

Of Parsley Baftard; or, Hedge Parsley.

I. THE Name. It is called in Greek, Δαρὰ
               ἀνδρίστος, in Latin, Saliurn
               matrum, Apium matrum, & Cau- 
               calis: in English, Baftard Par- 
               sley, and Hedge Parsley.

II. The Kinds. There are many Species of this
               Plant, as, 1. Cauclis vulgaris Fibrum albi Lm- 
               afii, Lappa agrestis Trogl, Lappulo Canaria Pli- 
               ni Anglica, Cauclis adus vulgaris & Myrtus
               Lappa Dilatata Thysanos, Cauclis Dodoni,
               Gefneri, alteramque: wodium, Echinophora
               Collums, our Common Baftard Parly. 2. Cauclis
               Anglica Fobre rotondus, Cauclis Apj folius Fobre
               rhabdus Gerardis, our English Baftard Parly with
               reddish Flowers. 3. Cauclis Maxima Baftis,
               Cauclis major Clupj, Cauclis maximus fpecies
               acuta, the Great Baftard Parly, or Great rough
               Parly. 4. Cauclis minor Fobre Rubens, Cauclis
               minor fucclis ruberibus, Small Baftard Parly with
               reddish Flowers, Hedge Parly, as Gerard has it.
               5. Cauclis nodosa fpecies cunctata Cauclis minor
               Cordis in Hysteris, & Thalys, Knotted Parly, Small
               Baftard Parly with knotted Joints. 6. Cauclis
               folo Fionculi, Cauclis Angliarae Labelae, Cau- 
               clis Pera Luppina, Cauclis folo Pecordum
               Baftis, Baftard Parly Penned Leaved, Hog Parly.

7. Cauclis eretto fpecies purpureus, Echinopho-
               ra major plasphylos purpureus Column, Baftard
               Parly broad Leaved, or the Greater with prickly
               Seeds. 8. Cauclis tremula purpurascens, Echin- 
               phora Lepophyllos Column, Baftard Parly the
               Lesser, Baftard Parly fine or small Leaved.

The Descriptions.

III. The first, or Our Common Baftard Parly. It
               has a Root which is straight and finge, running
               deep into the Ground, of a white color, and be- 
               ing the taste of a Parly. It rises up with a Point
               Stalk, about half a Yard high, and set at the Joints,
               with whits rough Leaves diversly cut. It is a

Parsley Baftard, or Cauclis.
The flower he has or seven such like small flowers. The leaves being broken, give little or no taste.

After the flowers are past, come the seed, which are rough Burrs, sticking to any thing they touch, like the Seed of Hounds-Tongue, within which are contained two brown Seeds, like unto half'd Oats, but larger.

V. The third, or the greatest Batchard Parly, or Great rough Parly. Its Root is white, hard and woody. From whence springing up many upright tall crested Stalks, three or four feet or more high, being hollow within, and with divers Points on them. These Stalks are spread out into several Branches, and at each Joint they send forth long and large winged Leaves, encompassing their Stalks at the bottom, which Leaves are large, and something like those of Angelica but rougher, and of a darker green, set by couples on the middle Rib, and an odd one at the end, all of them finely cut or dented about the edges. As the tops of the Stalks and Branches, grow long Umbels of Whitish flowers; somewhat of a purplish, or bluish, or dark color underneath, after which come very large and flat rough Seed, almost like that of Cow Parsley, but rougher, which is placed at the Head or Top, with a double point, and prickly round about.

VI. The fourth, or small Batchard Parly with reddish Flowers, or Hedge Parly, is another, has it. Its Root is small and white, from whence springing up small and rough Stalks, crested and hollow, growing up to the height of two feet or more, on which at the joints grow winged Leaves, made of several

**Batchard Parly**

**English, red flowered.**

**Parsley Batchard small red flower'd.**

**Hedge Parly.**
Parly Hedge Knotted.

VIII. The sixth, or Ballard Parly Fennel Leav'd, Hogs Partly. Its Root is fingle, long and white, running deep into the Earth, bruised about the upper end, with many Fibers or Cords of a brown color, which Root has the Taffe of a Partly. From which rises up divers Stalks full of Flowers, covered with a fmall or shiny Skin, like unto that of Mustard, rising up to the about half a Yard high. Gerard says, These Leaves are fiece cut or pigger, resembling the Leaves of Our English Saffron; but Ballard says, That both in Stalk and Leaf it is very like unto Fennel. At the top of the Stalks it bears flaky Rundred, or Fombies of white fpecies furnishing Flowers, fet close together, like this, and often fed after them. The Kernel or Seed within the Mabb, is nothing like to Half'd Burly.

X. The eighfh, or Ballard Parly the Lettfe, or Ballard Parly five or Small Leav'd. The Root is as the former but feller. The Leaves are not finely cut into ferrated parts like unto Wild Carioc. The Umbles of Flowers grow at the tops of the Stalks and Branches, and stand three and three or together, like this, and often fed after them. The Kernel or Seed within the Mabb, is nothing like to Half'd Burly.

XI. The ninth, or Ballard Parly with great prickly Seeds. Its Root is small and white, and something Sweet both in Taffe and Smell. The Leaves hereof are divided fomething like to those of the Greater Parly Leav'd Daucus, and fmall and fmall. The Stalk is a bout two Feet long and fomewhat rough, being like the Leaves at the joint upward, but fmalier, bearing small Umbles of which Flowers, standing together, and fomewhat unlike but too Seeds on them, which are twice as big as others, and more rough and ftruck, having a large flatter Kernel within it.

XII. The tenth, or Ballard Parly the Greater, deep red flower'd. - The Great red Flower'd Kind has larger winged Leaves than the twelfh Species, or Spanish Kind fsembling, being divided and cut in, after the manner of our Butter Saxhag Leaves. The Flowers hereof, are larger than those of the Younger, or our Common Ballard Parly but each of an equal bignef, and of a deep red color.

XIII. The eleventh, or Ballard Mountain Parly with fmall fine Leaves. The Root is some what long and thin, from which rises a Stalk of a Root in height, spread out from the bottom into small round fomewhat Branches, and they again into feller, whole fomewhat Branches, even near the Root as well as the others, bear small Umbles of very small or white Flowers, and afterwards small long Tear'd Seeds. The Leaves next unto the Stalk are divided into very fine and fmall Leaves, but those above on the Stalk are much more fmall, even like Hairs.

XIV. The little longifb ones, fet one againft another, fmall or fplayed in about the edge, and ending in a long and fharp pointed Leaf, not much unlike to the winged Leaves of Herbeek, but each of them broader, and the end Leaf longer: These Leaves, as also the Stalks, are rough and bafh, and of a dark green color. At the upper joints of the Stalks, overrided with a fmall or shiny Skin, of reddifh flowers, and fometimes more white, which being put away, there follows small, round, rough Seed, of fomewhat a strong and aromatic Taffe and Smell. It is an Annual Plant, and fprings up every Year from its Seed, being Soon.

XVIII. The fifh, or Knotted Partly, small Ballard Partly with Knotted Joints. It has a white long, and fmall Root, which perifhes every Year, and fprings up again by the fanging of the Seed, whether in the Field or Garden. From this Root fpring up feveral crefed, long, fmall, rough and trailing Branches, which commonly fycly along upon the Ground, fome longer, fome shorter, fome a Root long, fome a Foot and half or more in length, which are fet at feveral diftances with long winged Leaves, which are small, rough and deeply pigger, pretty deeply cut or defented about the edge, having 3, 4, 5, and fometimes 6 couples or pairs of Leaves upon a Wing, growing upon a middle Rib, with a single Leaf somewhat larger than the rest at the end thereof. These Leaves are rough, or a little crumpled, but not hairy, and of an overgrown, or deep green color. At the fettling on of each Leaf at the joints, close to the Stalks, at every joint round about it, almost close unto it, usually upon very fhort foot-Stalks, come fome fmall whiflifh or reddifh Flowers, out of rough Hulks, conflation of five Leaves apiece, after which follows the Seed, which is fmall, round and rough, hard and prickly, growing close to the Stalk.

XVIII. The
Chap. 543. English Herbs. 819

XIV. The twelfth, or Spanish Bardless Parsly. This Root perishes after Seed time, and the this in a Misty Plant yet being cut or broken, it grows no Milk. From this Root rise up several crested rough Stalks, and Leaves very like to the first. Parsons Baskell Parfly, but the Umbels of white Flowers are smaller, and grow more round together, as it were into the form of a round Head; and the Seed which follows is greater, very much striped, and rough, but not prickly. The Herb being broken in any part, it yields a sweet Milk.

XV. The Place. These several Baskell Parflies grow Wild in several Countries of Zuffra, Eng-land, France, Germany, Italy, Spain, &c. The first is common almost everywhere in our Country. The second was found in Lincoln-shire, on the North Decent of the North Field of Whitleigh nigh Bexley, it was also found growing in the Corn Fields about Bath. The third and fourth grows about Hedges, and in Plowed Fields, almost every where. The fifth grows Wild with us in several places. Gerard says, it is grown upon the Banks in the Fields about St. James’s and Pickadil-ly, which was before these places were Built upon, and made into Streets, &c. The red Nodules, Stalks, and Stoney Grounds, and those which grow not Wild with us, are many times to be found in the Gardens of the more Curious.

XVI. The Time. They all Flower and Seed very well in England, from the beginning of June to the end of August. The second and third Flower in July, or July, and the Seed is ripe in Summer, and August. If the Seed is Sown in September, it will come up and continue green all the Winter.

XVII. The Qualities, Specification, Preparation, and Vertues of these Baskell Parflies, are the same with those of our Common Garden Parfly in Chap. 539. afo foregoing, to which you are refer’d.

XVIII. Note 1. The Juice of Baskell Parfly, not only provokes Urine and the Bladder, but as Matthioli says, is comfortable to the Heart, opens obstructions of the Liver and Spicen, cleanses the Rein of Stones, Gravel, and Tauricous Mucilages, and therefore must be prohibitable against all Diseases of these parts, excites Urine, and strengthens the Instruments of Generation.

XIX. Note 2. The green Herb. According to Dioscorides, it was a familiar Saller Herb, and therefore used in his time more for Meat then Medicine; but later Physicians have found it to be good for many other Diseases, even for all that the Common Garden Parfly is good for, as is before ex-pressed; if the whole Herb is eaten with Vinegar, after a Vomit, it cleanses the Belly, and cauks a good Appetite, taking away locking of Meat, and disorders.

XX. Note. The Efficacy. It has the Virtue of the Juice, besides which it prevals exceedingly Hypochondriack Melancholy, is good against Quarrels, Scur, Scabs, Irish and French Dihafe, being given 2 Ounces at a time Morning and Evening either in a Glafl of Wine, or other fit Vehicle.

XXI. Note. The Powder of the Seed. Given to a Dran, more or less in a Glafl of White Port, or Lisbon Wine, it is said to clear and sharpen the Eye Sight, and provoke Urine exceedingly in both Sexes, as also all the Complaints in Woman. It is likewise given with Cerebrum or Sprenenwort, and Seeds of Agnus Callus, against the Running of the Pores. The Powder being drank also in Wine,

culs Fruitfulness in barren Women, and is good against the Bitings of Venerous Heads, more especially if a Carafe of the green Herb be also applied to the Wound.

C H A P. DXLI1.

Of PARSLEY Laughing, or PARSE-A-Flower.

I. The Name. I know no Greek Name for this Plant, but the it is called in Latin, Pulsatilla, also Apium Rubeum; also Sardoni-um, Herba Sardonia, & Herb Vera; in English, Laughing Parsly, by some, and Pafsque-Flower, or Pafsque Flower, by others, because of their Flowering about Easter, or time of the Paschal Solemnity.

II. The Kinde. This Plant is no Species of the Parsly, tho’ (through Calumny) it has obtained the Name of Apium rubeum, which I think it is Sement of the Antimony, tho’ some Learned Men are of that Opinion, nor yet a Kind of Crownfoot, which none would have it to be, rather a Genus of its own, not related to any other. Of this Pafsque-Flower there are several Kinde, as, 1. Pulsatilla Anglica purpurea, Pulsatilla vulgaris, Armeni Limonia Pulschompy, Sardona Plinis, Our English purple Pafsque Flower. 2. Pulsatilla Verbo rubra, Pulsatilla rubra Gerardis, The red Pafsque Flower. 3. Pulsatilla Verbo lutea, The yellow Pafsque Flower. 4. Pulsatilla Verbo alba, The white Pafsque Flower. 5. Pulsatilla Dunkis, The Danish Pafsque Flower. 6. Pulsatilla Dunkis Verbo duplci, The double Danish Pafsque Flower.

The Descriptions.

III. The first, or Our English purple Pafsque Flower. The Root is very thick and long, running downwards, or deep into the Ground, and not lying or running under the upper Crown thereof, as the Wild Antimonies do, boding at the top of the said Root, a Tuft of Hair, or kind of bary Beard adjacent thereto. From this Root rises up many Winged Leaves, lying upon the Ground, somewhat rough or hairy, hard in feeling, and finely cut into many small Leaves, of a dark green color, in form almost like to those of Corus, but finer and smaller. From among these Leaves, rise up naked Stalks, rough and hairy, set about the middle thereof, with four small divided Leaves, compassing them, the said Stalks rise up those Leaves, about a Span high, bearing at the top of every one of them one pendul-ous Flower, Bell fashioned as Cornflowers, and very beautiful, of a bright delayed purple color, or consisting of six Leaves of a fine Violet purple color, and sometimes deep withal. In the middle thereof is a tuft of many yellow Throats or Thorns, set about a middle purple Pointed. When the whole Flower is paff, there succeeds a bulky Knob, or

5 M 2

Head
Parsley Laughing Common.

V. The second, or Red Pauque Flower. This Plant in its Roots, Leaves, Stalks, and Seeds, is also in its manner of growing, differs not from that before described, saving, 1. That in this Plant the Leaves are longer and much more finely cut. 2. That the Flower is something smaller but with longer Leavens, which are of a bright red color, whereas the former was of a purple color.

VI. The fourth, or White Pauque Flower. Its Root runs deep into the Earth, of about the thickness of a Man's finger. Its Leaves are cut and divided, very like unto the Leaves of the first Kind, but several of them, green on the upper side, and hairy underneath. The Stalk is round and hoary, the middle thereof is beset with some small Leaves, as in the others, from among which rise up the Stalks of the Flowers, consisting of six Leaves, of a very fair yellow color on the outside, and of a hoary pale yellow on the outside: after which follows such a Knob or Head of hairy Thrums as in the former.

VII. The fifth, or Danith Pauque Flower. This in respect to its Root, Leaves, Stalks, Flowers, and form of growing, is very like to the first, or English Kind, before described, and differs from it only in these respects. 1. That in its Root, Leaf and Flower, it is larger. 2. That the Flower is of a finer purple color, and not so deep. 3. That sometimes, and in some Plants the Flower is found white. 4. That it will better abide with us, and be more easily managed than our English Kind, the same is a Native of our Country, and grows Wild there, in many places.

VIII. The fourth, or double Danith Pauque Flower. This in its Roots, Leaves, Stalks, Flowers, Heads, Seeds, and manner of growing, differs nothing from that before described, saving in the duplicity of the Flowers: for whereas the former Flower was single, this is double flowering, having two rows of Leaves, the one within the other.

IX. The Place. The fifth is found in many places of England, upon dry Banks which lie open to the Sun. It did grow very plentifully in a Pasture or Close belonging to the Parsonage House of Holdenharm, a small Village, about six miles distant from Cambridge. The first four grow Wild in France, Germany, and other Countries. In untilled, rough, Stoney and Rocky places. The fifth and sixth grow in Denmark, and were brought from thence into England, where they Flourish rather better than in their own Country. The
 Chap. 544. English Herbs.

second Red Kind, Lobel Gays, was brought from Syria. The third or Yellow Kind, Clavius makes it to be so, and both Antcinene, and the Red, which it was found growing plentifully at the foot of St. Bernard's Hill near the Cansons of Switzerland. The fourth or White Kind is growing on the Alps near Austria; in France likewise, and in other places. Now all these are planted and grow with us in our Gardens, where they flourish as well as in their Native places.

X. The Times. They all Flower for the most part about Easter, from whence came the Name of Poffe Flower. They do indeed Flower early in the Year, at the utmost in the beginning or middle of April, accordingly as the Spring proves favourable.

XI. The Qualities. These are all of them hot and dry in the fourth Degree: vehemently attractive and excruciatory, and therefore not to be taken internally.

XII. The Specification. By external application they are good against the Bitings of Mad-Dogs, Vipers, Rattle-Snakes, and all other sorts of Serpents and Venomous Beasts, drawing forth the Poison by means of their strong attractive forces; and for the same reason they prevail against an Invertebrate Scutcheon.

XIII. The Preparations. You may make of the Poffe Flower, all the Preparations which you make of Cowfoot, which you may see in Chap. 170. Seci. 26. ad 35. Thrice having all the same Virtues with those therein mentioned. But generally only one make, 1. A Cataplasm of the fresh Herb or Root. 2. A distilled Water of the whole Plant.

The Virtues.

XIV. The Cataplasm of Herb or Root. It is applied against the Bitings of Mad-Dogs, Vipers, Rattle-Snakes, and other Poisonous Creatures, and to places afflicted with the Gout, Sciaties, &c. with admirable success.

XV. The Distilled Water of the whole Plant. Cammarus in his Hortus Medicus says, that in Dorsalis it is used with so much Success, to be given to those who are troubled with a Tettan Ague, for it is certain that it is an Epsinum, or Medicamentum cephalicum, sed deslabellicum, a Remedy to open Obstructions.

XVI. The Danger. The Herb, Flower or Root, being taken inwartly in Infibulice, are without doubt delerious or deadly: It kills by making the Patient look Laughing all the while, whence it obtained the Name of Apsium Raisus. And yet notwithstanding the Standars by, or lookers on, may think, that the Patient is really a Laughing, or in a Laughing Humor, there is indeed no such thing. It is only by its Poisonous qualities, hurts the Senes and Understanding, thereby causing Follhemnity, and Contriving the Nerves, especially of the Mouth, Jaws, and Eyes, draws them this way, and that way, and sometimes in a manner all ways, making the Sick foam to the by-handers as if he continually Laughed, whereas, it is only a Convulsive Motion, wringing, or drawing of the Mouth and Jaws away, and so poor Patient dying in this Condition, the lookers on, think he is really laughing, and report it, when at the same time there is no such matter, but he goes out of the World under the Sense of violent Convul-...
and Branches thence, but leffer. The Flowers which grow in Umbels at the tops of the Stalks, and Branches, are yellow, which falling away, brownish, thin, roundish, flat Seed comes in their places, having a good, and a kind of Aromatick Smell.

V. The second, or Pine Parsnip. This is not so common in every Garden as the former, but yet is found in many. The Root is white within and without, which is not so long as the former, but it is thicker at the Head and smaller below. The Stalk is neither so big, nor so high, but Branched forth in like manner. The Umbels of Flowers at the tops of the Stalks and Branches are bigger than the former, and the Seed smaller. The Root hereof is not altogether so sweet in eating, but more flabby and smooth, but its Taste is more pleasant, if it grow in a hot and Sandy Soil.

VI. The third, or Our Wild Parsnip. The Root (as most Writers of every Country affirm) is shorter and more roundy, and therefore not so fit to be eaten as the former Garden Kinds are, but is thought to be more Medicineable. This Wild faint differs very little from the first Garden Kind, but only as a Wild Plant, and so grows not so fair and large, nor has it so many Leaves, nor such large Umbels of Flowers; it is thought to be the Garden Kind found Wild, (as the Garden Kind is thought by others to be the Wild Kind Transplanted into Gardens:) And it is to be met with in many places of England, as sweet and tender, after the Sowing or slye of the Garden sort be. This Wild Species grows in some Fields and places so plentifully, that a Sack full of its Seed might be gotten from it, which being Sown in Gardens (having a Sandy but yet rich and fat Soil,) and there well ordered will grow as good as the former Garden Parsnips.

VII. Valerianae Infana, or Mad-Nepe, we describe not, for that it is the same Plant with our Common Garden Parsnip, or Pine Garden Parsnip, before Described, the only difference between them and the Mad-Nepe is the time of Flowering, as Parsnip do Flower in the first Year after Sowing, the Country People do call them Mad-Nepe. These are only to be known by the report of the Gardeners, or such as Gather or Sell them; for they are so like to the Choice Landable ones, that there is no distinguishing them by the outward appearance. They are found by long experience to have an evil and pernicious quality; for they not only cause a Vertigo or Swelling of the Hand, but Freedy alls, and in some even Madnes is fli'd, out of which the Patient is not perfectly restored, some having continued in that Condition for the space of twenty four Hours, and others not having come perfectly to themselves for the space of a whole Days and Nights. Gerard says, that these MadNepe, are the Produce of our Common Garden Turms, settling from the Seed of the Garden Kind, which if they Flower the same Year they are Sown, they are said to degenerate, and become what the Country People in Coiflores, about Nantwich, &c. call Mad-Neps. But I suppose this is a mistake, that being the most probable, which Parshenfon has declared of our Common Garden Parsnip, as is aforesaid.

VIII. The Places. The first and second grow only in Gardens, where they are Nurrit up for Food, but especially the first sort. The third grows Wild in several places of England, as in the Muffles by Kirkefe, in the Grounds of formerly
The Virtues.

XIII. Boiled, Baked, or Roasted Parsnips. Eaten as common Food they sweeten the Blood and Jucies above all other Roots in the World; re- cumbent in Conformations, the Eater of them is more fitted to feed the system, and indeed much more than either Carrots, or Tarneeps. Bread made of Parsnips after an admirable manner, and potently pro- voke Urine. They strengthen the Stomach, Reins and Bladder, and provoke Urine. But the Wild Kind are more Physical, being Aperitive, Atematizing, Inciding and most Diuretic than those of the Garden. They are drest up with Salt, Butter, Eggs, and a little Juice of Lemons.

XIV. Bread made of Parsnips. It has all the former Virtues; it is sweet, and eats pleasantly enough, but ought to be eaten while it is new, for then it is best. It is made Baked or Boiled Parsnips with the addition of some fine pure Wheat Flour or Meal, as they usually make Bread of Eddo Roots in Carolina.

XV. The Decoction of the Roots. It is com- monly made in Water, to which at the end of the Boiling, a little, as a quarter part, of White or Red Port Wine may be added. It comforts or cleanseth the Stomach, Reins, Bladder, and Womb, opens, incides, provokes Urine, and gives ease in the Strangury. Some make the Decoction by a long boiling them in Milk. This rectifies in Concupiscions to ambition, and in short time makes a thin, lean, extravasated Body, plump, fit and in good liking.

XVI. The Pudding. It is made of the Garden Parsnip half Boiled, then chopped small, and mixt with Eggs, Rice, Beef-Suet Bread, Salt, and the other proper Ingredients. It is excellent Food, nourishes externally, and has all the Virtues of the Boiled Roots, Bread, and Decoction, made with Milk, and of course.

XVII. Sorghus Paludum latifolia. The Blood of Parfneps. It is made as the Blood of Potatoes, Sawyron, Eddy, &c. after this following manner, viz. Take of the best Garden Parsneps (If they be both Boiled or Baked in their Skins, or half Baked it may be much the better, the whist it they will also do) cleanse them well from their Superfluous, beat them well in a Marble Mortar with a Wooden Pestel, till they become a Pulp; take of this Pulp six Pounds; Cream of White Bread three Pounds; mix them well together; sprinkle them with White Port Wine, and put all into a Boat-Head, stipping it well with Cork and Wax, so that nothing may transpire: place the Mortar in warm Heated-tong, or in Bulino, or in a warm Sand butt, till the Matter is changed into a Rubicund or Bloody Colour, then force it through a Perm with a Preis, and put the expressed Blood into Bulino Vaporda, or such a like heat again, that by this second Digestion it may acquire a greater red-ness, and some faces mayorris, which separate: this Digestion and Separation continues, till the Blood becomes absolutely clear, and of a most per- fect red. From this you may, if you so please, make a Elixir, separate a thin and clear Li- quor; so having you remaining in the bottom; the Blood of Parfneps of a very glorious colour. It has all the Virtues of the Roots Boiled, Baked, Roasted, or made into Bread, Puddings, Broth, &c. afore enumerated. I do not believe that there is any greater Vegetable redorative in Concupiscions in the World besides, it invigorates to a strange Degree. Dose from a Drum to two, three, or four Drains, Morning, Noon, and Night, in a Glass of choice Brandy or Bari- tones Wine; or if the Patient likes not Wine, in Milk.

XVIII. The Powder of the Seed. It is strongly Aperitive, Absturitive, Carminative, Diaphoretic, Diuretic, Stomachick, Nephritick, Hydrek, and Alexipharmick: being given from two Scripules to a Dram, or Dram and half in White Port Wine, or of such proper Vehicile, it strengthens the Stomach regularly, expells Womb, gives ease in the Collick and Sides, provokes Urine, cleanses the Reins and Bladder from Stones, Sand, Gravel, Sile, or any Tartarous Matter obstructing them. It potently provokes the Terms in Women, and reeds Penton, and cures the Birtings of Serpents, and other Venemous Creatures. It is an admirable thing also against Snakes and other Pleuritick Pains, apt to afflict such as are Hypochondriack.

XIX. Note. You may also from Parfneps Seed prepare, 1. A Difilled Water. 2. A Spirit. 3. An Oil by Distillation. 4. A Spir- ifitious Tincture. 5. An Acid Tincture. 6. An Alkali Tincture. 7. Parasnipes or Powders. 8. An Elixir. Every one of which is possessed with all the Virtues of the Seed, before enumerated in the Section immediately foregoing.

CHAP. DXLV.

OF PARSNIP COW.
The Descriptions.

III. The first, or Our Valpar or Common Cow Parsnip. It has a Root which is long and white, with two or three long Strings growing or running down deep into the Ground, of a strong and unpleasant Smell. It springs up with three or four large spread, rough, winged Leaves, lying upon the Ground; or else raised a little from it, with long, round, hairy foot Stalks under them, parted usuallie into five divisions, the two couples standing against each other, and one at the end, and each division or Leaf being almost round, yet cut in somewhat deeply on the edges, in some Leaves and plants, and not so deep in others, of auburn green color, having a strong Smell. From among which rises up a round, crested, hairy Stalk, two or three feet or more high, with a few joints and Leaves thereon, and spread out into Branches on the Top; on the tops of which stand pretty large Umbels of white Flowers, something in

clothing to be a little reddish; which being pulled away, there follow after them, flat, thin, whitish, winged Seed, two always joined together, as is usual in most of those Umbelliferous Plants.

IV. The second, or Great German Cow Parsnip. Its Root is white, and like the other, but greater. The whole Plant is felf, differs very little from the former, but in the largeness of its Leaves and Stalks, being nearly twice as great, that is to say every single Leaf or division, which are seldom above three, on a long strong Stalk, which is about 6 inche long to the Leaf, which is hairy and rough, and of a dull faded sort of green color, a little folded in or crumpled, and deleted besides on the edges. The Stalk grows like the former, and comes to be sometimes 4 or 5 feet high, spread out towards the top into several Branches. At the tops of all of which are like Umbels of Flowers, (for the most part white) the Flowers and Seed being in form much like the first, but larger, of a hot pleasing Taffet, but not so unpleasant as those of the Common Kind.

V. The third, or Jagged Cow Parsnip of our own Land. Its Root is great, thick, and white, living after Seed time, or all the Winter, and springing up again every Year. It grows as high, or rather higher than the second or felf described, and with greater Stalks, having a white hairy coats on them. The lower Leaves grow very large, and much spread, winged, and divided into five parts: two couple standing each against another, but of another form, for each of these Leaves or divisions, are parted into distinct parts, yet closely joined at the bottom, the two side Leaves or divisions, being not of half that length that the middlemost is, which is not above an Inches long, in others above, and not above half an Inch broad, each of these having a deeper Cut or Notch at the bottom, than is on the leaf of the Leaf, which yet is divided with greater Notches than in most usual Herbs, the upper or end Leaf being usually parted into five divisions or Leaves, denoted in the like manner, little or nothing hairy, but of a deeper green color on the upper side, and groweth undernearth. The Umbles of white Flowers are as large as in the Leaf, and the flat thin white Seed, is so like that (setting aside these being a little whiter) that they are usually to be distinguished one from another, but only by the Taffet and Smell, which in this are little or nothing.

VI. The Places. The first grows in most Medows, and the Borders and Corners of Fields, and near Ditches generally, throughout England. The second is a Native of Germany, but I have found it growing in the Borders of Fields and Medows in several places in Cumberland. The third was found growing Wild also by one Mr. George Bowles, in some places in Shropshire.

VII. The Times. They all flower in June and July, and the Seed is ripe not long after, or in August.

VIII. The Qualities. The Root is hot and dry in the beginning of the second Degree: The Seed is hot and dry in the third Degree, and is Incitative, Aperitive, Cephalitic, Antrich and Hyteric.

IX. The Description. The Seed is prevalent against the Atrophia, Epilepsy, Lepra, Jaundice, and Hyterick Fits. The Root is profitable against Fihula's and Callous Ulcers.

X. The Preparations. You may make, 1. A Drink of the Roots, an Extrait of the Leaves and Powder of the Seed. 3. A Decotion of the Seed. 4. A Spirituous Tincture of the Seed.
The Virtues.

XI. The Drink or Beer made of the Leaves or Seed. You must first make a strong Decotion of them with Water, and then, being Blood-warm, you are to Vermoint or Work it up with Yeal or Leavers, as formerly do their Ale or Beer. It is used in all respects to be drank as Beer or Ale, for the quenching of Thirst, and is a common Drink at Meals in Poland and Lithuania.

XII. The Powder of the Seed. Given to a Drunck mixt with Honey, it is good against Affhyn's, Coughs, throrned of Breath, Heartburns, Wheezing, Epileptie, Jaundice, Leathery, and cleanses the Bowels, from rough, fmy, pitifious humors, ftickling in the Pallates of the Cures. For according to Galen, it is of a fharp and inclive Quality. It prevails aliog againft the Rickefs, or such as are Liver-grown, as the Vulgar call it. It provokes the Terms in Women, and prevails againft Vapors and Hydrick Fits.

XIII. The Decotion of the Seed. It may be made either in Water or Wine: and being ferveed with Honey or Sugar, it has all the Virtues of the Powder of the Seed afore enumerated, being drank inwardly, and bathed with outwardly upon the part affected, it gives ease in a Cephalies, or that which is called an Invererate or old Head-Ache.

XIV. The Spiritual Tartare of the Seed. It expels Wind, gives cafe in the Collie, provokes Urine and the Terms, and has all the Virtues of the Powder aforegoing, being given from a Dram to two or three Drains in any proper Vehicle; outwardly applied, it is good againft Scabs, Pimples, Slingles, running Sores, and other brack Inguyres.

XV. The Power of the Seed, from the Seed being burnt. Received up the Mouth or Nofterils, it is good against Carus, Leathery, expels old and moist Difeafes of the Head and Brain; received up the Womb by a Funnel, it prevails againft Vapors, Paintings, Swoonings, and Fits of the Mother.

XVI. The Juice of the Umbles or Flowers. If it is dropt into Ears which are uleated or fote, and which run and are full of Matter, it cleanses and heals them. It alfo cleanses, dries and heals Ulcers and running Sores in any other part of the Body; they being daily wafted therewith warm.

XVII. The raw Root. Being scraped as you rere the Herbe Rodulf Roots, and the fcrapings applied to the Calloous of a Fiffule, it softens it, and takes it away, diloping the fame to a speedy healing.

XVIII. The Powder of the Root. Being flewed upon a Calloous in a Fiffule it continues it, and being taken inwardly to 1 Dram or more, in Honey or any other proper Vehicle, it is faid to have all the Virtues of the Powder of the Seed before enumerated. It is faid to cleanse and strengthen the Stomach and Bowels, and to give cafe in the Collie.

XIX. The Decotion of the Root in Water or Wine. It is of like quality to that of the Seed.
Salmons Herbal.

Parsnip Water Greater.

Strings or Threads, which are fastened to the Stalk or Root within the Water or Muddy Ground: both it and the Leaves (says Parkinson) smell strong like Petroleum. This Plant is very like the former, but lower and leffer, growing two Feet, or two and a half high. The Leaves slender, are flat and full of Juice, being long, but narrower than those of the last kind. They grow stamopen, upon a long, foot Stalk, sometimes four, five, six, seven, and eight pair of Leaves set one opposite to another upon a middle Rib, and one single one at the end. finely sharp or dented about the edges, and growing as it were hot upright. The Stalk is slender, round and hollow like a Kex, which towards the top spreads it self into several Branches. At the tops of the Stalks and Branches grow the Flowers, which are white and stand in round Umbles, not much unlike to those of Fennel. The Flowers being past away, the Seed follows, which is small, and much like the former.

V. The third, or Water Parsnip narrow Leav'd. Its Root consists of a great number of small, slender, twisted brown Fibres or Strings, wrapped up as it were, among themselves, and strongly fixed or fastened in the Mud. The Stalks of this Plant are hollow like those of Hemlock, and a Cubit, or two Feet high. (Gerard says they are about three Cubits high) on which grow several Winged Leaves something like the last, but are divided into smaller Leaves, which are long, much narrower, and sharper about the edges, growing commonly two or three together. The Flowers grow at the tops of the Stalk and Branches: they stand in round Tufts or Umbles, and are of a pale, yellowish, green color: which being past away, turn into small Seed, very much like that of Parly, but in its Tuft, something resembling that of Cumin, or of Daucus Crepis.

Parsnip Water narrow Leav'd.

is larger and rounder than Amiseld. The whole Herb is of a strong but fresh and pleasant Smell.

IV. The second, or Lesser Water Parsnip. Its Root is very Fibrous, and consists of many small

Parsnip Water Leffed.
the Virtues.

XII. The Juice of the Herb and Root. It powerfully opens obstructions of the Vificera, especially of the Stomach, Liver, Melonentry and Reins: it is good against the Scoury in a cold habit. It expels Poisons, and the Cowdew very powerfully, gives ease in the Strangury, breaks gritty Stones whether in the Reins or Bladder, and expels Sand, Gravel, and other Tartarous Matters from the Viscera. It facilitates the Birth in a Woman in Labor, and brings away the After-birth. Doze 1, 2, 3, 4, 5, or 6 Spoonfuls in a Glass of warm White Port Wine, or other proper Vehicle.

XIV. The Distillation of Herb or Root, or Umbels of Flowers. It may be made in Water, Wine, and given from 1 to 6 Ounces, Morning and Night. It has all the Virtues of the Juice and Essence, but operates not so strongly as they, for which reason it is given in larger quantities: it warms, comforts, and rectifies the Stomach, causes a good Appetite and Digestion, and prevails against Vapors and Fits of the Mother.

XV. The Syrup. It is Pelcor, good against Congia, Colds, Wheezings, Horsehair obstructions of the Lungs, Athlam's, and other like Distempers, proceeding from a Vitid Maculage: it is Diuretic, and gives ease in the Strangury.

XVI. The Powder of the Seed. It is Diuretic, Nepturic, Lithuriopic, and an excellent thing against most Difficulties of the Reins and Bladder, proceeding from Obstructions, or Tartarous Creations: it carries off the Jaundice and Droppings by its Diuretic property: it expels Wind powerfully, and gives present ease in the Colick: and has all the Virtues of the Juice and Tinctures above before going. Doze from half a Dram to a Dram, or Drum and half, in the Syrup afterward, or in Wine diluted with the Syrup.

XVII. The Cataplasm of Herb and Root. If it is immediately applied to the Biting of a Mad Dog, Viper, Rattle-Snake, or other Serpent or Venomous Creature, it attracts or Draws forth the Poison, and secures the Patient against the danger thereof. It disfigures simple Contusions: and being applied gives ease in the Gout.

XVIII. The Distilled Water from the whole Plant. It has all the Virtues of the Juice, Essence, and Seed: but as it is much weaker in its effects and operation, so it is given in much greater quantities, as to 6 or 8 Ounces, mixed with a little White Port Wine. It is used also as a Vehicle to convey, several of the other Preparations in

XIX. The Spiritual Tinctura. It warms and comforts a cold and weak Stomach, expels Wind, is good against Rheums at Heart, Painting and Swooning away: prevails against the Colick, weakness of the Intestines, and Flux of the Bowels, and given in a proper Vehicle powerfully provokes Urine. Doze from two to four Drains.

XX. The Acid Tinctura. It is an Antidote against the Plague, Spotted Fever, and all Fears of Puellential and Malignt Fevers. It takes off the Febrile heat momentarily, destroys the putrid and corrosive Ferments: and if timely taken, secures the Life of the Patient against future danger. It strengthens and fortifies the Stomach, strengthens the Digestion, and causes a good Appetite. Doze so many Drops at a time, as to make the Vehicle gratefully Acid.

XXI. The Oily Tinctura. It is a present remedy against the Strangury, Stone, Cancer, and all manner of Tartarous Matters obstruing the Reins, Ureter, and Bladder. It gives present ease in the Collick, calls pains in the Vertebrae of the Back, and strengthens it, being instantly taken in any proper Vehicle, from 1 to 100, 40, 50, or 60 Drops, and also outwardly anointed upon the parts. It is profitable also against the Palpitation occurring outwardly and inwardly used. It provokes

n 2 the
the Terms, and happens and facilitates the Birth, and forces away the After-Birth.

XXII. The Spirit. It is Cordial, good against sickneds at Heart, Fainting and Sweating Fits, and other Diffumers of the Heart and Stomach. It expels Wind, cheers the Spirits, repelles Melancholy, and cures a kind of Elevation of Soul. Dole a Dram, two, or three, now and then in a Glass of Wine.

XXIII. The Fixed Salt. It is highly Diuretic, Nephritick and Hysterick: and is a Specifick against the Stone, Sand, gravel and Vifcount Slate in the Ren, Urines and Bladder. It gives potent Cures in the Stranguary, prevails against Vapors and Hysterick Fits, and cleanses the Womb of cold, violent, and putrid Humors which may offend it. Dole from 3 Grains to a Scruple, in Purgée or Hydropyrexia Water, Onion Water, White Port Wine, or any other fit Vehicle.

CHAP. DXLVII.

Of PATIENCE Garden. O R, Monks RHUBARB.

I. THE NAME. It is called in Greek, Ἰονία-ρυβάρβαρος, from Ioanthes, in Latin, Hippopetalum, Lapathum Hortense, Patentia Hortensia, Rhabarbarum Hortensias, Rhabarbarum Menabamus: and in English, Garden Patience, Garden Dock, Horse Dock, and Monks Rhubarb.

II. THE KIND. Of the Hippopetalum or Horse Dock, there are two special Sorts, viz. 1. Hippopetalum or Rambler Rose, Patentia Rotundifolia, Lapathum Rotundifolium, Rhabarbarum Menabamus, Garden Patience, or Monks Rhubarb. 2. Hippopetalum rotundifolium, Hippopetalum rotundifolium, Lapathum Rotundifolium, Rhabarbarum Menabamus, Garden Patience, or Monks Rhubarb.

III. THE FIGS. Or Garden Patience, or Monks Rhubarb. It has a very long great Root, brown without and yellow within, much like to those of the Common Wild or Water Dock, but a little redder, but when Dry, in color and taste like to the true Rhubarb, having also a leaf sort of diffused Veins, than the next following although it is dry, it grows up with very large strong tall Stalks, chambered or furrowed (and rises up to be about 8 or 9 feet high, as Gerard says, when it grows in good and fertile ground,) set about with great, large or broad and long Leaves (not much unlike to those of the Great Water Dock,) of a fair green color, and not covered at all about the edges. The Stalks towards their tops, freely branch out into several small Branches, which towards their tops bear reddish or puplicate Flowers, or Flowers of a light purple color, declining to brownish. Which being fall away, the Seed followeth, contained in thin yellow Hacks, and of a triangular form, like to the Dent of our Common Dock. This Patience or Garden Horse Dock, has obtained the Name of Rhubarb, for some small purging faculty which it has, much like to that of the True Rhubarb.

IV. The second, or Baldard Rhubarb, or Garden round Leaved Horse Dock. Its Root is exceeding great and thick, very like unto the Rha Barba
ticum, as well as color and taste as proportion, and Fages after the same manner, if grown in a greater Dove or quantity: it grows much greater than that of the Patience before described, with many great Branches and Fages adjoining to it, it is indeed yellow on the out-side, and semembut of a paleish yellow within, with some Stare of difyed colored Veins therein, like to the True Rhubarb, but much less, especially when it is dry, which then shows its fresh color, which the True Rhubarb commonly retains. This Baldard Rhubarb rises up with several large, great, broad, round, thin, and yellowish green Leaves, in shape like to those of the Garden Horse Dock, a little valued about the edges, they rise up from the Root, every one standing on a reasonable thick and broad Rooted foot Stalk. From among these Leaves, rises up a pretty large Stalk, much like the former, about two feet or more high, having some such like Leaves as before described therein, but smaller. Towards the top, the Stalk sends it self out into several Branches, some greater and some lesser, towards the top of which grow long spined Heads full of small brownish Flowers, after which followeth in thin clump Hacks the seeds, which is branching and triangular like to the Common Dock, or of the Garden Patience before described.

V. The
The thin it (as it purifies Knife, little which is Days. good Degree. and heal faid kind affttfe from Sena effeaual 8. ufed Weeks. It One taken little A be cures Chirurger and heal naturally of the like Difeafe, having always a regard to the quantity, which was the caufe of the Violent working in the firt Cure.

I have fometimes alfo been that the Liquid Juice of the green or freth Roots being given in fhc fashion man ner, has alfo cured Agues, as well as the Juice of the Leaues. The Juice of the Leaues or Roots, mixed with a little Vinegar, is ufed as a molt effeclual Remedy for the Cure of Scabs and running Sores.

XII. The Decoction or Infusion of the Roots. The Roots fliced and boiled in Water of Carline Ben nettifs to the conflagration of a third part, and then fervenfed with a little Hony: Being given a quantity of 8 or 9 Spoonfuls at a time, before the coming of the Fit of an Ague, generally caures it at or 3 times for taking it, as are of a robust or strong Body, may take 13 Spoonfuls of it a time. The truth of this has been proved by many experiments, (as Gerard Eys.) The simple Deco tion of the Roots of Passion or Alnts Rhubarb looks the Belly, Purges gently, helps against the Jaundice and Dropifie, and other like Difeaffs proceeding from a cold caufe, is good againft the Stinging of Serpents, helps the Sickness of the Stomach arifting from Choler, and cures the Bloody Flux, as also other Fluxes of the Bowels: and being taken with Acania, or Juice of Sorre, it is faid to cure the Sipting of Blood. The Decoction of the Roots in Vinegar, is effeclual to heal inflamations Scabs, and old running Sores. The Decoction of the Roots of Bafford Rhubarb in Vinegar has the fame Virtues and being drank into the bars it caures their paine gargled in the Mouth: it cures Scabs and Ulcers therein, and cafes the Tooth-ach: and being Drank, or taken inwardly it prevails against the Jaundice, Dropifie, Gout, Rheumatifm, Kings-Evil, Stone, Grave, Sand, Strangury, and purges the Liver, Spleen, Reins and Belly, and cleanses and cools the Blood. But for the general ufe in curing all these Difeaffs the Decoction or Infusion may be made in Water, or Clarified Whisy, and if the Patient like of it, it may be alfo fafely sweetned with Syrup of Violets, or Syrup of Roses Soothing.

XIII. The Diet Drink. Take Roots of Brother Rhubarb fliced, and Roots of red Madcker, of each 8 Ounces: Scou 8 Ounces: Anced brufed, Liqui rite brufed, of each 2 Ounces: Agrimony, Scabions, of each one Handful, which eat a little with a Knife, put them into an Earthen Bowl, or a Small Wooden Cask, which may hold 4 Gallons or better: affife theirefrom 4 Gallons of Strong new Ale, which let stand for 3 Days. At the end of this time the Patient may drink of it, as an ordinary Drink for 3 Weeks or a Month together, (and the longer it is continued the better) providing another like Cask of the fame, to have in readinefs, one under another. It is faid to Cure the Dropifie, or Jaundice, Gout, Rheumatifm, Spleen, Rickets in Children, Kings-Evil, and all manner of Itch, Mangement, Scabs, Peltides, and other Biting affes out in the whole Body: it purifies or exercifes the Blood from all Corruption, prevails againft the Green Sickness, and admirabley opens all manner of obftructions of the Stomach, Lungs, Liver, Spleen, Heart, and Memotery, Reins and Womb, provoking the Ferms when flow, after a fingular manner.

XIV. The Powder of the Roots. A Durn and half or 2 Durns of the Powder of Alnts Rhubarb mixt with Ginger in Powder a Scrupul, the whole being rifing in a Dith of warm Broth of Poffen Drink, Punges Choler and Hagm very gently and safely without any the leaft danger. The Powder of the Root of the Bafford Rhubarb does the fame thing, but is more
The P E A S E. Manured.

CHAP. DXL VIII.

Salmons Herbal. Lib. I.

more effectual, both for inward and outward Dis-

cases. It is good against a Qualy, Bilious Qualy,

scrophulous or humours Tumors in the Neck

and other parts, commonly called the Kings-Evil, as

also Swellings and Kernels behind the Ears; It

gives ease in the Strangury, helps such as are

troubled with the Stone, Sand and gravel, pro-

vokes Urine, and is good for such as are troubled

with dunces of Night.

XXV. The Powder of the Rasp-Comrade. Take

Root of Monks or Bilford Rhabarb in fine Powder

2 Drams: Reduce Sulphur in fine Powder 2 Scraps.

Cherries in Powder 1 Dram: mix them for 4 Doses

for a Man or Woman. It cures the Scarsy, Dibply,

Gout, Rheumatism, Jaundice, Kings-Evil, Palsy,

Seas, Inch, and all forts of Pains and other

breakings out whatsoever. It prevails against Agues,

Purges off Choler, Elegyn, and watery Humors,

cleanseth throughly the Stomach, and Bowels, and

opens all obstructions of the Liver, Splenic, Me-

enter, Reits, and Womb.

XXVI. The Powder of the Seed. That made of

the Seed of Patience, coolness, alluring or birds, and is

of extraordinary use in stopping Fluxes of the

Bowels, and in setting of Blood. The Seed of the

Bilford Rhabarb, is also manifestly alluring, and

is said to cure the Bloody Flux, given in a

Glass of Red Speritch Wine. It etches the growing

gripping pains of the Stomach, and takes away

Nauselines, and loathing of Food: The Powder

of either of them may be given every Morning

Euphlying, and at Night at Bed time, from a Dram

to two Drums, in a Glass of Red Port, or Barcelo-

nie Wine.

XXVII. The Distilled Water. Drawn from either

of the Plants, it is good to cool and allay In-

flations, cleanseth the Face and Skin from exter-

nal Offensions or Dismetions, and is very profitable

to heal running Sores, foul Ulcers, and Scababees

in what part of the Body ever.

XXVIII. Note. The Monks Rhabarb is of the

Nature of the True Rhabarb, yet the Bilford

Rhabarb approaches the nearest thereto, and is

much the strongest and best of the two; it has

not only the shape and proportion of the True Rha-

barb, but the same color both within and without,

with very little difference: they agree also as well

in Taste and Smell, and is color the Spire of a

yellow color, when it is chewed in the Maw, as

Rhabarb does, and it Purges the Belly after the

same gentle manner as the Rhabarb does, only

beaten it differs, that it must be given in at least

the double quantity to that.

Number from one to nine inclusive (I never saw ten:) of which some are round, others almost cubic; some small, some great: some white, some green, some grey, others spotted, &c.

V. The tenth, or Square Coated Peafe. Its Root is small and Fibrous like the former, and perishes every Year. It is a pretty Kind of Peafe, and might for the Form of the Leaves be very well referred to the Kinds of Lotus or Trefoils. It has three or four small weak Stalks, which spread themselves out into many Branches, having two Stalks of Leaves at every Joint, and three small jointed Leaves standing on a very small jointed Stalk, coming from the Joint. The Flowers grow for the most part two together, of a perfect red or Crimson color, like in form almost, to the Common Garden Peafe Blossoms: after which come long, thick, and round Coles, with two Skins or Films, running all along the Cod, at the Back or upper side, and two other such like Films, all along the belly or under side of the Cod, which makes it seem to be four square: in which is contained, round discolored Peafe, something smaller, and harder than the ordinary Peafe.

VI. The eleventh, or Heart Peafe, which some call also, Pfeafum Veſcicarium, Bladde Peafe, Cor Indium, and Cor Indicum (because they first came from the Indies.) It has a Root which is very small, Buffy and Strings, with many Fibres adhering to it, and perishing every Year at the first approach of Winter. It rises up and spreads much, if it has a good Soil to grow in, having several slender weak Stalks, which will lie down upon the Ground, and entangle it self with the Cipipers which it has, unless it be supported with Stakes, Bollers, or some such like thing. These Stalks send forth large,
Salmon's Herbal. Lib. I.

Pease Heart.

large, long, thin, and very green Leaves on all sides, upon long foot Stalks, being divided either into three or five parts, each of which is much rent or cut in on the edges. As the Plants with the Leaves from the middle of the Stalks almost upwards, and at their tops off, come forth several small whitish Flowers, set together upon a foot Stalk, each consisting of few small Leaves sprouting, which being past away, small Bladders succeed in their places, in which are contained the Grains or Pease: these Bladders grow whitish as they ripen, having six ridges, of which three are the more eminent, and open into three parts, in each whereof lies one round, hard, blackish Seed, of the bigness of a great Pea, spotted on the cavity side with a mark, much of the form of a Heart, as it is painted on Cards, whence came the Name.

The Places. All these several sorts of Pease grow with us only in Gardens, and the wonder is of them in Manured Fields, for the profit of the Husband-Man. The tenth is only Sown in Gardens: and so also the eleventh, being sown brought to us out of Italy and other places, being originally (as is supposed) a Plant of Indian growth.

The Times. They are all Sown in the Spring: The first ten kinds Flower in June, July, and August, and the Grain, or Pease ripen in the mean Season. The eleventh Flowers in August or September and the Grain or Pease is ripe in September or October.

The Qualities. We speak now of the first nine or ten kinds of Pease: they are hot and moist in the first Degree, Aperifive, Abbative, and Diuretic, Stomatric, Nephritick, and Arthritick, Chlyfick, Antifeptic and Spermatogetic.

The Specification. They are peculiar against the Strangury, or Fullness of Urine, Sand, gravel, Stones and Tartarous Muillage or Slime in the Reins, Ureters, and Bladder: Bread good Chyle, nourisht much, and refolute in Consumptions.

The Virtues.

XIII. The Effences of the Leaves and green Cods: It is highly Aperifive, Abbative and Diuretic, opens Obstructions of the Reins, Ureter and Bladder, breaks Gritty Stones, and expels from the Reins and Bladder, Stones, Gravel, Sand, and Slime Humors in great quantities. Dote 5, 2, or 4 Spoonfuls or more in a Glass of White Port or Liqueur Wine.

XIV. The Meal or Flower of Pease. Made into a Pudding, with Milk and Eggs, that it is Aperifive and Diuretic, yet it nourisht very much, and being much or long eaten, it refolute in Consumptions, the Patients Drink being every Day a new Milk: Bread made thereof, or Cakes, and eaten while they are new, are also reforific: they very much strengthen the whole Body, provoke Luft and excrete Seed.

XV. The Albus of Pease: Made into an Elixir of the Pease either green alone, or with the Cods, or dried. It is a famous thing against the Strangury and all Fullness of Urine, Soone Gravel, Sand, Salmy Matter, &c. It openeth the Urinary parts, expells the obstructing matter, and eases the Pain. Dote 6 or 8 Ounces sweetned with Honey.

XVI. The strong, Broth or Pottage. It is of great nourishment, and it is made good and strong with Knuckles of Veal, and Legs of Pork, and Brained from the Halls of the Pease, and then be eaten as daily Food, it wonderfully refolute in Consumptions, Charifies Etagfuling Nature, increaseth Seed, and provokes Luft extremely. It strengthens the Bowsels, and spearesfull of Lungs or Figs, and furnishes a Power in it as to cure Impotency in the Male Kind, whether it be from a weakness in the Instruments of Generation, or from a defect of Seed, it may be made pilific and gyver with a little Pepper and Salt, known of an Orange or Limes, and a little Sweeten.
of PEA SE, Wild.

I. The Name. It is called in Greek, Pifum agrifolium. In Latin, Pifum Syphilis: in English Wild Pease.

II. The Kinde. Authors have given us several sorts hereof, those which we shall and are choice of in this Work, are only these following, viz. 1. Pifum Syphilis commune, Pifum Syphilis primum, the Inft, or Common Wild Pease. 2. Pifum Syphilis alterum, The second, or other Wild Pease. 3. 62a, Ochorus Theophrasti in his de cœstis Plan tarum, Lib. 4. Chap. 2. Ervilia Planifolia, in Lib. 18. Chap. 7, which is now its usual Name: Arvene niger Matricula (which is erronious) Ervilia Syphilis. 4. Ochorus Syphilis, fæc Ervilia Labeaf, Cicer erinum Ladvenci, Orbis Parkinson, Ervilia Flora & Frutus aulo, Labeaf, Whitewinged Wild Pease. 5. Pifum Spontaneum Mar tium Anglica, English Wild Sea Pease. 6. Pifum et fructu Matricula Brynices, The other English Sea Pease, or Suffolk Pease. 7. Pifum Syphilis nigrum maculatum Curicus, Spanish black spotted Wild Pease.

The Descriptions.

III. The first, or Common Wild Pease. It has a Root which is as thick as ones Finger, and long, with many Fibres adjoining. This Plant little differs from the Manured, either in its crumbling corner'd Stalks, or in its broad, fliff, green Leaves, too always being set at a Joint, and six or more letters long, on the Branches, which end in a Clofure. The Flowers are white, many standing on a foot Stalk together, which turn into so many Coles, each of them much smaller than the Manured, and the Seed, Grain, or Pufle within, much left also, and of no Puff.

IV. The second, or other Wild Pease. Its Root abides many Years, and is much like the first, but the Branches of this are scarcely half a foot long, with broader, and shorter Leaves, and them, yet like the former but more pale. The Coles and Pufle likewise differ not much in form, but are much lefr.

V. The third, or White winged Wild Pease. Its Root is small and long, with some Fibres adjoining, which wholly perishes every Year. This 5 Q and

The Virtues of the Heart Peafe.
kind of Pea. This in its Roots, Stalks, Leaves, Flowers, and manner and form of growing, differs nothing from the last. Described, facing in the color of the Flowers, which in this are tending to a reddish purple: the Pea in the Cods also are more dicky, tending to black.

VII. The fifth, or English Wild Sea Pea. This in its Stalks, Stalks, Leaves, Flowers, and Color, and manner of growing, differs not much from the second sort before described: but herein this differs from that, viz. That it grows somewhat sharper, and bears many Flowers together in a Taft, mixt of purple and Ash color; and the succeeding Havars or Cods are small and long.

Pease Wild Winged.

VIII. The sixth, or other English Sea Pea, or Suffolk Pea. Its Root runs down incredibly deep into the Ground, even two Foot, or twelve Feet deep at least, and spreading infinitely (as it were) therein, among the very Stones and Beach of the Sea, from the Head of this Root springs up a triangular Stalk full of Joint's heading, in the Ground, with two Leaves at every Joint, broaded forth in divers Places with twined Leaves at their top, consisting of ten or twelve dark green Leaves, set by couples or pairs on a middle Rib, with a small Clapper at the end. Each Leaf not being much unlike to Sea Pea. The Flowers grow towards the Top of the Branchers, 8 or 10 set together in a Cluster, upon a small long Stalk, which both for form and color, are very like to the fifth Kind of Wild Pea, but with a white-ness in the middle, when it is full blown. The Fruit or Cods which follow, are larger than those of the Common Field Pea, and contain (many times) 8 or 10 Peas in a Cob, each of which has the white-grease called the Eye of the Pea, which envelops half the Pea, like a Semicircle, the which being Ripe and dry are of a darkish color. About a half deep or more under the Stones, there is found some Sand, or sand-earth, in which the Roots of this Plant spread, which are not great, but slender and thin, and not sweet but bitter, at the whole Plant is, and the Peas also. The old Stalks die away every Year, but from the old Head of the Root, will grow many long, white Tendrils, like the Root of the small Bird-creed, by which it wonderfully encreases, and not by the Seed, as has been found by Experience. For this Kind of Plant upon, or among the Stones of the Beach, it is surely possible it should grow there, there being no Rushes or Earth to nourish the same, till you dig two or three
three feet deep; the Birds also for the most part devour it all. Allthick Parkeon supposes it to be true, that the Sandtome some of the Seed or Pease in his Garden, but they would never Spring up. However, this matter of Fall may be true, yet it is probable, that if the Seed or Grain had been sown in a Ground or Soil proper thereto, it might have grown, notwithstanding what Parkinson has said.

IX. The seventh, or Spanish black spotted Wild Pease. This Kind differs not much neither in its Root, (which Perish every Year) Stalks, Branches, Leaves, Flowers nor Color, from our first sort of Wild Pease described in this Chapter, but in many things is it like. Yet it is shorter, and the Flowers are of a pale yellowish green color: and the Pease are of a dark color spotted with very black Spots like this.

X. The Places. The first has been found in many places of England. The second, on the Chalky Hills, at Kings-Hey in Kent, not far from the Places there is a first sort of this Species, which has been found in some Barren Fields in Essex. The third and fourth grow with us only in our Gardens, but Label Elias, they grow naturally in Lombardy. The fifth has been found growing near Romney in Kent. The sixth was found growing Annus 1555. being the third Year of Queen Mary I. between Oxford and Atherford, where it grew upon the Beecn of the Sea, in places where never Grain or Heritage was ever seen to grow, but the neighbouring People thereabouts said, that they had observed, and known them to grow there of a long time before. In that Year there was a great Dearth, so that many were forced to make Bread of Acorns, and the People gathered many Quarters of these Pease (being in great necessity) to eat them for Food, and with them from Starsbury to Bovre, and that time might be accounted a great Blessing from Heaven. Stow in his Chronicl, and Camden in his Britannia, make mention of these Pease: but vainly thought that they might first come thither by some Shipwreck. But this is false, for it is a singular Plant. Jui Generis, specially differing from all the other Kinds; and this is true, from its form and taste: but besides in England has not been found growing upon the Sea Shore (which seems to be natural to it) as at Rye in Kent, at Pentle in Suffolk, at Gifford in Surrey, over against the Camber, and at Ingate in the garden of Stow. The seventh grows in Spain, from whence it has been brought into our Gardens.

XI. The Times. These all Flower, and bear their ripe Fruit with the latter Kind of Field Pease; the sixth Kind Flowers about the end of July, and the Cods are ripe about the end of August.

XII. The Qualities, Specification, Preparations, and Uses of these are the same with that of the Adurmed Kinds. The third and fourth Kinds (according to Color) are in a mean or middle property between those which nourish much, and thinl, but are hot and mild, and have a drawing, digesting, cutting, and cleansing Facutl, that they also purge the Liver, Spleen and Kinds; cleanse the Stomach from Stench, Mophepl, Tettans and Kingsworms, diffuse hard Tumors in the Cods, and heal Apoplectics, running Sores and putrid Ulcers, the Ache being mixt with Honey; and this is spoken in General, of all the Kinds.

The General Description of the Garden Kinds.

V. They have a small Root which perishes every Year; The Ram or white Chich Pease, (and so of the others) has Stalks of a Yard long, on which do grow winged Leaves that are many small and almoft round Leaves dressed about the edges, set on both sides of a middle Rib. At the Flowers come forth one or two Flowers, upon short foot Stalks, Pale fatisifion, white or whitefhit, or felf purpiffed red, lighter or deeper, according as the Pease which follow will be, which are contained in small, thick, and short Pods or Cores, (in which by one, or two Pease, more usually) a little pointed at the lower end, and almoft round at the Head, yet a little conved or Shove. This White Chich Pease is much used in Spain, so that it is usually one of their Chief Dishes at all their Banquets.
The Descriptions of the Wild Kinds.

VI. The first, or Greater Wild Ciccr. It has a hard and woody Root, which lives long, and

Pease Chich Garden.

spreads far about. It has very long winged Leaves set on the Stalks, composed of many, every one of them being small, and longer than those of the Garden Kind before described, not distant at all about the edges, and of a flat green color. As the tops of the Stalks, come forth many Vases of Flowers, thick set together, of a pale, yellowish color, almost white, after which follow rough, thorny, Cods, in Vases off, each of them small pointed at the end, within which are contained other small, smooth Hairs, which have many small, flat, yellow, round Seed, (or Thalliis fets,) but Lauptantium, makes the split of Dilectichium, to bore blackish Flat Seed or Grains, and not like to the Manured Ciccrs, (which some take to be both one, as also that of Matthioli.)

VII. The second, or Lesser Wild Ciccr. This in its Roots, Stalks, Branches, Leaves, Flowers, Cods, Grant, and manner of growing, is altogether like the former, but in this it only differs, that it is not altogether leffer in the whole, but leffer in every part.

VIII. The third, or Woolly Mountain Ciccr. It has upright round Stalks about a Foot high, and fists or woolly, spreading themselves forth into small Branches, on which grow winged Leaves, ten or twelve on a side, of a middle Rib, with an odd one at the end, each of which is left or on woolly, and long and unto the Vetches, some broader and some narrower than others. As the tops of the Branches, grows a Spike of rough pale colored Flowers, and the Cods which follow, are somewhat long and woolly, with a crooked Thread at the end, containing within them small black Seed.

IX. The fourth, or Mountain Ciccr without Stalks. Its Root runs deep into the Earth, it is on the Rocky Ground on which it grows does not hinder it, from whence spring several hairy root Stalks of Leaves, which contain about twelve or more of a side, something round yet longer than those of the Garden Ciccr, their edges being hairy, and some of them equally, others unequally yet one against another, with an odd one at the ends. The Flowers grow near about the Root, being somewhat long and pale, and after them come Woolly Cods having two partitions, full of small yellow Seed, like unto those of the Medicin, which are of a yellow color.

X. The fifth, or Trefoil Wild Ciccr. It has a long slender Root with some Branches and Fibers separating, from which rise up Stalks about two Feet high, divided into some Branches spreading abroad, on which are set upon long foot Stalks one above another, Leaves divided into three parts, like the Wild Trefoil, and each of the larger, thicker and rounder than those of the Garden Ciccr, a little dented about the edges. The Flowers grow two or three together upon a long foot Stalk, at the Joints with the Leaves, which are like the Garden Ciccr Flowers, but larger. The Cods that follow are small like unto the Garden Kind, but something flatter, having some small Leaves at their bottoms, within which is much smaller Seed, and more flat, and rather like to those of the Ciccrula, in Chap. 126. aforesaying.

XI. The sixth, or The second three Leaved Wild Ciccr. This has a thick, long, Branched Root, which is blackish without, and whitish within. The Stalks are full of Branches, with Leaves like unto Ciccrs, but three always set together, and no more. The Flowers are red: and the Cods are like unto the other Wild Ciccrs, but hairy, and spotted with red Spots.

XII. The seventh, or Greater Spanish Wild Chichling Pease. It has a Root which is very abound and

Pease Chich Wild.
Chap. 550. English Herbs.

Eubrous and perfing yearly. It spreads on the Ground, with several square, hairy, and crested Stalks, sometimes a yard long or more, at the several joints of which, grow many dark green hairy pointed Leaves set on each side of a middle Rib, which end in a Ciffer, like Lentils, or Vetches. As the foot of the Leaves, some forth single-Flowers are every short foot Stake, of a dainty, yellowish purple color, with deeper purple Veins therein, and of a deeper purple at the bottom of the upper Leaves, next to the Stalks which when they are full, thence in their places short, thick, and almost roundish Cods, covered with a short hairy ish thereon, within which lies 3 or 4 round blackish Peafe, among which is a fmall black (as big as that of the Cicercula, but not cornered.)

XIII. The eighth, or Leftor Wild Chich Peafe. The Root of this pertifies like every other Cicer, and is called Peafe in England, and Pinto in Portugal, as smooth, thinner, and not hairy, with a rounder, and blackish colored Peafe within them.

XIV. The Places. All the Manured or Garden Cicer, and Peafe sown with us in Gardens, or in Fields, as other Peafe are, not only in England, but in other Foreign Countries, where they are Sown for Food, as in Spain, &c. The fifth or sixth of the Wild kinds, grow upon Hills, and in Woods, and sometimes by Hedge Edges in Fields. The seventh grows in Spain, and the eighth in Portugal, from whence they are brought to us in Seed, and are Nurtured up with us in Gardens.

XV. The Times. The Garden Chich Peafe, they are Sown sooner than Peafe, yet they are gathered at the same time with them, or a little after. The fifth or sixth Wild Cicer, or Chich Peafe, is Sown in March and April, and the Cods or Peafe are ripe in August or September. The seventh and eighth Flower with us in the end of July, and the Cods or Peafe are ripe in August or September. But these three Soweth them in other places, viz., Spain and Portugal, their natural places, beds that be gathered their ripe Cods or Peafe in April and May.

XVI. The Qualities. Garden Cicer or Chich Peafe are hot and dry in the first Degree, Inclive, Alteferve, Diuretie, Nephritick, Hydrotie, Emmenagogick, Chalybick, Neapathie, Golettagogick, and increase Heat and Oifness in the Body. The Wild Cicer or Chich Peafe are so much more powerful than those of the Garden, by how much they exceed them in heat and dryness, perceived by their fiery and more bitter Tafte; whereby, it is manifest that they much more open obstructions, provoke Urine, break the Stone, and have all those other properties of Inclining, Opening, Digesting and Disolving, which are attributed to this Garden Kind, and that both more speedily and more certainly. And Pliny says, that if they be taken too largely, they breed Wind, and loosen the Belly, but not without many other ill effects.

XVII. The Specification. They are peculiar in eathing the Sarangy, breaking the Stone in the Reins, expelling Sand, Grass and Tartaro Matter from the Urinary Parts, and provoke the Cour- sics in Women. They prevail again the Pleuritick Pains and Stitches in the Sides, carry off the Droplfy, and Yellow Jaundice by Urine, are Emul- sique and expelling. The white or Red Cicer, or Chich Peafe, are both of them which are only used as Meat or Food, they are a little windy, but are said to Nourish more than either Peafe or Beans, for which reason they are of extraordinary use in curing Consumptions; They increase Milk in Nurses, and Seed mightily, their Liver and Women, incite Lust powerfully, and cure Barrenness in both Sexes, which things all the Kinds of Cicers do, and for which reasons they are commonly given to Stallion Horses. The White are accounted a Delicacy among the Spaniards, and commonly one of their choice Dishes in all their Feasts, as we have before hinted. The other Garden Cicer, but chiefly the Wild Kinds, are most used as Physick or Medicine.

XVIII. The Preparations. You may make there- from, 1. A Baidel Herbs, of the White Cicer or Chich Peafe. 2. An Elixier of the Lewis and green Cods. 3. A Decellation of the green Cods. 4. A Meal or Flower of the Grain. 5. Bread and Puddings thereof, if of the white Rams Chich Peafe. 6. A Catalogue of the Meal or Flowers, of the Stream and Cod: From which a Vivi Nive may be extracted by Exaltation. 8. A Diffluent Water from the Flowers, or from the green Cods, or from the white Plant. 9. A volatile Spirit, Oyl, and Salt of the dried Cicer, as you make thereof of Beans in Chap. 55. Selt. 16. aftergoing. 10. A Strong Broth of the White Cicer, made by boiling till they be done, such Knaecles of Veal, Mutton, Pork, and Beef, &c. and then drained out from the Hulls.

The Virtues.

XIX. The Virtues and Uses of all the aforego- ing Preparations are the fame with those of the Foot. In Chap. 55. Selt. 10. ad 18. Chap. 56. Selt. 12. ad 17. Chap. 57. Selt. 11. ad 17. And Chap. 54. 20. to all which you are referred for full Explanation, we only show the being altogether of the fame Qualities and Nature.

XX. Note. 1. Gaden says that Cicer are windy Food, yet that they Nourish more than Beans, provoke Urine more, as the entical Seed. They are more cleansing than Peafe or Beans, and thereby are said to be laid out in the Stones in the Reins.

XXI. Note. 2. There is in a Cerin to be made of them, by boiling them in Water, which being freely eaten plentifully encruieth Seed in both Sexes, as also Milk in Nurses, it provokes Urine, and generally keeps the Belly flable.

XXII. Note. 3. The Decellation of any of the Cicers in Water, chiefly of the Wild, made with Oifomony, Diodyger says it is good for th: Droplfy and Yellow Jaundice. But that the Wild Cicer are said to be the most powerful for Medicines, yet the white Ram Cicer or Chich Peafe, are said more powerfully to encruieth Seed and Milk, and provoke Urine.
Salmon's Herbal. Lib. I.

CHAP. CLI.

Of PEASE Everlasting.

I. T HE Names. It is called in Greek, Λαθυρος, and in Latin, Lathyrus perennis, Cicereula, & Cicereula perennis: in English, Pease Everlasting.

II. The Kinds. There are but three Species observed of this Plant, viz. 1. Lathyrus perennis major, Cicereula perennis major Buzan i; Cleruim Matthei i; Erasmus Sylvester Pfeffer i; Evallium Cefalpinii, Pisan Ciceronian Trago, Lathyrus Lathifolii, Pisan perennis, Pease Everlasting the greater. 2. Lathyrus perennis angustifolius, Ordon Venetus Chi fi, (but very improperly, for tho' it came from Venetia, yet it is no Ursus.) Blew upright Pease Everlasting, Pease Everlasting narrow Leaf'd. 3. Lathyrus perennis Sylvesteri Dendoii. Wild Pease Everlasting.

The Descriptions.

III. The first, or Pease Everlasting the greater. Its Root is great, black and rugged on the outside, running down deep into the Ground, it is of the thickness sometimes of a Horse Arm, and whithin, spreading it fell out into some Branches, with a few Tubers, by which he seems to intimate, that they refit Putridity or Corrup- tion, but he relates this thing upon another account.

The Diagram.
Parietaria, or

Pellitory

The Description.

Pellitory,

Parietaria

of the Wall small.

not so great or high, having tender, reddish, rough Stalks, shorter and thinner than the other, but with something greener Leaves thereon, yet rougher, (not much unlike to those of Balm) so that they will stick to any Cloth, or other thing they touch. The Flowers and Seed differ not much from those of the greater, but are smaller, and the Seed is more like unto Purslane Seed (when rubbed out of the Halka) than the former.

V. The Places. The first grows wild generally throughout all England, about the Borders of Fields, and among Rubbish, or on the Sides of old Walls, chiefly Stone Walls, on the moist

Chap. 552. English Herbs.

839

III. The first, or Our Common, or Greater Pellitory of the Wall. Its Root is somewhat long, with many small Fibres attached thereto, of a dark reddish color, and shdes all the Winter (albabo the Stalks with their Leaves perish,) and springs up again every Year. It rises up with many brownish, red, tender and smooth, clear, and almost transparent Leaves, about two Feet high. Upon which grows at the several Joints, two Leaves, something broad and long, like unto those of Poison Mercury, or Greater Pellitory, in bair, or somewhat rough Heads or Heads, after which comes small black and rough Seed, which will stick to any Garment or Cloth it shall touch.

IV. The second, or Lesser Parietaria, or Pellitory of the Wall. Its Root is much like the former, and the Plant grows in like manner as that does, but

The Kinds. There are but two peculiar Kinds used in Physick, viz., 1. Parietaria vulgaris, Helcinea communis Helcinea vulgaris, Helcinea minor, Parietaria minor. Our common or greater Pellitory of the Wall, or Greater Parietaria. 2. Parietaria minor, Helcinea minor, Parietaria exigua Treajt. The lesser Parietaria, or Pellitory of the Wall.

I. The Name. It is called in Greek, Παρίτηριον, Παράτηριον (the first quod foleo rum us) feminine vata tibus adheres: the latter, quod Pardines est (uterque tenuor:) in Latin, Helcinea, Parietaria. It is also called Parietaria, or Parietaria, all Muralium, or Herbae Muraria (because it naturally grows upon Walls.) And by some Authors, Ursatellas, Vitrages, & Vitrages Herbs. Gaicn and Fucus Selectae Bild, That in their days (allo Celsion Celers, and Pinp out of him) that several did call it Parietaria, but this erroneous Name is so Foreign to the Plant, that it needs no refutation: in English it is called Pellitory and Parietaria of the Wall.

II. The Description.

Pellitory, or

Parietaria

of the Wall common.
Salmon's Herbal. Lib. I.

Corners of old Church-Walls, and Stone Buildings, and other like Places. I have seen it grow plentifully upon the Stone Walls of the Cathedral or Minstrel of Ely, from which I have sometimes formerly gathered it. It will thrive also well enough, when Planted in Gardens on the shady side, and where it is moist withall; and if a great deal of Stone of Brick Rubish, and old Morar of Walls be mixed with the Earth, it will thrive admirably well; and if it is suffered to Seed and Sow it well, and then to spring up of its own Sowing, it will not easily be excelled those afterwards. The fomd or offtery Kind is rare in England as also in Germany, and is not to be found growing naturally with us, but as it is Planted in Gardens: these two seldom grow together in one place; and the latter keeps its green Leaves sometimes all the Winter.

VI. The Times. They both Spring up in the middle or end of April and in May, they Flower in June and July, and the Seed is ripe in July or August, or not long after.

VII. The Qualities. Pellitory of the Wall, is said to be cold and moist in the first Degree. It is highly Aperitive, for it gives, Especially in Diarrhea, Traumatick, Hepatick, Nephritick, and Arthritick.

VIII. The Specifications. It cures the Strangury and Droppings, and is highly profitable against the Stone, Sand, Gravel or Tartarous Slime in the Reins and Bladder; is good against Coughs, and pairs of the Liver, Splenks and Womb.

The Virtues.

X. The Liquid Juice. Given to the quantity of 6 or 7 Spoonfulls at a time, it gives wonderful ease to such as are troubled with the Strangury or Suppuration of Urine, cailing them very speedily to make Water, and to expel Sand, Gravel, and Stones or Tartarous Slime from the Reins and Bladder, and carries off the Water in Drops, to admission, giving thereby a speedy cure to that Disease. The Juice held a while in the Mouth, gives ease in the Tooth-ache, and drops into the Ears it cures their Noise and Ringing, and takes away pricking and shooting Pains in them. The fomd Juice cools Inflammations, and is good against Burning by Fire, or Scaldings with Water: it prevails against Anthrax inflammations, or any other eruptions of heat, being bathed often there with, and wet Cloths dipped therein being also laid on. It is very effectual to cleanse Pileham's and to heal them, more especially if a little Honey be mixed therewith.

XI. The Essence. It has all the Virtues of the Liquid Juice, and may be given in the same Dose. It eases the pains of the Liver, Splenks, Reins, and Womb: and opens all their obstructions. Used as a Gentian, it cures Infalmoes, Swolin, Sore, and Ulcerated Throat: and is profitable being inwardly taken, and outwardly applied, for the curing of old running Sores, and purifed Ulcers in any part of the Body, beyond many other things.

XII. The Syrup. It is made of the Juice and Honey: it has all the Virtues of the Juice and Essence, and may be given Morning and Night, 1, 2, or 4 Spoonfulls either alone, or mixt with a Glafe of White Port Wine. It is a peculiar thing for the cure of the Dropy. Therewith my Father cured me of the Dropy Anjaures, when the hopes of Life were almost past. I took 3 or 4 Spoonfulls of this Syrup Morning and Night for a Month together: I carried off the Water after a admirable manner, and I became perfectly well, without so much as taking one formal Purge.

XIII. The Distillation in Wine or Water. It has the Virtues of the Juice, Essence and Syrup, but nothing near so powerful, and may be given Morning and Night, to 6 or 8 Ounces mixt with Honey, it becomes an excellent Gargle for an Infalmoed Sore, or Ulcerated Mouth and Throat.

XIV. The Gyfster. It is made of the Juice or Essence mixt with Honey. It eases Pains in the Sides, Back and Bowels, proceeding from Wind, and the Stone and Gravel in the Reins. It heals also a bloody Flux, and Excitations or Ulcer in the Bowels.

XV. The Ointment or Liniment. It is made of the Juice with Oil of Roses and Coriace, or White Lead. It is good against any kind of Ulcerous or Putrid Occupations in the Skin, cleanses foul, rotten filthy Ulcers, and such as spread or creep, cures running Sores and Seals in Children Heads, and pulls the falling of the Hair: applied to the Fundament, it cures the Hemorrhoids or Piles and quickly cures them. Mixed with Goats Sper, or a little Cypress Turpentine, it cures the Jaundice.

XVI. The Cataplasm. The Green Herb beaten up with a little Wine, and applied as hot as it can be well endured to the Belly, it eases the Colick, and pains of the Bowels proceeding from Wind. The Cataplasm of the Simple Green Herb, with a little Salt, cures simple green Wounds, cleanses old running Sores, and purifed Ulcers, and causes them to heal, and it is to effectual to heal any simple green Wound, that being bound thereto for three days, it will heal it without any other Salve, Balm, Ointment or Medicine. If the Cataplasm is made with Mallows, with Wheat Bran and Green Flower, adding also a sufficient quantity of Wine in the boiling them together, with a little Oil Olive, and applied warm to any bruised Nerve, Tender, or Muscle, it does in a short time restore them to their primitive state of Health and Soundness, eathing the Pain, diffusing the Contusion, and dissolving the coagulated Blood.

XVII. The Distilled Water. It has the Virtues of the Juice, Essence and Distillation, but in a much inferior or meaner degree. Mixt with Sugar and Drink, it works the fame effects. Applied to the Face or Skin, it is said to clear it from Spots, Freckles, Pimples, Wheals, Tumors, Sun-burn, Morphew, Scurf, &c. leaving the Skin clean, smooth and delicate.

XVIII. The Saline Tincture. It is excellent to cleanse the Reins, Ureters, Bladder, and Womb, helps against the Strangury, provokes Urine, and brings out from the Urinary and Stone, from the Reins, Ureters and Bladder.

CHAPTER LIII.

PELLITORY of Spain:

OR, SNEESEWORT.

I. THE Name. It is called by the Arabians, Macarocarba, or Hacharbarba; in Greek, Πύριτηθρον, &c. in Latine, Pyrethrum, &c. in English, Pellitory of Spain, and Sneeewort.

II. The Kinds. There are several sorts of this Plant, as, 1. Pyrethrum vulgare; 2. P. aureum; 3. P. Ergastii; 4. P. Matthisii; 5. P. Syrphorum; 6. P. Germanicum Thalpis; Pyrethrum Pratense Clusii; Pyrethrum flore Tursceniul Sanctamentorio Lobelii; Pyrethrum Brunfelsii; Pyrethrum Syrphorum Cordi; Pyrethrum flore Drosae Syrphorum Doderii; Pyrethrum album flore Tellusii; Taraxacum vulgare flore Aquaticum; &c. And in the Middle Ages, Matthioli almo.st forsoke the name of Aquaticus; 7. P. Vulgaris; 8. P. Germanicum; 9. P. Tragacanthi; 10. P. Brumfordii; 11. P. Camerario; 12. P. vulgaris; 13. P. Germanicum; 14. P. Lobelii; 15. P. Germanicum Thalpis; Pyrethrum Lateral; Pyrethrum Conochilum; Pyrethrum Umbelliferum; Pyrethrum Pratense; Pyrethrum bulbifera; Pyrethrum Vulgaris; Pyrethrum Officinarum; Pyrethrum vulgare Officinarum; Pyrethrum aureum; &c. 16. P. Lobelii; Pyrethrum argenteum; &c. 17. P. Lobelii; Pyrethrum argenteum; &c. 18. P. Lobelii; Pyrethrum argenteum; &c. 19. P. Lobelii; Pyrethrum argenteum; &c. 20. P. Lobelii; Pyrethrum argenteum; &c. 21. P. Lobelii; Pyrethrum argenteum; &c. 22. P. Lobelii; Pyrethrum argenteum; &c. 23. P. Lobelii; Pyrethrum argenteum; &c. 24. P. Lobelii; Pyrethrum argenteum; &c.

The Description.

III. The first, or Common Field Pellitory of Spain. Its Root is long and subtilish, pointing at several distances, creeping far about under Ground. It shoots forth here and there, being one about two, or three inches high, the leaves, which are green white, being point-like, in round Tufts together, somewhat like to those of Yarrow, or Milfoil, with a very fine yellowish Thrum in the middle, bordered all round with very short white Leaves, dented in at the broad ends, which falling away, leave behind them small Heads, with Clusii Seed therein. Both Leaf and Root are of an hot pleasant biting Taste, like unto the True Pellitory of Spain in Sect. 6. following, and of which it took its Name.

IV. The second, or Common Field Pellitory with a double Flower. Its Roots are many long Strings, running here and there in the Ground. It has straight and slender Stalks, being with long and narrow Leaves, with a stem round about the edges, not much unlike the former, and as it were in all points like the first described Wild Kind, only greater with an almost every where. On the Tops of the Stalks stand four or five, or more white Flowers, one above another, with a green Leaf at the bottom of the four Stalks of every one of them, being small, thick, and very double, with a little yellowish in the middle of every Flower. Like, but finer for form and color into the Flower of the double Featherwurf, but smaller. This Plant has no Smell at all, but is very pleasant to behold, for its double white Flowers fade.

V. The third, or Common Shop Pellitory of Spain. Its Root is long, and growing down right, of the bigne of a Man's Finger or Thumb, growing in our Country, but not half so great where it grows naturally, with some Fibres and Branches from the sides thereof, of a very hot, sharp, and biting Taste, drawing much Water into the Mouth, after it has been chewed a while. It is a small and low Plant, bearing many fine green Leaves, upon its slender Branches, which lean, or lie down upon the Ground, divided into many parts, yet somewhat larger and broader, than Camomill, the Stalks thereof are bigger, and more full of Juice than those of Pellitory. The Flowers grow at the Tops of the Stalks, and are white, but much larger than any Camomill Flowers, being a Pale, or Border of many Leaves, white on the upper side, and reddish underneath, set about a middle yellow Head or Thrum, but not standing to close together joining at the bottom.
Pellitory of Spain, Shop Common.

VI. The fourth, or True Pellitory of Spain.

The Root grows sometimes as thick as two Thumbs together, but often of a Thumbs thickness, and a Foot or more deep in the Earth, of a brownish-yellow color on the out side, and whitish within, of a very hot, burning, sharp and biting Taste, drawing forth much Saliva or Water into the Mouth, more plentifully and quickly than the Common Pellitory of Spain, which has a Daily-like Flower: This Root endures after Seed time, and with us all Winter, if it be carefully defended in the Winter Season. From the Head of this Root spring up several Stalks of fine cut Leaves, the form and divisions whereof do something resemble that of May-weed, being short, and not long like Feneld, or like Wild Carrots, as Dioscorides compares them, from among which rises up some Stalks, with few or no Leaves on them, branching not into two or three parts, bearing a round Umbel of white Flowers, after which follow somewhat round dark colored Seed, larger than that of Anfeed.

VII. The fifth, or the Other true Pellitory of Spain.

Its Root is flenderer and frable, in which consists the chief difference: it grows also somewhat lower than the former: and the Leaves are also something longer and fener, more resembling Dill. The Stalks are flenderer and full of Leaves. And the Umbels of Flowers are white, but not so large.

VIII. The Places. This kind grows in Fields and Meadows by Hedges and Pathways, almost every where. It was formerly found growing in the three great Fields next adjoining to Kentish Town near London, and in several Fields in Kent above
Chap. 553. English Herbs. 843

about South-foot; and is also Nurt'd up in Gentry Gardens. The second grows only in Gardens with us, and in Gardens, or in Manured places. The fourth is Native to the hotter Countries, as, Spain, Italy, &c. The fifth grows in some Mountains in Germany, and other Countries. As, it is a root of Earth, so that the Roots grow in the Chinks and Gutters of the fame; and in England these two fall grow in Gardens.

X. The two first Flowers in the end of June, or in July, and give ripe Seed, not long after. The third Flowers not till August, and sometimes as late, that it gives no ripe Seed before it parishes, unless it is carefully preserved in Winter. The fourth and fifth, Flower and Seed in August, or towards the end of Summer.

X. The Qualities. They are all of them hot and dry in the Fourth Degree, Aperitive, and Vegetable. As with the first, third, and fourth, more especially of the third and fourth, are particular against the Tooth-ach, Agues, Cataracts, Diffillations upon the Eyes, Apoplexies, Epilepsies, Vertigo's, Lethargy, Carus, Magtrim, Head-ach, Gout, Sciatica, Numb and Dead Palfies, Collicks, obstruction of the Terms in Women, &c.

The Virtues.

XIII. The Juice of the Leaves or Roots of the first and third. An Ounce thereof, in a Draught of Mustard, or other strong Wine, an Hour or two before the Fit of an Ague, and the SICK preceeding to SUCH, as upon it, is SufTantially to cure the Patient, at second or third time taking it at first time.

XIV. The Effect of the fame. It has the Virtues of the Juice aforefaid, being given in the fame manner, besides it warms and comforts the Stomach and other Bowels, gives ease in the Collick, and obstructions from Wind, and powerfully acts in the Terms in Women. It also facilitate the Birth of a Woman in Labour: it provokes against Cataracts, Apoplexies, Epilepsies, Vertigo's, Lethargy, Carus, Magtrim, Head-ach, Gout, Sciatica, Collicks, inwardly taken, and outwardly applied to the parts affected.

XV. The dryed Leaves or Roots. Being chewed in the Mouth, they draw down from the Head, Brain among Rocks on which there is but a Crust of Earth, so that the Roots grow in the Chinks and Gutters of the same; and in England these two fall grow in Gardens.

XVI. The Powder of the dryed Leaves or Roots. Being taken inwardly, from a Scruple to a Dram, mixt with a little Syrup or any other fit Vehicle, it warms a cold and moit Stomach, strengthens it, and therefore may be given Morning and Night, to 3 or 4 Ounces at a time. They are excellent for Women in Labor. And by bathing them outwardly gives ease in the Gout, and all other pains proceeding from cold and moisture.

XVII. The Cataplasm of the Green Leaves or Roots. Applied to the Gout or Sciatica, they give pleasant ease of the pain, and being continued (as the Physician shall advise) will in some little time cure the fame. It is also good against any such or pain in any other part of the Body, caused by cold and moisture.

XVIII. The Balsam or Ointment. They have the Virtues of the Cataplasm, but not altogether so powerful against the Gout, but being applied they take away black and blue Spots, which come by Blows, Falls, or Bruises, as also all other Defections or Blemishes of the Skin.

XX. The Oile of the Roots, made by Distillation or Infusion. Culled Days. That being rubbed on the parts of the Body (I suppose he means on the Breast or Stomach and Belly, as also on the Back and Spina Dorsit) it helps such as have the Ishaking Fits of Ague. It is without doubt a very warming and comfortable Oil; and therefore of singular use against both Numb, and Dead Palsies, Convulsions, Cramps, and other like Pains and Aches.

XXI. The Spirituous Tincture. It is a most singular thing against the Colick, Pains of the Stomach, Sicknecis at Heart, Vomiting and Fainting. It has all the Virtues of the Juice and Essence, and may be given in Powder, Drink, Broth, or Wine, Morning, Noon and Night, from 50 to 100 Drops, or more.

XXII. The Acid Tincture of the Roots. It radically cures the Plague or Pestiilence, and is a most excellent thing against all Pestilential, Malign and Burning Fevers, of what kind soever. It strengthens and fortifies the Stomach, causes a good Appetite and Digestion, refills all that is good against Coughs, Colds, Affhmas, and all obstructions of the Lungs, or the other Vicera, provokes the Terms in Women, as also Urine, and is profitable against the Strangury, Stomach-ache, Stone, &c. in the Reins, Uterus and Bladder, Doth so much as to give the Vehicle a pleasant Affect, and may be taken as often as the Patient Drinks.
The Virtues of the fourth and fifth Kinds.

XXIV. The Liquid Juice, and Essence of the Leaves or Roots of the True Pelitory of Spain. Have all the same Qualities and Virtues of the Common, and that of the Stop, before declared; only with this difference, that as the True Pelitory of Spain is more potent and excellent than the Common, so, that of the Stop, so also are these Preparations of this Plant, very much transcending them in their Efficacies.

XXV. The Dryed Root. Chewed in the Mouth often, it eases the Venereal pain of the Teeth proceeding from an influx of Cold Rheum upon them; and so used, it also draws away Rheum from sore eyes.

XXVI. The Powder of the Root. Made into a Pill by mixing it with a little Matherate, or made into an Elixir with Honey, it is effectual against all cold and moist Diseases of the Head, Brain, Lungs, Stomach, and other Bells; it prevails against the Appoplexy, Falling Sicknes, Vertigo, Meprum, Lethargy, Carus, Obstructions of the Lungs, Coughs, Cold, Wheezings, Affluens, Colic, etc. Dose from a Scrupel to a Dram, Morning Falling, and at Night at Bed time.

XXVII. The Infusion of the Root in Wine. It has all the Virtues of the former Infusion at Set 17. aftergrowing, but this is much more powerful for all those purposes and intentions: If the Green or Dryed Root is well bruited and Infused in Vinegar, and the Mouth Gargled therewith, it prevents giving ease in the most Violent Tooth-ach: and refills the influxes of Rheum from the Head to the Teeth, Ears, Ears, Tongues, Jaws, and other parts.

XXVIII. The Oil or Ointment of the Root. They are of use to warm, or to heat, comfort and strengthen any part of the Body, Nerves, Tendons, or Muscles, affulted with cold and moist Humors, or which are affected with Cramps, Convulsions, Palsy, Gout, Sciatica, or the like. They may be made of the green Roots, by many repeated Inflations or Boilings, and will be found very profitable against the Shaking and Dead Pallies, or any pain or ache proceeding from Cold, as aforesaid. Being timely used, they are said to prevent a Gangrene when approaching.

XXIX. The Caraplus of the green Roots. It effectually eases the Gout and Sciatica, if prudently applied, and has all the Virtues of the Caraplus of the Roots of the former Kinds, specified in Set 18. aftergrowing.

XXX. The Spirit of the Root. It is Cordial, Anticoicick, and Antiinflammatory, good against Fainting and Swooning Fits, Sicknes at Heart, Belly-ach, or Gripping of the Guts: It expels Wind out of the Stomach and Bowels, and admirably strengthens the Stomach, causing a good Appetite and Digestion. Dose a Spoonful or more in a Glass of Wine now and then upon occasion.

XXXI. The Spirituous Tinture. It has all the Virtues of the Spirit, but superior to it in efficacy, and may be given from half a Spoonful to a Spoonful in some proper Vehicle. It provokes the Terms in Women, facilitates the Birth, brings away the After-birth, and eases After-pains. Held for some little time in the Mouth, it eases the Tooth-ach. And Bathed upon parts affected with the Cramp or Convulsions, it warms and comforts the Nerves and Muscles, and quickly cures the Dialectic.
English Herbs.

Chap. 554.

Pennyroyal.

The Descriptions.

III. The first, or our Common Pennyroyal. Its Root is Bulby, long and Fibrous, creeping under the upper surface of the earth, from whence springing forth many round Stalks, divided into several Branches, rather stemming or lying upon the Ground, than standing upright. On which are set the Leaves which are purplish, and as wild in our Fields and Commons, it differs indeed but little from the first, but in the largeness of its Leaves and Stalks, which are growing up higher. The Flowers hereof are purple, and grow in rundles about the Stalks, as the others do.

V. The third, or Thick or double Pennyroyal. This differs very little from the former, either in Roots, Stalks, Leaves, Flowers, or manner of growing, growing that the Leaves are something smaller, and also thicker, set on the Stalks, and the Branches grow closer together.

VI. The fourth, or White Flowered Pennyroyal. The Roots creep under the Ground, with a multitude of Fibres, and this kind grows more upright with its Stalks than the former, and sometimes a foot higher also, having Leaves therein, set by couples like it, and in some places, other smaller Leaves likewise growing with them. The Flowers (as the former) grow in rundles, or in a sort, round about the Stalks, at the several joints, but are wholly white, and so white, being transplanted out of the Fields, and Planted in Gardens. The Smell and Taste of this Plant, as also its Medicinal use, are altogether the same with the first, and other kinds, and every way as acceptable.

VII. The fifth, or Narrow Leav'd, or Hearts Pennyroyal. This fine and delicate Plant, has creeping Fibrous Roots under Ground, but shoot forth longer Sprouts than the former Kinds, from whence springing forth many tall, hard, upright Stalks, on which are set at equal distances many small, long and narrow Leaves, all along the Branches up to the Top. The Flowers grow round about the Stalks, at the joints with the Leaves, at many of the spaces up towards the height, of a pale purplish color: and the Smell and Taste thereof is freer, and much more pleasing also.

VIII. The sixth, or Round Leav'd Pennyroyal. It is a small Fibrous creeping Root, which sends forth flender Stalks, almost as upright as the last, having the Leaves set by couples at each Joint, which are small, and round like unto those of Money-wort, or Herb Two-Pence, but much less. The Flowers grow in rundles, or one at the other, encompassing the Stalks, which are of a pale bluish color. The Smell of this Plant is much more pleasant than that of the Common sort.

IX. The Places. Tho' all and every one of these Species or Kinds of Pennyroyal grow with us, in our Gardens, yet several of them grow also Wild in our Fields. The first is Common in many watery or moist places of our Land, which yet for its most excellent use is almost everywhere, that is Planted in Gardens. The second is found Wild in Essex, in divers Places of the High way, between London and Colchester, and throughout the Country, and yet more abundantly in other Countries, from whence it is Planted all over in Gardens. The third has also been found growing Wild, in many places of England, and like the others,ed, and made a Garden Plant. The fourth is a Native of Italy, and found growing in several places of Piedmont, from whence it has been brought to us. The fifth grows in moist and smooth Grounds about Mompelier in France, where the Inhabitants scarcely use any of the other Kinds, tho' they have them in great Plenty. The sixth grows in the Gardens at Padua, from whence it is Planted to us.

X. The Times. They all Flower from the beginning of June to the end of August, and sometimes later.

XI. The Qualities. Pennyroyal is of Subtil parts as Gilets says: It is hot and dry in the third Degree:
The Virtues.

XIV. The Liquid Juice. It powerfully digests, opens, and provokes the Terms in Women, expels the Birth, and Child and After-Birth, if it be vomited, eases the pain and graving of the Stomach, is profitable against Convulsions, refists Poisons, and cures such as are bitten or hung by Serpents, Mad-Dogs, Scorpions, or other Venomous Creatures. Dose 2, 3 or 4, Spoonfuls at a time, Morning, Noon, and Night, in a Glass of Wine, or other Vehicle.

XV. The Essence. It has all the Virtues of the Liquid Juice excepted. It is good against Allihma's, Coughs, Colds, Wheezing, Hoarseness, and most other Diseases of the Lungs, causing an easy expel-
oration (if taken with Honey) it refists Melanchohy and causes Cheerfulness; and drunk with the Juice of Stachel Oranges, Limons, or choffe Vintages, it is good against Painting, and Sweating Fits, Vapors, and such like. It helps the Sickens in Children, is good against the Leptos, opens the obstructions of the Liver, Pancres and Moftenery, and eases the pain of the Spleen. Being drinck in choffe Strong Wine, it gives ease in the Collie, and eases After-pains of Women lying in. Confillantly taken for some time, itiets the Emafles and Conipacyy of the Body, making the Patient Leaner; yet at the same time, it much engraces Seed in both Sexes, and strongly provokes Luf. Dose 2 or 3 Spoonfuls at a time in a Glass of Wine, Morning and Night.

XVI. The Decotion, or Infusion in Wine. It has all the Virtues of the Juice and Essence, but nothing near to powerfull. It warms the coldhens of the Stomach and Worms, and other Vile-
ness, helps against the Swelling and Handnese of the Womb, cleanses foul Sores and Ulcers, and mixt with Honey cures them to Digest. It is good against black and blow Eyes, and disfertilings of the Skin, being outwardly applied. If a little Sal Prunella be dissolved in it, and it be held in the Mounth, it cures the Tooth-ache. It is good against Paint-
ings, Sweating, and Hyderick- Fits, and pro-

Serves and those who have any complaints of the Stomach, and if it be taken in the evening, it is also good against the Kouh, and facilitates the digesting of the Food, and helps to quicken and clear the Eyes-
light, is profitable against the Falling-Sickenes, and eases all forms of pains of the Head. Dose 6, or 8 Ounces, Morning, Noon, and Night.

XVII. The Powder. It is made of the dried Herb when is known, and has all the Virtues of the Juice, Essence and Decotion, but all the with that Celerity. Dose Morning and Night, from half a Dram to a Dram in Wine. Mixed with a little Honey and Spirit, and applied to Sores and Ulcers, it digests and cleanseth them.

XVIII. The Erbeine. It is thus made Take Powder of Tips of Penegroy when in Flower, or Ouzens, Aftorachus Laxant in fine Powder, Resin, and Senna in fine Powder, of each half an Ounce, mix them. Snuff it up the Naffils Medically, and it attracts Humors both thick and thin out of the Head, and cleanseth it effectually, by which means it is profitable against the Megrim, Head-

ach, Lethargy, Carus, Sleepiness, Dullness, Drowsines, Apoplexy, Epilepsy, Verrigo, Con-

vulsions, Fainting, the other Diseases of the Head, Brain and Nerves, proceeding from cold and moisture. And if it is taken inwardly twice a Week in the Morning, from a Scrupule to a Dram, or more, according to Age and Strength, it carries off the Mortification of all the afore-
named Diseases, and so the more effectually contributes to the Cure.

XIX. The Elecrory. It is made of the Erbeine, with three times its weight of Honey; edging with all Powders in Powder, Roots, an equal quantity to the Scummery. It is given inwardly from one Dram to three, and has all the Virtues of the Juice, Essence, and Erbeine before enumerated. Applied to cold running Sores, Fijhal's, and pa-

ted Ulcers, it causes Digistion, cures the pain, prevents their censoring and spreading farther, and very much induces their healing. There is no bet-
ter Remedy against Kited Heels, than to apply the Dry Powder of the Erbeine first, and then over it a Plaster of this Elecrory.

XX. The Balsam, Ointment, or Oil, made by Infusion or Boiling. Applied to such as are troubled with the Gouts, they quickly eafe the pain, warm the parts, and take away cold griefs of the joints. Also against Gravel, they gently draw, digests also, cleanseth, and heal old running Sores, and purit Ulcers.

XXI. The Distilled Water. It has the Virtues of the Juice, Essence, and Decotion, but in a much stronger Quantity. It is good Ophthalmicke, for Blood-flot, Watering and Sore Eyes: and fo used as a Gargle, it heals Sores and Ulcers in the Mouth and Throat; otherwise it may be useful in Expelling the Dross of the Stomach, and other Preparations of the Plant down into the Stomach.

XXII. The Spirituous Tincture. It has all the Virtues of the Juice and Essence, being given Morning and Evening, from 1 Dram to 3, or 5, in a Glass of Wine, or some other convenient Liquid. It eases the Graving of the Stomach, and curset Convulsions of the Bowels. Out-
wardly bathed upon the Head, it eases the Head-
ach: and bathed upon other parts, it prevently easeth their pain, and also refors the parts troubled with the Cramp. Taken for fourteen Days or more together, in Juice or Water of Black Currans, it eases the Falling-sicknes, and is also profitable against the Vertigo, Lethargy, Carus, and other like dull Diseases of the Head and Brain.

XXIII. The Acid Tincture. It admirably re-

fors the Tone of the Stomach being hurts, stops Vomiting, destroys Putridity, and delays the heart of Fever to the Neck; and makes a good Purgem, and causes it to be easily expelleted. It is a fugu-
lar Diuretick, and therefore profitable against the Strangury, Sand, Gravel, Stone, or Tatarian Mischief in the Heels, Uterers and Bladder. It
Chap. 554. Engish Herbs. 847
takes away stoppages of the Stomach and Lungs, and caulis only breathing, it creates a good Appearance, dispelling Diathesis, and expelling Wind and Vapors, out of the Stomach and Bowels. It is also profitable against all purulé, non-purulé, malaria, and pestilential Fevers, and provokes even the petar Et Degrade, and it may be given in all that the Patient Drinks, whether Ale, Beer, Wine, or Barly-Broth, to a grateful acidity.

XXIV. The Oily Tinctorie. It is good against the Gout, Sciatica, Rheumatick Pains, Cramps, Convulsions, and Pallie, being very well annointed Morning and Evening upon the parts affected, as also (in the cafe of the Pallie) all along the Back Bone. Taken inwardly it Potently provokes Urine and the Terms in Women, and is good against the Strangury, or any stoppage of Urine from True- rous, Gravely or Lapidific Concretions. It helps the Birth of Women in Labor, brings away the Dead Attach, and helps the Birth, and casts a plentiful cleansing afterwards. In the cure of Pallie, as well as to be used outwardly, it is to be taken also inwardly, because it not only warms and consorts the Blood, but also exalts the Animal, but carries off the Morbidical Cause by Urine. Done from a Scruple to a Dram or two Drains in any proper Vehicle, Morning and Night.

XXV. The Oily Vehicle. It is a most admirable Cordial, and an excellent reviver of the Spirits Natural, Vital and Animal. It clears the Heart, comforts Nature, strengthens the Brain and Nerves, is a most excellent supporting and Hysterick Fire, and restores the whole Humane Frame, the put into the greatest disorder. It is a singular thing against Convulsions of all Kinds, and absolutely cures them in their Storm, when Death seems to stand at the Door. Done from a Dram to 2, 3, or 4 Drains, in some of the Distilled Water, or rather in a Glaas of Wine, 2, 3, or four times a Day, or as often as is needful.

XXVI. The Distilled Oil. Inwardly given, and outwardly applied, it cures Convulsions, the Falling-Sicknes, Palsy, pains of the Head, Migrain, Vertigo, Lenkathy, Carus, Grout, Sculac, and Jaues, in all sorts, all the Virtues of the Juice, Effences, Tinctorie and Spiritus, but in a much more exalted manner. Done from 10 Drops to 20, drop by drop into Syrup, or well mix with it, and then taken in a Glaas of Wine, Morning and Evening: as it powerfully provokes Urine and the Terms, so, when the Birth is near, it causes the Child to be brought forth into the World in a Moment, expels the dead Child and After-birth, and prevents and cures After-pains.

XXVII. The Peaceful or Fever's. They consist of most subtle parts, cut, extract, open, dissolve, provoke Urine, break the Concretions of Gravel and Slime, and expel them, provoke the Terms, facilitate the Birth, whether living or dead, force away the After-Birth, andランスously expel and take away After-pains. They are Scramtack, Cordial, Pectoral, give pleasant effect in the Collick, open obstructions of the Lungs, being very good against Coughs, Colds, Athma, Heartburns, Wind and Nerves of Breath. They are good in an Inverrate Head-ach, Migrain, Vertigo, Falling-Sicknes, Apoplexy, Convulsions, Palsy, Cramp, Numbeats, Lamenfits, and weekness of the Nerves, Migrain and Joint, being inwardly taken, and outwardly bathed therewith. They are power ful against all manner of Aches, Pains, Stalins, or weekness of any part, as also against an Inven tation, or any thing proceeding from a cold and moist cause. They are an Antidote against Poison, the bittings of Mad Dogs, Serpents and other Venomous Creatures. They prevail against the Malignity of the Plague, and all other Malign and Pestilential Fevers, as also against Scorbutick Boils, Broches, Scabs, Scruit, Mort-Sports, Pimpls, and other like Symptoms, inwardly taking them every Day for some time, and outwardly bath ing therewith in the afternoon. They provoke Sweat powerfully, and are a great Alespharmic in the French Pox, being daily taken in Ale, Wine, Whoy or thin Broth, after the manner of Diet, and have performed as much as any Gentianae Diet could do, they being a kind of Specick against that Diffick and its Inverrate and Malign Symptoms. They are said to cure Batreemnes in Man or Woman, (if there is not a defect of parts) cleanse, strengthen and forthe them, and are a Specick for the Diffick of the Genitalia. They are prevalent against Carburis, and cold Rheums, help drench of the Eye-Sight, cure a Shinking Breath, Cache Pains, and Cough, and often hard Tumors of the Liver, Sphees, or Metency, by bathe those Regions therewith, for they warm, strengthen, and comfort and ease all the parts of the Body. Done from 30 to 60 or 100 Drays, or more, as the Prudence of the Physician shall Prescribe, and that 2 or 3 times a Day at least (And in cafe of the French Pox, 5 or 6times a Day) in Ale, or Wine, or Water and Water mixt, or in some Syrup or Cordial Taly, and to be continued for 2 or 3 Weeks, or 2, or 3 Months, as the exigency of the Diffe may require, outwardly bathe the parts affected with them twice or thrice a day as long as you shall nee for their use.

XXVIII. The Cataplasm. Made of the Green Herb, and applied, it is good against the Gout and Sciatica, Blows, Strains, and other pains of the Joints. It also takes away spots or marks in the Skin; and applied to the Regions of Liver or Spleen, it eases the pains in those parts, and to the Region of the Womb, it helps the swelling and hardenorm of the Mother. Applied with Vinegar, it causes eating Ulcers to digest, and cleanses such as are filthy or purule; and it is said to be profitable also against the Leprosy, Morphew, and other like Distempers. Applied to the Ears, it heals Burning by Fire, and Scalding with Water. Applied with Vinegar to the Forchhead and Noftrils, it is profitable against Carus, Leghary, and Epilepsie, giving present relief in the same.

PENNY-WORT WALL, see Navel-wort, Chap. 515.

CHAP. DLV.

OF PEONY.

I. THE Names. It is called in Arabick, Per sia: in Greek, Πεωνία: from Peon, a famous Phyfician in his time) and Fowendy, in Latin, Peonia, and Olyphsa or Dolefiia (from the red Grains in the Pomegranate called Sida.) It has obtained also many other Greek and Latin Names, as, Penterob∞ν or Pentebo, Orbon, Hanagot, Pasion, Pantiaritots, Thymandick, Selonion, Selinomen, Agalophor, Idaus: Dalylia,
Salmon's Herbal

Lib. I.

The Descriptions.

Peony Male.

of the Root, which is thick and short, and Tuberous also, of the same or like smell with the Male. The Common Female Peony, has many Stalks, with more fierce of Leaves on them, than those of the Male base. The Leaves also are not so large, but divided on the edges or deeply cut in, some with great and deep, others with smaller Cups or Pouches, and of a dark or dead green color. The Flowers are of a Strong Hody Smell, and usually smaller than those of the Male, and something more purple, tending to a musty color, with yellow Thrums about the Head in the middle, so the Male Kind bar. The Heads or Horns with Seed in them, are like also but smaller. The Seed is black, but left shining.

Peony Female.

III. The first, or Male Peony. its Roots are great, thick, and long, spreading in the Ground, and running down pretty deep. It rifed up with

many brown Stalks, on which do great tangled Leaves, viz. many fair green, and sometimes red

dish Leaves, one set upon another on a Stalk, with

a particular Division of the Leaf at all. The Flowers grow at the top of the Stalks, consisting of five or six broad leaves, of a fair, purplish, red
color, with many yellow Thrums in the middle

harding about the Head, which others rise up to be

the Seed Vessels, divided into two, three, or four

rough crooked Pads, like Horns, which when they

are full ripe, open, and turn themselves down one

eight to another backwards. Bening mixing them

divers round black shining Seed, which are the true

Seed, being fall and good, and having also many red

or crimson Grains, which are black and idle, inter-

mixed among the black, as if they were good Seed,

which makes them more Beautifully.

IV. The second, or Common Female Peony single

Flower. The Root consists, as we find before, of many Roots joined together, and divided, formed at the ends of long Strings, and all from the Head

Paeonia Viaria, Herba Ginna, Hafra Regin, Paeonia Afror, with some others; but Paeonia, is the ge-
neral Name, which bears away the Ball: in Eng-
lish Penny, and Paeona.

II. The Kinds. Tho' there are many Species of

this Plant, yet there are but two Principal Kinds, viz. Paeonia Mas, the Male Peony, and Paeonia Femina, the Female Peony. Of the Paeonia Mas, or Male Peony, we know but of one only Species, which is thus distinguished from the Female. The Leaf of the Male is whole with out any particular
division, notch, or dent, on the edge, like to that of the Wall-Ner-Tree, its Roots are long and
round, divided into many Branches, something like to the Roots of Gentian or Elecampane, and not
Tuberos at all. The Female (of which there are a great many sorts) has its Leaves cut in or divided
into parts, more or less, and has Tuberous Roots or Clogs, like those of the Afsbudd, with many
great, thick, round pieces, hanging or growing at the end of smaller Strings, and all joined to the top of the main Root. From what has been said, these following Kinds are eminent, viz. 1. Paeonia Ruta, the Male Peony, which is singular Species, as before said. 2. Paeonia Femina vulgaris flore speficis, the Common Female Peony single Flowered. 4. Paeonia Femina Vulgaris flore pleno

radae, the Common double red Peony. 4. Paeonia Femina Flore cornico flores, the Single blith Peon-
y. 5. Paeonia Femina flore plano alboae, the

Double blith Peony. 6. Paeonia Femina Paeonia xanthina, the Single red Peony of Constantinople,
or Turkish Penny. 7. Paeonia Femina Flore

fimbris & pleno Claff, Orthodox his Female single

and double red Peonies. Authors have some more

Species of Paeony, but they seem to me, to be

some of the former Kinds over again, or being abiding Strangers to us, are totally unknown in

our Country.
V. The third, or Common double red Peony. The first, or Male, for the sake of which the former Female Kinds, but no flowers, like unto the former Red Peony, this double Peony, as well as the other single, is so frequent in every Garden of Note, throughout every Country, that it is almost labor in vain to mention any Places where it does not abound. A third kind, or Female Peony, both in its Stalks and Leaves, but that it grows somewhat higher, and the Leaves are of a broader green color. The Flowers grow at the end of the stalk, and are very large, thick, and double, as fair, beautiful, great, and double, that no other Flower comes near them, but abide until blest above 8 or 10 Days. They are of a more reddish purple color, than the former Female Kind, and of a sweeter Smell. After the Flowers are past, the Gods of Seed or Grains follow, which sometimes prove abortive Seed, and sometimes good Seed, which being sown, bring forth Plants, some of these bearing single Flowers, and some others, as double Flowers, as Nature is pleased to dispose them.

VI. The fourth, or Single bluish Peony. Its Roots are like the other Female Peonies. Its Stalks are higher, and its Leaves of a paler, or whiter green color than the double Blush next following, and more white underneath, so that it is much less affected by the frost than another Kind. From the Seed of the double Blush, as some have thought, its Leaves also have many Vains, which are somewhat discolored, or differing from the color of the former Peonies. The Flowers are very large and single, consisting of five Leaves for the most part, of a pale flesh, or bluish color, with an eye of yellow discolored or mixed therewith, and some are divided into Twades, tips with yellow Pendants, hanging about the middle Head.

VII. The fifth, or Double bluish Peony. Its Roots are like unto the former Female Kinds, but something longer, and of a brighter color on the out side. This double bluish Peony has not its Stalks so high as the double Red, but something lower and fatter, bearing buds like mixed Leaves, cut in, or divided here and there in the edges, as all these Female Kinds are, but so large as the loft. The Flowers are smaller, and left double by much, than the former double Red, of a faint, flowing, crimson color at the first opening, but decaying, or growing paler every Day, so that after it has had long, (for this Flower needs not its Leaves in a great while) it will change something wishing, for which reason some have ignorantly called it, the double white Peony. The Seed or Grains, which in some times bears, is like to the Seed of the former Female Kinds.

VIII. The sixth, or Single red Peony of Consolation, or red Turkish Peony. The Roots of this Kind, have longer Claws, and not so flour, as those of the ordinary Female Kind, and of a paler color on the outside. This last is very like in all things unto the double red Peony, but that the Flowers hereof are single, and as large as the loft, and that it is larger than either the single Female or the double Red Peony. It consists of eight Leaves, of a deeper red color, than either the single or double Peonies, and not purplish at all, but rather of the color of an ordinary red Tulp, standing chief and most prominent.

IX. The seventh, or Clusius his Female single and double red Peonies, ex feminis Floris pleniti rarissimae, Clusiiis, Jovis, busy in Hunt, in some Tem, and in the common double Red Peony (which is not very usual) he Sowed them, and within 3 Years he had Plants which bore Flowers, some single and some double. Of the single Sorts, one bore Flowers, for color most like unto the Mothers, but no single, confining only of six Leaves, as the Ordinary or Common Female sorts. In another single, a larger Flower, of eight Leaves, whose color was of a deeper red, drawing somewhat to blackness. A third bore a double Flowers, as great as the Mother Plant, or greater, and of the same color. The fourth sort was like the Mother Plant in Leaves, and its Flowers was double, but lesse, and not so thick Leaves, the color of which was of a deep red, being near the largeness of the double Blush, having some black Vains in those Leaves which green in the middle.

X. The Places. For all these several sorts of Peonies are originally Natives of Foreign Countries, and have been brought home to us by Travelers, and made Denizens in our Gardens, where they have grown and flourish so long, that they are now become Natives of our Land also; and we nourish them, as well for the Beauty and Ornament of their Flowers, as for their most excellent and honored Medical Virtues.

XI. The Times. They all Flower in May, some of which Flowers abide but few Days, whilst others abide many Weeks.

XII. The Qualities. Peony is temperate in regard to heat or cold, and dry in the frail Degree, gently Syrpicic, or Aperiphic, Altisperic, Anodyne and Strengthening, Cephalick, Neutonick, Hysterick and Emmenagogick.

XIII. The Specification. The Male Peony has been oftestines (even for many Ages) known to be used in a certain Care for the Epilepsie or Falling-Sickness; it also provokes the Terms in Women, and is probable against the Epilepsies or Night-Nae.

XIV. The Preparations. 1. The fresh or Male green Root. 2. A Juice or Essence of the same. 3. A Powder of the same Male Peony. 4. An Infusion of the said green Male Root. 5. A Powder of the Flowers. 6. A Syrup of the Flowers. 7. A Distilled Water from the Flowers or fresh and green Root. Where Note, That all these Preparations are spoken of the Male Kind, that being only and truly effectual Plant for all the purporses intended, which yet is much more farse or rare than the Plants of the Female Kind. But for want of the Male Species, Physicians and Apothecaries use the Female, which tho' probably it may be good for the same purpoyses, yet doubless is much weaker in its effects, and therefore cannot be attended with equal Success.

The Virtues.

XV. The fresh or green Root of the Male Kind. It is affirmed by no less than others, that a good or large piece of it hung or worn about the Neck of a Child troubled with the Falling-Sickness, will care it. That a Child was freed from that Diseafe, that for eight whole Months had worn it about its Neck, and then being taken away for tryal of the Matter, the Child fell into the Diseafe again; but having a fresh Root hung about its Neck again, he became afterwards perfectly cured.

XVI. The Juice, or Essence of the Male Root. Either of these are much more approved for the cure of the Epilepsie than the Anmulet hung about the Neck: it may be given to Children from the Spoonful to two, and to elder Persons from two to four Spoonfuls, in a Glass of warm Broth, or Red Wine, Morning and Evening, some few days before and after the Full Moon; and if it

\[Q\]
Of PEPPER, Guinny or Indian.

I. THE Names: It is called in the Indian Language, Arrz; in Greek, Rhabdis (b cpa-
ro, Morsos: ) in Latin, Capsicum, Capsicum Americanum, Capsicum & Piper Indicum, & Amer-
icanum: In English, Guinea Pepper, and Indian Pepper. It is generally thought to be the Silagu-
flamum Pimenta, (Silago Quinsy producunti) and Fige-
rus of him also (Quo stradis Piperis) & (Acrinum fit) Capsicum bicolor, Zanthoxyla, Common Acrinum, Piper Indicum & Bracteolatum, or Bracteolatum, Piper Calcabium & Histoporum, and by many Piper Guinny, as tho' it came origi-
ally from the Guinny, tho' in truth, it came to us in

their Northern Climates, from the West Indies: but I deny not, that it grows in Guinea alfo, for

that I have had the report thereof, from Eye Wic-

cetts.

II. The Kinds. There are many Species of

this Plant, several of which grow with us in

England, and molt, if not all of them, in some

of our Plantations in the West Indies, for which

reason we shall take notice of, and Defcribe thes

following, viz. 1. Capsicum majus vulgar is ob-
lungu siliqua, Capsicum longum, Capsicum rubrum, & Siliquum majus Wettum, Piper Indicum ma-

jus Marthei, Our most Common Guinny Pepper

with long red Cods. 2. Capsicum Pyramidal

eretum major, The great upright Spire fashion

Guinny Pepper. 3. Capsicum Pyramidal eretum

minor Bractiaceum, Siliqua magni, The greater

upright Heart fashiond Guinny Pepper. 6. Cap-

sicum Cordatum eretum minus, The leffer

upright Heart fashiond Guinny Pepper. 7. Cap-

sicum Cordatum propinquus, The pendant, or

hanging Heart fashiond Guinny Pepper. 8. Capi-

sicum Siliqua Olivieris prope, The hanging

Infusorium Guinny Pepper. 9. Capsicum Sil-

iqua Olivieris erecta, The upright Olivier fashion

Guinny Pepper. 10. Capsicum longum eretum

major, The greater long and upright Guinny Pe-

pper. 11. Capsicum oblongum major Siliqua recur-

vus, The greater crooked or Horsed Guinny Pe-

pper. 12. Capsicum oblongum minus Siliqua recur-

vus, The leffer crooked or Horsed Guinny Pe-

pper. 13. Capsicum bifurcatum Siliqua, Forked, or double

pointed Guinny Pepper. 14. Capsicum retorus-

sum minor, Small round Guinny Pepper. 15. Capi-

sicum retorandom major surrellum, The greater

round upright Guinny Pepper. 16. Cap-

sicum Siliqua rotundata Coriaria, The round Cherry

fashiond Guinny Pepper. 17. Capsicum Siliqua

lata & vaga, Broad oval, elliptical Guinny Pe-

pper. 18. Capsicum Siliqua flava brevissima, The

shorter Gold yellow Guinny Pepper. 19. Capsicum

Siliqua Vta longa, The longer Gold yellow

Guinny Pepper. 20. Capsicum Coele pilo, Hairy

Shall'd Guinny Pepper.

The Descriptions.

III. The fifth, or Our most Common Guinny

Pepper with long red Cods. It has a Root which

is given some few Days before and after the

Change likewise, it may be to much the better.

either of their Preparations, have been found pro-

table, and more available in elder Perfum, than with

some others, because they have more strength and
efficacy with them. They provide the Terms also

in Women, where they have been fipt, and are

effectual for such as have not been sufficiently

delisted after their Labor, and are also troubled

with Vapes, or Fis of the Mothers. They are

provable alfo to be given to fuch as are troubled

with the Inflam, or Night-Mar, called by Pliny,

Sugrefio Natans, being a Disfafe which affects

People in their Sleep, or between Sleeping and

Waking, oppreffing both Voice and Motion, and

in a manner the Breath likewise. It is truly

good for fuch as are troubled with Melancholy,

yes, with a deep Melancholy, and affected with

Melancholy Dreams.

XVII. The Powder of the Male Root. It may be

given from a Dram, to a Dram and half, or two

Drans, in a Glaf of Red Wine as afoead,

against the Epilepsy, Inflam, Melancholy, and

other Distrefs of the Head and Brain, and that

Morning and Evening, at the times before directed;

but if it is given for Cleaning of Women in Child

Bed, provoking the Terms, facilitating the Birth,

Etc. it ought to be given in White Porto, or White

Lisbon Wine, and that in the largest Dole.

XVIII. The Infufion or Direction of the green

Male Root. The Root is to be taken and washed
clean, and then thumped well, and put to Infuf

chole Gaury for three or four Days, and then

trained out, and to given fift and half, a good

draught at a time for a few Days together, be-

fore and after the Full Moon, it is fad to cure

the Falling-Sicknefs, efpecially if there is a due

and orderly Preparation of the Body beforehand,

with Powder made with Beemuy, as the Learn-
ed Phyfian fhall direct. There have all the other

Virtues of the Juice and Effence, and are likewise

available in older Perfons, if the Infufion (i.e. the

Ephery) be not grown too old and pall Care.

XIX. The Powder of the black Grains or Seeds

of the Male Kind. Given from half a Dram to

dram and half in Syrupick Red Wine, it pre-

vails against the Epilepsy, as the Root afored

does, besides it efTelently stops Fluxes of the

Belly, as Diarrheas, Dysenteria, Liereticas, and

the Hepatic Flus, very much throughout the Head,

Brain and Bowels; it also cures the Ephedra or

Inflam, and other Diftempers of the Brain: Bra-

thalian faith, It is available to refrofe Speech to

fuch as have loft it.

XX. The Syrup of the Vines: It has the

Virtues of the Juice, Effence, and Infufion, but

in a much weaker Degree, and therefore ought to

be given from 2 to 4 Spoonfulls, Morning and

Night, in a Wine proper for the purpofe.

XXI. The Diftilled Water of the Vines or green

Roots. It has all the former Virtues, but very

much weaker, and therefore may be given from

4 to 8 ounces or more, Sweetened with the Syrup

of the Vines, and is used alfo as a Vehicle to con-

verfome of the former Preparations in.

XXII. Note. The skulllae and Apothec

carry is to take care, in fiffing after, and chafing

the Male Kind, that he be not cheated with that

of Tragus, which certainly is no Penny, but a kind

of Prunella, or Bosfard Distany.
Pepper, Guinny or Indian.

from round Stalks, having a certain Firth within it, and in our Country about two Feet high, and not about three in its Native places of Growth, spreading it self out into many branches on all sides, even from the very bottom, which divide themselves again, into other smaller Branches: at each joint of which come forth two long Leaves upon short foot Stalks, somewhat bigger than those of Night-shade, elfe very like, with divers Veins in them, not as all divided about the edges, and of a very sad green color. The Flowers stand severally at the joints, with the Leaves, very like the Flowers of Night-shade, compounding most usually of five, yet sometimes of six white small pointed Leaves, standing open like a Star, with a few yellow Threads in the middle: After which comes the Fruit, either great or small, long or short, round or square, as the Kind are, and standing either upright or hanging down, as their Flowers shew themselves, either of this or that form, as shall be found in the following Descriptions.) In this it is somewhat great and long, about three inches in length, thick and round at the Stalk, but smaller towards the end, which is not very sharp, but roundish pointed; green at the first, but being full ripe, of a very deep crimson shining red color on the out side, which is like a thick Skin, white on the inside, swelling tolerably well and square, having many flat yellowish white Seeds therein, cleaving to certain thin Shines within it, which are broader at the upper end, and smaller at the lower, leaving the end or point empty, as not reaching so far, the whole black or God, but especially the Seed, being of so hot and fiery a Taste, that it enflames and burns the Mouth and Throat vehemently, and for a long time after it has been chewed, with such an extremity, almost to hazard Choking. The Description of this first Kind, is proposed as a pattern for all the rest following, so by which you may frame at large all their Descriptions, the chief difference consisting in the form of the Fruit, whether Husks or Cods, as shall be more demonstrated in every one of them in their before named order.

IV. The second, or Great upright Spire fashioned Guinny Pepper. This is much alike, or very little differing from the former. The difference of the Fruit is, that this stands upright, is great below, and smaller, and smaller to the point, which is sharper than in the first, else it might seem the same inverted, that is, either that turned upwards, or this turned downwards, of as home and orient a shining Coral color, as that other is.

V. The third, or Lesser upright Spire fashioned Guinny Pepper. The Fruit of this Kind is lower by half than the last, and not so sharp or small at the end, but somewhat round: and the green Leaves also are smaller and narrower. The Stalk likewise is smaller, and not so high. The Flowers of this are of all the rest, which bear their Fruit upright, and upright likewise, which is in a certain rule to know, what Fruit will be pendulous, and what upright.

VI. The fourth, or the very small or smallest Pyramidal Guinny Pepper. The Fruit of this is small and grows upright, the Cods being shorter and round, an Inch long at least, and of a blackish red, before they be fully ripe, but when perfectly ripe, are as red as the rest. This Plant grows taller, fuller of Branches, and more stored, both with Flowers and Fruit, which make the goodlier profped. The Leaves are no smaller than those of the last before going, and of the same dark green color with the rest.

VII. The fifth, or Greater upright Heart fashioned Guinny Pepper. This Plant grows to be but of a mean height, not so high as any of the former; its Leaves are large, but not so small at the ends. The Fruit is not hanging downwards, but standing upright, being something great, flatish, and as it were bunched out at the upper end, near unto the Stalk, and smaller below, short and round pointed, something resembling the form of a Heart. Heart.

VIII. The sixth, or Lesser upright Heart fashioned Guinny Pepper. This differs not from the last, but in the smallnesse of the Fruit, standing also upright, and being smaller by a third part, or near a half, and shorter also.

IX. The seventh, or Pendulous or hanging Heart fashioned Guinny Pepper. The form of this is something like to the fifth, or greater upright Heart fashoned Pepper, being near of the same bigness, but a little more unequall, and not so round, and full as red being ripe: it is pendulous, or hanging down, not standing upright at the other. There is another sort of these Pendulous Peppers, (altemus minus) differing in nothing from the greater, but in being smaller.

X. The eighth, or Hanging Olive fashoned Guinny Pepper. This has but small, long, and round Cods, smaller below than above, being very like unto an Olive Plum, of full as red a color being ripe, as any of the rest, and hanging from its foot Stalk downwards.

XI. The ninth, or Upright Olive fashioned Guinny Pepper. This differs from the last, but in being greater than it, and in its Fruit standing upright, and not in any thing else.
Salmon's Herbal.

Lib. I.

XII. The tenth, or Greater long and upright Guinny Pepper. This is long and round, yet not like that which carries the form of an Olive Berry, but much longer, and of an equal bigness all its length, growing also upright.

XIII. The eleventh, or Greater crooked or Horned Guinny Pepper. This has great large Cods, about five inches long, sometimes little or nothing crooked at the base end, which is long and small; and sometimes a little crooked or bended upwards, and sometimes very much.

XIV. The twelfth, or Laffer crooked or Horned Guinny Pepper. This differs from the last in not being half so thick and long, and keeping its end bowed or crooked contusely, not varying as that does. Both this and the last hang down their Cods towards the Earth. And the whole Plant is likewise less than the former.

XV. The thirteenth, or Forked or double pointed Guinny Pepper. This is very like the Long upright Pepper, and much about the same form and bigness, being of an equal size almost all the length thereof: but differs from it in this, that the lower end is parted as it were into two short round Points, and it also a little feathery there than upwards, neither in color, nor any thing else differing from any of the rest.

XVI. The fourteenth, or Small round Guinny Pepper. This grows in the same manner and form, that the last kind does, not differing therefrom in any thing, but in the Leaves, which being in the same form, are not so great and larger: and in the Plants, which in this is small and round, (standing four feet right, and some upright, but none pendulous or hanging down, each of them upon a long foot), about the bigness of a Batberry, round and nothing fo red, of dark or blackish red color, exciting to red: and in another sort, almost black, having fuch like Seed within them, but smaller. This seldom bears ripe Fruit in our Climates. These Plants or Fruit which we have had from the Bermudas where they are Native, are of a yellowish red.

XVII. The fiftenth, or Greater round upright Guinny Pepper. The chief difference in this, consists in the form of the Fruit, which grows upright like the flowers do, being great and round like an Apple, and in the greatness of all the fruits which bear round Fruit, of an excellent red color when it is ripe, like unto polished Coral.

XVIII. The fiftieth, or Round Cherry fashion'd Guinny Pepper. There are two Species of this Plant, one in fuch a fmall round Fruit, like unto an English or Flemifh Cherry: the other which has a little point at the end, this being a little bigger than the other, and both of them hanging down.

XIX. The fourteenth, or Broad crumbled Codded Guinny Pepper. The Cod of this Kind are somewhat large, greater above, and smaller below: something flat allies, and not round, but crumbled at one, or shrunk half together, fpringing without pretty Sweet.

XX. The eighteenth, or Shorter Gold yellow Guinny Pepper. It might be thought by fome, which see only the Cod of this Pepper, that it differs from all the rest, in the manner of growing, as well as in the color of the Fruit, but it is not fo. For it has like Leaves, Stalks and Flowers in every part, and only differs in that he bears Cods, very like unto the fifth sort here described Sect. 3. which is the Common Kind, but that they are shorter, and ending in a smaller, or sharper point, and of a fair Gold yellow color, not red as at the others before are.

XXI. The nineteenth, or longer Gold yellow Guinny Pepper. This differs in nothing from the last, but in the Cods, which are not so thick as they, but a little smaller, from the middle thereof, and a little longer, softening very freely unto the pointed end, of a fair Gold yellow color as the former.

XXII. The twentieth, or Flaky Stall'd Guinny Pepper. Its Roots are like to the others: and it grows with round green Stalks or nothing crooked at the root end, which is long and small: and sometimes a little crooked or bended upwards, and sometimes very much.

XXIII. The Places. All these Sorts of Pepper are Native of the Western or Americas, as Brazil, New-Spain, Mexico, Peru, Florida, Carolina, Virginia, Barbadoes, Bermuda, Jamaica, &c. and also they have been found growing in Guinea, and many other parts of the African Continent. From the West-Indies, until the south brought to Spain, Portugal, Italy, England, Holland, &c. and are grown in our Gardens, where they thrive and profit very well, and are now found in almost all the Provinces of Europe, for the profit they make of the Fruit, which serves them in all those parts, instead of our Common East-India Pepper.

XXIV. The Timers. They are commonly Sown about the end of March, or beginning of April, in their Frames, and are usually Flowered about the beginning of August, and the Fruit or Cods ripe not throughly, that is, they come not to the beauty and perfection of their Carolinian red and neat, until the beginning of Winter, and do abide both with Flowers and Fruit, most of the Winter in those hotter Climates: but with us, as soon as the Frost comes they perish, and therefore must be Hoarded if you will preserve them.

XXV. The Qualities. Guinny Pepper is hot and dry in the fourth Degree, Alfringent, Carnivorous, and Thyrnous, Neurorcircous, and Altemorphous, growing in the governments of Portugal, and the New Provinces, and the Carolinian red and neat.

XXVI. The Specification. It cures Vomiting, want of Appetite, weakness and Indigestion, the Cholick, expels Wind, and powerfully provokes the Birth: it facilitates the Birth, expels the After-Birth, and is profitable against Sand, Gravel, Stone, and Tartarous Slime in the Knees, Uterus and Bladder.

The Virtues.

XXVIII. The Pickle. The Cods are Pickled as Cucumbers, French Beanz, and other things of like Nature: being to prefered, they are of extraordinary use to Rheumas and forthe the Sowth, (shop Vomiting), to remove Nausseousness, cause Appetite, and a good Digestion: they expell Wind in the
the Stomach and Bowels, and are good against pains in the Intestines, and the Colick. They are commonly eaten with Meat, as a Pickled Sallet.

XXIX. The Compound or Artificial Pepper. This Receipt is taken from Gorgio de Ruggio, who is the chief Author that has wrote amply of their Grammar or Indian Peppers. Take of the ripe Cods of any of the sorts of Galmony Pepper, (being all in Properties or qualities alike) dry'd by themselves, and then in an Oven, after the Bread is taken out, put into a Pot or Pipkin, with a sufficient quantity of Flowers, that they may be sufficiently dry'd; and after which take them from the Flower, (and from their Stalks if they have any) cut or chop them very small, both Hocks or Codds, and Seeds within them: and to every Ounce of them put a Pound of fine Wheat Flower, or the same with which they were dry'd in the Oven: make them up into Coles or small Leaves, with so much Leaven, as may be convenient for the quantity: Bake these again as you may do Bread of that sort, and being well baked, and a little hard, and dry'd, and Bake it again, that it may be as dry and hard as Bisket: which then beat into fine Powder, and sift it through a fine Sifter or Sieve, to be kept for use, or be to be mixed and made into any Powder, as Meat or Sauce, or any other purpose: for our Common Eall-India Pepper is used for. In my opinion, half the quantity of Flower here prescribed may be enough: and it may be a useful addition of Ginger to an Ounce may be fully enough. It gives a good Sau- vor, and it may be a better Taffe and Kelfth to Meat or Sauce, than the Common Pepper: and is fingularly good with such Meats as Asparagus and Fish. Flagrant or Windy, to break and diflump the Wind tooth in the Stomach and Bowels, and for such whole Bodies abound with Crudes and Moisture. One Scraple of the said Powder may be taken in a little Brook-Chicken, Musten, or Veal-Broth, for comforting and strengthening a cold and moist Stomach, to help Digestion and provoke Appetite.

XXX. The Simple Powder of the Cods and Seeds, and any other use ful. It is made by drying them thoroughly, (not burning or burning them) which may be done in a Baker's Oven, after the Bread is out, and repeating the drying for so long, till they will beat into Powder in a Mutter. It has all the Virtues of our Common black East-India Pepper, and may be used as Spice, in Sauce orotherwise, as that is: It diffuses and ex- pels the Wind, comforts and warms the Stomach, is good against the Colick, and griping the Guts, provokes the Terms in Women, facilitates the Birth, and forces away the Dead Child, and AFTERTHINGS, being also prevalent against all Obstructations of the Reins and Bladder throne Sand, Gravel, Stones, and Tumorous or Slimy Matter lodged in those parts. Dose 1 Scraple to a Man or Woman, mix with some proper Syrup, or with Honey, or other fit Vehicle, Morning and Night, or at time of any Paroxym.

XXI. The Vinegar, or Infusion. It is made by infusing it in the best Dutch Wine Vinegar, 2 Ounces of the Powder. If it is made of the free rite Code, you may put 5 or 6 Ounces or more, (first cut small) to a Quart of the said Vinegar. It is an admirable Stomachick, fireless and for those it provokes Appetite, and causes a good Digestion: it may be used at Meals, as Sauce with Meats, and such other things as re- quire Pepper and Vinegar: and upon occasion for the Tooth-Ach, it eases the pain, and provokes them from Rottenness. Mix with Red Port Wine, and used as a Gangle helps a sore Throat, and in a little time heals it.

XXXII. The Decotion in Wine. It has the Virtues of the Vinegar, eases the Tooth-Ach upon the Spot, and makes an Excellent Gangle for a Sour Mouth and Throat. It immediately gives ease in the Colick, stops Vomiting, and is probable for such as are troubled with a Chymisy: It is said to be good for such as have a Watery Rapture, outwardly applied: provokes Urine powerfully, helps against the Stomach, Sand, Gravel, Stone, &c. Induces the Terms in Women, and causes speedy delivery to Women in Labor.

XXXIII. The Opiumtuck. The Powder mixt with an equal quantity of Levigated Nitre, and dissolved in White Wine, or mixed into a Linitum with Oil of Ben; and applied, it takes away Scabs, Moth, Spots, Freckles; red and fiery Pimples and other hot and sharp eruptions of the Skin.

The Linitum mixt with a little Sharp Wine Vinegar, and applied, eases the pains of the Spleen, and diffuses the hands thereof, it also diffuses other cold Tumors, and Ordinaries Swellings.
Salmon's Herbal

Lib. I.

Chap. DLVII.

Of Pepper--Wall.

I. The Names. It is called in Archiæ, Hel-ßhèmæ, Hoonrachhobæ, and Teleph, in Greek, Ælévæ õî:v õivv, in Latine, Ælébæ minor Lodabilis, Æzoon ææ Carlid, Æzoon mi:nor For-vidi õaftæ Toolah, Sedum mi:nor caufitium, Êlæf, Gramen Teritum Pînii Anguiis; Dúcùlùm fe:] to tìs teritum Columbat, Sempervivum min-imar Lodabilis, but Columnae think it is not fit to be called an Æzoon, or Sedum, because they are all extremely Cold, whereas this is very hot, even in the fourth Degree, and to this Opinion I adhere, knowing it to be no Species of the Sedum's, but a Plant of another Kind. In English it is called, Wall-ô:pper, ææ Little Stone-Côp, Frîcker, and Wall Mugf-Eait.

II. The KINDS. Authors make two Species of this Plant, viz. 1. Ælébæ mi:nor, õiv Sedum Teritum Doïgörîdæ, to which all the Names in the former Section belong, Our Common Wall â:pper. 2. Ælébæ inñufæ, Æzoon mi:nor Thelæ & Vercûlarchius Inpîdæ, Æzoon mi:nor Carid, Inpîul, or Tétles Wall-ô:pper.

The Descriptions.

III. The first, or Our Common Wall-ô:pper. It has a Root which is Scrupulous and fibrureus, much like to those of the Stone Crops. This Root sends forth many Softs, which as they live upon the Earth, take Root and Spread. It is a small Plant, and grows much like to some of the Stone Crops, with many very slender Softs, bossed round with small round Leaves growing very thick or close together. As the tops thereof grow small pale yellow Flowers, in small Tufts. The Tuft of the Plant is very hot and Sharp upon the Tongue, which chiefly distinguishes it from the Sedum's, or Stone Crops, that it is also distinguished by its form, being small and thick for a round Leaver.

V. Gerard describes it thus. Its Root is noth- ing but a great Root, which is a little and little Herb, whose Softs are slender and flîght. The Leaves about the Softs stand very thick, being small in growth, full Bode, sharp pointed, and full of Juice. The Flowers stand at the top, and are very small, of color yellow, and of a sharp bînting Tolt.

V. The second, or Inpîul, or Télles Wall-ô:pper. This has a Root only made of Fiber, and is as small a Plant on the left, growing altogether like it in Leaf, Stalk, and Flowers, which are yellowous tcheñwe; but it is chiefly distinguished from the former by the Tuft, which in this is noth- ing biting, but utterly infulous and is called Tolt.

VI. The Places. The first grows almost every where in dry and fîny places, and in Chinks and Chinnies of old Walls, and on the tops of Houles. It is always green, and therefore was ranked by former Authors among the Sempervivæ, or Ho:eîe-locks. The second grows also in the like Places, on Mud or Stone Walls, or among Rubble, or in sandy or gravelly Places, and oftentimes on the sides of old Tiled Houles, and Lent-Houles, etc.

VII. The
Chap. 557. English Herbs.

Pepper-Wall Insidia.

VII. The Times. They both Flower in the Summer Months, in June and July, and sometimes sooner, and the Leaves (if the Scion is not very extraneous) continue green all the Winter.

VIII. The Qualities. The fruit of these is only usel in Phy lic, and is hot and dry in the fourth Degree, very attractive, sharp and biting; outwardly applied it raises Blister s, and at length exacerates the part it is apply ed to.

IX. The Specifications. It cures the Sciatica and Gout, prevents against the Kings Evil, is Alexandrethick or good against Fieyon, and cures Quartums and other Ayes of long con tinuance.

X. The Preparations. You may have there from. 1. A Liquid Juice. 2. An Essence. 3. An Infolated or Decocted Oil. 4. A Balsam. 5. A Catechism.

The Virtues.

XI. The Liquid Juice. By reason of its hot and attractive qualities, it is (when taken inward ly) Emetic. Being taken with Vinegar, or some other proper Vehicle, it educes thick and tough Phlegm, and other tenacious and viscid Humors in the Viscera, by Vomit it evacuates also Cholerick Humors, and thereby cures Quartan Ayes, and other Ayes inveterate, or of long continuance. And taken in the same manner, it expels any sort of Poxion, whether Vegetable, as of the Aconites, or Animal, from the swallow ing of any Poisou us Creatures; but, Curvat qui sumptatur, fays Parbin son, I suppose because of its heat.

XII. The Essence. It has all the Virtues of the Liquid Juice, being taken in the same manner, or in the same Vehicle: and may either of them be given, from a Spoonful to two Spoonfuls, more or less, according to the Prudence of the Physician.

If the Dose is given in a large quantity of the Vehicle, it will certainly be less dangerous to at tach a good quantity of Poffe Drink, or Morton Broth be Drink after it, if it is found to burn much; it much expels wind, and being given in a small quantity warms and comforts the Stomach, and gives ease in the Collick.

XIII. The Infolated or Decoc ted Oil. It姓 pains and diffiicules Tumors proceeding from cold and moit Humors, and is a very beneficial thing, in alleviating pains of the Gout. Anointed upon the Spine Derf, and parts afflicted with the Palfy, it diffus the Flatus and Humor, and cures that difficult, if it is in recent Anointed on the Neck and Throat, it is good against the Quinny, fellings of the Almonds, and other Distemper of the parts: Anointed on the Piles it cures them.

XIV. The Balsam. It is made with Beef Suet, Straining Turgentine, with a little Vinegar in every quart. It is a potent thing against the Gout, and all manner of Aches and Pains of the Joints being applied, (especially being at the same time exhibited:) it is profitable against the Kings Evil, taking away or diffusing Knots and Kernels in the Neck and Throat, before they are broken; or if Ulcerated, discharging, cleansing, and healing them in a short time.

XV. The Catechism. It is made by beating the Herb up with a little Horse Lord. Applied to the Hips, it cures the Sciatica, and to Joints affected with the Gout, it cures the Pain and eulces the Mountick Matter, and this it does by drawing Blister upon the parts affected. And applied to Kernels or Scrophulous Tumors in the Neck and Throat, commonly called the Kingseas, it removes or takes them away after a singular manner.

XVI. Note. The second of these, is cold and moist in the second Degree, and on the second it is thought to be astringent withal. And to stop Flusses and dilutions of Rheum, inward Bleeding, and outward hot eruptions of the Skin, and to heal cancerous and fretting Sores and Ulcers, and is safely to be used, and effectual for all the purposes for which our Common Horse-Leev is used, its Qualities, Preparations, Virtues and Uses, being much the same, which see Chap. 484, Sect. 10, ad 37, and Chap. 487, Sect. 6, afogoing of this Book.

CHAP. DLVIII.

Of PERWINCLE.

O R.

The CLIMER.

I. The Name. It is called in Greek, Κλεματ, because it brings forth its Stalks which creep or climb like those of the Vine: Daphnordos, because its Leaves are like those of the Bay Tree;) in Latin, Clematis, & Vinea.
Salmon's Herbal. Lib. I.

Vinca Pervinca, Chamadaphne Plinij, Centunculus Plinij: in English, Pervinca, or Vinca, also Pervinca.

II. The Kinds. There are three several sorts which are common amongst us, viz. 1. Clematis Daphnoidees major, Vinca Pervinca major, Chamadaphne major, The greater Pervinca. 2. Clematis Daphnoidees minor, Vinca Pervinca minor (diverorum colorum) Chamadaphne Plinij, Centunculus Plinij, The lesser Pervinca, or single Pervinca of divers colors. 3. Clematis Daphnoidees, five Vinca Pervinca Florae duplici purpureo, Pervinca with double purple Flowers.

The Descriptions.

III. The first, or Greater Pervinca. Its Root consists of a great Bough of fibres, which run and spread themselves much, clinging themselves strongly in the Ground. This greater Pervinca is something like to the next, or smaller Kind, but much larger, yet its Branches creep not in that manner,

but stand more upright, or left creeping at the joint. The Leaves also hereby stand by couples at the joints, but they are broader and larger by the half than the next following. The Flowers likewise are larger, consisting of five Leaves, of a bleue color, a little deeper than the bleue in the lesser Kind. This Plant is far tenderer to keep than the smaller Species, and therefore ought to be planted in a warmer place, yet a place which is cool and shady.

IV. The second, or Lesser Pervinca, which is a single Pervinca of divers colors. Its Root is in its Belly, little bigger than a Nutt, rooting at first out, in the Ground, and creeping with its Branches and Thieves far about, whereby it quickly takes up a large compass, and is therefore well usually planted under Hedges, where it may have room enough to run in.

From this Root spring forth many Branches, tak

Perwinkle purple small.

Perwinkle Wild small.
The Virtues.

The Description.
In the Garden in those Months, unless it be under a House-are, or where they may be sheltered from the Winter's cold, because many times the Year not failing out to be moderate or kindly, the Plants give ripe Seed, and so should be seek both for Seed to Set, and Roots to Set or Plant again. The Stalk of this Marshallus Plant is great and thick, thicker than any Moss Thumb, bunch'd out, or Swelling with a Kind of Knot at every Joint, in some Plants the Stalks will be of a fair green color, and these really being white, or white and red Floreris: and in some a dark green color, which will give yellow Flowers. The Stalks and Joints of thrie, which will give red and yellow Flowers Spotted, are somewhat borr Vent, but not so red as those which give wholly yellow Flowers. Upon the Stalks which forced into many Branches, there grow at their Joints upon foor Sheet, fair green Leaves broad at the Stalk, and pointed at the end. At the Joints likewise, towards the upper part of the Branches, at the foot of the Leaves, come forth several small Flowers, upon four foot Stalks, every one being small, long and slender, from the humble to the big, which is broad, spread open, and round, and contains but of one Leaf without division, like unto a Bell-flower, but not comarted at all. These Flowers are of diverse colors, and diversly mixed and spotted, some being wholly white, without any spot in them for the most part, then all the Flowers of the Plant. So likewise some bearing yellow, and some wholly red. Some Plants again are mixed and spotted variably, either white and red, or purple (except here and there, some may chance to be wholly white, or red, or purple, among the red), or red and yellow in the whole Plant (except as before, some may chance in this kind, to be either wholly red, or wholly yellow) that you shall scarcely find 2 or 3 Flowers in a Hundred, which will be able spotted and marked, without some diversity, and likewise every Day, as long as they blow, which will be until the Winters or rather Autumna Cold puts a stop to their promiscuity of blooming. It has oft been observed, that one side of a Plant will give fairer varieties of Flowers than another, which is most commonly the Easten, as the most temperate and finddy fry. All these Flowers do open for the most part in the Evening or in the Night time, and so stand blown open, until the next Morning Sun begins to grow warm upon them, which then close themselves all together, as the Blows of the Flowers shriveling into the middle of the long Neck, much liko unto the Blown Bird-weed, which in a manner does so close up at the Saints warme heat. Or else, if the Day is temperate and mild, without any Sunshine upon them, the Flowers will not then close up for the most part of that Day, or until it is towards Night. After the Flowers are fully open, some general Heads of Seed, that is, but one at a Place, as the Flowers blow before, of the bignes of a function of a small Pea, but not so round, standing within the green Hoods, in which the Flowers grow before, which Seed is a little flat at top, like a Crown or Head, and round below where it is fastened in the Cups of a black color when it is ripe, but else green all the while it grows on the Stalk; and being ripe, is soon shaken down with the Wind, or any other light blow. W. Gerard has another Description, which being compared with the former, will more likely fit forth this admirable Plant; and it is in these following Words. Its Root is thick, and like unto a green Balsam, incommodously black, and within white, and firm in Lathe, or otherwise mingled a Superb Sweetness: it brings forth many Flowers from July to October in infinite Number, even until the Fruit does cause the whole Plant to perish, we notwithstanding it may be preferred in Pots, and set in Chambers or Closets that are well warm, so freed from the injury of our cold Clime, provided always that there be no Water cast upon it, or put forth into the air, to take any moisture in there, until the March following: at which time it must be taken forth out of the Pot, and planted again in the Garden: by this means many Plants have been preferred, as well as by Sowing of Seeds, which Swam Plants will bear Flowers in an ample manner, and in as good time, as thosereffen Planted. This admirable Flower, called the Marvel at Peru, or the Marvel of the World, springeth from the Ground, like unto Bell in Leavos, among which it is seen in a Stalk two Cubits and a half high (viz. about four Foot and half) of the thickness of a Finger, half of Juice, very firm, and of a yellowish green color, whitened or leaved with joints, somewhat branching forth, of a purplish color, as in the Female Ballevina; which Stalk divides itself into fiery Branches or Branches, and these also knotted, like the Stalk. Its Branches are decked with Leavos growing by couples at the Joints, like the Leaves of Wild Peacock, green, flufly, and full of Joints, which being rubbed do yield the like unhappy Smell as Wild Peacock do, and are also very unlivly, yet in the latter end they leave a Taffe, and fhiro fine of Tobacco. The Stalks towards the Top, are garnished with long yellow abroad single Flowers, folded as it were into one, before they be opened, but being fully blown, do ressemble the Flowers of Tobacco, glittering oftentimes with a fine purple or cranof color, many times of an Hoyle Fifth color, sometimes white, sometimes yelows, and sometimes refembling an old red or yellow color, sometimes whitish, and most commonly of two colors, which occupy half the Flower, or intermixing the whole Flower with stricles, or orderly streams, new yellow, new purple, divided thro' the whole, being sometimes great, and sometimes little spots of a purple color, finished and scattered, in a myst variable order, and admirable mixture. The Ground or Field of the whole Flower, is either pale, red, yellow, or white, containing in the middle of the hollowness a Prick or Pointed set round about with six small Strings or Cords. These Flowers are very facet, and pleasant, resembling the Narciflus or White Daftiball, and are very suddenly fading. For at Night the Flowers are wide open, and to continue stilly of the Clock the next morning blooming, at which time they begin to close (after the manner of Bird-weel) especially if the Weather is very hot: but the Air being temperate, they will sometimes remain open the whole Day, and from one to another, and in those cases, sometimes only at Night, and so perish, one Flower lasting but only one Day, like the True Ephemera um or Heceraeita. This wonderful variety does (not without cause) bring admiration to all that observe it. For if the Flowers be gathered, and reformed in several Vases, and compared with those Flowers, which will Spring and Blowing the next Day, you shall easily perceive, that not one Flower is like another in color, the one you should compare an hundred which Flower one Day, with another hundred which you may gather the next Day, and go from Day to Day, during the time of their Blowing. The Cups and Heads which contain and embrace the Flowers, are divided into five pointed Sections, which are green, and as it were confing of Skins, wherein is contained one Seed and no more, covered with a blackish outer Shell having a blunt point on which the Flower grows, but on the other end next the Cup or Heace, it is adorned with a little fine cored Crown. The Seed is of large as a Peper Corn, which of it self falls with any light motion. With-
Chap. 559. English Herbs.

in this Seed is contained a white Kernel, which being bruised, resolves into a very white Pulp like Starch. Thus Gerard.

V. The second, or Lesser Marvel. The Root of this is like it is incredible to me in proportion to the rest of the Plant. This Small Marvel of the World, or of Peru, as it is called, grows in the same manner that the former greater does, but nothing so large or so high, having such like Leaves set on the Stalks, but much lefer and rounder: the Flowers likewise being of a red color for the most part, and made of one Leaf, opening into the Morning, like the others, they are so small, that the whole Flower of this is scarcely so big, as the one part or division of the greater Flower, and the Seed which follows, as in proportion to the Flower going before it.

VI. An Observation. This larger Plant yields in our Gardens, five or six several Varieties of beautiful Flowers, as, 1. Pure White. 2. Pure Yellow. 3. Pure White, and Red Spotted. 4. Red and Yellow Spotted. But besides these there are some other sorts, amongst which was, 7. One of a Pale Purple or Peach color. 8. And a Purple or Peach color Spotted, Cvs, all which differences in Flowers may be discerned by the Leaves of the Plant, and manner of growing, which are all different one from another: and many of them in their Native Countries differ from those which we have growing with us in our Gardens; but concerning them all, the chief difference almost consists in the Flowers.

VII. Observation 2. Within a while after the first Frost have taken the Plants, so that the Leaves wither and fall, dig up the Roots whole, and lay them in a dry Place for three or four Days, that the superfluous moisture on the outside may be exhausted, and dried away which does wrap them up severally, in two or three brown Papers, and lay them by in a Box, Chest, Tub, or in some other convenient thing or place in the House, all the winter time, where no Wind or moist Air may come to them. And thus you shall have these Roots preferred, and fit to Plant again the next Spring, which will spring and thrive the next Year, if you plant them in the beginning of March, as has been often times proved.

VIII. Observation 3. Some have put them up into a Barrel or Firkin of Sand or dry Ashes, which is also good, if the Sand or Ashes be truly dry, but if they be any thing moist, or if they give again in Winter, as is usual, that moisture of Sand or Ashes, will putrifie the Roots, so that they will be nothing worth, when the time shall come that they should be planted.

IX. Observation 4. This is also to be noted, as to the sowing of the Seed; that if you would have variable Flowers, and not all one color, you must chase it out of such Plants as be variable while they grow, and out of such you must reserve your Seed: for if the Flowers be of one entire color, you will have for the most part from those Plants which will bring forth Flowers all of a color, whether they be white, red, or yellow.

X. The Places. These Plants grow naturally in Peru, Mexico, and other Provinces of the West Indies, where there is a perpetual Summer, or at the least no cold Frosty Winters: and from those parts the Seed was first brought to Spain from whence it is supposed to have been carried to most other Countries in Europe, and particularly into our Gardens in England, having now had it with us, for near this hundred Years, or more: so that now they are almost in every Garden of Note.

XI. The Times. The Roots ought to be planted in the middle of March if the Season is temperate and warm; otherwise in the beginning of April, at which time they are to be taken out of the Paper, or from the Sand, in which they lay Buried, and then placed in that part of the Garden which is warmest, and withail shady and a little moist. If you raise them from the Seed, it is to be from or planted about the middle of April. They bring forth their Flowers from the end of July, and Flower thro' all August and September, till other, or till cold Air and Frost come, which pull them down; the Seed ripening in the mean Season.

The Virtues.

XII. This Plant is esteemed more for its Rarity and Beauty, than for any Virtues it is known to have, nor have we learnt anything concerning the Plants from the Indians, among whom it is a Native: its exceeding and admirable Beauty, and Sweetness of its Flowers being the only reason for which it is Nurtur'd up in our Gardens; in which it is indeed a pleasant Ornament. However, Jacobus Antonius Conifor is of Pada says, That he had found out by experience, that the Powder of the Root, taken to two Drasms inwardly, in any Drinck, does exceedingly well purge, Watery Humors.

CHAP. DIX.

Of PETERS-WORT.

Square JOHNS-WORT.

I. T H E Names. It is called in Greek, Πετρωτικός, Afsynos, & Afsyno-

ides: Dioscorides, it was called also, αασφυνο č & ἀσφυνον, Hypericum, i. e. Johns-Wort, and Androsaemon, i. e. Tanacet, or Park Leaves: and
cenerated, it is called a kind of Androsa-
mem, but it is truly neither of these Plants: in
e, it has no other Name than Afsynos, from the
Greeces; and in English, it is called Peter-
wort, or Johns-worts Square Stalked, John-swort the

great.

II. The Kinds. Authors have many Kinds of this Plant, the three following are eminent, viz. Afsynos vulgaris, Matthioli, it is, Androsaemon brizanum, is Afsyni, Hypericum Debatum, in his First Edition, Androsaemon alternus Hispidum Columnae (and yet he doubted whether he should call it Hy-

tericum, or Androsaemon, and said that it came nearest unto Afsynos, tho' something differing from
Salmon's Herbal, Lib. 1.

III. The first, or Our Common Peters-wort, or Square Johns-wort. It has a hard and woody Root, not very thick, running under the upper surface of the Earth, with a great number of Fibres springing from the same, and running struck down into the Earth; it sends forth new shoots every Year, and abides a long time, or for many Years. This is that Peters-wort which is well common with us in England, and rises up with square upright Stalks for the most part, something greater and higher than Hypericon, or Johns-wort, but brown in the same manner. At every Joint, it has two Leaves, something like those of Hypericon, but larger, a little rounder-pointed, and with very few or no holes to be seen therein, and having sometimes some smaller Leaves, rising from the Bases of the greater, and sometimes a little hairy within, as the Stalks will be. At the tops of the Stalks grow many yellow Star-like Flowers, with yellow Threads in the middle very like unto those of Hypericon, so that but for the largeness and height, it is not readily discerned from Hypericon. The Leaves and Flowers give a bloody Juice, being bruised between the fingers as that does, and it has such like Seed, and of as Strong and Befmaids Smell.

Johns-wort.

Note, That by a mistake of the Printer, the true Figure of Peters-wort is placed in the Chapter of Johns-wort, Chap. 405, Fig. 575. b, which ought to be placed here; and this Figure of Johns-wort, which is put here, ought to be placed there, of which we desire the Reader to take notice, to avoid being mistaken.

IV. The second, or Mathis Peters-wort, or Creeping Mathis Peters-wort. It springs up with Stalks round, mostly, and soft, which stand not upright, but lean downwards, taking Root at the Joint, having somewhat rounder pointed Leaves, set at the joints, two for the most part together. The Flowers are as yellow, and of the same bigness as the former, but give not that pure and red a Juice as they do, and in these particulars confine the whole difference from the first, setting aside also the Natural Place of its growth.

V. Johnston upon Gerard, thus describes this second Species. It sends forth divers round hairy creeping Stalks, which here and there put forth new Fibres or Roots, and those are set at certain Spots, with very round and hairy Leaves, of a whitish color, and two at a Joint. And on the tops of these Stalks grows a few small yellow Flowers, which consist of few Flowers space. Those Stalks and Stalks send forth Branches, making it to be feveral as at the tops. This [says he] may well be called in English, Round S. Peters-wort.

VI. The third, or Great Flowered Peters-wort. This Plant is very much like the last described, having that it has a round brown upright Stalk, two Feet high at the least, with such like, but larger Leaves, and round pointed, of a pale green color on the upper side, and whiter underneath. The Flowers which put forth at the end of the Stalk, are of a pale yellow color like the first, but much larger, with yellow Threads therein alike. There is a larger Peters-wort than this, which is said to grow in Candia, which they call Apthorsetis Cruetis major, but it differs in nothing from this, but in the large ness of its Leaves and Flowers, which are three or four times greater: the whole difference may arise (for all that I know) from the different Goodness of the Soil.

VII. The Places. The first grows in many Groves and small low Woods in several places of England, as in Kent, Huntington, Northampton, and Cambridgeshire, as also near Water Courses in other places. Gerard found it in many places in Kent, as in a Copse by the then Mr. Keynes House near South-East. It grows also plentifully in the North parts of England, especially in Landfide and Croyden. The second grows in the Marches in the Low Countries, and in divers Boggy Grounds of this Kingdom, as Johnston says, and is truly that Plant which Clusius describes in Audtmanus. The third is a Native of the Pyrenean Mountains, and has been transplanted from thence into our Clime, and is nowish in some of our Gardens. Yet I have heard some excellent Botanist say, that they have sometimes met with it upon several of the Mountains in Wales.

VIII. The Times. They all Flower in June and July, and the Seed is ripe in July and August.

IX. The Qualities, Specification, Preparations and Virtues of Peters-wort, are the same with those of Johns-wort, in Chap. 405, Sect. 5, ad 22, of this Book aforesaying, to which I refer you. But Johnswort is said to be the more powerful and efficacious to the purpo ses intended, and so to be preferred before Peters-wort.

X. The
The Fonder of the Seed of Peterswort. Dioscorides, Pliny, and Galen say, That if it is taken to the quantity of two Drams at a time in Mead, or Honied Water, that it purges Cholerick Humors, and thereby helps such as are troubled with the Sciatica or Hip Gout.

PICK-PURSE, see Shepherds-Purse, Chap. 218. PIGEONS-FOOT, see Doves-Foot, Chap. 228. PIGEONS-GRASS, see Columbine, Chap. 148. PILD-CORN, see Oat Wild, Chap. 525.

CHAP. DLXI.

OF PILE-WORT. OR, FIG-WORT.

I. THE Names. It is called by the Arabians, Memiton: in Greek, Xanthium; in Latine Chelidonium minus, (and yet in truth is no Chelidonium, or Celandine, nor any Species thereof:) but the most common Latine Names are, Ficaria, & Scrophularia (because it cures the Kings-Evil,) also Amnthro Virginij Gaulindana, Tysculus Sactor, Ranunculbus latifolius Langedenfti, (and yet it has no biting Taffe as the Rumenculi have;) Chelidonia Estandfdjia Rutum, and it is thought to be the Strument Pлимі in English, Pile-wort, Fig-wort, and by some, the Leffer Celandine, ( tho' improperly.)

II. The Kinds. There are two Species of this Plant, viz. 1. Victoria seu Scrophularia major, Hirantainia major, The Greater Pile-wort, or Fig-wort. 2. Victoria seu Scrophularia minor, The Leffer Pile-wort, or Fig-wort.

The Descriptions.

III. The firft, or Greater Pile-wort, or Fig-wort. Its Root is Fibrous, full of many small Kernels or Knots, some smaller, some greater, growing without any order, almost like Grains of Wheat, but larger, and of a white color. The Leaves are round, thick and smooth, growing almost as large as Arum or Ararabcca, sometimes a little waved about the edges, and sometimes not, each Leaf standing upon a longer foot Stall than those of the following or Leffer Kind, yet lying upon the Ground. The Flowers which grow severally, as the next or leffer do, stand upon longer foot Stalks, are of a pale yellow color, and larger than they, confifting but of five or fix Leaves, cut in at the ends unto their middle, and having some reddish Threads in the middle of the Flowers.

IV. The second, or Smaller Pile-wort, or Fig-wort. It has a Root which is made up of many small Kernels, or Knots, like Grains of Corn, some of them being twice or thrice as big and as long as others, of a whitish color, with some Fibres at the ends of them. This Plant does spread out with many
Pile-wort small.

The Virtues.

XI. The Liquid Juice, or Essence. They are Specificks against the Scurvy, Jaundice, Gout, Stone, Gravel, Kings-Evil, and productions of the Hormorrhoids or Piles, being inwardly taken from 2 to 3, or 4 Spoonfuls, Morning and Night, in a Glass of White Port, or Lisbon Wine, and withall fasting and foaming the parts affected therewith hot, twice, or thrice a Day, for half an hour together.

XII. The Decoction. It has the Virtues of the Juice or Essence, but much weaker in its effects and operation, and may be given for the fairest purposes, from 4 to 6 Ounces, sweetened with Syrup of Violets, or of Roys Salutaris, Morning and Night. If the Decoction 1 part, is mixed with the Juice or Essence 3 parts, and used as an Ermthon up the Nostrils, it purges and cleanses the Head and Brain, from cold and moist Humours which offend it, and many times prevents an Apoplexy, and Cures the Epilepsy, Vertigo, Lethargy, and other Diseases of like Kind.

XIII. The Oil or Ointment. Anointed 2 or 3 times a Day upon the Hormorrhoids or Piles it cures them, and is wonderfully beneficial in the Cure of the Kings-Evil, and hard Tumors in many parts of the Body, being anointed upon the parts affected, and Cloths dipt in the same applied over them.

XIV. The Balsam. If the Piles or Scrofula be distended to break, it will ripen and break them, and afterwards more fully digest the indigested Matter, cleanse and heal them after an admirable manner, beyond most other Medicaments appropriated to the Cure of those Disorders.

XV. The Computation of the Green Herb and Roots. It dittillates and heals simple Contusions, being applied whilst they are recent; is profitable against an Orders in the Knee, and other difficulties (being applied warm) or maturates, heals, cleanses and heals the Hormorrhoids in a short time, and withal gives present ease and relief in the pain of Rheumatism. In a recent Scrofula, it dittilates the Kernels and Knoxs, that they may be hard, so as to be inviolate, if long applied; but if they tend to suppuration, it hastes it and breaks them, after which they may be washed with the Juice or Essence, and then cleansed and healed with the Ointment and Balsam.

CHAP. DLXII.

Of Pimpernel.

THE Names. Some take this Plant to be the Alechba of Straspe, but the Mus or Male Kind Fice Phaeiro, he calls it in the Arabic Tongue Ansales, and the Latin Fire Caraira, he calls, Carduilla. It is called in Greek, Ἄμαγγαλα (en tooth or poison plant en Gallis Pharyx, which was hill or sent in) in Latin, Angesellus in English, Pimpernel. Some Authors call it, Balsam Gallina & Angeselli, but these are rather the proper Names of a Species of Althae or Chickweed. Melicam an old Writer calls it Macios which is extant also in Dioscorides, among the Barb-
The Description.

III. The first, or Male Pimpernel, or Pimpernel red Flower'd. Its Root is small and Fibrous, persisting every Year. This Common Pimpernel flowers in May, with several round square Stalks, rising on the Ground, beset all along with two small and almost round Leaves at every Joint, one against another very like unto Chickweed, but without spot having a round flat green color. But it resembles the Stalk, in which particular it differs from it. The Flowers stand singly, each by themselves, at the Joints, between them and the Stalks, consisting of five small round pointed Leaves, of a fine pale red color, the former or Male being of a red color, but those or the Female, being of a fair blew color, in which only the difference consists.

VI. The third, or Dull red, or purple colored Pimpernel. This does likewise in all things resemble the former, saving that the Flowers of this are of a dull or dark red color, having an Eye or glimpse of purple therein.

VII. The fourth, or Pimpernel with blufh colored Flowers. This in its Roots, Stalks, Leaves, Flowers, Seed, and manner of growing, is altogether like to those before described, and only differs from them, in the color of the Flowers, which is of a fair blufh or incarnate color.

VIII. The fifth, or Pimpernel yellow Flower'd. It has a Root which is small and Fibrous, and perishes not every Year as the others do, for with the Plant when in Flower, there has been gathered dry Stalks with
the Heads of Seeds upon them, which have remain'd all the Winter, from the former Years growing. This Plant grows in the same manner as the others do, with many spreading Branches upon the Ground, but they are something greater, and so are the Leaves also, larger than any of the former sorts, but set by couples at the Joints, where the Flowers come forth upon long foot Stalks, like unto the others, but larger, and of a fair yellow color, with pointed Leaves some what like unto Nummularia, with round Heads also, containing the Seed.

Pimpernel yellow.

IX. Gerard says, Its Root is small and thirsty, that it is very weak and feble Branches growing upon the Ground, before the Leaves one against another like the great Chick-wood, and not unlike to Nummularia, or Money-wort: between which and the Stalks come forth single small tender foot Stalks, each bearing at their top, one single yellow Flower, and no more.

X. The fifth, or Pimprenel narrow Leaf'd of Monellus of Tourney. Its Root is small and Thready like the others, perishing in the same manner every Year. It grows also in the same manner which the others do, with spreading Branches upon the Ground, and Leaves set at the several joints, which are longer and narrower, and withal more pointed, something resembling the Leaves of Galiola or Holy-Hyppop, not always two at a joint, but sometimes three, and sometimes more, tho' not often. At the joints likewise with the Leaves, round several Flowers, as in the other sorts, upon small long foot Stalks, made of five small round pointed Leaves, yet something greater than those of the former kind foot, having a circle of a purple color in the middle or bottom, which afterwards yields such like round Heads and Seeds.

XI. The Place. The first grows in Flowered Fields, near Path-ways, in Gardens, and Vine-yards, in Mowing and Corn-Fields, almost every where. The second is not so common, yet found in many places, as near Battle by Oxford, and plentifully in Romney Marsh, as in Highbank Venner, Arritor, and Round in Northamptonshire, and at Eatonfield in Buckinghamshire, Gerard found it also growing in a Chalky Corn-field in the way from one Susan's Houfe of South-Veet to Longfields Down. The third only grows in Gardens at Branthoford, at Leyden in Holland, and amongst the people of the Low Countries. The fourth, Parkinson says, grew of it in his own Garden, here in London, and came up every Year of its own flowering. The fifth grows in shady places, as in Hampyn Wood, about Shiford, at a place called the Park, and in many places in Kent, especially in Wood-Lands. The sixth is a Native of Spain, about Cadiz, and John Monellus had of it growing in his Garden at Tournay in France, Johnson says also, that he found it growing in Essex, among the Corn at Whittingford, being the then Seat of one Mr. John Wright.

XII. The Times. They are laid to Flower from May to August, and the Seed to ripen and fall in the mean time. They Flower chiefly in the Month of August and in Harvest time, and the Husbandman has an Obligation of the Weather from the Flowers, and will prejudice what shall follow the next Day after; if the Flowers be clofe thur up, they say it breaks Rain, and foul Weather; but if they be open and spread abroad, it is thought the contrary, that the Weather will be fair.

XIII. The Qualities. Pimpernel (Male and Female) is hot and dry in the fifth Degree, Alberbarie, Aperitif, Appetifive, to the Gales De fæc. Simpl. Med. Lib. 6. says, They are of a cleansing faculty, and have an attractive heat, whereby they draw forth Thom's, Splinters, or other like things, which are gotten into the Keel. Colmetic, Digestive, Diffusif, Diuretific, Incarnative and Traumatific or Venerial, they are Car-diack, Hepatick, Nepthetick, Phthisic, Emmengageick, Soporifick, and Anexepathetic.

XIV. The Specification. Pimpernel is a peculiar remedy against the Plague, and all Malign and Pestifential Fevers, and other Contagious Diseases: it cures the biteing of Serpents, Vipers, Rattle Snakes, Mad-Dogs, and other Venemous Creatures: it is good against the Strangury, Stone, and Gravel, and heals all Wounds and Ulcers, whether inward or outward; stops the Flux of Humors into any part, eafe pains in the Fars, and the Piles, and prevails against an Ophthalmia, and other Difficulties of the Eyes.

The Virtues.

XVI. The Liquid Juice. Applied to Green Wounds, it coagulizes their Lifs and heals them: to Ulcers, it cleanses them and incarnees. The Face or Skin being washed therewith, it is good to cleanse it from its roughnesses, ill color, and other deformities thereof, and to make it fair, smooth and clear.

XVII. The Essence. It has all the Virtues of the Liquid Juice, besides which it is of great force against the Plague of Pestifence, and all sorts of Malign and Pestifential Fevers, being a few times used, and Sweating well upon it. It is also prevalent against the biteings of Mad-Dogs, Serpents, or other Venemous Creatures, the Biting of Scorpions, Hornets, and other like Insects. It gives ease in the Strangury, and removes the Pain, heat, and Stoppage of Urine, and is most excellent...
against inward Wounds and Ulcers, as Ulcers of the Lungs, Reins, and Neck of the Bladder. And applied outwardly to all Green Wounds, which are simple without Fracture or Incision, it quickly constricts and heals them: it also cleanses and dries Ulcers, and such as are made by Poisonous Bodies; it cleanses them from their Corruption, restrains their malignant corroding, invades their venomous qualities, and dries up their Flux of Humors, and so quickly brings them to healing. Fomented on the Piles it eases the Pain, and discomforts them, and drops into the Ear on the contrary side, it eases the Tooth-ache. Dose 2, 3, or 4 Ounces Morning and Night.

XVIII. The Pisculation in Wine. Given from 4 to 8 Ounces, it is a good remedy against the Plague and other pestifential Fevers, and Contagious Difficulties, so as after the taking thereof, as hot as the Patient can well drink it, they lie in their Beds, and are discovered in two Hours after, whereby the Poison of the Disease will be expelled, this being thus used for 2 or 3 times. It has all the other Virtues of the Liquid Juice and Essence afore specified, but ought to be given in a larger Dose, as it is before directed.

XIX. The Erfhine. Take of the Juice 4 Ounces, Scremony in habrit Powder 2 Drums, mix them. Snuff up the Nostrils; it Purges the Head and Brain of cold, molift and phthisical Humors, gives ease in the Head-ache, Migrain, and a Cephalea, or invertebrate Periodach, and in a little time cures the Vertigo, Lethargy, Carus, Apoplexy, Epilepsy, Night-Mare, and other like Distempers of those parts; as also deftrusions of Rheum into the Eyes, Ears, Nose, Jaws, Teeth, &c.

XX. The Ointment or Balsam. It cures simple Green Wounds, at a few times dressing, and applied to a pestifential Bubo, it ripens and breaks it. Applied to the Gout it eases the pain, and digests, cleanses, incarnates, and heals old filthy and running Ulcers; and Kings-evil Sores, more especially it to every 4 Ounces of the Ointment or Balsam, half an Ounce of Powder of Tobacco, and 1 Ounce of Levigated Mercaricus ductus be added, the Ulcer being cleansed at every dressing with the Liquid Juice, Essence, or Descompation, after-gone.

XXI. The Cataplasm. It is attractive, and being applied to any part where there is any Tick, Stint, Plague or Fever, it draws it forth: and applied to a simple Contusion, it diffusses the Tumor and cures it.

XXII. The Diffusled Water. It is a Cofmetick, and has all the Virtues of the Liquid Juice, being applied according to Art to the Face and Skin; but I am of opinion that it is not full out so effectual as the Juice or Essence: yet it will be more powerful if a quarter part of the Juice of Lemons be added to it, and then it will make an excellent Garraflon for a Sore Mouth and Throat, and a good cleanser of the Teeth.

XXIII. The Spirituous Infirnity. It has all the Virtues of the Liquid Juice, and may be given Morning and Night from 2 Drams to 4, in a Glass of Wine, or other fit Vehicle, against Poison, Plague, and Pestilence, bitings of Mad Dogs, &c. It is in Sec. XVIII. already before mentioned. It prevails against Convulsions, Fainting and Swooning Fits, Vapors, and other Distempers of the Heart, Liver, Spleen, and Womb.

XXIV. The Tobacco. It is a potent thing against the Plague, and all malignant and pestifential Fevers, destroying the Malignity, and extinguishing almost in a moment the preternatural Heat.

CHAP. DLXIII.

Of PIMPERNEL Water and Sea.

II. The Kinds. There are many sorts of Water Pimpernel, as 1. *Anagallis aquatica* folio subrotundo non erosato, *Anagallis aquatica Lobelii teris* (this Guilandus thought it sometimes to be Alisma Dioicordis, and at another time to be Ocellaria, but in both was mistaken): 2. *Anagallis aquatica* folio revulso non erosato Bimini, *Water Pimpernel*, Lobel's third Water Pimpernel, 3. *Anagallis aquatica* angustifolia, *Anagallis aquatica* Lobelii quarta; (Samuel Plani, Lib. 25. Chap. 11. as some think): 4. Long Chickweed Leav'd Water Pimpernel, or Lobel's fourth Water Pimpernel, 5. *Anagallis aquatica* angustifolia Scutellaria Bimini, Narrow Leav'd Water Pimpernel. 6. *Anagallis aquatica* folio Fulgida Bimini, *Stom alatum*. 7. *Anagallis aquatica* Trigla, Small round Leav'd Water Pimpernel. To these might be added the several sorts of *Brooklies*, which the Lati nes call *Anagallis aquatica*, but these because they are better known by the Name of *Brook line*, we have treated of before, apart, in a Chapter by themselves, viz. Chap. 83. Appendix of this Book. 8. *Amblylla lenisfolia*, *Alfing Glaciee Marinas*, *Alfing genus Felugium Cliffs*, Sea Pimpernel.

55 The
The Descriptions.

III. The first, or Water Pimpernel, which is Lobel's third Water Pimpernel. The Roots of this Plant run or spread out off abroad, but is a small Bough of white Fibres, from whence spring many smooth, pale green Leaves, small at the bottoms and broad.

Pimpernel Water of Lobel.

Pimpernel Sea.

or rather Althea minor, the Lesser Chickweed. The flowers grow at the top of the Stalk, Star fashion, of a herby color like Box, or Sedum mine. It includes its Seed, which is small, in a three cornered Harsh. All the whole Plant is Saltpetre, bitter in Taste, and somewhat burning. The Ephipite Cruciate is here added to the Name, because the Leaves which grow thick together by simple, like each other, as it happens in most Plants which have square Stalks, with two Leaves at each Joint. And it is in English, Sea Pimpernel rather than Sea Chickweed, because the Leaves in Shape, are like those of Pimpernel, than of any other Plant. And also for that the Author Lobel has called another Herb by the Name of Sea Chickweed.

VIII. The Places. The four first grow by River sides, small running Brooks, and watery Ditches. The fifth has been found growing in the Marshes of Dartford in Kent, also between Sandwich and Sandown-Castle, and in the Ditches on this side Sandwich. This Flower grows in many handling Waters, and watery Ditches in several parts of the Kingdom. The third and fourth grow in like Places, tho' they are not so common, but are Natives of Germany. The fifth grows in the South Island belonging to England, especially in Portland, and in the Gravel and Sandy Ponds, which lie low, and against the Sea. It has also been found in the Isle of Sheppey near the Water side, and in Wight-Bay by Monegole in the Isle of Wight.

IX. The Times. They all flower in June and July, and sometimes in August, and give their Scotch Name the Month after the time of their Flowering as the Brewermen do.

PINE, see Pine Tree, Liv. II. Chap.
PINKNEEDLE, see Cranes-Bill Musked, Chap. 160.

CHAP. DLXIV.

OF PINKS Great and Small.

I. THE Names. I know no Greek Names belonging to these Plants, the Latins call them Caryophyllii Symphytis, or Caryophyllii Athos; and in English, Pinks, or Baffard Gillflowers.

II. The Kinds. There are several sorts of Pinks, as, I. Caryophyllus Hortensis Florae simplici, vel minor Florae simplici, The Garden single Pink. II. Caryophyllus Hortensis minor Florae multiplex, The Garden double Pink. III. Caryophyllus Symphytis minor, The Wild Pink. Now each of these three principal Kinds, have several other Species under them, hereafter in this Chapter to be declared.

The Descriptions.

I. Caryophylli Hortentis minores Florae simplici,
Single Garden Pinks.

III. Caryophyllus Hortentis minor simplici, The Common single various colored Pink. This in its manner and form of growing in all its parts, is like to the Gillflowers in Chap. 318. foregoing, saving only that its Leaves are smaller and shorter, in some more or less than in others, and so are the Flowers.
Salmon's Herbal. Lib. I.

IV. Caryophyllus minor albus, the single white Pink. It is the Common white Pink, with a single white Flower of five Leaves, finely jagged about the edges.

V. Caryophyllus Pluriflorus albus roseo rubro flore Stellatus, The single white Star Pink. It bears Flowers almost as deeply jagged in as the following Pluriflorus, of a fair white color, having a Ring or Circle of red, about the bottom or lower part of the Leaves, and are as foetet as the Pluriflorus. This being Scots, does not give the Star of foil bright a red color but becomes more dun.

VI. Caryophyllus Pluriflorus, Feathered or jagged single Pink. These have small and round, a little jagged about the edges, of Sete. III. above, but somewhat shorter and smaller, or Gras like, and of a whitish or greenish green color. The Flowers stand in like manner as the top of the Stalks, in long, round, slender, green, Hats, confisting of five Leaves, very much cut in on the edges, and jagged almost like a Feather, of a light red or bright purple color, with two white Threads running in the middle, crooked like a Horse at the end, and are of a very sweet Smell. But there are some of this sort, which have not those two crooked Threads or Trunks in the middle, but have in their Feet many small Threads, not crooked in all. The Seeds of them are all like to the Seeds of Gilliflower, or other Pinks, viz. small, black, long, and flat.

VII. Caryophyllus hortensis minor rubra, The single red Garden Pink. This is like the White foregoing, but that the Leaves are not so much jagged, and the Flower is of a pale purplish color.

VIII. Caryophyllus minor purpureus, The single purple Pink. This is of a fair purple color, beauti- ful in its Kind, and almost like to the purple Gilliflower.

IX. Caryophyllus minor Carneus, The Blush colored Pink. This has broader and larger Leaves in the Flower, than any other Pink, and of a fair blush or flesh color.

X. Caryophyllus Pluriflorus altus, the white Feathered Pink. This has the edge of the Flower more finely and deeply cut in than the former, without the Ring or Circle of red at bottom.

XI. Caryophyllus minor purpureus Dilatos, The light red, or purple colored Pink. This is like the former Feathered Pink, and differs only from it in its color.

XII. Caryophyllus minor Stellatus, The Star Pink. This is a beautiful Flower, finely jagged on the edges, but not so deep as the former Star Pink, and has a fair red Circle at the lower end of the Leaves on the right.

XIII. Caryophyllus Pluriflorus albus Africani, five superbus Africana, The white Feathered Pink of Aftria. Its Roots are small and woody like the others, its Leaf or lower Leaves are some- what broader and greener, than any of the former Pinks, being both for breadth and greenness more like unto Sweet John. The Leaves on the Stalks are smaller, standing by couples at every Joint, at the tops of which stand such like jagged Flowers, as the last described, and at large, but more deeply cut in or jagged round about, of a pure white color, and of a most fragrant sweet Smell, conforting the Spirits and Stomachs after a while.

XIV. Caryophyllus Pluriflorus purpureus Africana, The purple Feathered Pink of Aftria. This in its form and manner of growing is altogether like the former, and differs nothing from it but in the color of the Flowers, which in this are of a purpl- ish color, and having the same sweet Smell. Some have mistaken a Kind of Wild Campion, growing in our Woods, as by the Path sides in Horned Parks, and other Places, to be this white or Austrian Feathered Pink: But by comparing the Flowers, the mistake will be sufficiently manifest.

XV. Caryophyllus minor repetit simplex, The single creeping or married Pink. This is the single- leaf Pink both for Leaf and Flower of all the other \[\text{Kinds which are nourished in our Gardens, having many flowers and small Grassly green Leaves upon the Stalks, which as they grow and lie upon the Ground (not standing fo upright as the former) do take Root again, whereby it quickly spreads, and covers a great deal of Ground in a little time. The Flowers:} \[\text{are small and a little full beneath the edges,} \[\text{whereof some are white, some red, some white and with} \[\text{red, and some of them red spotted with white, all of them single Flowers.}

XVI. Caryophyllus minor maculatus, The spotted Pink. It is a small Flower, having small spots of red here and there, differed from white Flowers.

XVII. Note. Now here is to be Observed, That those single Flowers which are like unto Pinks, but do rise from the flowing of the Orange Tony, or any other colored Gilliflower or Cora- numis, are not to be accounted of as in this Class of Pinks, but the Kinds of Caryophyllus majoris, or Gilliflower.

XVIII. Caryophyllus Marini, Sea Thrift or Cushion. This our Common Thrift, is well known unto most which have Gardens, because of its general use to Empale or Border Knots and Beds in Gar- dens, for that it abides green Winter and Summer, and that by cutting it will grow thick, and be kept in other form you please. It has many Root and hard green Leaves, smaller than many of the Graffes, growing thick together, and spreading upon the Ground. The Stalks are noded of Leaves, a Span high, bearing a small Tilt of light pink, or bluish colored Flowers, ranging round, and close thrall together.

XIX. Caryophyllus Marini major, five, Mediter- ranean, Great Thrift, or Great Sea Gilliflower. This is a larger or greater Kind than the former, and of as great beauty and excellency almost, as any of the former Pinks, whether single or double, as well for the Flowers, as like unto Gilliflower, being longer and larger than any Pinks, and of a whiter green color, like unto them, not growing long or by couples upon the Stalks, as Pinks and Gilliflower do, but standing close upon the Ground, like unto the common Common Thrift. At else that the Stalks, rising from among the Leaves, being sometimes two feet high, are Jet so slender and weak, that they are easily able to bear the weight of Flowers, naked or bare, both of Leaves and Stalks, springing only in one place, where at the Joint each Stalk has two small and very short Leaves, not rising upwards, as in all other Gilliflower and Pinks, but growing downwards, and do bear each of them a Tilt or Umbel of small purplish or bluish colored Flowers at their tops, standing something like to Sweet Williams, but more roundly together, each Flower consisting of five small, round, stiff, or hardish Leaves, as if they were made of Paper, the bottom or middle being hollow. They blow not all together as the common Common Thrift of flowering, but for the most part one after another, not flowering usually above four or five Flowers open at one time: so that it is long before the whole Thrift of Flowers is bloomed to be the white or lights, and the dryer the time is, the sooner their time of Flower- ing is over. Its Root is somewhat great, long and hard, and not so much spreading in the Earth, as the Roots of Gilliflower or Pinks do.
II. Caryophyllus Hortenfis minorae Flore multiplex.  
Double Garden Pinks.

XX. Caryophyllus Hortenfis minorae Flore multiplex contrigera. The Common double various colored Pink. The form of the whole Plant and manner of

Pinks double.

Some have taken it for a Gilliflower, but the green
Leaves are almost as small as Pinks, for which Reason, I rather refer it to the Pink Kind.

XXVII. Caryophyllus Hortenfis minori double multiplex. The double matted Pink. This is like
the single matted Pink, in its form and manner of
growing, at Sect. 15, differing, not differing in
its Leaf, but in its Flowers. The Flowers are
but once double, or of two rows of Leaves, of a
fine reddish color, spotted with Silver spots, but
those which follow are so thick and double, that
they oftentimes do break the Pot or Dish, and are
not altogether of so deep a red color, but more
pale.

XXVIII. Caryophyllus Plumeris Alpdracus, alias Purpurascens multiplex. The double white
and purple Austrian Feathered Pinks. These differ
not from the single at Sect. 13, and 14, differing,
neither in its Leaves, Stalks, nor manner of growing,
but only in the Flowers, these being double,
and the bell of the double kinds.

XXIX. Caryophyllus Plumeris multiplex maculata purpurata in fando, The double Feathered Pink
with a purple spot in its bottom. This differs not
also from that at Sect. 5, differing, but only in the
duplicity of its Flower.

III. Caryophyllus Sybballa minorae, Wild or Field
Pinks.

XXX. Caryophyllus auricula prolifera, Chidding
Pinks. Its Root is small, white and hard, persishing
every Year after Seed time, and raising itself again
by its own feeling, or else, it must be found in the
Spring. It has a few pale green, short, blunt,
grey Leaves, lying on the Ground for the first
Year, and are the next Year carried up with the
Stalks, divided into some Branches, and set by
couples at the joints, having a short, thick, grey-
ished green Husk at their tops, out of which shoot
forth by degree, one after another, seven or eight
small faint Flowers, smaller than the smallest
Garden Pink by much, which scarcely show themselves above the brim of the Husk: more Flowers
than one, seldom appear at a time out of the Husk,
very rarely two, by reason of which, they are
found in Flowering. After they have done blooming,
there is found in the outward Husk, so many several small
long Husks, as there were Flowers, each containing,
within them small blackish Seed. Of this kind, there
is One which has but one Flower rising out of
the Husk, and of a paler reddish color than the
former.

XXXI. Caryophyllus protendera nother major.  
Our greater Wild Field Pink. This grows near
Depford and Redef, and in many places of England
Wilt, being a small Kind of Pink, as it may be
called. It spreads much oftentimes, and roots
by the Branches as it grows, with small short green
Leaves near the Ground, and by couples on the
Stalks, with small reddish Pink like Flowers on the
Top.

XXXII. Caryophyllus protendera nother minor, 
Our lefer Wild Field Pink. This is leffer than the
former, and grows among the thick Grass in our
Meadows near London, as towards Totem Court,
and other places adjacent to the same. Its Root is
so small and Torendy, that it will not bear Trans-
planting. Its Stalks are very slender, on which
are set smaller, shorter, and greener Leaves
than on the former. The Flowers also are smaller,
and of a clear shining red color, sometimes but One
of a Stalk, and sometimes more, especially if it grows
under Hedges and busher which may defend it by
their Shadow.

XXXIII.
Salmon's Herbal. Lib. I.

Pinks Wild, or Field.

XXXII. Caryophyllum arvense Leavd, Wild Pink in Tuffs. It much resembles a Wild Campion, having short broad Leaves, somewhat like its Leaf be Catchfly, but of a hoary green color. The Stalks have the like Leaves set by couples on them, and at the top several small flowers, rising altogether from one joint, and each flowering on a short foot Stalk, composing thereby a kind of Umbel, some of a reddish, others of a white color.

XXXIII. Caryophyllum arvense holosperma Hirsutum, Wild hairy Sea Pink. This grows very like a Garden Pink, but of a greenish or hoary green color, and somewhat hairy overall. The flowers grow out like Pinks in long Husks, but more like to a small Wild Campion, of a reddish color tending to a marly, and gives smaller Seed, unlike to that of Pinks.

XXXV. Caryophyllum holosperma tomentosum, Hoary Sea Pinks. Its Root is small and creeping, and sends forth several slender round jointed Stalks lying on the Ground, and dividing themselves into many branches, a foot or two, or more long, on which are set Leaves by couples, some of them broad and long, others more round, yet all of them hoary white, like unto the Leaves of Graphium Americanum, called white Live Long, or Life Everlasting. The flowers are white, confining of five Leaves, and round pointed. This abides long, and spreads much upon the Ground.

XXXVI. Caryophyllum angelicus tomentosus, Hoary narrow Leaf'd Pink. This small low Pink, scarcely rises with the Stalks an hand breath high, which are woolly, and branching into two or three parts. It has very narrow long and woolly green Leaves thereon, one being longer than another. Each of the Stalks has a white Flower consisting of four Leaves, standing in a Green Circle.

XXXVII. Caryophyllum pinnatus latifolius, The low broad Leaf'd Pink. It rises up with a foot few Stalks, which presently divides it into two Branches, about half a foot high. The lower Leaves near the Ground, are somewhat broad and short, but a little longer on the Branches, being felt, and a pale green color. set by couples at the joints, each of the Branches bear but one small, pale, purplish, white Flower, rising out of a small short Husk.

XXXVIII. Caryophyllum Albus Anno, The white Mountain Pink. Its Root is great thicke and woody, which sends up very many small and narrow Leaves, finer and finer than Grass, not unlike to the smallest Tulip: among which rise up tender Stalks, jointed or Kneed by certain distances, set with the like Leaves by couples even to the top, one opposite against another; at the tops of which grow several dwelling Flowers composed of five small white Leaves. The Seed is small and blackish.

XXXIX. Caryophyllum pumilus Alpinus, The Dwarf Mountain Pink. Its Root is long, black and much spreading, by which means this little

Pinks Mountain Dwarf.

Plant covers the Ground for a good space together, like as a Moss, making when the Flowers are blown a beautiful show, which is commonly in June; the beauty of its verdure and black, being thick intermixed, makes it look like a verdant carpet, by which it very much pleases the Eye. The Stalk is about an inch, or something more high, set with little hoary pointed green Grass Leaves. The Flowers which grow upon these Stalks, are composed of five little flesh colored Leaves, a little divided in their upper parts. The Seed is contained in black shining Heads, which is small, reddish, and kidney shaped.

XL. The Places. The full sixteen single Garden Pinks, and the next ten double Garden Pinks, are in our Country, only Inhabitants of Gardens; but in some Foreign Southern Countries and warmer Climates, they do often grow Wild in the Fields. The last ten grow Wild abroad in Paturres and Borders of Fields, in many Regions, as in England, France, Germany, Italy, Spain, Sc. The Common Sea Thrift grows in the Salt Marshes

2t
Chap. 565. English Herbs.

CHAP. DLXV.

OF PLANTAIN Common.

OR,

WAY-BREED.

I. THE Names. It is called in Arabick, Lifen, and Lofan alphabet; in Greek, Λυλαγρομη & λυλαγροφα, (a formas, viz. Agnina; Lylagroin. It is also called Vebbeno (multinervia) and Vebbeno (fuscus nervus) from the seven Nerves or ribs, which are in every Leaf: in Latin it is called, Plantago (a Planta Vocabulo.) in English, Plantain, and Plantain, also Way-breed.

II. THE Kinds. There are several Generick Species of this Plant, as 1. Plantago communis Latifolia, The broad or long Plantain, of which in this Chapter 2. Plantago angustifolia, or quinquenervia, Long Leaved Plantain, or Ribwort, of which in Chap. 566. 3. Plantago Cornus, Cornus Cornum, Bucks-born Plantain, of which in Chap. 567. 4. Plantago Aquatica, Water Plantain, of which in Chap. 568. 5. Plantago Maris, Holificus, Sea Plantain, of which in Chap. 569, following 5 of all which in their order.

III. THE Kinds of the broad Leaved Plantain. 1. Plantago latifolia vulgaris, Plantago major, Plantago rubra Brunsfelsi & Treggi (because the Seed thereof is redder than the Seed of any of the other kinds) Our common broad Leaved Plantain. 2. Plantago latifolia maxima, Plantago maxima tota glabra Bambini, The largest or greatest broad Leaved Plantain. 3. Plantago major incana Lobelia & Chaffe, & Plantago Salpiglossis, Plantago media Dodonie, Euchafi & Sergieri, but Tavernamentannus and Turner call it Plantago minor, Great hairy Plantain. 4. Plantago latifolia rufa multiformis, Plantago latifolia exsita Chaffe, Plantago latifolia incana spinarum Bambini, Plantago spiralis, Plantago Panicula sferica Leav'd, Rod Plantain, Plantain broad Leav'd variously formed. 5. Plantago sinus saxo exsita Parkinson, Plantago Umbilicata Latifolia Lobelia, & comorula unifolia, Cunmpred Plantain, or Exotic Plantain.

The Descriptions.

IV. The last, or Our Common broad Leav'd Plantain. Its Root is made of many white Strings, growing somewhat deep, and taking so fast hold in the Ground, that it is not easy to pull it up. It springs up with many fair, broad, and almost round pointed Leaves, with seven Nerves, or Rib in every one of them for the most part running all the length of the Leaf of a sad green color on the upper side, and a more yellowish green underneath. Among these Leaves rise up several small slender Stalks, about a foot more or less high, not cleft to branches, naked or borne of a little into their top, where each Stalk bears a small long round blackish green Spike or scaly Head, whose Blossoms or Flowers are small white or flesh, with

Plantain Common.

Plantain Hoary.

with Aglets hanging at their ends, almost like to the bloomings of Corn, or Wheat; after which come small brown Seeds, enclosed in the small Husks, Scales, or Skins.

V. The second, or Large or greatest Lepid Plantain. Its Root is thick and Blackish, and the whole Plant seems in all things to be like the former, fusing, that it exceeds it in largeness, or greatness, and height. For the Leaves which by on the Ground, are six inches and sometimes more in length, and four inches broad, and the foot Stalks of every Leaf, are near a Hand breadth long. The naked Stalks which bear the spiked Heads, are like the former, and are some times two or three Feet high, and the Head or Spike, sometimes a Foot long. This sort has been sometimes found to have Leaves a Foot long, and half a Foot broad, which are somewhat torn on the edges, for which reason it is called Plantago lirulata maxima foliis laciniatis, and this sort has some small Leaves under the spiked Heads.

VI. The third, or Great Hoary Plantain. Its Root is like the first, blackish and stringy, so also its Leaves and Spikes, but the Leaves are very houry, or white, especially in the hotter Countries, of Italy, Sicily, Can- did, Spain, Portugal, Florida, Carolina, &c. much more than in these our colder Climates, and somewhat smaller. Clusius says, That in Spain, it seldom bears its spiked Heads, but when it does, they are smaller than those of our first common Kind; But in Carolina, &c. it bears its spiked Heads as frequently as in England, and much about the same magnitude.

VII. The fourth, or Ripe Plantain, Plantain broad Lepid variously formed. Its Root is like unto the former; and the there are many sorts of this Plant, yet all of them have large, and sometimes hoary green Leaves spread on the Ground, either whole, like the former great Plantain, or a little jagged towards the lower parts of the Leaves. From among which rise up, short naked Stalks, bearing every one at the top, either a broad round Head, made of many small, short, green Leaves in fashion of a Rose, or a spiked, thick, long Head, made of many shorter green Leaves, bul- bing thick below, and smaller upwards, sometimes a Plant will have both these forms at once together, and some again out of the middle of the Rose, will have another short Spike of green Leaves rising up. Others at the bottom of the Rose or Spike, will have one or two other small Vaults, either round or long. One sort there is likewise, whose long spiked Heads are parted into many and sandy several spear-pointed Spikes, and therefore called Spiralis. There are also many other varieties of this Species, as Nature is pleased to play with them in their production.

VIII. The fifth, or Crumpled Plantain, or Exotic Plantain. Its Root is composed of a thick round Head at its top, butting, at its bottom running downwards, many long Fibres or Strings, whereby it takes good Rooting in the Ground. This upon the first year four of its Seeds, rises up, but falls one great and large Leaf, almost a Foot long, softened as it were together, and wound about Spike fashion into two parts at the upper end thereof, which opening it self, and remaining somewhat hollow, becomes much crum-
XIII. The Preparations. You may have from
their Plants, 1. A Liquid Juice. 2. An Effluce.
5. A Powder of the Root. 6. A Powder of the
uum. 10. A Cataplasm. 11. A Distilled Wa.

The Virtues.

XIV. The Liquid Juice. Belong Depurated or
Clarified, and drunk for several Days together,
prevails wonderfully against all Torments and Ex-
coriations of the Guts or Bowels, helps distollar-
ations of Rheum upon the Throat, Glands, Lungs,
&c., and stops all manner of Fluxes in Man or
Woman, and the overflowing of the Terms in
Women. Do's from 3 to 8 Spoonfuls or more,
either raw or mixt with some Spyrick red
Wine.

XV. The Effluce. It has all the Virtues of the
Liquid Juice, besides which it is good to use
Spiriting or Blood, and all other Bleedings by the
Mouth, also Pilling Blood, and is probable to
help a bloody or cold Water, occasionally for
any Ulcer in the Reins or bladder, as also to stop
the free bleeding of Wounds; it is likewise an efpecial
Kenney against a Phthisis or Ulceration of the
Lungs, and a Venemous Cough arising from
the Guts. It is said to be good against the Falling
lickens, Dropdie and Jaundice, and opens Ob-
strueations of the Liver, Spleen, and Reins.
It cools Inflammations of the Eyes, and takes
away the Pin and Web (so called) in them.
Drop into the Ears, it eases their Pains, and re-
tores Hearing much decayed. Do's from 3 to 6
Spoonfuls more or less, either alone or with
some for Vehicle, Morning and Night, or
often.

XVI. The Decoction. It has all the Virtues of the
Juice and Effluce, but ought to be given in a much
larger Dose, as to half or three quarters of a
Pint. The Decoction of the Roots in Wine, (accord-
ing to Dosgearies) is good to cure Quotidian,
Tetan and Quarantian Agues: and this is probable
enough, for I am apt to believe it performs that
Cure, by Virtue of its Natural Spyricity. It may
be given an hour or two before the Fit.

XVII. The Powder of the Leaves. It has the
Virtues of the Juice and Effluce, yet is not al-
gether so effectual as they, in the Dropdie, Epi-
lepsy and Jaundice: put upon old putrid and run-
ing Sores, it cleanses and dries up the malady,
and in some measure increses. Taken in Drink
to a Dram or Dram and half, it is said to kill
Worms in the Belly: and strained upon old Ulcers
which have Worms in them, it kills them, more
effectually if white Wine Vinegar be sprinkled upon
the same.

XVIII. The Powder of the Root. Given from 1
to 2 Drains, it is said to Cure Agues, to Stop
Vomiting and Fluxes: and to Strengthen the Stomach.
Mixed with equal parts of Powder of Peritomy of
Spain, and put into a hollow Tooth, it is said to
cafe the pain thereof: put into Wounds and Ulcers,
it dries and heals them.

XIX. The Powder of the Seed. Taken every day
Morning and Night, from 1 to 2 Drains in any
Vehicle, as in the Yolk of an Egg, Pulp of a Roasted
Apple, or in Milk, or Maltbroth, or in some proper
Graspe, it is said to heal Ulcers of the Lungs, Stop
Coughs, and all sorts of Fluxes of the Bow-
nels, Catarrh, and helps weaknes of the Stom-
ach.
of the plantain narrow leaf.

CHAP. XIV.

RIB-WORT.
Plantain long Leav'd, or Ribwort.

IV. The second, or Leifer Ribwort, or Ribwort Plantain. This in its Roots, Leaves, Stalks, Heads, Flowers and Seed, and in every of its parts, as also in its form of growing, is like unto the first before described, and differs only in its magnitude: this growing almost much smaller than that.

V. The third, or Rose Ribwort, or Rose Ribwort Plantain. It has a pretty thick long Root, with many Fibers adjoining to it. Its Leaves are like the two former Kinds; so that by its single Leaves it is scarcely to be known from them, before the Stalks with the Heads begin to appear, which when they are full ripe, form themselves in a variable manner, some having large or long narrow Leaves set together, somewhat sparingly, imitating a large or dispereded Rose; others having shorter green Leaves, more compact and close, making a more comely form of a Rose, sometimes fully laid open, and sometimes more close, and as it were half closed, and sometimes out of the middle of the Rose wall arise two or three or more short Stalks, bearing each a small green Rose, and therefore called Proliera made of many small Leaves set together in the same manner, and sometimes many short spikes set close together in one Head, or separate each by itself. This Kind has fearfully ever been seen to bear Seed, but is encreased by slipping or parting the Root, and planting or setting it again.

VI. Johnson in Gerard says, That this Rose Ribwort has many broad and long Leaves sharp pointed, and of a dark green color, Ribbed with five Nerves or Stems like the Common Ribwort, among which rise up naked Stalks, furrowed, channelled, or crusted, with certain spiny edges. As the tops therefore grow a great and large Tuft of such like Leaves, as grow next the Ground, making one entire Tuft or Cluster, in shape resembling a Rose, (whereof I thought good to give it the Surname) which is from its flower.

VII. The fourth, or Ribwort, or Ribwort Plantain with denser Leaves. Its Root is small, long and fibrous like the first Kind. In its Leaves and manner of growing, it is very much like the Second or Leifer Ribwort, but smaller, narrower, and harder in handling, being denser above the edges, and so sharp without, that they may seem to be Prickles, which has caused some to call it, Peregrina Spinosa, the I think improperly. The fished Heads grow upon slender Stalks, about half a foot high, being somewhat open, or dispered.

VIII. The Places. That first grows almost every where by Hedge sides, Path way sides, Borders of Fields, and Fertile Medows. The Second grows likewise in divers Medows and Fields, and by Path-ways, and is also found growing in Gardens as a Weed. The third is found Wild in several places of this Kingdom, in some places in the North of England, and formerly in a Field near London by Hogdon, and in many other parts of the Kingdom, from whence for the rarity thereof, it has been Transplanted by some lovers of Plants, and nourished up in Gardens. The fourth grows with us only in Gardens, being brought thither in Seed from Spain: but I have sometimes found it growing Wild in some parts of Florida.

IX. The Times. They all Flower and Seed at the same times, (viz. in May, June, and July) with the former Broad Leaved Plantain.

X. The Qualities, Specification, Propositions, and Vertues, of Ribwort Plantain are exactly the same with the former Broad Leaved Plantain; saving that some Authors are of Opinion, that the Ribwort exceeds in Virtue and Efficiency, to all the Intentions for which the Broad Leaved is applied.

CHAP. DLXVII.

Of PLANTAIN. Bucks-horn.

I. THE Names. It is called in Greek Καρυνια (Corinum pulchra genet effigient folia, as Pena says,) in Latin, Corunopus albo, but they likewise call it Corinum Cerbi, and Corinum Cornutum, Herba Stella, Hamaram, & Sanguinaria, or Sangi-nain, (the one from the place of its growing, the other from its Qualities, Properties or Effects.) I think it might be more properly called, Plantago Cornutus, Plantago Cornus, Plantago Cornutus, et Cornutotata, a Horned Plantain: in English, Bucks-horn Plantain, and by some, Crow-foot Plantain.

II. The Kinds. We scarcely know any more than two Species of this Plant, viz. 1. Corinum vulgaris, Corinum vulgare, Corinum foliaceum Cordi, Geferii, & Canum, (because in Italy, France, Spain, and other places it was Nurt up in Gardens for a Salter Herb.) Corinum Cerbi, & Herba Stella Doden, & Lobelli. It is also called,
called, "Coronopus Synthysris" because it is also found wild in several countries: Our common Bucks-horn Plantain in England.

2. Coronopus Infata Prophyra Columna, Coronopus Synthysris hispato Bas-tan, Prickly Bucks-horn Plantain.

The Descriptions.

III. The foft, or Our Common Bucks-horn Plantain. Its Root is fingle, long, and small, with several fibres adjoining thereto. If it is Sown or Planted from Seed, it riseth up at first with small, long, narrow, hairy, dark green Leaves, almost like Grass, without any divisions or paths in them, but those which succeed arejoin'd in, on both sides of the Leaves, into three or four flices, and pointed at the ends, resembling the Sages of a Bucks Horn, from whence it took its Name. And being well grown, these Leaves ly round about the Root upon the

Bucks-horn Plantain.

Ground, in order, one by another, thereby re-fembling the form of a Star, and therefore called Herba Stella. From among which rise up several hairy Stalks, about an Hand breadth high, bearing every one of them a small, long, fpyky Head, very like unto those of the Common Plantain, having such like Bloomings and Seed after them. The Swall and Taste thereof is very much, or altogether, the fame with that of the Common and Ribwort Kind.

IV. The fopird, or Prickly Bucks-horn Plantain. This differs but little from the former, but that its Leaves are something larger, broader and thicker, and more hairy or rough. And the Dots or Jags of the Leaves are more sharp and prickly. The Stalks and Heads are likewise more rough and hairy. These are also chief differences, in all other things, it is like to the former.

V. The Places. The fift usually grows in dry sandy Grounds, in Barren Plains and Unfertile places, in many parts of England, as in Cattle Fields, near Weftmiflers; at Waltham Abbey, not far from London, as also upon Black-Heads near South-wark, and many other like places. In Italy, they are also Planted in their Gardens, as a Sallet Herb, because they commonly eat it in Salads. The second Grows on Rocks in the Island Prelacies in Columns says I have had it from my Witnesses, who told me, that they had seen it grow upon some of the Mountains in Wales, and some other like Places in England.

VI. The Times. They horn Flower in May, June, and July, their Seed ripening in the mean Season: and their Leaves abide fresh and green in a manner all the Winter.

VII. The Qualities, Specification, Preparations, and Virtues of Bucks-horn Plantain, are the very fame with those of the Common broad Leaf'd Plantain, (in Chap. 365. Soll. 11. ad 27.) to which I refer you.

VIII. Obfcr. 1. The Juice or Effence of this Plant, Is laid to be a peculiar remedy against the Biting of Vipers, or other Venomous Beasts, by drinking of it either alone, or in a Glass of Generous Wine, a Cataplasme of the Green Herb being also laid upon the Wound or place bitten. It stops all all bleedings and erupitions of Blood, whether at Mouth or Nose, whether in Urine or Stool, cures the Drenched or Bloody Flux, and other Exces of the Bowels, and is promifable to Fauus Aegitna, Lib. 7. Eyes, against the Colicke. Given inwardly from 4 to 8 Spoonfuls at a time in Syrupick Red Wine, 3 Hours before the coming of an Ague, it cures it, more especially if the Leaves of the Plant be laid to the eyes, and the Eye will fall with vanity, as it had been done by Witchcraft.

IX. Obfcr. 2. The Decotion in Wine. It has the Virtues of the Juice or Effence: besides which, if it is long drank, it cures the Strangury, and is provable for such as are troubled with Sand, Gravel, Stones or Tumourous Matter in the Reins, abating the heat and Infammation of the Kinct, Urifiers or other adjacent parts, and strengthening them. And given Morning and Evening for some Days together, it helps all sorts of Stone and Urine, casted from a Defection of hot, sharp, and Soft Rhexes, by cooling the parts, abating the acrimony of the humor, and stopping the Fluxion.

X. Obfcr. 3. The Root, whether in Powder, (which may be given from 2 Scruples to 3 Drams, in any fit Vehicle Morning and Night,) or the Decotion in Wine, or Infusion in Spirit of Wine, have all the Virtues of the Juice, as well the Essence and Decotion, aforesaid, saying that the Root is thought to be more potent than the Herb or Leaves, and to be a more specific Remedy for the Colicke.

XI. Obfcr. 4. The Cataplasme of Leaves and Roots with Bay Salt. Applied to both Wxs, and Bound on pretty hard (yet not too hard neither) cures Agues admirably: it stops the Course of the Flux, and soon after it promotes the Ague, as to compleat a Cure.
of PLANTAIN Water.

I. The Name. What Greek Name this was called by in Dioscorides or Theophrastes, is uncertain, but in respect to the Latin Name it may be possibly Water, in Latin, Plantago Aquatica, Arrmiglium Aquaticum: and in English, Water Plantain.

The Descriptions:

III. The first, or Our common greater Water Plantain. Its Root consists of a great Bush of many long Fibres or Strings set together: which

Plantain Water Star.

sends forth several long thick green hollow Stalks, with large long green Leaves on them, having some form of Ribs in them, like unto Plantain; but they are much smaller, stiffer, and longer, and with sharper ends. From among these rise up several tall three cornered feedy Stalks, divided in several Branches at the Tops, on which stand a great number of white Flowers, composed of three leaves spicile. After which follow small three cornered green Heads, in which is contained the Seed.

IV. The second, or The lesser Water Plantain. Its Root consists of many small white Flours like the former, which sends forth several long Leaves, six times smaller and narrower than the former, from among which rise up divers bare Stalks a Foot high, bearing a Tuft of many white, colored Flowers, consisting of three Leaves spicile like the former, each standing on a long foot Stalk, and all rising from one Head, like an Umbel, after which follow rough Heads of Seed like so many of the Crowfoot.

V. The third, or Lesser Water Plantain with Calthope like Seed, Star Water Plantain. Its Root is a Bush of long white Fibres or Strings which sends up several small and long Leaves like to those of the Ribwort Plantain, but much smaller, and turning themselves backwards. The Stalks are slender and naked, and about half a foot high or more, which bear at their tips flared few Tufts of white three Leaf'd Flowers, which being pull away, come after them, prickly Heads spreading out with ends like to a Star, in which lies the Seed.

VI. Johnston in Gerard says, That this Plant in its Roots and Leaves is like to our first described, as also in the Stalk, but much lighter in each of them, the Stalk being about a Foot high, at the top of which stands many pretty Star like shiny Seed Violets, containing a yellowish Seed.

VII. The fourth, or The leaf Water Plantain. Its Roots consists of nothing but a Bush of very fine Fibres or Threads. This Leaf Water Plantain spreads it self wholly upon the Ground, bringing forth several small, long and narrow Leaves, standing on very slender foot Stalks, from among which come many slender Stalks lying down on the Ground, being not much above an Inch long, and ending in small Heads, which sending forth small Fibres, comprehends a great space of place, and take Root again, shooting forth other smaller Leaves, from among which spring forth six for six small round Buttons (no Flowers being yet been observed on the Plant) standing on very fine Stalks, opening into two parts, showing very small Seed within them. From among these round Buttons grow also, other rows or courses of small Heads, bringing forth other smaller Leaves and Buttons than the former.

VIII. The Places. These all grow on the banks of Rivers, in Watery Ditches, Paddles, wet Ponds, and other standing Waters. The first grows almost every where in moist Places throughout the whole Kingdom. The second and third are not much, but in the like Places, as in a Ditch on this side Altonage, in the Isle of Wight. The third has been found growing in the Ditches on the left Hand of the High-Way from Hottens to Hightown, and to that little beyond Ilford, in the Way to Rainford: Mr. Goodfey found it also growing upon Hawn- farm Heath.
The Names. It is called in Greek, Οὐνάω, in Latin, Holospernum, & Holospermum, (for it is written both ways) also Plantago Marina: and in English, Sea Plantain.

II. The Kinds. There are many Species of this Plant, but these five sorts are chief, viz.
1. Plantago Marina vulgaris Lollifi, Loddonensis, & Gerardi, Our common Sea Plantain. 2. Holospermum Salaminica, Holospermum Hispanicum, Plantago angustifolia alba Dodona, Plantago Hispantis minor, Holospermum hispantium albicans minor Banibini: The greater Spanish Sea Plantain. 3. Holospermum minus, Holospermum hispantium albicans minus Clusii, Banibini, Plantago Hispantis minus, Holospermum Salamaticum minor, The lesser Spanish Sea Plantain. 4. Holospermum angustifolium major, five Serpentaria minor, Coronopus Sylvestris Matthioli, Serpentina Marina, Plantago Marina Camerarii in herba, Plantago angustifolia Dodonae, The greater Graft Leaved Sea Plantain. 5. Holospermum angustifolium minus, Serpentina Omissa Minima Loddifi, Holospermum quadratum Loddonensi, The lesser Graft Leaved Sea Plantain. To these may be added, 6. Holospermum Latifolium, Conda maris Vacaum, Myosotis, Holospermum affinis Condoumaris Banibini, Coronopus Sylvestris Trags, Moufe Tail. This, the Consericius, Lancerus, Loddonensis, Thulue, and Banibino himself, accounts among the Kindred of the Holospernum, yet others have been of another Opinion, for which Reason we have related it alone, in a particular Chapter by it itself, viz. in Chap. 704. afterwards, and therefore shall say no more of it in this place.

The Descriptions.

III. The first, or Our Common Sea Plantain. Its Root is somewhat white, thick, and long, with long Fibres adjoining thereto, and shotes may Years, from this Root spring up many narrow, long, and thick green Leaves, having here and there a dent or two on the one edge, and pointed at the end. From a young these Leaves rise up several bare Stalks, with a small spike of Head thereto, smaller than Common Plantain, otherwise alike, both in its Blooming and Seed.

IV. The second, or Greater Spanish Sea Plantain, its Root is something long and hard, with several Fibres adjoining to it. It differs not much from the former Greater Kind, having many narrow hoary Leaves lying on the Ground, but shorter and broader than they. From among which rise up several naked short Stalks, little more than an Hand breadth high, four nights from the middle shoots in the tops, with many whitish green Flowers, standing more foursided in the spike Heads than the former, which contain in their Heads a certain kind of small Seed.

V. The third, or Lesser Spanish Sea Plantain. This in its Root and Fibres, Stalks, Heads, Flowers, and Seed, or also in its manner of growing, is very like the last, differing that this is much smaller, and not so gray or hoary, and the Flowers are like those of the Ribwort, or Buckhorn Plantain, but the Heads are smaller, and the Leaves greener and narrower.

VI. The fourth, or Greater Graft Leaved Sea Plantain. Its Root is somewhat thick, long and woody, with some Fibres thereto adjoining. This Greater Graft Leaved Plant has a great number of small long Leaves, almost like grafts, but that they are stiff and hard, sometimes lying upon the Ground, and sometimes raised a little higher, from a Stem under them. They are of a greenish or hoary green color, and having on some of them, some small galls on the heads, or on the spikes, or on the Leaves, or on the Stalks, about half a Foot high, with small spikes Heads, like unto Plantain Heads, set on their tops, in which is contained also such like Seed.

VII. The
Plantain Sea Grass. Leave'd great.

VII. The fifth, or Lesser Grass leave'd Sea Plantain. This in its Roots, Leaves, Stalks, Heads, Flowers and Seed differ not much from the former, or Greater Kind, but this it is smaller, and fearefully having any decay on the edges, it grows also much lower, not exceeding three or four inches in height, and the Leaves not above two or three inches at most in length.

VIII. The Places. The first grows near the Sea, and upon the Sea Coast, in moist places of England, as also upon the Sea Shores of many other Countries. The second and third are Natives of Spain, the greater of which Cal_timer is, he faw by the High-way sides near to Valencia; but since his time they have been found to be Natives alfo of our Country, growing at Busable in the Isle of Wight, and in the Isles of Jersey and Gernsey. The fourth and fifth Kinds are Natives of Italy, as Maffonius Eys, and of Germany as Camarius Eys, growing by a Lake of Salt Water near Iffels; since those times, we find them to be Natives alfo of our Country, and several Eye Witness have affirmed, that both the greater and lesser Sturis grow near the Sea Side in the West parts of England, in all the Trafts of the Marshes near Apsey in Gloucefter-shire, and that they grow upon the Rocks in Scilly, Gerrifey, and the Isle of Man. The firft Species has been found growing by the Fort on both Sides the Water at Graves, at Erith near London; at Lee in Essex; at Rey in Kent; at Wel-Salter-alto, and at, or near Briftol.

IX. The Times. They Flower towards the end of May, and thro' all June and July, and their Seed ripens in a short time after.

X. The Qualities, Specification, Preparations, and Virtues of Sea Plantain, are fully the same with tho' of the Common Plantain in Chap. 565. Set. 11. ad 25. to which I refer you.

XI. Observation. 1. Gerard fays, That heif Herbs have the fame Faculties and Virtues which the other Plantains have; and that they are thought to be the hotf or moft efficacious of all the Kinds. And Parkinson fays, that what has been laid of the other Plantains may in some part be juftly referred to thefe, for in their coldness and dryness, and other Properties, wherein the Plantains are excellent, they do but little differ, and therefore, That it needs not to repeat the fame things here again, which in other places have already been spoken.

XII. Observation. 2. Only fays Mattifonius, That the fourth Kind here mentioned called Serpentus, the People of Gerius in Italy where it grows, use it to epifcal good purpose, against the Bittings of Serpents epifcally, and of other Venenumous Beasts (which Mattifonius himself fays, That he had found true by good Experience:) as also to help those that are troubled with the Dropsy, that chiefly which has poifon'd the whole Body properly called a Sarcitis or Aseforise.

XIII. Observation. 3. Galen, Dioscorides, and Pliny, have proved Sea Plantain, to be fuch an excellent Wound Herb, that it prudentely cloths or thuds up a Wound, tho' it be very great and large. And by the fame Authority I speak it (fays Gerard). That if it be put into a Pot whereby in pieces of Flib are Beiling, it will Soder them together.

C H A P. DLXX.

OF POLEY;

POLY Mountain.

I. THE Name. It is called in Greece, Tisara (the diminutive Canitim, which enim Canitim vel Canum significat, because it is like to the hoary Hairs of a Man's Head;) in Latin, Polium, or Polium Montanum: in English, Poly, and Poly Mountain. Some will have Polium to be Latus, and that Dioscorides has twice treated of that Herb under divers Names, for that the Kinds, the reason of their Names, and the Qualities or Faculties do agree. There are two, viz. Amboticka, which they will have to be Polium Montanum; and AmbotICKE, which is Polium Horatuce. The Name Latus is from the whitish color, and Polium from its hoariness, as is afo recorded, being like to the white Hoariness of a Man's Head.

II. The Kinds. Authors have made ten or more Kinds of this Plant, but they being most of them
Strangers in our Climate, nor yet found to be growing in our Transmarine Plantations, we shall only take notice of, and Describe the three Species following, viz. 1. *Polem Montanum* vulgaris, *Polem Montanum* Latham’s, *Polem Montanum* primus Dodonaei, Our ordinary or common Polley. 2. *Polem Montanum* minus, *Polem Montanum* primus Matthioli, *Polem Montanum* album, White Polley, or upright Spanish Polley Mountain. 3. *Polem Montanum* Lavedale Feto Badiani, *Polem Montanum* secterum Matthioli, *Polem Montanum* septicum Cafi, *Polem recensionarium* feminine Lavedale Feto Lobsli, Spike or Lavender Leav’d Polley.

The Descriptions.

III. The first, or Our ordinary or common Polley. Its Root is somewhat long and hard, with a few Fibres hanging thereto. It is a small low Plant, not above a Foot high, having several white or hoary round and hard Branches, on which are set divers long and small hoary Leaves, overlaid as at more with a yellowish white Down, a little dent’d about the edges, and something broader or greater than any of those which follow; two always set together on the Stalks as they grow up: at the tops whereof grow whitish or hoary yellowish Heads, thrashing out many small pale colored Flowers, and in some places more yellow, standing in heavy Heads. The Seed is small and blackish. The whole Plant smells sweet, strong and quick withall. The Branches being Sift, and set in the Ground, will grow very well, and by that means be sufficiently encrusted, for in our Climate it seldom gives perfect Seed to be Sown. Yet Clusius says, that he had some Plants raised from the Seed of this Species, but they brought forth Flowers more pale than the Author’s Plant, and some more white, especially on the outward, being pale on the inside.

IV. The second, or White Polley, or Upright Spanish Polley Mountain. Its Root is hard and woody like the former. The whole Plant is shorter than it, and rises up with many small slender Branches, standing more upright than the fifth or common Kind, and not leaning downwards to the Ground, but it grows upright, yet it grows not much higher. On its Stalks and Branches are set

*Poley Mountain white.*

**Poley Mountain Common, or Yellow.**

many hoary Leaves, smaller than those of the first sort, and some small ones together with these, a little bented about the edges towards the ends, and as hoary, or rather more hoary than it. At their tops grow longer and smaller Heads, bearing white Flowers, coming forth out of hoary Caps, larger and more spread in the following. The Seed is blackish and small, yet greater than that of the sixth before described, and the Plant itself is smaller. And the smell of this is more sweet and acute than that.

V. The third, or Spike or Lavender Leav’d Polley. It has a hard woody Root, spreading itself over many small Fibres. From this Root springing forth several weak Branches, on which are set many small hoary Leaves, two together, one against another, as in both the former, which are something green on the upper side, and hoary underneath, something like to the Leaves of Rosmarinus, or Lavender, and not at all dented about the edges. At the tops of the Branches, come forth many Flowers not blossoming, but loosely spread, which are of a white color, not differing in form from the other, but coming forth of a deeper Black, yet not so very hoary as the others. The Seed is black like the ruffs, and the whole Plant has
Pole Mountain Lavender
Leav'd

has a small sweet Smell, not so pleasant as the former, as some Authors say: but Matthiolus says it smells well, the not so pleasant as ninian is, being of less virtue and efficacy than it.

VI. The Place. All these are natives of more Southern and warmer Climates, as Italy, Spain, Canadas, &c. but here they are raised up only in Gardens, the first of them being most common with us.

VII. The Time. They flower all June and July to the beginning of August, and the Seed ripens in the mean Season.

VIII. The Qualities. Pole is hot and dry in the third Degree: Aperitive, Astringive, Diuretic, Volumetric, Cardiac, and alexipathic. The first or greater Kind is most in use.

IX. The Specification. It is profitable against the Jaundice, Dropsy, Spleen, Bitings of Venemous Creatures, Poison, Strangury, obstructions of the Course, cures Green Wounds, as also old Sores and putrid Ulcers, cleansing, drying and healing them.

The Virtues.

XI. The Juice or Essence. They are good for such as are bitten or hung with any Venemous Creature; and is profitable against the Dropsy, Jaundice, Hypochondriack Melancholy, and Pain, Tumor or Swelling of the Spleen. They provoke the Terms in Women, give ease in the Stomach, provoke Urine, and force away the Gravel, Stones or Tartarous Matter from the Reins and Bladder. Dose from 3 Spoonfuls to 6 or more, Morning and Night, in a Glass of white Lisbon Wine. If they are given in too great Dose they are apt to trouble the Stomach a little, and sometimes (if the Stomach is very foul) to cause Vomiting. If the Lips of Cuts or Wounds be washed with them, they cause Concretion, and a sudden healing.

XII. The Decestion in Wine. It has all the Virtues of the Juice and Essence, but not altogether so efficacious, and therefore ought to be given in greater Quantity. It opens all obstructions of the Viscera, as of the Stomach, Lungs, Liver, Spleen, McKintry, Reins and Womb, thereby carrying off the encumbrances of those parts by Urine, and curing the Scurre, Blemishes, and other like Disseases. Used as a Lotions, it is profitable for the cure of Green Wounds, and it cleanses, dries and heals also old running Sores, and filthy purrid Ulcers.

XIII. The Pouder of the Leaves and Heads. It has the Virtues of the Juice, Essence and Decestion, and may be given Morning and Evening, from half a Dram to two Drums, in a Glass of white Port, or Lisbon Wine, or a Spoonful or two of Syrup of Violets, or Chasquithifere. Scouring upon old purrid Sores and Ulcers, it stops the flux of Humors, cleanses, dries, and heals them. The first or greater Kind is most used with us, yet is the Pouder of the Jeffer Kind, (which is the more bitter in Taste, and the more sharp or quick upon the Tongue) which is put into the Violets and Venice Trets, and other Antitobes or Counter Poisons, and is indeed of greatest Virtue.

XIV. The Cataplasm made of the green Herb. Applied to great Cuts or Wounds, it quickly Concretes and heals them, and this the greater Kind does best perform.

XV. The Spiritualis Tincture. It very much comforts and strengthens the Stomach, Bowses, and Womb, give present ease in the Collick, and is profitable against Convulsions whether in old or young: It refits Poison and is good against the bitings of Mad Dogs, Vipers, and other Venemous Creatures. Dose from 1 Dram to 3, Morning and Evening in a Glass of Wine.

XVI. The Acid Tincture. It opens all manner of Obstructions of the Bowses, of what kind soever, strengthens and fortifies the Stomach, creates an Appetite, and caues a good Digestion. It is a potent Remedy against the Scurre, and refits the malignity of the Plague or Pellitence, as also the Spotted Fever, Pipples, and all other Malign Fevers, more usefully happening to quick upon People, where there is a high and excited Temperament of the Blood: Dose 30 or 40 Drops at a time, in all that the Patient drinks.

XVII. The Oily Tincture. It is an Anti-collick, and a potent Diuretic, giving present ease in the Stone and Strangury: It expels Sand, Gravel, Stones if they be small, and Tartarous Mucilage from the Reins, Urines and Bladder. It provokes the Terms in Women, facilitates the Birth, and gives ease Labor: it also caues a due cleansing afterwards, and either prevents or cures After-pains, which are fo very troublesome to some Women, that they exceed the Vehemency of the labor it self.

5 V Taken
Salmon’s Herbal. Lib. I.

Taken also daily Morning and Night inwardly in Wine, and the Back Bone being also anointed therewith twice a Day, as also the other parts afflicted in a Palsy, it has been found by good Experience to Cure that Disease, as also Numbness, Trembling of the Limbs, and other Faradick Disaffections of the Nerves. It helps Limberne, gives ease in the Gout thereto never to esteem, prevents against the Scarcities, and is a powerful remedy against Rheumatisms. Dole from 15 to 50, 60, or 60 Drops at a time, Morning and Night in any fit Vehemt.

CHAP. DLXXi.

Of POLYPODY.

I. The Names. It is called by the Arabians, Bishara, as Seraph has it: by Avicen, Dehers, and Bideg: by others Aseig, and Beffinji: in Greek, Eunomos, (a Poly-

formum circuli, Eys Disfiguratae: or a cier-

mut circulo, seu circus Polyporum, Iays Pliny:) in Latin, Polypodium, & Flicula.

(gaoffs, para velice, & Fliculatis Herba:

in English, Polypody: some call it Wall Fern, and Oak Fern, (according to their places of

growth) but then they ought to add another

Epithet to it, and make it Great, as, Great

Oak Fern, because there are smaller which are

properly so called, as you may see in Chap.

365, Succeeding, of which the Polypody is no

Species.

II. The Kinds. We make three particular

Species hereof, tho’ the two first differ not

much, one from another, but in their place of

growth, and these are, 1. Polypodium, (and it is called by all Authors,) Polypo-

dium Alaternum, Wall Polypody, or Polypody

of the Wall. 2. Polypodium quercinum, vel

quercinum, Polypody of the Oak. 3. Polypo-

dium ulterum, Polypodium minus, The smaller

Polypody.

The Descriptions.

III. The first or Polypody of the Wall.

Its Root is long, not a Finger thick, creep-
ing a slope, on which are seen certain little

Buttons, like those Pan and Deeria which ap-
ppear in the Tails of Cattle Eilhes, which

has a certain sweetness, with a Tuffe somewhat harsh. The Leaves of this Polypody

might be thought to be like those of the

Male Fern, but that these are far leafer,

and not Mick at all on the edges. These

do presently spring up from the Root, be-
ing cut in on both the edges, with many

depth Gishes, even to the middle Rib. On the

upper side they are smooth: on the under

side they are tightly Powdered, as it were

with dally Marks. The kind of Fern (for

it is a Species of the Fern’s) wants not only

Seeds and Flowers, but Stalks also.

IV. The second, or Polypody of the Oak:

Its Root is smaller than one little Finger, ly-
ing a slope, or creeping under the upper craft

of the Earth, or matter it grows on, brown-

ish on the outside, and greenish within, of a
certain succulth hardnesse in the Tuffe, fit
Chap. 571. English Herbs.

with certain rough Knobs or Excruciations on each side thereof, having also much mossiness, or yellow hairiness upon it, and some fibres under-neath it, by which it is nourisht. It is a small Herb, and consists of nothing but Roots and Leaves, having neither Stalk, nor Flowers, nor Seed, as it is thought. It has three or four Leaves rising from the Root, every one singly by its side, of about an Hand length, which are mignon, confiding of many small narrow Leaves, cut in, to the very middle Rib, fanding on each side the Stalk, each being larger below, and smaller up to the top, very like unto the Olimn. Fern, not having any dents or matches on the edges, as the Male Fern hot, of a fat green color on the upper sides, and smooth, but somewhat rough on the under side, by reason of certain yellowish spots, which are thereon.

V. This Polypody of the Oak, Gerard thus defcribes. The Root has many Strings tied to it, one folded within another, of a mean bifcul, and fparse leaves being very large, with buds forth borne and there new Sprouts or Sprigs, whereby it interlaces. This Polypody is much like that of the Wall (before defcribed) yet the Leaves of it are much finely cut, fome of them very fmall, and of a pale green color, so that with their Stalks and middle Rib, but on the other side, it is rough like thefe of Fern. This Fern grows alfo without Stalks, and continues alwayes without Flowers.

VI. The third, or Smaller Polypody. This dif- fers not from either of the former before defcribed, neither in Root, or Leaf, or Marks on the under-side of the Leaves, but only that the Root is smaller, and flenderer, and the Leaves alfo not fo long and large. This finalleafe, as I fuppofe, may rife more from the place where it grows, than from the difcrepancy of Kind, for alfo, in fome places, the Leaves may feem to be a little named on the edges, yet in refpeft to the general growth of the Plant, it is but accidental.

VII. The Places. The firft grown upon old Mud Walls, as alfo in Muffy, Stony, and Gravelly places, near unto Springs, and where it has moft mellow and moift Earth to spring and live in, alfo upon old Stone Walls, and the tops of Houfes: It is likewife found in the corners of Fields, espe- cially under Trees and Thorns, and now and then in Woods: in fome places it grows rank, and with a broader Leaf, in others not fo rank, and with a narrower Leaf. It is likewife to be found upon old raven, Trunks or Stumps of Trees, as of Oak, Beech, Huf, Willow, and feveral other forts of Wood, and in the Woods under them, that which grows upon Boards, is prefumed before the rest, but instead of this, moft doe ufe that which grows under the Oak, and for all that I know, it may do nearly as well. The third or Smaller Polypody grows where the place is hard and dry, or in barren places, where fearely any other thing will grow or thrive.

VIII. The Time. By reafon it is grene all the Year, and this Flower, the Seed as it is thought, might be gathered for use at any time, yet it fends forth young grene Leaves only in the Spring.

IX. The Qualities. It is hot and dry in the firft Degree, and as Galen fays, without any biting property: Aperitive, Altemitive, Anodyne, Splen- ticke, Architick, and Catharticke.

X. For the Sickness. It purges Melancholy, Choler, and with flem. Flegm: is good against Agues; Goft in Hands or Feet, hardnefs, pain and tumor of the Spleen. Collift. Stitches in the Sides, Wind, Coughs, fmothers of Breath, Wheezing, Hofts, &c.

XI. The Preparations. The Root is only, or chiefly in Use, and you may make them thus: 1. A Simple Deceotion in Wine or Water. 2. A Com- pound Deceotion in Wine or Water. 3. A Powder of the Root, in Oyle or Water. 4. A Catapla'm. 5. A Diluted Water, not only from the Roots but from the Leaves alfo.

The Virtues.

XII. The Simple Deceotion in Wine or Water, or in Early Broth, or Chicken Broth, or in Whif, or Aleud, or Hohted Water. If it is made with a little and mollifying things, it is of good ufe to purge the Belly, to Digest tough and thick Humors, and purge Phlegm, whether thick or thin, even from the joints: and by using this for a confiderable time, fome who have been troubl'd with Pains and Tumors in their Hands, Knees, Joints, have been wholly cured of the fame. It purges off also, Celirar and Melanch- oly Humors, is good against Pains and Tumors of the Spleen, and probablc for fuch as have been troubl'd with Quaran Agues, especially if the Deceotion is made in Whif, or Early Broth, with Epithyrum, Beets, Maltone, and Par- fry Roots. It is probablc alfo against Prickings and Stitches in the Side, as alfo against the Collif, the invertebrate, but therfor it is ought for a pretty long time, and Seed of Amife, Caterlender, Caterlender, and Kennel, with Ginger ought to be added. It is a fife and gentle Medicine, free from damge, and that brings no trouble to the Stomach, to all Scattons and Perfons, which daily Expe- rience has confirmed. It may be given from an Ounce to an Ounce and half, or two Ounces in a Deceotion, for one Dofe, which may be given in the morning Falting , with due Observatton, as in other gentle Purges.

XIII. The Compound Deceotion in Wine, Water, Early Broth, Chilled Broth, Whif, Aleud, or Hohted Water. Take the Polypody cleaned and bruifed, from half an Ounce to an Ounce or something more: Alexandrian Sents from a Dram to 2 Drums: Amife Seeds, Caterlender, Caterlender Seed, Suces Kennel Seed, Ginger, all bruifed, of each a Dram; Cloves fin, a Scrape: Wine, or Water, or Broth, &c; a fufficient quantity, But greatly with a fimmering Heat, for almoft half an Hour, then drain out of a funnel Bag, which Dubife with Syrup of Violets, or of Citron Peals, for one Dofe. It admirably Purges Melancholy, opens the Spleen and expells the malignt Hypochondriack Humor: It pre- vails against Foulnefs, and radically currs the moft profound Malnefs, whether it be raging or other- wise, provided it be ufed alternately with Oplates, as with my Laudanum Volatile, Laudanum Specific- cum, or my Guif Vifce, &c: But the powering with this Deceotion ought to be repeated 6, 8, or 10 times, or more, as the exigency, or necessity of the Difeafe may require. It carris off the Caufe of the Collif, as alfo of the Grass, gives relief in Obstruifions of the Spleen, Aftifmns, Coughs, Colds, Hofts, fmothers of Breath, Wheezing, &c: And being continued for some time, is an excellent thing for the fpeedy prefurfation of Agues, and has all the Virtues of the Simple Deceotion, with great advantage, because it more powerfully carris off the Morflin Maffe, Caterlender, and relieves the Maffe, and with Sticks gently, and is probablc against all the Difeales, for which the Simple de-
Of POND--WEED.

POMPION WILD, see Melon Wild, Chap.

CHAP. DLXXII.

Of POND--WEED.

OR.

RIVER--WORT.

OR.

WATER--SPIKE.

1. The Name. It is called in Greek, Than-
usworos, (quod Flaminibus vicinos) and
Zaemian (quod Specta Fontatais). In Latin, Po-

II. The Kinds. Authors give us many Kinds of this Plant, but we shall describe only the four following, as being those which are found growing in our Country, viz. 1. Potamogeiton latifolii

mum major vulgaris, Fontalis latifoli major vulga-

ris. Our common greater broad Leav'd Pond-

weed.

2. Potamogeiton Angustifolium major, Fontalis longifolii major. The greater long or narrow Leav'd

Pond-plant. Roots coming out of the Lungs, which sometimes grows so big as to flop the Water up, it is said to cure it. It cures also those Colds or Chaps, which sometimes happen between the Fingers of the Hands, or Toes of the Feet, as also those coming in the very Fundamental.

XVI. The Distilled Water, from both Roots and Lungs. It is much commended for the Cure of the Quaran Ague, being taken many Days together, as also against Melancholy, or fearfull or Troublesome Dreams. If it be distilled with Sugar Candy, it is good against all the Distinctions of the Lungs, as Affluents, Coughs, Coldes, Shortness of Breath, Hoarseness, Wheezing, and Catarrhus, or thin Distinctions of Rheum from the Lungs, which oftentimes causes a Consumpation, as an Atropa, and Consumpation of the Lungs. If a Foot Soak be made of the Herb or Root by Incantation, and it be added to the Distilled Water, it makes it more efficacious or powerful to all the purposes and intentions aforesaid.

XVII. Note. It is credibly reported, that if the Devolution of the Roots made with Water, or the Roots themselves, be given to Hogs, that it will preserve them from the Murmures, by purging away the poisonous, deleterious or malign Humor, which causes it.

Pond-plant broad Leav'd great.
Pond-weed broad Lea

d small.

IX. The Qualities. Pond-weed is cold and dry in the first Degree, and Gallet Eys, it cools and binds as knot-grass does, but is of a thickeroffice. It is Altriginnious, Anodyne, Colferick, Vulnerary, and Archtiick.

X. The Specification. It is a Fluxes, eases the Belly, is good against Antihome Fire, alluvages Inflammations, gives present cafe in the Gout, and heals old running Sores and Ulcers.

XI. The Preparations. You may make them from,

The Virtues.

XII. The Liquid Juice or Essence. Given to two Spoonfuls, Morning and Evening in a Sypick Red Wine. It eases gripings, and helps all sorts of Fluxes of the Bowells: and being Bathed therewith, it is good to help Affects, Ulcers, old running Sores, and powring Cancers. It allays Inflammations, Antihomes Fire, and is good against Freckles, Tanning, Sunburning, Pimples and heat of the Face.

XIII. The Decotion in Wine. It has all the former Virtues, but may be taken inwardly, to 6 or 8 Ounces; it is a very good Gargarium for a Foe Mouth or Throat, cleanly, drys and heals Ulcers, &c. But Made with Water, It is better for to cool Inflammations, alay the heat in Antihomes Fire, &c.

XIV. The Powder of the Leaves and Heads. It has all the Virtues of the Juice and Essence, a Dram at a time being given inwardly Morning and Night in some Sypick Red Wine. Obtrusively being finered upon old running Sores and Ulcers, it is said to drop the Fluxion, cleanse, dry, and heal them, and this it more efficaciously does, if it is mixed with an equal weight of the Powder of common black Rotten.

XV. The Ointment. It is cooling and Anodyne; is good against all Inflammations of all sorts, running Sores and old Ulcers in the Legs,difficultes of the middle Ripe, and other breakings out in the Face and Skin.

XVI. The Capllisten made of the Leaves or Heads and Roots. Being made by distilling them with Oil and Vinegar, and applied to places pains with the Gout, it gives present cafe: and made with Honey and Vinegar, and applied, it heals old running Sores and old Ulcers in the Legs or other parts: made of the Root alone, it is said to diflolve Knots and Kernels in the Neck, and other places of the Body.

CHAP. DLXXIII.

OF POPPY GARDEN.

I. THE Name. It is called in Greek, Nnaw, in Latin, Papaver: and in English, Poppy.

II. The Kinds. There are four principal Species of this Plant, viz. 1. Papaver Rbarba. 2. Papaver somniferum. 3. Papaver somnifarium. 4. Papaver Rhoeas, or erratiwm, vel Sylvestre, vel Buddran,
Salmon's Herbal. Lib. I.

Rutabag, The Wild Poppy, or which in Chap. 574.
3. Moso soynti, Amorcharum Habitat. Papaver
Chorculum, and Cornutum. The Horned Poppy,
of which in Chap. 575. 4. Moso soynti, Papau-
ver Spatunum, Spurting Poppy, of which in Chap.
576. following.

III. The Kinds of the Garden Species. There
are many sorts of this Species, but the following
are chiefly, viz. 1. Moso soynti, Papaver album fatu-
num simplex, The single white Garden Poppy.
2. Papaver albus fataum simplex, The single
black Garden Poppy. 3. Papaver rubrum, and rubete
fataum simplex, The single red Garden Poppy.
4. Papaver album multiplex, The double white Garden
Poppy. 5. Papaver rubrum multiplex, The
double red or bluth Poppy. 6. Papaver nigra
multiplex, five purpureum multiplex, The double
murry or purple Poppy. 7. Papaver Rhesus her
multiplex, The double red or Corn Poppy. 8. Pa-
paver Spinatum, The Thorny Poppy:

The Descriptions.

IV. The first, or Single white Garden Poppy.
It has a Root which is white and choopy, which
persists as soon as it has given ripe Seed. This
springs up fresh with four or five whither green
Leaves, lying upon the Ground, which rise with
the Stalk, encompassing it at their bottoms, and are
very large, as well broad as long, much rent or
wrinkled in on the edges, and dented also before. The
Stalk, which for the most part is but one, and some-
times three, or four Feet, or more high, has some-
times no Branches at the top, but usually but two
or three, which are the Moss, each of which bears
one Head, wrapped or folded in a thin Film or
Skin, which blows down before it is ready to blow,
and then rising and being broken, the Flower which
was folded within it, spreads itself open, and consists
of four very large white round Leaves, with many
smaller round Heads in the middle, set about a small
round green Chaplet or Head, having a Green, or
Star-like Cover on its top, which Head growing
ripe, becomes as great as a large Apple. Bellambo
flora, That in Naarla, (where they make Opium) the
Heads are so large, that they will hold half a Pint. In
these Heads are contained great numbers of white small
round Seed, in several Partitions or Divisions, set into the Shell, the middle
thereof remaining hollow and empty. This Head
keeps close, and opens not at top under the Crown,
or all the black Kinds for the most part do. All
the whole Plant, Stalks Leaves and Heads, which
they are fresh, young, and green, yield a Milk, or
milky Juice when they are broken, which is of an
unpleasing bitter Tast, which manifests the
Stomach, and is in Vomiting, and of a strong heady
Smell, which being condensate is called either Opi-
um or Meconium. Of this white Kind, there is
another in all things like unto it, but that the
Flowers, and especially the Heads of Seed, are not
so great by the half, and for the most part has more
Branches upon the Stalks, its Seed is as white as
the other, and fall as large or great.

V. The second, or Single black Garden Poppy. Its
Root is like to the former, and there is but little
difference to be seen between this and that, until it
comes to flowering, for that the Flowers of this are
sometimes left, and of a blackish purple color, with-
Chap. 573. English Herbs.

very black, will fall out, if the Head thereof be turned downwards.

VI. The third, or Single red Garden Poppy. This Poppy has various Species, with respect to the Variable colors of the Flowers, yet they differ not from the former, but only something in the Leaves, these being longer, and in some crumpled, and cut in or jagged on the edges, but in the jagged edges also some of the Flowers, and especially in the colors of the Flower and Seed; for the Flowers of some of them will be very red, of others paler, some of a Rose color, others of a marron color, and very double, something jagged at the ends, and of a whitish color. In the middle of which Bands a round Head or Bead, with a striped Cotyledon or Cover on its Head, very like a Star, compassed about with some Threads, in which, when it is ripe is contained, in several Cells or Partititious, small, round, white Seed. The whole Plant is of a strong healthy stalk.

VII. The fourth, or Double red or blush Poppy. This Kind of double Poppy, differs not in any other thing from the former, but only in the color of the Flowers, which are of a bright red, tending to a bluish color, parted, and striped in many places with white, and exceedingly more jagged than the former, almost like a Feather at the ends, the bottom of all the Leaves being white. The Seed hereof is white as the former, which is not so in any other Poppy, which bears not a full white Flowers.

IX. The fifth, or Double marron or purple Poppy. This Kind varies both in Flowers and Seed, also neither in Leaves, or any other thing from the fifth. The Flowers are thick and double, and jagged at the ends, in some more, in some less.

either deeper, or paler, yet all of them have a deeper Spot, somewhat large, in the bottom of every Leaf. And as the Flower varies, so does the Seed also, for the Rofe and pale colored Flowers bring gray or Alh colored Seed; the reddish and deep marron, no so pale Seed, but more inclining to black. The Seeds of all these Kinds, the white as well as the black or gray, if they be suffered to seed, will spring up again the next Year, and bear every Kind, its own color of Flower and Seed, without the least degeneration or paling of their forms or appearances, unless by mere accident.

VII. The fourth, or Double white Garden Poppy. Its Root is hard, woody, long, and perishing every Year, and must be new Sown every Spring, if they do not spring up of their own Sowing, which if they do, the Flowers are seldom so fair and double, as they which are Sown in the Spring. It has divers broad and long white or green Leaves, growing Milk, (as all the rest of the Plant above Ground does, wherefore it is broken or cut.) These Leaves are very much rent or torn on the edges or edges, and nadled or indentured beside, es-compassing the Plant, in manner like a woolen Cloth, being woven fore and after, from the Branch bearing, a few, large, great Flowers, which before it breaks out, is contained within a thin Skin, and being blown open, is very thick of Leaves, eithet red, or bluse, or purplish red, more or less, or of a sad marron, or tawney color, with brown, or black, or tawney Buttons. The Seed is either of a creamy white color, or (as in one Plants) more blackish.

X. The seventh, Double red, or double Corn Poppy. This double Poppy is like to the Wild or Field Poppies, which is well known to all. It has longer, narrower, and more jagged green Leaves than the former
former Kinds, the Stalks are more airy, and the Flower of a deep yellowish-red color. Now this differs nothing from the Corn Poppy, but in the duplicity of the Flower, which is very thick and double, but not fall off, to large as the former. This rips from Seed in the like manner as they do, and is to be preferred.

XII. The eighth, or Thomy Poppy. Its Root is small and spreading, dying every year. It rises up at first with three or more yellowish green Leaves lying on the Ground, streaked with white Veins, having many Corners or Dents as it were about them, at which stand many shrapp Privetlees or Dorma, not having any white Streaks or Veins on the under side, but in the white mildly Veins, are like to that which we call Our Lady's Thistle, and on the under side are mere without, with some small Privetlees, along the middle Rib and Veins, encompassing the Stalk at their bottoms, the Stalk rises sometimes two or three feet high, spreading it self forth into several Branches, with the like but lighter Leaves on them, and bearing at every of the Tops one small Head, enclosed in a rough Skin or Fal, like as the Popies have, which opening, there forth a small yellow Yellow, confuning all of six Leaves, yet sometimes being hot faire, and some times-waxt in with a small, long, green, prickly Head in the middle, tip'd at the top with a red Spot, which quickly bears many, and with many yellow Flowers. Planting about it, the Flower is fall, (for it continues but a while) the Head grows ripe, having five or six Ribs from the top to the bottom, and is likewise between the Ribs, armed with very small, but cruel sharp point Privetlees, in which is enclosed, round rough thick Seed, twice as large as any Poppy Seed. Every part of the Plant yields a yellow Juice.

XIII. The Places. The fifth, three, or four stoned Kinds grow not Wild in any place, that I know of, but are Planted and Nutted up in Enclothor, for the general good they do to mankind. The Native place of the four double Kinds are unknown, but we have had them for a long time in our Gardens, and it is said that they came from Confingiamplor, or out of Turky. The eighteenth or Thomy Poppy, has been found growing in Fords, and other parts of the West Indies, from whence the Seed was first brought to us.

XII. The Times. The fifth 7 or 8 Garden Kinds, do all Flower from the beginning of June, until the middle or end of July, according as the Season may be, but if they spring up on their own Sowing, they may Flower somewhat the earlier, viz. in May, or end through July. The Heads of Seed are commonly ripe in July, unless they be cut off. The fifth Kind Seldom Flowers before Midsummer, and the Seed is ripe in August, it is to be Sown in Autumn, else it scarcely springs up.

XIV. The Qualities. Poppy is hot and dry in the second Degree, or rather in the third: Afflicting, Apathetical, Narcotical, Cephalick, Spleenetic, Arthrhetic, Antimateriaeligious, Sudorific, and Antieaterick.

XV. The Specification. Poppy (in its several Preparations) is medicinal for the Cure of Affections, Coughs, Colds, Consumptions, Pleurifie, Pains and Stitches in the Sides, Spleen, Womb, Reins, and Bladders, Vapors, Hyderia, Frets, Colic, Gripping of the Guts, Stone and Gravel in the Urinary parts, all Fluxes of the Bods, as, Drothera, Dysnomia, Lycemia, and Hepatic Flux; all

Fluxes of Blood, by the Nose, Mouth, (as Spitting and Vomiting Blood) Secret parts (as Pilling Blood, over-flowing of the Terms, &c.) of Fun- dament, (as the Hamorrhoids, Bloody Flux, &c.) bleeding of Genum Wounds, Horse Wounds, &c. to Wounds, old Sores, Ulcers, Fistula, Joints, or any other Parts, &c. Gours in Arms, Hands, Fingers, Hips, Knees, Ankle, Feet, Toes, Rheumatism, &c.

XVI. The Preparations. They are almost innumerable, those following, as most Material, we shall bestow of in their Order, viz. 1. A Liquid Juice of the Leaves, Flower, and Edel, usefull.

XVII. The Virtues. It is Medicamentum Anodynum, giving present ease in any pains in what part of the Body occur, by bathing the parts afflicted therewith warm, two or three times of a Cup of Water, and bathing the Heads, Forehead, and Temples therewith, it cures the Head-ache, and cures Sleep and Rest; the fame it does, if a Rope Cake be dippt therein, and is bind up on the Forehead and Temples, and for those Cancers, and Fluxes of Rheum falling upon the Eyes, Nose, Palate, Tongues, Jaws, Teeth, &c. Applied upon the feet Fever of any Dispresent, it allays the Inflammation, eases the pain, dissolves the Tumor, and quickly cures the Diffitex, more especially if it be mixt with a little White Wine. (Lengthens 'till.)
Chap. 573. English Herbs.

889

parts afflicted with the Gout being well bathed therewith, and Linen Cloth fix or eight times, double being dpt therein and applied, it effects the pain, cools the Inflammation, if any be; Stops the Flux of Humours to the parts, and in a short time cures it. Held to the Mouth, it Cures the Tooth-ach upon the Spout. Bathed upon sore, hard, inflamed and pained Breasts, it softens, cools, and effects their pain almost in a Moment.

XIX. The DECIDATION of the Leaves and green Heads. It has all the Virtues of the fruit and Essence, but nothing near to powerful. Given inwardly 3 or a Spoonfull at a time, most helpful, it is found to stop Carcass, and Vomiting. Coughs, give rest and ease, and cause Sleep, and prevail against pains of the Stone and gravel, to Stop Fluxes of the Belly, and overflowing of the Terms.

XX. The Decidation of the black Seed in Wine. Being drank, it effects inward pains of the Bowels, stops all Fluxes of the Belly, as Diarrhoea, Dysentery, and several other complaints. It stops all the overflowing of the Courtes in Women: and outwardly bathed upon any place, is a powerful Cure of Humours, it eases the pain and uncommonly tempers the Humors held in the Mouth, and repeated for some time, it has been found to give ease and relief in the Tooth-ach.

XXI. The Decidation of the Shells of the Heads is similarly useful. So are the Shells of the Poppy-Heads. They are usually boiled in Water, the decidation of which is given to 2, 3 or 4 Ounces to procure Rest and Sleep, so also if the Head and Temples be bathed therewith warm, for some considerable time.

XXII. The Powder of the Seed. Dispersers, Galls, and others who write that the Seed is immediately eaten in Bread, and made into Cakes, and eaten with pleasure. And Matthioli with several others have observed, that in our Days the White Poppy Seed is Sown in Italy and other places, and much used, yea, and the Black Poppy Seed also, which they all agree, is stronger in Operation, and only Medicinal, or only to be used in Physick for the Cure of Diseases: This Black Poppy Seed a Matthioli says, that the Inhabitants of Traces, in their Fields, and Grounds, among Beans and other Passions, which they familiarly Eat, being made up with Wheat Flour into Cakes, the Seed being cast into the same and kneaded together, and yet he says, they are not at all the more Sleepy or Drunken, than those who Eat none of them. As also, that in Scythia, and the Upper Asia, the Inhabitants do Eat the Expounded Oil out of the Black Seed, familiarly in their Meals instead of Sallet Oil, and find no inconvenience or Drunkenness from coming upon them thereby. And hereby he says, That he shook off the fears of the danger of Poppy, which his Wife Mather had, by their grave Admonitionsseasoned him withall in former times. The Powder of the Seed, whether of the White or Black Poppy, being ground to a fine powder, or half a Dram, according to the Age, and Strength of the Patient, in any proper Syrup, is good to stop Fluxes of the Belly, and ease the pains of the Spleen, as also to procure rest and Sleep, being given at Bed-time, tho' it had no such operation being eaten made up into Bread or Cakes, because (as 1 Suppofe) it might be taken, want of its dee Doce.

XXIII. The Surgeon of the Seed. Matthioli says, That the Emsalion, or Atth of the Seed, (1 Suppofe of either White or Black Poppy) made with Early Water, he had oftentimes given, and in great quantity, in the hot Fits of Agues, and in Burning Fevers, both to affuage Thirst and procure Rest, and so dote, it has a good Property in it, to procure Rest and Sleep.

XXIV. The Oil of the Seed by Expression. This Oil we have shewn before, in Sect. 22. The People of Austria and Spain, Eat, as others Eat Sallet Oil, and therefore without doubt, it can have no dangerous effects. It is good against Hoarsness, Wheezing, and loss of Voice, being taken inwardly and to take a Mixture with Syrup of Clove-still-liquors, of Citrons Peels, or of Fables, it prevails against vehement Coughing, and Croupes of Breaths, Affittys, &c. outwardly applied, upon any part, it can be Infammation, ease pain, and takes away redness and Pimples in Face and Skin.

XXV. Syrupus de Papaveris magis composition: Syrup of Poppies, the greater Composition. Take the Heads of White and Black Poppies, with their Seed, whilst green, of each 6 Ounces, Linen-bag 15 Ounces, Tartaries N. 320, Lettice Seeds 5 Ounces, Seeds of Malteses and Lettuce (tied up in a Bag) of each a Dram and half a Dram, Boil all according to Art, and draw out to three Pounds of which, Po Clarify, or double refined Sugar 4 Pounds, and make a Syrup according to Art. It is good against Colders, Phthisics, Consumptions, &c. for Stills, Pleuritics, eases all manner of pains giving Rest and Sleep; Dose from 1 Ounce to 2.

XXVI. Syrupus Papaveris alio modo minus composition, Syrup of Poppies the lesser Composition. Take Heads of White and Black Poppies, whilst both are green, of each 6 Ounces, Seeds of Lettice and Violets, of each Ounce, fair Water 2 Gallons; Boil them till the Virtue is out of the Heads, then strain it out, and add double refined Sugar 4 Pounds, make a Syrup. The Virtues of this are the same with the former, and it may be given in the same Dose; It is an excellent thing against Epis and Ritches of the Sides, pains of the Spleen, and Giddiness of the Head.

XXVII. Syrupus Narcoticus Gregorij Horstii, Horstius his Syrup eating Pain. Take Syrup of Corn Poppies 16 Ounces, Linen-bag Opium a Dram, Dilute the Ludum in White Poppy Water & Ounces, and make them well together. It has all the Virtues of the former Syrup of Poppies, and gives pleasant colic in the Colic, Gout, and Stone: but it is most commonly used in Venereal and Strong Pains of the Head, for which purpose, it was often used by the Ancients, and is now, being powerful for that Intention: Dose from half an Ounce, to one Ounce or Ounce and half.

XXVIII. Syrupus de Ruscus a duo Decordation Liquidam, Syrup of Ruscus, or of Condensed Juice of Poppies. Take Heads of White Poppies, gathered after the Flowers are fallen off, and kept three Days apart, 8 Ounces; Heads of Black Poppies with the Seeds gathered together 8 Ounces; Spring Water 6 Gallons; digest 24 Hours, then boil a little with a turning Feather, and gently press out the Juice, which afterwards boil to 3 Pints, and with 2 Pounds of double refined Sugar, make a Syrup according to Art. It is Hypotics, Narcotic and Pectoral, good against Difficulties of the Bowels, Lungs, and Bowels, Coughs, Colds, Hoarsness, Affritts, Colic, Pleuritics, Consumptions, and stops all sorts of Fluxes of the Bowels, and the overflowing of the Terms in Women. Dose 1 more or less, according to Age and other accidents.

XXIX. Decordation Liquidam est, seu Syrupus Hemoptesius, Another Liquid Decordation, or Syrup of Poppies. Take Heads and Seeds of White and black Poppies, 4 Ounces; Black Poppies 4 Ounces; Spleen-Seeds 2 Ounces; Brown Sugar 3 Pounds; Boil a full Hour, then press out the Juice, and dilute it with 5 Pints of fresh Water, the Dose is as before.
Black Poppies, which green, of each 5 Ounces. Sugar, half a Pint of Liquorice bristled 2 Ounces and half a Pint of Spring Water a Gallon, extract all the Tincture out of the Juice, in more Balms, in 48 Hours, let it out and set it, then a dram to the Poppies Heads and a dram to the confectionary, then press out the Juice, evaporate again till it comes to about 2 quarts, and with a Pounds of double Refined Sugar, boil it in the Confectionary of a Syrup. It gives color to the Palm, and makes Rett and Sleep, it flows Vomiting, and all manner of Fluxes of the Belly, Fluxes of Humors, Catarrhs, Coughs, Splitters, and Piling Blood, &c. It gives color to the Cachex, Germs and Stone, and prevents Althamus, Pleurisy, pains and Stitches to the sides, &c. "Dose 1 Ounce in any proper Vehicles."

XXX. [Illegible text]

XXXI. Dittany Herba, or Dittany with Balsam. Take white Poppy Heads, with the Seeds, with this green, N° 235, for Pox, Pests, Scherbert, of each N° 123, Pulp of Sweet Cardam, Liquorice of each 5 Ounces, Seeds of Cinnamon, of each half an Ounce, of Flowers of a Rose, of Sweet Almonds, of Pokers, of each half an Ounce, to a proper quantity of Spring Water, extract all the Tincture out of the Seeds, and make it into a Syrup, sets the end of the Sprit, the Ache in the Bones and Joints, and is a Secret. It thickeneth Rennet, curds Expectoration, quenches Thirst, mitigates the extremity of cuts and burns, helps colds and moilsiness, and gives Relief and Sleep. It is prevalent against the most acute pains, chills, and chills of the loins and Bowels, as Stone, Gravel, Colds, and Gripings of the Graces it gives color to the Pleurisy, and Ballet, Pleurisy, and it is peculiar against all Chickering Fluxes and other Fluxes of the Belly. Dose from a Spooriall to two Spoorials or more.

XXXII. Dittany Herba, or Dittany with Balsam. Take green Heads of White Poppies with the Seed, N° 203, Pulp of ripe Carrots, 3 Ounces, Althamus Roots, or rather Bitter Berries, Liquorice of each 5 Ounces, Pulp of Spring Water 6 Quarts, mix and boil the Water again till it comes to 3 Quarts, then strain out by Exsudation, and strain again, and with Sugar of Rett 1 Pound, but it to the strength of a Syrup, or of New Honey. It has all the Virtues of the former, yet by some not thought so powerful; however it is very profitable in all thin, and sharp Ruminations, and other Difficulties of the Lungs, and Asthma.

It takes away the lethargy of Coughing, and makes Rett, for which effects it was highly celebrated by Mccustian. I have here Substituted Bitter Berries, of the Althamus Roots, because the former make the Preparation more elegant and graceful, and I judge the Bitter Berries to be full as efficacious.

XXXIII. [Illegible text]
Philonium Persicum, and Romanum, may be
from a Scrape to a Dram, this Philonium Magni
bred, may be given from a Grain, to 3, 4, or 6,
according to the case. XXXVIII. Philonium Turcaefae Galleni, Gallen.
Contex: cing Pain. Take Extrav. of Opium a
Pound, white Pepper, Herbaec Seed, of each 2
Pounds, Saffron half a Poun., Eperamphium, by
rethraum, Indian Spickhard, of each in five Pounds
an ounce and half, Money the triple weight of all,
viz, alike 18 Pounds: mix, and make an Elixairy
according to Sirs. It is said the Virtues of the Phi-
lonium Persicum & Romanaem, allerging; and may
be given from a Scrape to a Dram, the Opium
being, $1, a twenty fourth part of the Composition.
It is a very good thing, to eat all
manner of intolerable Pains in any part of the
Body, chiefly of Stomach, Pleura, Spleen, Guts,
Reins, Womb, Joints, &c. It helps in Scutitac-
ings, flux, stone, gravel, heat and Scalding of the
Urine, Const. Colic, &c.
XXXVIII. Philonium Turcaefae Galleni, Gallen.
The Oil by Inflation or Inflation, or
Boiling. It is made either of the Flowers, or of the
green Heads and Seeds, or of the Leaves and Stalks;
but that which is given under the green Heads is the most
efficacious. It cools Intumescences, repirucces a
Flux of Humors, it shares the Milk and Pains in
Women breacles, gives ease in Rheumatism, Gout
and Sciatica, poscives against Leprory, Membrane
and Scurt, and eases the pain of the Head, being
well anointed upon the grieved parts twice a
Day.
XXXIX. The Ointment of the green Poppy
Heads and Seed. It has all the Virtues of the Oil
in the last Section, and may be applied to Concretes
which are breeding in Women Breacles, or in any
other forms of blood, the Humor, causes the Pain,
and if proper Intervals be given in the mean time,
may be of extraordinary Service for that purpose;
what we should propone to be taken inwardly in
this cafe is our Lawkewa Catharticum, the De-
fription of which you have in Sect. LXXI. Follow-
ing.
XL. The Cathartic. It is made of the green
Heads and Seed, and for some of them of the green
Leaves. Applied to the Fore-head and
Temples, it gives present cafe in the Megrim or
Head-ach, and is profibably applied to the Crown
of the Head (being first Sharred) in a Delirium,
Frenzy, or Madness. And it gives present cafe be-
ing applied to the Spleen or Region of the Womb,
or to places grieved with the Gout, Rheumatism,
&c. Dothes Intumescences, and hinders the Flux
of Humors to any part.
XL. Diluted Water of white Poppees. It is
cooling, and very profibable against violent Burn-
ing Fivers, to be drunk ad libitum, being first
acquainted with Spirit of Saltsahr, and then a little
diluted with double Refined Sugar: It makes a
very good Vehicle, for conveying other Preparations
of Poppy seed, whether Discords, Expell-
atories, or Laxatwn. It is profitable also against
Dillemias and Frenzies, also Intumescences in any
part of the Body, whether inward or outward.
And gives Rest to weary Bodies, and pleasant
Sleep.
XLII. Diluted Water of black Poppees. It is
Drawn from either the Flowers, green Leaves, or
green Heads and Seed. It has the Virtues and Uses
of the formers mixed with White Wine Vinegar,
and the Forehead and Temples bathed ther-
with, it eases the Megrim and Head-ach, and
causes Rest and Sleep, and is a peculiar thing to
both with the cutting of Iorus Sucra, or An-
thorities Eire.
XLI. Spinn of white Poppees. It is made
either of the Flowers, or of the green Heads and
Seed, or of the whole Plant, as the Spirit of Corn
Poppy, and other Accidents made. The Virtues is also to give ease in the
Collick, and to alleviate pains in any part
of the Body. It gives ease in the Stone and Guts,
and is profitable against Alum-pains of Wo-
men in Child Bed, and with a great deal of plea-
Sure induces Sleep. But their things does it more
powerfully, if you make a Tincture of the Flowers
with the wine. Dote from half a Dram to 3
Drams plus minus.
XLV. Alcachona, or the lipifite Jufces of
Poppees. It is made the Extrav. of the green
Heads and Seed of the white, or black Poppee,
or both of them, or of the Exprefed Juice of the
whole Plant. This is put into a proper Glass
Body, and the Poppee Waters of two or three drams of
it in it, or a gentle Seed hot, till the
Magma comes to the consistence of Hony, or of an Elixairy for making Pills, according as it is to
be used. This Magma is Alcachona. It is of
the consistence of Hony, it is then fit to be made
into an Ointment or soft Emplofher, which being
Sharred cures frencies and Madness: it fell,
never to extream: if applied to the Scena
it eases the pain, and Cures them.
that which is brought to the thickness of an Egg on
must be prepared as Opium is (declared in Sect. 36. and 47
following,) before it can be used inwardly, and
then it will have the Virtues and Effects of Opium,
not altogether so powerful.
XLV. Opium, The Tears of Poppy Heads. It is
made only in hot Countries, in China, India,
also major, Turkey, and other Eastern Countries.
The Trachon Opium is accounted the best of all,
and after that the Indian. Parldeil says, that he
has gathered some of it from the green Poppy Heads
standing in the Garden, and his half grown ripe,
here in England. The general Heads are flat, cut,
or Wounded with a Knief, in two or three places
obliquely, towards the lower parts of the Head,
which then yield a Milky bitter Juice, at firft
comming forth, which is gathered practically every Day,
with some convenient Instrument at a proper
efly, this being dried in the Sun, (but not at the
Fire.) becomes that Opium, which is brought to us,
and which we le, and by its gradual dying, runs to the color we feel it of. The Question now
is, out of which Kind of Poppy, Opium is extracted,
whether out of the Heads of the black Poppee,
or of the Heads of the white Poppee Gerar
says, that it flows from the Heads of the black
Poppee, and this he seems to have from Discoper-
ides, or Matthioli in his Epitome, has the Words,
Opium autem, quod a Papaverum minorum Capitii-
bus paratur, magic reflexed, inoffic, sub Rcipe.
And Matthioli in his Comment, appears to be
of the same opinion, for speaking of the black Poppee,
he says, Carentem ex incipit, Papaverum Capitii-
bus open, five Successus snis, utc. al Opium Vacum
addoscat, at sequitur discoperides. But Per-
son will have it to be, the Tears flowing only
from the white Poppee. The Appro jet (tays be)
gathered from the Heads only of the great white
Poppee, growing in the East Countries of Afa MA-
riot towards India, &c. is the true and left Opium,
that is, or should be used in Medicine. And our
Lenedd Willis was of this opinion, for speaking of
Opium, and Discoperides, &c. he says, I am
not used in this place to describe the white Poppee,
but of which these are made, nor the Evaporation of
the Opiae Juice. Now by reason of this divers-

X 2 5
ty of Opinions among the Learned and Great Men, how wholly we certainly determine, and by what means shall we find out the Truth? Angelus Salis, a Lizen, and Learned Man, seems to determine it for us, Anatom. Ephemerum Vegetationum, Sect. 6. Cap. 2. Opium (dextrilis) nihil habet effe, quam solum, & accesserit hac, et Papaveris ad 6 angis capitibus, et effe in effe Pyjamos apud Tyros Iapistis Nautis et aliorum Pro- vinciarum, ad libitum, frequenti in offa, Alphab. Rur. ad me deferint. From these Words I am apt to believe, that it is indistinctly extracted from both the Species.

XLVI. Extraitum Opii, the Extract of Opium. It is done several ways. 1. The Extraction with fair Water. Take Turkey Opium whatever quantity you please, suppose a Pound, dissolve it in Spring Water 2 Quarts over a gentle Fire, then let it set 24 Hours, and decant the clear Tincture, add more Water and over a gentle heat extraxt again and let it set till as before, and decant the Tincture again which part to the former: Repeat this Work of extracting, so long as the Forces will yield any Tincture, their Tinctures being all parted together, evaporate either in Balneo, or by a Sand, to the constancy of a thick Extrait fit for Pills, or almost to dryness, which Magma, keep for use. 1. Let the Tinctures before evaporation you add Spirit of Wine Vinegar, 3 or 4 Ounces, or Oils of Salt, Sulphur, or Vitriol 2 or 3 Ounces, mix them well together, and then evaporate the Extract will be too much the better, and be alfo corrected into the 2. Angelus Salis, makes an Extract of Opium thus. Moilin Opium in fluces with Vinegar, and dry it, till it will powder with your Fingers, which Powder dissolve in Vinegar of Roses in a Sand heat: Strain out and afbract, disolve it again in Redified Effence of Elder, and add with Whites of Eggs, and infipidize to a confistency fit for Pills. This Swain powerful ly. 3. Extractum Opii Quercetinum. Cut the Opi- um into fluces, and dry them with a moderate heat in Sand (avoiding the Flames) till it will sub into Powder with your Fingers, so will the filking Sulphur (in which is the Narcotic and Potoxicent force) be gone; dissolve this Powder in Juice of Limons, or Lime Juice, or in Spirit of Vinegar, and afbract it to a confistency fit for Pills. 4. Extractum Opii Collianum. Dissolve the Opium in Hydro Water and extraxt the Tincture, as in the fifth way, which afbract to the thickened of Honey, dissolve this in Spiritus Vinicorum, and extraxt a Tincture again, which afbract to a confistency fit for Pills. 5. Extractum Opii Hartiment. Take Powder of Opium made by drying at the Fire; then which extraxt a Tincture with Juice of Limons, or pure Wine Vinegar, fo long till they will be no longer Tinged, digest these Tinged Li- quors 10 Days, decant the clear, and afbract to a dose thickens. By these ways of Extraction the Opium is purified or cleansed, prepared and made fit for other Compositions, and sufficiently correct ed for general Use.

XLVII. Pudax Opii, the Powder of Opium. Take either of the former Extractions, dry them by the Fire (being cut into thin flakes) and gradually increase the facility till the Milk will reduce into a thin Powder, which you may steep for use: 1. To the Opium prepared and made fit for any Preparation of Compound Pouders, etc. take Opium 4 or 5 Ounces, or 10 or 12 Pounds, or Tinctures, which are Acrid, and think in, or have occasion. Out of this Simple Powder of Opium thus prepared, you may make Pudax Opii Compositum, or Pudax Optimus, after this manner. Take of this Simple Powder 5 Ounces, Salt of Tar-
or an Extrait. Then add thence choice Lime Juice, choice Canary, pure Spirit of Wine, of each a Pint and half; Powder of Cloves 2 Ounces; Cochineal, Saffron, Writers Camphor, of each 1 Ounce; Consider half an Ounce dissolved in Oil of Orange 2 Drums, or so reduced in a Pip; mix all and digest for a Month, in a very gentle Sand heat, shaking the Glass once or twice a Day; then let it stand in a cool place, till it is perfectly settled, and decant the clear Tincture, keeping it a Glass close stop for Use. The Power and Virtue of this Medicine, flies like Lightning that the whole Body, for it is no sooner received into the Stomach, but it

tom, of a confidence fit for Pills, this Spirit thus drawn off, is a Spirit at bot-
in a Moment. This Spirit suggests not theExcr
clusion of Excrements, nor adds the Passages of
Urine, it blemishes not, nor excites the Limbs,
nor changes the natural complexion of the Skin to
pale, nor causes cold Sweats, (shortness of Breath)
nor distillation of the Animal or Vital Faculties,
but it has all the good effects which are attributed
to the most excellent Llanandum, tho' not with the
full same strength and force; it appellate all per-
mutations of the Mind, and intellefinite and violent
Commotions of the Body, as Dipsomaniacs, and the
Rage, Fury and Madness of the Anchow (the prin-
cipal director of the Spirit of Life) following again
Peace and Concord, Rest, and Ease to the whole
Man, and all the faculties of the Body. So that
after it has finely and slily (as it were) appeased the
Pain, and allayed the Grief, it procures a quiet
and pleasant Rest and Sleep, restoring Nature to
its pristine State, and repairing its decayed
Strength: whereby, notwithstanding Health comes
on, with a violent Cure, and takes pollution
of its ancient Habitation, exterminating in all Ages
and Sexes, the Roots of bitterness, and the Semi-
nalities of Pain and Difficulties. This Spirit is of
such a kind: and valuable Nature, in as feeable a
Cardinal should be given without it, and it may
even be given from half a Dram, to 2, or 3 Drasms
yearly, to half an Ounce, according as the Age,
Strength, Complexion, and Necessity of the Sick,
and other Accidents will admit of.

Lll. Llanandum Liquidum Helmonti. Helmont
his Liquid Llanandum, according to these
Authors. Take the mixed Opium and Salts of
Juice of ripe Quinces mixed with Salts of
Salt of Tarax 1 Ounce, digst all or 2 Drasms
gently and slow, or till your Believer appear
prescott the Liquor, which prepared for
Revolution is at Hand, than they reduce that
be in Powder 4 Ounces, and use a moderate
Strength to advance the Revolution, 8 so will the Opium rise,
and totally dissolve. At the top of the Liquor, will
be a filthy impure and Scummy part which joins.
At bottom will be an impure and Earthy part. And
in the middle will be, a pure and transparent La-
guage, or red as a Bubbles, which separate, ffericate,
and keep for Use. This is the true Llanandum
of Helmont from Langlet, and may be given 6
of 15, 20, or 30, in any proper Vehicle. Salini-
ery, etc. But if you please you may infufflate this
Liquor to the confidency of an Evanroll fits for
Pills, and either keep it in that Form, or dissolve
it again in pure Spirit of Wine, which being Filtered, is to be digested for a Month, to
ripen it and bring it to perfection, then infufflate
again, to the confidency of an Evanroll. From this,
the true Llanget proufies wonderful things, in
calls where Llanandum is to be used, giving at a
time not above a quarter, or half a Gram, at
mold a Gram. This small Dose is imputed to the
union and close binding up of the Particles of the
Opium, full diluted by the Fermetation, and then re-
duced or concentrated again by bringing the Matter
to the Form of an Evanroll. This Llanandum In-
duces Rest, allays the sharpness of Humors, and
drops their motion. It quirolizes Nature, and parts
of the Body afflicted, corosotes all the Bowels,
therin the Natural Heat, restores the Retentive
Faculties extinguished, drops all Fluxes of Blood in
Man or Woman, as the overthrowing of the Terms,
and all forms of Fluxes of the Belly, Canarbis,
and other thin and corroding Definitions, either
upon the Eyes, Ears, Teeth, Throat, Lungs,
Stomach, Joints, or any other part external or in-
ternal. It calms all the Head, arising from
attenuated Humors, taken inwardly, or applied to
the Forehead and Temples. It diffuses and ex-
presses Wind, and takes away noiznes in the Ears. It
calms the Tooth-ach, drops Vomiting, and all other vi-
olent Purgations and Fermetations of the Humors.
It gives ease in the Difficulties of Cancer, Colic,
and in all glipping pains of the Bowels in Man or Woman, given as well as by the Mouth, by
Syphillis. It is a powerful Remedy against the
Stone, gravel and Phthisiac Matter in the Lithur-
ny parts. It not only allays the Fermentation of
the Humors, but abates their Acrimony after due
Purgation. It curcs a Gastricis (Univerful being
premised) and strengthens the Spemtrick Vegetable.
It cures all sorts of Gout and Rheumatism, and
is prevalent against all pains in any Age or Sex,
acting from what cause soever, especially after
general Remedies, or previous Excoriations.

LVt. Another Prefcription of Helmonts Liquid
Llanandum. Take Juice of Quinces a Gallon, which
put into a Fermentation with Ale Tripl, with this ex-
trct and a deep Red Tincture from Thebaicum
1 Pound, which strain and Aromatizes, then draw off
one half of the Liquor in Boile, and keep the re-
mainder part for Use. It has the Virtues of all the
four grand Virtues and Efficacies in Difyperforic affections, and is esteemed by many Physitians, the most sale of any Llanandum.
Dose 4 or 5, ad 20, 30, or more (according to
your Believer) in the Spirit of Wine, in any Hour
at any Vehicle at Bed-time. There is yet another Pre-
fraction of Helmont Liquid Llanandum, the which
you may see in our Print Medizin, or other
authorities, on p. 115. Sect. 23. lately emitted into the World, to which we refer you.

LVt. Llanandum Speciebus Paraefes, Paraefes
his Spectiebus Authors. Take Thebaicum ex-
traded a Pound, Poudres or Extracts of Ginnamum,
Gentian, Saffron, of each half a Pound, the Juices of
Sour Oranges and Quinces, of each 3 quarters of
Pond; mix, and digst with a gentle fire for a
Month, or till the mixture is disdiluted, strain out
by pressing, and apply to the confidency of a soft Ex-
tracit for Pills, then add Ambergris in Fine Powder
an ounce and half, Blood in Fine Powder 3 Drasms,
Magsteries of Coral and Pearl, of each 1 Ounce,
mix and digst which, then add to the Quintessence of
Gold 1 Ounce, mix, and compleat the Great
Speciebus. If this be not compleat, and Poudres
leaves out the Quintessence of Gold, and subtilizes
some proper Salt; we rather advise to add in place
thereof, an Ounce of pure Oil of cinnamon, as it
is extreamly compleat. The Recipe of the Llanandum Paraefes given us by
some Authors, which is the following. Take
Extract of Thebaicum Opium a Pound, InfusiaJuice of
Honebute, Speciebus 12 Drasms, of each 10
Ounces, Emnity 2 Ounces, Salt of Pearl and
Coral, of each an Ounce and half, Liquor of white
Amber extraduted with Alcool of Wine, Bone of a
Savage Heart, Bazar- Stone, Unicorn Horn, Aurum
Petkule, of each an Ounce, Mark 3 Drums, Am-
bergris 2 Ounces and half; or for want of Aurum
Petkule, you may add of the Chymical Oil of Cin-
namon and Colombe, of each 1/2 an Ounce, mix them
well, and digst again for a Month, and so keep it
for Use. It cals all manner of Pains in a Mo-
ment, stops all sorts of Fluxes of the Bowels,
Caries, Coughs, overboiling of the Terms and
Whies in Women, stops Bleeding, &c. And is a
Speciebus in the Pleurisy, Colic, Hysterick-fe,
Gripings of the Guts, Gout, Rheumatism, Ref-
fficiencies, a powerful Remedy against the
Tintura Opii Simples and Composata, and that of
Paraefes, as also of the Llanandum Helmonti at
Sel.
Chap. 573. English Herbs.

Selt. 48, 49, 50, and 53, aforegoing. Dofe 4 gr., ad 6, either in a Pill, or divided in any proper Vehicle.

LVI. Landanum Landenfe, The London Landanum. Take Thurian Opium extruded, a Pound; Extract of English Saffron a Pound and half; Extract of Saffron 2 Ounces, Strong Tincture of Spirit Distilled, made with Spirit of Wine, half a Pound, Ambergrif, Musk, of each 5 Scratches; Oil of Nigrom 160 Drops, or 3 Drums; mix them perfectly together, and evaporate in Bathes, or a Sand heat, to a dry Compositions. 1 is a most excellent Composition, and has all the Virtues of the Londonum Paracelsus in the former Section, and may be given in the fame manner and Dofe, every Night before the Bedtime.

LVII. Nepherifh Opium, A Confit on Sorrow and Sadnefs. Take Tincture of Opium (fift prepared with Spirit of Vingefir, then with Spirit of Vingefir) half a Pound, and in proper Vehicles, made with Spirit of Wine, of each a Pound, Salt of Coral and Peart, of each a halves Pound, Tincture of Species Dimbru a Pound, Ambergrif, 2 Ounces, mix, and by the gentle heat of a Bafh, evaporate to an accommodatory fit for Pills. The Volumes embrace the fame Virtues with the two former, fave that this mofc clears the Heart and Spirits, caules Glaudnes, and drives away Murtherly Dofe. Dofe 4 gr., ad 6, or 8.

LVIII. Requefeting Opium, Nicholas his Con- fift caufing Keft and Sleep. Take red Roses Ex- augugated, bleo Virolez, of each 4 Ounces; Thur- ian Opium (diluted in Wine) 3 drams of aromatke Her- bume, of white and black Poppy, of Exudan of Purfanne, of Extat of, Extat of, Roots of Med- drups, Spuidum, Gam Trafaced, of each an Ounce; Nigrom, Cinnamon, Ginger, red white, or a Sand heat, to a dry Compositions. 1 is a most excellent Composition, and has all the Virtues of the Phantion Pergrum, and Romannem, and may be given from 2 Scruples to 2 Drums in any proper Vehicles, even according to the Reafon of the thing may require.

LIX. Thurian Landnemens nono, vel Salammadon, Our new London Trecte. Take Extract of Opium a Scruple, Strong Tincture of Liquorinet, Elecampane Root, of Gentian, of Zedanly and of Bay Berries, Juifal Afturem of each 4 Ounces, which diffuse in 4 Joofh Spirit of Wine, as to make a proper Vehicle; mix it together, and make an Eflufrable according to Art. This Composition the Opium is about 1/12 or an Hundred fifty fith part of the whole. It has all the Virtus of the Phantion Pergrum, and Romannem, and may be given from 2 Scruples to 2 Drums in any proper Vehicles, even according to the Reafon of the thing may require. LXI. Landanum Specificum moxfum, Our Spet- cific Londonanum. Take Extradt of Thueban Opium a Pound, Oil of Saffron 5 Ounces, mix them well together, to which add, Oil of Nigrom by Expre- fion a Pound, Anodyne Saffour of Mars 5 Ounces, Bexar Mineral, Pouders of Campfire, Cefcha, Winter Cinnamon, Indian Spickhard, Indian Saffour, Saffron, Venetian Small Red mix together, digef in a very gentle, or rather eafy warm and heat for a Month, then add Oriental Long loud, Bexar Mineral, Celnites, Salts of Cold and Peart, of each a half, with half the Black Cofper, of which bring it to a conftancy for Pills, with half deep in Wooden, or Silver Boxes with Surcefe for Life. It is one of the best Anodynes in the World, caufing all manner of Pains to be removed, in any part of the Body inward or outward. It is prevalent against all forts of Fits and Palpitations of the Heart, as Palpitation, Trembling, Sweating, oppofition of Winds, Fits of the Mother, Convulsions, Verges, Frene, Delirium, Madness, Magain, Head-ach, &c. It caufes peaffant Reft and Sleep, it flops all forts of Coughs, Coughs, and dilatations of Throes, upon any Member or part, is good against Cold, Wringing. Head- aches, Tr fever, fore of the Throat, Ulcers of the Lungs. It caufes Pains of the Teeth poftively, and is admirable against the Gout, Rheumatifm, Saffron, and French Diffufes. It expels all forms of Fomes, and Stitches of the Sides, it flops the Whites, and the overaduring of the Terms in Women: and in- ftead of Agues all forts of agues, being given in a Glas of Comfy, about 3 Hours before the Meal, or the hour of the Fit. Dofe from 1 Grain to 4, according to the Age and other Accidens of the Patient. The proportion of the Opium to the rest of the Ingredients is 1 to 3 or 4 in Six.
Women, spitting and pissing of Blood, vehement Coughs, Cold, Catarhs, and other definitions of Humors. It combats the Vices, and all the Internal Members. It is of Wonderful power against the Scurvy, Dropies, Jaundice, Goat, Rheumatism, Vapors, Fits of the Mother, and other like Diseases of the Womb, and prevails also against all kinds of Agues and FEVERS, incontinence, retching, continual, colic, purgative, or Malign, and is given even in the Phlegmatik, and in all sorts of Epidemick Diseases, Measles, Small Pox, &c. It gives ease in all rheumatic Pains, of what kind, and in what part of the Body. It is a great help against the Stone, Gravel, &c. in the Urinary parts, is a singular thing against Affem, Pleuritis, and a Phthisis or Consumption of the Lungs. It clears the Head, revives the Vital and Animal Spirits, before the Faculties,altht Nature, and caueth pleasant Rest and Sleep. "And it is a Secret in curing a Conovevex in Menstruation, and a Ranging in Women, Universaliy Being been præmi'd.

LXII. Laudanum Catharticus Pharm; for Purging Laudanum. Take Extract of the officinar Opium 1 Pound, Extract of Aloes made with Saffron Powder, or Angelica Water a Pottle, A Dose given from 2 to 6 Months, but Levigated 2 Pounds, Refluxum Scrammonium in fine Powder 1 Pound, Cuprnum, Ginger, of each in fine Powder half a Pound, Oat of Angelica, Chryson, and Warcermen of Oyle the Opium mix and make a Mafs for Pills. It Purges very well, more than twice the quantity of After would do, without the Opium, and Purging without Pain, cattle all manner of Pains in the Body; the Belly being bound, it will Purge or gently loosen it, according to the largest or smallest of the Dose given.

The Virtues of this Medicine are to be admitted, never enough to be praised. It strengthens the whole Man admirably, and is commended for corroborating the more Noble Bowels, but above all for correcting of corrupt and evil Humors, and its very directly purging the Body, which it does by a very safe and pleasant Operation. I have cured by this Medicine alone Indurated Cancers, and of some Years standing, where they have not been broken or ulcerated, and for these nothing can fail at a first, but what does not encrease, must necessarily decrease. So, since this Medicine hindereth the Putrim of the Cancer, it must in time decrease, and as it were pise away, and this it doth by stopping the Fluxion of the Humor to the part, and carrying it off another way. It eases the Cough, and good against Affem, and helps this Catarhs: it induces Rest and Sleep, and proveth against Quotidian, Tentian, and Quartan Agues, being given some Hours before the Fit. Dose half a Scrapel to a Scrapel, or half a Dram at Bedtime, according to Age and other Circumstances. The Proportion of the Opium here is 1/3, or as one to twelve.

LXIII. Gatta Vite Ninfra, Our Cordial Drops. Take Extract of Opium, made as before directed, 16 Ounces, which distill in Tincture of Salt of Tartar 8 Quarts, or in Powders of Annisfits, Angelica, Coriander, Cloves, Myrrh, of each 2 Quarts, the Alorpium being half incorporated with the Strong Tinctures of Saffron, Caterhines, Cloves, Winters Cinnamon, Nutmegs, Virginia Snake Root, Zedakia, of each 2 Ounces, all of them (the Saffron excepted) reduced into fine Powder, Cellarum (freed from Skin and fat) in fine Powder 4 Ounces, The Opium being distill'd in the said Tincture, distill for a Month, staking the Bottle every 3 Days, by the time that it is perfect, and decant off the clear Tincture into small Glass Bottles, to which add Nodick Salt or Sugar of Vinegar 3 Ounces, Cuprur half a Pound, mix and dissolve, and distill 10 Days, and so keep it close stop for Life. It has all the Virtues of any of the former Tinctures of Opium, or of any of the Phthisiacs' or of any of the most exalted Laudanum, which we have disconcerted of before at last, and is much better to be given to Such, who cannot swallow Elixirs, or Pills. This being to be given only in Drops at Bed-time in a Glass of Wine, or of Water, or other Vehicle, the Patient beli lke, as White Wine and Sugar, Mace Ale, Broth, Fine Water, or a little Syrup. If it is taken for a Cough, which is troublesome in the Day-time, or for a deep Consumption, or for prevention of any Illness, it may be taken in the Morning Ealing, in the dead of Night, the Doze is to be regulated according to the Age of the Sick, and other Circumstances. To a Child of a Month, Quarter, half Year, or Year old, you may give from 4 Drops to 10. From a Year to 2, 3, 4, or 5 Years old, you may give from 10 to 15 Drops. And to older Persons from 6 Years of Age to 12, or 14, you may give from 16 to 22 Drops. From 12 Years of Age to 22, 24, 40, 60, or 60 Years of Age, the Doze is to be given upon 3 to 4 Drops, 40, 50, or 60 Drops at a time, which in ordinary cases may be the highest Dose. But in all Perfections, Ages, and Sexes, it will be better to begin with a smaller Dose, and increase it little by little, gradually till it comes to the highest. It may safely be given to Women with Child, being a most excellent thing to prevent Miscarriage.
An APPENDIX to,
see XLVII, and XLVIII.

LVIII. Some confound Opium with Maceonium, but erroneously: for Maceonium, as Disforfer, lib. 4, chap. 25. Teffines, is a fpiced Juice from the Poppy, which is Infipid, which ac-
gcording to Fred. Hoffmann, is thus Prepared. Po-
poverum Veficus can jub tandentes tum礎 alcinii-
practicum, non in Martonis tertius pallidns for-
marque digerunt videlicet in Balneis till a Gummy
Magnus or Subtance remains, which being put into
cold Water will be forthwith congealed: This is
German Opium no ways Sophificated, which may
be made use of instead of the True Opium.
CHAP. DLXXIV.  

Of PAPY PAPY Wild.

I. THE Names. It is called in Grec., 

II. The Kinds. It is of two principal Species, 
1. \textit{Popoterrimum syrophyrum}, which is also called \textit{Puporj}, \textit{Popoterrimum}, \textit{Red Poppy}, 
2. \textit{Argemone vel \textit{Cyathum subcales leflis}}, and of 
this there are several Kinds, the chief of which are, 
1. \textit{Argemone Capitato rotundato}, \textit{Argemone, 
2. \textit{Argemone,} as \textit{Papip} lib. 25. 
III. Our common red \textit{Poppy}, \textit{Corn Poppy}, or \textit{Corn Rose}. It is called \textit{Leaves} rising every Year 
of \textit{Corn} growing. Its \textit{Leaves} are long and 
very much cut in on the edges into many 

PAPY Corn or red, or Corn-Rose.

Wind Flower, or \textit{Lolch} says, this is \textit{yellow} so 
found with it. From among which rise up several 
rough \textit{bears} Stocks, more than two Feet high 
sometimes, which bear also \textit{yellow} like leaves here and 
there on them, but larger than the \textit{bears} below, all with 
\textit{hairs} when broken, a \textit{yellow} Kilk or \textit{Taste}. On the 
top of each \textit{Stemand} grows one \textit{flower}, lesser than 
that of the \textit{Corn Poppy}, but consisting of a round 
pointed \textit{flower}, of a more point or \textit{dilute} red 
\textit{flower}, each of them having sometimes a blackish Spot 
in the bottom, but sometimes without it, with several 
blackish \textit{threads} flaming about a \textit{small green} 

Salmon's Herbal.
The Heads, which when it is ripe, is something short, round, and rough, with some Crofts thereon, and a little round Head or Cover, but no a Crown or Star, at its top, like the other Poppies, in which is contained such as small blackish Seed as in the Corn Poppy Heads, but larger.

V. The second of the Bafford Kinds, or Long Headed Bafford Poppies. This is in its Root, Leaves, Stalks, Branches, Flowers, Seed, and manner of growing, and indeed in all things, like the

Poppies Wild long Cadded.

first Bafford Kind, facing that the Heads of this are larger than those of the last, smaller below, than above, and having a little round Head or Cover at the top, but no Crown, and is rough and hard like it, and in this confides all the difference.

VI. The third of the Bafford Kinds, which is, the Yellow Wild Bafford Pappy of Wales. Its Root is long and brownish on the out side, spreading it self out into some Branches, with many small Fibres adhering to them, which perish not every Year as the other sorts do. This Yellow Pappy has many winged large Spred Leaves lying upon the Ground, that is, many Leaves set together on each side of a middle Rib, each divided Leaf being somewhat deeply cut in, in some Places of the edges, more than others, and of a deep, but fair green color. From among these Leaves, rise up several branched Stalks, about 2 feet high, having some such Leaves thereon, but smaller, and set at several Distances. At the tops of the Stalks and Branches grow fair, yellow, and pretty large Flowers, consisting each of four round Leaves a piece, with many yellow Threads in the middle, standing about a long green Head, which when the Flower is fallen, and the Head ripe, is then larger than the former long headed Bafford Kind, and in like manner smaller at the bottom, and larger at the top, with a small Head or Topping thereon, containing within, much small black Seed, lying within several Cells, in the same manner as in other Poppies.

VII. The Places. The Corn Pappy is plentifully enough to be found in almost all Corn fields throughout all England, as also on Banks and Ditch-Sides, and under Hedges thro' most parts of the Kingdom. The first and second of these Kinds are often found, as well in Corn fields, as by the Way-Sides, in Somersetshire and Kent, and other Counties of this Land, and in the Corners and Borders of Fields, and by the Hedges and Highway sides, going from London to Bath, Gerard says, that he and Label, found them growing in the next Field to Southfleet in Kent; and John fon in Gerard says, that he found them both growing in Cheyles Fields, as also in those belonging to Ashmelffield, in all which Places I may feel have also often found them. The short or round headed one has a Flower of a more elegant color, but is not found so plentifully as the other long Headed one.

The third grows in many Places in Wales, in Valleys and Fields, at the Feet of Hills, and by Water Sides, about a Mile from a small Village called Abber, and in the midway from Denbigh to Con dur, as also near a Wooden Bridge, which gives passage over the River Dee, to a small Village called Balam, which is in North Wales, and in going up the Hill which leads to Bangor, as also near Anglesey in the way leading to the House formerly Sir John Gros's.

VIII. The Times. The first Flowers from May about the Summer Months, and the three half about the end of June and in July, and the Seed is ripe in August, or not long after Flowering, in some Places earlier, and in some Places later.

IX. The Qualities. They are all of them of the Nature of the Garden Pappy, to which I refer you.

X. The Specification. The Corn Pappy has the same Spockick Virtues with the Garden Pappies. The Bafford Kinds cool, are profitable against Inflammations of the Eyes, the Bloody Flux, Obstructions of the Spleen, and the Blisters or Blistings of Venomous Cancers. They heal Green Wounds, also old Sores, Cancers and Raving Ulcers, and help against the Quincke, give Caffe in Gout and Rheumaticks, consume Warts, and take away black and blow Spots, or discolorings of the Skin, They are profitable against Soe Eyes, and are good to take away Clouds, Milts, Films, or Skins, which grow over them, and hinder the Sight.

The Virtues.

XII. The Juice or Essence. They are Analysys, and being bathed warm upon any part of the Body give present Caffe, bathed on the Head Headache, and Temple, they ease the Migrain and Head-ach, and cause Relief and Sleep. They alway Inflammations, and prevail against Affluence Fire, and
Salmon's Herbal. Lib. 1.

Salmon's Herbal. Lib. 1.

omit the sharp and fiery Heat of Bumings and Scaldings.

XIII. The Distillation of the Great Heads and Seed. It has all the Virtues of the Jace and the Poppy; but as the leaves of the latter, which, given inwardly, it cools the heart of Feverers, is profitable against Deliriums and Frenzies, calms pains and stitches in the Sides, and prevents against the Colic; dropped into the Eyes, it is good against Inflammations therein, Blood-ther, vehement Pains, and defcriptions of hot and sharp Humors. Dose from 2 to 3 Spoonsfulls, sweetened with Syrup of Violets, or White Sugar.

XIV. The Oil or Ointment. It is singular against the Gout in Hands, Arms, Legs, etc. The Head and Temples anointed therewith, it eases the Megrim and Head-ach, and procures Relief and Sleep. It is good against Delirium or Frenzy, and is profitable to cool and allay Inflammations in what part of the Body you please.

XV. The Salves. It is made of the Great Heads and Seed, and for want of them of the Seed. It has in outward application all the Virtues of the Jace, Effece, Oil and Ointment: Applied to the Fore-head and Temples it gives ease in the Megrim and Head-ach. Applied to the Crown of the Head (being first Shaved) it is profitable against Doteage, and perturbation of the Senses. Applied to any part, it reprefpes, and recumbers the Flux of Humors, especially to the Joints, calling off all manner of pain whatsoever.

XVI. The Distilled Water out of the Great Heads and Seed, and indeed from the whole Plant. It is refreshing and cooling, and very profitable being taken inwardly against burning Fevers, more especially if it is accompanied with few Drops of Spirit of Saffron, or Safflower, and then dulcified with Double the quantity of Sugar, and makes a good Vehicle for conveying other Medicines, especially Opiates down into the Body: it gives Relief and Ease to weary Bodies, and caues pleasant Sleep. It quenches the heat, and allays the fiery of Ambition Fire, by cooling and suppressing the Humor. Dropped into the Eyes, it prevents also against an Ophtalmia or Inflammation in them, and stops the Flux of the Humors.

XVII. The Distilled Water from the Violets. It is a singular good thing for the cure of the Pleurisy, and all sorts of pains and stitches in the Side. It is an excellent thing to give to Women in Child-Bed, after due cleansing, and to give pleasant Sleep. It is held also to be of good use against Surmisses, to drink it Evening and Morning, more especially if it is steeped with the Syrup of the Violets. For making Eyes. It is more cooling in quality than any other Poppy, (excepted to) and therefore cannot but be as effectual in hot Agues, Frenzies, and other Inflammations either inward or outward.

XVIII. Spiritus Papaveris erratici, The Spirit of Corn Poppy. Take Wild or Corn Poppy Flowers 6 Pounds, purified Spirit of Wine 16 Pounds, mix, digest 3 Days, and then distil in a Glass Aemument in Balano to disth Joyce the distillated Liquor upon as many more of the same Flowers, digest again 3 Days and distil again; this distillated Spirit afford again a third time upon fresh Flowers, and if you prefer a fourth time, distilling each time to boile, Lastly, in a gentle Balano, draw off three parts of the Liquor, which keep as Spirit of Poppy Flowers.

Or thus. Take Fresh or Corn Poppy Flowers 20 Pounds, White Port Wine 16 Pounds, mix, and half Sugar 2 or a Pound, and a large Lemon dissolved in the Wine, take a fermentation, till the whole become somewhat acid, then distil in Balance to disth Joyce the Liquor upon to Pounds more of fresh Flowers, digest 3 Days, and distil in like manner to boile. Then in a gentle Balano, draw on the one half of the Liquor, which keep for Spirit of Corn Poppy Flowers. If you continue the distillation to describe in the former manner, to the Liquor for Aqua Papaveris, or reserve it for making more Spirit with. If you would have a Spirit from the whole Plant, you may proceed with it in the former manner, as with the foregoing, by either of the former ways, or otherwise you may make it after this manner. Take Corn Poppy Flowers, the whole Plant when in Flowering, as much as you please, bruise it well in a Stolle, and every Rain Water 4 times the quantity in weight, distilling in every gallon of Water a Pound of Brown Sugar, mix well, and confine them to ferment to a fit adbility. Then distil in a copper Vessel and filter, in a proper heat, dean of the half quarter part of the humidity for Spirit of Poppy; and half the remaining part for Poppy Water: which keep for use, or reserve for making new Spirit of the Plant. Any of these Spirits are excellent against the Colic, and to allay pains in any part of the Body. They give ease in the Stone, and are profitable against all pains, and colic-like communication with a great deal of pleasure indues Sleep. But these things they will do more powerfully, if you make a Tincture of the Flowers with the same. They have in a large measure, the Virtues of Spirit, in Sc. LII. of the former Chapter, but not altogether to powerfull. Dose from half a Dram, to 3 Drams, per os.

XIX. The Balneo- and Infantarian, The Salve of Spirit of Poppies. Take Corn Poppy Flowers new gathered a Pound, Common Seeds 2 Ounces, Nutmegs 1 Ounce, Ambryce and Galingale Spirit of Wine 4 Pounds, distil according to art, strain, and keep it for use. Dose from a Dram to a Pint, at the Hour of Sleep, or in the Morning after Suffering. It is a Specific also in a Pleurisy. The Spirit of Wine here intended is only common Spirit of Wine or Brandy, for otherwise the Dose could not be so large as we have here given it. It is not only excellent against Surmisses and Drunkards, as also the Pleurisy, but against all manner of pains and stitches in the Sides, Beel and Stomach, the Colic and gripings of the Guts, pains in the Back, Knees and Bladder, but indeed against all manner of hard and violent Pains, of whicke ever so great, it gently provokes Sweat, diffuses compleate Blood, and gives relief against the strongest Aegies. It may be given either alone unctioned upon the White Scapulae, or Lathes strucke a watch at Night going to Bed.

XX. Tincture of Corn Poppy Flowers. Take Corn Poppy Flowers fresh gathered a Pound, Spirit of Corn Poppy Flowers, choice Canary or Stony Wine, of each 2 Pounds; Waters Consuam in two Pounder 2 Ounces; Cucumber in fine Powder, choice English Sugar, of each half an Ounce; mix, digest, and make a Tincture according to art. It has all the Virtues and Excellencies of all the Spiritus of the Flowers, as in V. XIX. and XX., aforegoing: besides which it is an excellent Cordial and a potent expeller of Wind, and therefore good against Fainting and Swooning Fits, Stomachs and Heart, &c. Dose from half an Ounce to an Ounce, or more in a Glass of Angelica Water, well dulced with white Sugar.

XXI. Tinctura Papaveris erratici Myrtifolia, another Tincture of the name from Myrtifolia. Take Corn Poppy Flowers 2 Ounces, surinate them with Spirit of Vitriol. Dose from the Distillated Water from 2 to 3 Ounces, the Tincture of fresh Flowers, extract a Rowund Tincture, which filter,
Chap. 574. English Herbs.

filter, and adde thereto, Syrup of the Juice of Corn Poppy Vomiers Vitrified & Ounces: mix and keep them for use. It is excellent in all thin and slaph defluxions of Rheum upon the Lungs and Afferis Arteries: it causes Reft and Sleep, cures Coughs, Hoarshefs, and Wheezings, cures the Plaftidiak, is good againft Pleurizes, pains and fitsches in the Sides; cures all sorts of Dolors and Griefs, abates Inflammations, provokes Sweating, and vanishes the Bloody Flux, as also the Terms and White in Women. Dofe: 4 Ounces alone, or in fome proper Vehicle.

XXIII. Syrupus de Papaveris eretitvis, seu Rubrum, Syrup of Corn Poppies. Take Corn Poppies Flowers 2 Pounds, warm Spring Water 4 Pounds: steep or infuse, and the next Day finis its, repeat the Infusion with new Vomiers, and again, with its equal weight of Sugar, boil it into a Syrup in Boile. It is excellent to cool and abate the heat of Fivers, cures all sorts of Pains, caufes Reft and Sleep, abates the violence of Pleurizes, Colds, violent pain in the Sides, and fops all sorts of Fluxes of the Belly, as Diarrhhea, Dyfenteria, Litemaria, Hepatick Fluxes, as also the Terms and White in Women. Dofe: from one Spoonful to 4 or 2, either alone, or in fome proper Vehicle.

XXIII. Syrupus Hemoptea, seu Digdudum Liquidum Papaveris eretitvis, another Syrup of Corn Poppies. Take Heads and Seeds of the Wild or Number 20, Juice of Spanish Liquo- or Rice on Ounces, bruifie the Heads and Seed, and steep them in Rain Water 8 Pints, for 4 Hours; and then difluf in it the Spanish Juice, but gently in Bal- lons to 6 Pints, then add thereto a Pound of Sugar, and with white Sugar 1 Pound make a Syrup. It gives caufe in Pains, and caufes Reft and Sleep; it helps Vomiting, helps in the Colics, is good againft a Loafe and all other Fluxes of the Belly, as also Fluxes of Humors to any part, prevail against Affhmas, Coughs, Colds, Plaftidiak, flitting and pilling Blood, gives caufe in the Stone, Gravel and Scurvy, as also in the Gout, and all other Pains wherefover. Dofe: from half an Ounce to an Ounce, Ounce and half or more, as occasion requires.

The Baftard Wild POPPY.

XXIV. The Qualities. It is hot and dry in the third Degree, Alterative, Amony, Vulnery, Ar- thriticke and Alteecharpaeck.

XXV. The Specification. It prevails against all kinds of Sight, Bloody Flux, the Pyorrhe of Venomous Beasts, obftrucfions of the Spleen, Quinquies, Belly-ach, Gout, Colics, Convulsions and the like; it isfield to cure Warts also, Green Wounds, old Sores, running Ulcers and Fulfuffs.

XXVI. The Preparations. You have thereon,

The Virtue.

XXVII. The Green Leaves. Being oftentimes in a Day, and for feveral Days together, rubbed upon Warts, they confume them, and take them away; the fame they do to Corns, more efpecially, if they be fleft gathered, are alfo bound thereon, Morning and Night.

The Liquid Juice. Drop into the Eyes, it takes away Milfs, Clouds, and Films, which hinder the Sight, alfo Inflammations and Heat, and cures the Diffige of the Eye called Argyenol, from which the Herb took its Name) which is the Tune in the Eye: the Malady, when it lies on the black of the Eye, it appears white, and contrary- wise, when it falls on the white of the Eye, it appears black, or of another color. Bathed alfo on Warts it confumeth them.

XXIX. The Infufion in Water or Wine. It palls powerfully againft the Grippings of the Guts, a Diarrhhea, of Loofeflows, and other Fluxes of the Bowels; and is field to give caufe in the pains of the Hypochondrers.

XXX. The Decotion in Wine. Bathed upon places black and blew, or otherwife difcolored by Blows, Falls, &c., whether on the face, Eyes, or other parts, it quickly removes them to their owne Color. It is good againft the Bloody Flux: and is a pre- eminent Remedy against the flinging or biting of any Creatures.

XXXI. The Ointment, made with Oil, Wine and Turpentine. It heals any simple Green Wound, running Sore, or old Ulcers; and being applied to Joints pained with the Gout, it eafes the pain, and in a little time cures the Ditfige. It is good alfo against Cramps, Convulsions, and other like Di- ffiges of the Nerves.

XXXII. The Cataplasm of Leaves and Heads. It heals Cancers, old Ulcers, running Fulfuffs; confumes and takes away Warts; cures recent Con- tusions, as also difcolorings of the Skin. And being made with Wine Vinoice, it cures the Quin- fey being applied to the Throat, and eafes the Gout, and takes it away being applied to the place agrieved.
Salmon's Herbal. Lib. 1.

Corculatum luteum. The yellow Horned Poppy and Sea Poppy. Many Authors have thought that Glaucon was made hereof, as Dioscorides himself says, and as Pliny Herodic thought. But Dioscorides in describing Glaucon, does not say it is the Juice of Horned Poppy, but it is the Juice of an Herb, that has Leaves something like unto those of the Horned Poppy, but Litter or thicker, and yielding a yellow Juice; so that being but like to it, it cannot be the same thing. 2. Pappus Corniculatum rubrum. The Red Horned Poppy. 3. Pappus Corniculatum albo Violaceum. The blem of Violet colored Horned Poppy. This the Spaniards call Rejetas, and some Amapolas Moradas, because the flowers give a juice like Mulberries. Of the 11 Species, there are the two following sorts, viz. 4. Tussac & Tussac in Latin, Hypocome, and Hypopium, Hypocome legitimam Cuffi, & Battini, The Buffard Horned Poppy or Hypocome Dafoledis. 5. Hypocome alteram, Hypocome altera Species Battini. The second Kind of Buffard Horned Poppy. Some Authors have the Buffard Species to be a sort of Cuminum Sylvestrex, and call each of them, Cuminum Hypocome, & Cuminum Sylvestre Flacquem, but I think very improperly, for they are not in the least akin to any of the Species of Cuminum, but rather a sort of Wild Poppies, as is very manifest both from their Poppy like Small and Qualities.

The Descriptions.

IV. The first, or Yellow Horned Poppy, or Sea Poppy. Its Roots are white, long, and tough, spreading it itself out several ways, and enduring many Years, the Plant keeping its Leaves also all the Winter.

Poppy Horned Yellow.

It has many long, and somewhat large, tuberous, or bulky Leaves, lying upon the Ground, very much cut or torn on the edges, and something rough or hairy; from among which rise up several stalks round 5 Inches, rather than standing upright, somewhat hairy also, spreading forth into several Branches, and bearing a large blossom, at the top of every one of them, consisting of four Leaves, of a delicate pale yellow color, with a few threads in the middle, standing about a small crooked Petal, which in some years to be a long, naked, round Red, for Inches or more long, with a small Head or Button, as it were, at the end thereof, in which is contained, small blackish round Seed, every part of this Plant, being cut or broken, sends forth a yellow Juice, and of a bitter Taste.

V. The second, or Red Horned Poppy. Its Root is long and slender, persisting every Year, raising it self again from its own Sowing, so as not be taken out every Year in the Spring. This has fewer, thinner, and more jagged Leaves than the former, nothing so yellow, but of a dull green color, something buby also. The Stalks are slenderer, and longer, having blossoms at the tops of them, like the other, and consisting of four Leaves at piece, but much smaller, and of a pale reddish color for the most part, tho' sometimes they are found fuller. After which come stalks like crooked or horned Pods, but smaller than the former, containing seeds like small blackish Seed within them. This Plant when cut or broken yields no such yellow Juice, as the other does.

VI. Johnston in Gerard, gives us another Horned Poppy, which he calls, Pappus Corniculatum Phaeo-corculatum, or Red Horned Poppy with smooth Leaves. This he says is much like the last described, and according to Cufius is rather a variety of that sort than any differing Species. Its Leaves are with many deep jaggs in them, much like as Rocket bar, but are smooth, and without hair.
Chap. 575. English Herbs. 903

Hair, and the color of the flowers are of a pale yellowish red: both which accidents Chulius says happen to the former, towards the latter end of summer.

VI. The third, or Blow, or Violet colored Horned Poppy. Its Root is long and small with a few flowers appearing as it, and perhaps every year. This grows much fewer, and with smaller Leaves, very much, and fairly cut in, or rather divided into many parts, of a small green color. The Stalks are too long and black, for something thinness, rising not much above a foot, or Feet and half high at most, with small Flowers at their tops, like unto the second kind for form, viz. consisting of four Leaves, but of a fair blue color. A stem, which spring out of a Violet; after which come small, slender and shorter Pods, not above a Finger length, in which lies such like blackish seed but smaller.

VII. Godworth, or Bedford Horned Poppy, or true Hippocamph Barberry. Its Root is small and a little Strength, perishing every year, at the full approach of Winter, and is hardly made to spring again, but by forcing its Seed in Autumn. This plant has divers long Leaves lying on the Ground, very much divided, and cut into many parts, of a pale or whitish green color, so like unto Fumitory in the color of the Leaves, as also somewhat near it, in the many divisions and parts thereof, that it will soon deceive one that does but lightly view it, but is smaller and thinner, and more gentle in handling, yet is larger in Spain, as Chulius says, than what grows there about the middle of these Leaves rise up a Stalk, sometime two, with some Leaves thereon, which divide or spread out towards the top into several Branches: at the top of which is a small yellow Flower, consisting of six Leaves, two whereof are larger than the rest, and stand opposite to one another, the others being very small and scarcely discerned, till the Flower comes out long, crooked, flat, busy Horn, or Cud, full of Joints, somewhat like unto the Haws or Horns of the Scorpioides Mactholl, but greater and longer, in the former, some of which by several square yellowish Seed, very difficult to be taken forth or separated from the Haws or Skins. The Plant has a Poppy like Smell, and of an unpleasant Taste.

VIII. The fifth, or Second Kind of Bedford Horned Poppy. This Plant is very like unto the former, but that the Leaves thereof are so broad, long, but more finely divided, something like unto the Selby, or alternate of Merillis, or Wild Cherwell: The Stalks are smooth, full of Leaves and Branches, which send forth yellow Flowers, made of five pointed Leaves; which being fully open, long Cuds come in their places, which stand not upright, but hang down, and are crooked like the former, but straight, and Jointed, containing greater yellow Seed, not much unlike to those of Gipsy or Goat's Nase.

X. The Sprints. The first or Sea Poppy, grows upon the Sands and Banks of the Sea, and Naturally by the Sea side as well beyond Seas, as on the Coasts of our own Country in many Places. Gerard has it growing near unto Rye in Kent, in the Isles of Scilly and Theresa, at Lee in Essex, and Hurst Castle, and at White-houlde, and in many other places on the English Shore. It is a pleasant Plant, and is much planted in Gardens, for its beautiful Apeaf, as well as for its Virtues. The second and third are Native of Spain, Austria, and Bohemia, Angelica Tales, and Bartholomew ab Cervantes: this last grows in the Kingdoms of Aragon and Castile in Spain, in the Fields near Common High-ways, but with us they both flourish only in Gardens. The fourth and fifth grow in Provence in France, in the way of Arles and Mompellier, and other places in that Kingdom: as also in divers places in Spain, as Chulius says: but as with us they are only found growing in Gardens.

XI. The Timmer. The fifth Flowers from May all the Summer long to the beginning of September, and its Seed ripens in the main time. The second Flowers seldom before July, and gives ripe Seed every Year, if the Season proves temperate and kindly, otherwise not. The third, as it late before it springes up, so it comes late in the Year to flowering, for which reason it barely gives ripe Seed with us. The fourth and fifth Flower about the end of June, and July, and the Seed is ripe in August, and in some places earlier, and in others later.

XII. The Qualities, Specification, Preparations, and Virtues of the two last, viz. the Hippocamph, are much the same with those of the Coriander in the last Chapter, so that nothing more need be said of them here.

Of the True Horned Poppy.

XIII. The Qualities of the Horned Poppies. It is said to be hot and dry in the third Degree. And is Alkali, Aperitive, Digestive, and Venerary: Heu- pacic, Nepetric, and Cathartic.

XIV. The Specification. It prevails against the Strangury, Obstruction of the Stomach, heals Green Wounds, and old rotten Sores and Ulcers, and by its Cathartic Quality calls the Pains of the Sciatic.

The Virtues.

XVI. The Liquid Juice or Essence. Given to 2 or 3 Spoonfuls (if the Juice, being first clarified) in a Glass of Wine, it provoketh Urine, cleanses the Reins and Bladder, and carrieth off the Morbid matter of the Gout, Rheumatism, Stone, &c.

XVII. The Decoction of the Root in Water. Being boiled to the conclusion of the one half, and then strained out and Drank; it opens the Obstructions of the Liver and Bladder, and gives ease in the pains of the Sciatic, and admirably provoketh Urine, giving ease in the Stony.

XVIII. The Powder of the Seed. Being given from the quantity of 2 Scuples to 2 Drams, viz. about a Spoonful at a time in Mee, or Hotened Water, it is said gently to purge the Belly.

XIX. The Oil of the Leaves and Flowers made by Infusion, or Glycerin. It is good to clear the Eyesight, and to take away Spots and Films upon them, for which purpose it is also used to the Eyes of Cartell.

XX. The Liniment of the Leaves and Flowers. It is made of their Juice mixed with Honey and Orib. Musk, with an addition of Oil of Hypericum: cleanseth foul and virulent Ulcers, and that in power-fully, that Gout affrights, that it should not be applied unto those Sores or Ulcers, which are already cleansed, lest it should continue the quick Flesh also. It takes away also by the strength and
Poppy Spatling.

CHAP. DLXXVI.

Of POPPY Spatling.

I. THE Names. It has no Greæ Name, that we know of; but is called in Latin, Papaver Spatulum, in English, Spatling Poppy, or Frothy Poppy, because oftentimes about the Joints a certain frothy kind of Substance is seen.

II. The Kinds. Whether it is of the Kinds of Poppies or no, I will not determine. It is a singular Plant of the Kind, and ought rather to be accounted a Kind of Lychan, (as most Herbarijers think it to be;) it is called by some Ben, or Behen album; (differing from it from the Valeriana rubra Dohamii, &ca. duplurips Libeller, each of which is called Ben, or Behen rubrum:) tho’ neither of them is the true Behen album, or rubrum of the Arabinus; Bashina calls it, Lychan Synepuris, que Ben vel Behen album vulgus, which is all that can be said of it as relating to its Species.

The Description.

III. Its Roots is white, and spreads it self abroad in the Earth abiding many Years. It is a small Iris Herb, having divers weak tender Stalks, full of Joints, about half a Yard or two Feet in height or length, they usually lying up on the ground, on which grow many pale yellowish green Leaves, two always set together one against another at the Joints; having many times upon the Leaves, but more often about the Joints of the Stalks, a certain white frothy Substance, like unto that which is called Cacock Spit. As the tops of the Stalks grow many Flowers together, every one on a pretty long Root Stalk, hanging down their Heads, which are white, composed of five small white Leaves a piece with a deep notch in the middle of each one of them, making the Flower to seem to confit of more than five Leaves; they are standing in a large Head or Hoftler ftriped, the flower feemingly appearing above it; wherein afterwards is contained Black Seed.

IV. The Places. It grows generally throughout England in many places, and particularly in hedgerows, by some it is much valued, and therefore planted as in Gardens.

V. The Times. It Flowers almost from the beginning of June till the end of July, and sometimes later, and the seed ripens in the mean season, and as the Root abides all the winter, it also do some of the Leaves keep green all that Season.

VI. The Qualities. It is hot and dry in the second degree. Aperitive, Aperiific, Cephalick, Cathartic and Emetic.

VII. The Specification. It is peculiar for the use of the Epilepsy and Falling sickness, and other cold and moist diseases of the Brain.

VIII. The Preparations. The Powder of the Seed is only in use.

The Virtues.

IX. It may be given from a dram to two grains, in Mead or Honied water; it caules vomiting, and purges downwards Putridous or deepy humors, and is especially good for the Cure of the Falling Sickness, and other Cold and moist diseases of Head and Brain.

POTATO-Canada, for Harthcroke Jerusalem, Chap. 390.

CHAP.
CHAP. DLXXVII.

Of P O T A T O, Spanish, Virginian, and English.

I. T H E Names. It has no Greek Name that we know of; but it is called by our Modern Authors Battata, Batata, Amato, Canter, Ignap, &c., &c., and by the Indians, Papas, Papas, and Papus, we in English call it, Potato, and Patatas.

II. The Kinds. There are three several Species of this Plant, which are almost as different one from another, as they are every one of them different from the Jerusalem Artichoke. 1. The first is Battata, the Papa Hispánianum, the Spanish Potato, because it grows not only in Spain, but in all the Spanish West Indies, as also everywhere almost in our West-India Plantations. 2. Papus ut Battata Virginiana, The Virginian Potato, which grows wild not only in Virginia, but almost everywhere thro' the whole Continent of Florida. 3. Papus ut Battata Anglicana seu Hiberviana, The English or Irish Potato, which grows in vast plenty in many of our English Gardens, so that now the Roots are sold by Bulbs in our London Markets.

The Descriptions.

III. The first, or Spanish Potato. It has many firm and sweet Roots, which being boiled, baked, or Roasted, are of a pleasant sweet Taste, excelling in deliciousness any other Root whatsoever: its leaves are in shape and form somewhat like to Asphodel Root, tuberous, knobby, and from two to eight or ten inches in length, more or less, with an uneatable thickness, much greater than Asphodel Roots, and larger at one end than at another: some parts of them are longer, others rounder and thicker, some of them of a white color, some of a yellow color, others of a pale brown, and some of a kind of red color, and of a white, or yellowish white within, the whole Root being of one fold, compact, or uniform Substance, without any Heart or Pith in the middle, as Carrots and Parsnips have, many of them springing and growing as it were from one Root, from the Head of these Roots spring up many long Branches, which by reason of their weight and meekness cannot stand of themselves, but trail on the Ground, a Tread or Tread and half in length, or more, on which are set at several distances, broad, and in a manner triangular, or three cornered Leaves, not very much unlike to those of Lily, left in feeling to, and of a dark green color, the two sides thereof are broad and round as to the middle part thereof, but pointed at the end, and growing pretty close to gether.

Spanish Potatoes.

IV. The second, or Virginian Potato. The Root of this is nothing like the former neither in form, magnitude, color, nor taste, nor resembles it in any thing but the field, compact, uniform Substance thereof. The Roots are small, some about the bigness of Wall-Nuts, green and all, some bigger by much, and others greater, some of them almost round, some oval, some of a long round, and almost pointed at each end, some smooth, others knobby, all of them being tuberous, of a dirty brown or yellowish color on the out side, and white within, out of a pleasant sweet Tast, as the Spaniards are, but rather of a Pitsaltan, or insipid Taste, which yet being boiled, baked, or Roasted, and eaten with Butter, Salt, Vinegar, and a little Sugar, are most admirable Food, and not much inferior to those of the Spanish Kind, (both sorts of them, as also the English following, being very meanly when they are dry, for which reason they require a great deal of Butter.) It has many thick and somewhat flexible Branches, leaning a little downwards, or easily born down with the Wind or other things, before with many Winged Leaves, of a dark green color, wherof divers are smaller, and some greater.
greater than others. The flowers grow many together upon a long stalk, coming forth from between the leaves and the great stems, every one severally, upon a short foot stalk, somewhat like to the flowers of Tobacco for the form; being one whole leaf, six cornered at the base, but something larger, and of a pale brown purplish color, or pale brown color, and in some almost white, with some red threads in the middle, standing out a thick Galbonell, Poisn, with white green at the end.

After the flowers are past, there comes up in their places small round berries or fruits, as large as a Damson, or Bolly, green at the first, and something which afterwards with some white Seede therein like to Night-blind, from the likeness of which Batninus upon Matthiolus calls it Solanum tuberosum triloculare.}

V. The third, or English, or Irish Potato. This is a roundish tuberous Root sometimes smooth, sometines knobby, of various magnitudes from the smallness of a Filbert, to bigger than a large bit double, and very compall, and of one uniform Substance, white within, and red without, having a Cuticula or Scar Skin, over the principal Skin, not perfect in Taffes, like those of the Spanish Kind, but of some planation in its Taffes; what being thoroughly boiled, baked or roasted, are much like the others. They are dearished under the Ground by many small threads or strings, from the head of the Root, and one from another, each creasing to its tubercous bulk, in its stratum or place where it lies, without running deeper into the Ground, as long Roots usually do.

VI. The Places. The first grow in Spain and Portugal, and in the Hebrides, as well among the English and Dutch in our Plantations, as among the Spaniards, who plant them universally for Food. The second grow plentifully in Virginia and through all Florida. The third are only North up in Gardens in England and Ireland, where they flourish and come to perfection, and gladly encreas into a vast plenty.

VII. The Times. The first bear their green Leaves all the Summer, which perish with the Stalks at the first approach of Winter, or any great frost; the second thrive their Leaves in the beginning of May, the flowers bud forth in August, and the Roots are fit for Food in September. The lift their Roots come to perfection towards the latter end of Autumn, and encrease in largeness and goodnes, being a good provision for Food, through the whole Winter.

VIII. The Qualities. The Leaves of Potato are manifstly hot and dry in the beginning of the second Degree, as manifestly appear by the Taffes. But the Roots are temperate in respect to heat or cold, drynes and moisture: They affrighte, are moderatedly Diureticke, Stomachick, Chalybick, Antilep- tick, and Spermogoniatric.

IX. The Description. They nourish the whole Body, restore in Consumptions, and provoke Luf. X. The Preparation. You may have therefrom, 1. The boiled, baked, or roasted Roots. 2. The Broth. 3. Sausages. The Blood.

The Virtues.

XI. The Preapared Roots. They stop Fluxes of the Bowels, nourish much, and restore in a pining Consumption: Being boiled, baked, or roasted, they are eaten with good Butter, Salt, Juice of Oranges or Lemons, and double refined Sugar, as common Food: they encrease Seed and provoke Luf, exciting Fruitfulness in both Sexes: and stop all sorts of Fluxes of the Belly.

XII. The Earth of the Roots. They are first boiled five in fair Water, then taken out and pealed, these Roots that come into the same Waters again, and boil till the broth becomes as thick, as very thick Grues, or than Olive Pudding: some mix an equal quantity of Milk with it, and so make Brothes: others after they are peeled, instead of putting them into the Waters, they were boiled in, boil them only in Milk, till they are disfitted as aforesaid, and the broth is made pleasant with sweet Butter, a little Salt and double refined Sugar, and so eaten. If but all the Virtues of the Roots eaten in Subltance, nourish more, and restores not only in an Ate

Chap. DLXXVIII.

Of Prick--Madam.

The Names. It is called in Greek, Ανθέων οξινονιτίς: in Latine, Verum- litoris, Sedum Vermiculare, ilicexbor vermiconata; and in English Prick Madam, (being a certain Kind of small Houleleek, or Stone Crop.)

II. The Kinds. There are several Species of it as 1. Anthera longifolia seu Housleek, Verumcallis Ar- chepale, Tree Prick Madam. 2. Anthera compacta seu Epilobus, Verumcallis Etragumulata, Stub- by Prick Madam, or the leaf Tree Prick Madam. 3. Sedum minus Housleek, succumptionis minus primus Vaudonei, Sedum minus naue Faghi, Verum- callis fove ilicexbor major vulgaris, The Common greater Prick-Madam. 4. SENPORENTIA minus affli- vam Labeis, Sedum minus costae fravelis, Verum- callis fove ilicexbor minor, Alson medium Houleis, The lesser Prick-Madam, or small Stone Crop.

The Descriptions:

III. The first, or Tree Prick-Madam. In Roots are long, woody, and spreading in the Ground, this Plant rises up to be five or six feet high, as I have sometimes observed it, when it is planted in Gardens in a good Soil, and is plentifully stored with Branches, from the bottom to the top, and thick for both small, long, and round green Leaves, without any Taffes, very like to those of the small Houleleek, called Stone Crop: (but Labeis says, it has a kind of Saltish Taffes.) yet taller and greener,
Prick-Madam small.

VI. The fourth, or Leaff Prick-Madam, or small Stone Crop. Its Root is creeping, in like manner as the former, or Common greater Prick-Madam, and roots it self forth in divers places above. It has small and long Leaves like the last going before, which are fat upon short foot Stalks, nor much above an Hand breadth long, which are not so thick, but more flat, and of a more Stryptick Taffe. The Flowers are of a proper yellow color, and greater than the former, but standing in sparef Tuffs in the same manner. It loves both Leaf and Stalk in Winter.

VII. The Places. The first and second grow by the Sea side, and farther off Likewise, where the second will have a brackish Taffe, as well as when it grows near the Sea. The third grows many times in Gardens, and in other Places upon Stone Walls, and tops of Housies, almost in every where. The fourth grows among Rubbish, and in the Borders of Fields open to the Sun, alto on Mud, or on Stone Walls, and on other Sandy and Gravelly places, and often times upon the Tails of old Tiled Housies and Pennouths in many parts of the Kingdom.

VIII. The Times. The first and second Flower in Auguft, or very late with us: The third and fourth Flower in June and July, and sometimes sooner.

IX. The Qualities. They are cold in the third Degree, and dry in the four. Alkali, Amony, Reparcurative, and Valencurary.

X. The Specifications. It is good against the Gout, Pains, Aches, Swellings, and heat of Urine, Stone, Gravel, burning Fevers, Head-ach, Bleeding at Nofe, Inflammations, Eryphelas, Pimples, Shingles, Tattoos, Ringworms, and other breaking out: as also stops Fluxes of Humors to any part, and is good to heal Scoriing Sores, old Ulcers, Carcinis, Burnings and Scaldings, with Fire, Water, or other things. It is fad to waste away Warts and Corns, and to free the Skin from Scurf, Morphe, and other deforments and defor- mities thereof.

XI. The Preparations. You may have therefrom 1. The green Leaff. 2. A Liquid Juice. 3. A Syrup. 4. A Poffit. 5. An Oil or Ointment. 6. A Complafs. 7. A Diluted Water.

The Virtues.
Studdings with Fire, Water, Oil, or other things, as also Cataracts running Sorens, burning Ulcers, Pimples, Leprosy, and other like Breakings out of the Skin. They give ease in the Gout, and all other pains proceeding from heat, and hot scaldings or burns; in what part of the Body they are, and have all the Virtues of the Liquid Juice, as to outward applications. Anointed on the Fore-Head, Temples, and Crown of the Head, it eases the Head-ache, Migrain, and allays the distempered heart of the Brain.

XVII. The Cataplasm. Applied to Inflammations, simple Contusions or Bruises, Anthony's Fire, or other hot and fiery eruptions in the Skin, it allivates the heat, and cures them; so also applied in the Gout it gives ease to the parts, and applied to the Crown of the Head and Temples, it is good against Poxes, Deliriums, and Malign. with the pains of these parts, and cools and allays the preternatural heat of the same, and has indeed all the Virtues of the Juice, Oil and Ointmen, as to external Applications.

XVIII. The Distilled Water. Drink inwardly, it has all the Virtues of the Juice and Syrup, doth not altogether fo powerfull, it quenches Thirst, allivates inward Heats and inflammations, and abates the sharpness of Humors in the Stomach. Outwardly, it has all the Virtues of the Juice, Oil and Ointmen, and in expector is an incomparable thing against an Boughphall, and all External Heats, Pimples, eruptions of the Skin, and other deformities thereof. The Distilled Water, or the Juice, being bathed on any place stung with Netts, Bees, or Wasps, or bitten with any Venomous Creature, it presently gives ease, and takes away the pain thereof.

C H A P. DLXXIX.

OF PRIMROSE.

I. THE Name. It is called in Latine, Primula veris (for I know no Greek Name it has) which Name I suppose it has obtained, because it is one of the full of those Plants which Flowers in the Spring, also, Alphsa Syphonum Column, and in English, Primrose.

II. The Kinds. The Primrose is said to be a Species of Herba Paradise, or Clovehip, and of this Species, there are two principal Kinds, viz.

1. Primula Veris, or Primrose, specially so called, of which we shall treat, God willing, in the next Chapter following.

III. The Kinds of the Primrose specially so called. Of this there are these following Species, viz.

IV. The Short, or Single white Primrose. It has a long, strong, phruses and bulky Root, from the Head of which rise up several small subshrub yellow Stalks, about 3, 4, or 5 inches in height, at the tops of which the Flowers grow in a small rough white Phant, and of a pale or whitish yellow color, having five roundish Leaves denoted about the middle of their edges, and of a pleasant flowers color. There is another Kind hereof, which is somewhat smaller, and bears smaller white Flowers, without any form of yellowness in them, which are usually brought into Gardens for their rarity, and different from these just now described, either in Kent, or Essex, or any thing else, but having these yellow Stalks smaller, and not so deep, as in the other Wild Kinds.

V. The Second, oringle green Primrose. This has its Leaves very like unto the Greater double Primrose, but smaller, and of a fudder green color, and

Salmon's Herbal. Lib. 1.
The Flowers stand severally upon long joint Stalks, as the first Single kind grows, but larger than they, and much more near the Somewhat yellowish green color that the Husk is of, so that at first opening, the Husk and the Flower, seem to unite but one double green Flowers, which afterwards separating themselves, the single Flowers go out open, much more above any other Single Primrose does, growing in the end to be of a purer green color.

VII. The third, or Single green and white Primrose. The Leaves of this differ in a manner, nothing from the former, neither does the Flowers, but only in this, that out of the larger yellowish green Leaves, upon every Stock a double green Flowers, of a little deeper green color than the Flowers of the former Single kind, consisting but of two rows of round Leaves much usually, and both of them of an equal height above the Husk, arising a pretty time in Flower, as we effectively if it stands in a shady place, or where the Sun can get none but a little to it.

VIII. The fifth, or Henk's double Primrose. It is very like unto the Double small Primrose, so well in Root, as in Leaf, and Magnitude, the Stalk not rising much higher than it, but bearing Flowers in a far different manner. For these bears not one or two larger Leaves of a kind, Stalk, but sometimes two or three single Flowers upon one Stock, and also at the same time a bigger Stalk, and something higher, having one green Husk at top. Thereof, some contain it in one blade, and some times whole, in the middle whereof stand sometimes, divers single Flowers thrust together, every Flower to be seen in its proper form. And sometimes there appear with some whole Flowers, others which are but parts of Flowers, as if the Flowers, were broken in pieces, and thrown into one Husk. The Leaves of the Flowers (being of a white or pale Yellow, or pleasant pink color) seldom rising above the height of the very Husk it self, and sometimes, as I have observed in this Plant, it will have upon the same Stalk, which bears such Flowers as these, a whole Flower or two, making the Stalk seem Branched into many Flowers, by which it is manifest, that it will diversify itself in so many forms, not abusing content in any Year, as the other Kinds do.

IX. The sixth, or Common double Garden Primrose. The Leaves of this are very large, and like unto the Single kind, but something larger, because of its cultur'd in Gardens. The Flowers do stand every one severally, upon long slender foot Stalks, as the Single Kinds do, in greenish Husks, of a pale greenish color, like unto the Field Primrose; but very thick and Double, and having the same Scent with them.

X. The seventh, or Small double Primrose. This is in Root, Leaf, and Flower, altogether like unto the last Double Primrose, but that it is smaller in every respect, for the Flowers rised not above 5 or 6 fingers high, and but twice or double, that is, with two rows of Leaves, yet of the very same Primrose color and manner, with a deep Saffron like yellow, which adds a greater grandeur thereto: in other things it is like to the Common or Ordinary Primroses.

XI. The ninth, or Turky crimson Primrose. This differs but little from the last, neither in its Leaves, Stalks, Flowers, magnitute, and form of growing, nor indeed in any thing, except in the color of the Flowers, which in this is crimson, as in the other it is a purpl.

XII. The tenth, or Red Primrose. This is of a newer date than any of the former, has more beauty, and greater variety than the former. In Roots, Leaves, and Flowers, it differs much from the Common Single Field Primrose, only the tops of the Roots, and bottoms of the Stalks, are of a reddish; but the greatest difference is in the color of the Flowers, these being of them, with a curious diversify of reds, some deeper, and others lighter, from blood red, to a pale Pink color, some are of a bright Rose color, and some of a Brick color, some of a Deep color, some of an all Bals Coat, and some Hair color, all which Flowers have been raised from Seeds, as also, these more excellent Kinds following.

XIII. The eleventh, or Fair red Primrose. It is a pleasant Flower, of a most beautiful, rich, shining, Venetian red color, such a yellow Star in the bottom, as in all the rest.

XIV. The twelfth, or Scarlet Primrose. It is a Flower of very great esteem, and of a bright scarlet color, and more rare than any of the former Kinds.

XV. The thirteenth, or Red Primrose Hoef in Hoef. It has many Stalks rising from one Root, each of which bears a Flower, and has Husks in Hoef, upon every Stalk, this is two Flowers, incomming, one standing within the other, one is bigger, and of a deeper red color, in others lesser and paler, of this Kind Mr. Rea says, he had raised for several diversities, differing from each other, either in size, fashion, or color.

XVI. The fourteenth, or Double red Primrose. This is the rarest of all the Kinds. The Flower is said to be almost as large, thick, and double, as the Common, of a pale yellow kind, and of a fair red color. For the sake of this Flower, much Seed has been sown, in hopes to have obtained it.

XVII. The Fifteenth. The first three Kinds have been found growing Wild in most places of this Kingdom. The eighth and ninth come to us now of Turky; but now all the various Kinds here treated of, are found to grow in Gardens, and are cultivated by the diligent lovers of Flowers. The English Kinds are hastily and properly described, which is not too hot, or too much in the Sun. The Red Kinds are planted, sown, and ordered in the same manner as we do Beers Ears. Yet if sown in a Bed of good Earth, towards the end of September, they will come up in the Spring, and soon come to bear Flowers. Hender Primrose grows in Godalmed Wood, 3 Miles from Settle, in Yorkshire.

XIX. The Tenth. Primrose Flower generally very early in the Spring, and sometimes again in Autumn. Some Flower earlier, some later, and some in the midst of Winter, as the Flowers are raised from Cold and Froth, and the midlest of the Winter will admit. The Common double Primrose Flowers
Salmon’s Herbal. Lib. I.

Flowers in April: the Common sage and red Kinde in March: and many of them will begin in September, and continue bearing Flowers all Winter unless check’d by hard Weather.

XX. The Qualities, Specification, Preparation, and Virtue of Primrose, are the same with those of Cowslip, in Chap. 157. Sett. 18. ad 32. allogaining to which we refer you.

XXI. An Observation. The Juice of Primrose Roots. Being Smelt up the Noze, or gently Syringed up with a small Syringe, it purges the Head and Brain of cold, moist, and plentiful Humors, which altho’ the Original of the Nerves, and cause Apoplexies, Epilepsies, Vertigo’s, Meigrim, Head-ach, Carus, Lethargy, Convulsions, Palies, Rheumarthins, and other Diseases of like Kind. I cured a Man who had four Flies of an Apoplexy, by the use of this Erhine, and a little Youth of an Epilepsy, by the use of it seven or eight times, and taking the Poudre of the Root also inwardly: I cured an Ancient Gentleman of a Lethargy therewith, and two other Young Gentlewomen, one of a Meigrim, the other of an inveterate Head-ach.

XXII. Another Observation. The Poudre of the Roots. Given to a Drum and half, or more, it purges the Head, Brain, and Stomach, of cold, moist and putrid Humors, and is prevalent against all the Diseases for which the Erhine or Juice is exhibited. It purges Choler and Felegm very well. With 10 Doses of this Poudre I cured a middle Aged Woman of the Palisy: and with much the like Number of Doses, I cured a Man of 50 Years old, of the Gout; proper Topicks being also in the mean Seation applied.

XXIII. A third Observation. The Decotion of the Roots in Wine. It is good against the Stone in the Reins and Bladder, and heals inward Wounds and Bruizes; and bath’d upon weak Joints it strengthens them. The Decotion of the Leaves and Flowers in Wine, being drank, it is good against Althma’s, Coughs, Colds, Horrenfies, Wheezings, shortness of Breath, and all other Diseases of the Head and Lungs, and is said to draw any Thorn or Splinter out of the Flesh.

CHAP. DLXXX.

OF PRIMROSE Bears Ear.

Vulgarly called AURICULA.

I. THE Name. This Plant knows no Ancient Greek Name, but it is, called by Lag. danensis, Prunale vers prope (from the thicknes of the Leaves) The thick Laid Primrose. It is also called sanicula Alpina Laubini & Gynex, for they will have it to be a Species of the Saniculae, however it is a very good Wound Herb: by others, Sanicula altera, Varidactyla Alpina, The Alpine or Mountain Cowslip, because it is certainly of the Family of the Saniculae: but now in our time it is mostly called Auricula Ursi, and in English called, the Bears Ear Primrose, to Bears Ear, and Auricula (without any other addition) which is the most Common and usual Name.

II. THE Kinde. We have already treat’d of of these Auriculae under the Title of Bears Ear, in Chap. 59. aftergoing, where we have given you a compleat Description of the three principal Kinde, which may serve for all the several individual Species of Auricula. But they being properly Primroses, and this being the place, in which they ought to be methodically treat’d, we shall for the Like of Florisii, and all Lovers of the Flower Garden, expand our Dilatour, and more largely shew you a great many of the Individuals, which for beauty like we before omit. We shall treat of them, with respect to their colors, which are chiefly, 1. Purple and Blew. 2. Red or Scarlet. 3. Yellow or Buff. 4. White. In each of which we shall shew you so many fine and delicate Species or Individuals may be sufficient to Stock a Florisii Garden, who from their Seeds, being managed according to the following directions, may raise many new Varieties. The number of the various sorts being many, we shall not give you their Names here, but put them to each Plant, in its order, as it is treat’d of.

The Descriptions.

I. PURPLES and Blews.

III. 1. Auricula Ursi Waste purpurea, Purple Bear Ear. In Root is composed of many obtuso Strings springing from the main long Root, which is very like a Cowslip, or Primrose Root, as it is in all the other parts besides. From the Head of this Root spring up many green Leaves, something long and smooth, narrow from the bottom of the Leaf to the middle, and broad from thence to the end, being round pointed and a little sharp.

Auricula.
VII. 15. *Auricula Ursi Flore rubro fatisuro oblique.* Deep, or blood red Auricula, with a yellow Eye. It has small and long green Leaves, nothing mealy, but satisuro about the edges. The middle of the Leaves forwards to the ends. The flowers hereof are of a deep red color, tinged in a blood red, with a deep yellow circle, or rather bottom in the middle.

XXVIII. 16. *Auricula Ursi Flore rubro fatisuro oblique.* Th. deep, or Blood red Auricula without an Eye. This is another kind, bearing a small and long green mealy Leaves, smaller than any that have mealy Leaves. The flowers hereof are of the deep red color with the leaf descriptd, but without any eye or circle at bottom, of any color whatever.

XIX. 17. *Auricula Ursi Flore obfolute major.* The Spanish blish Auricula. This Great Auricula, has as large Leaves as any other of this Kind whatsoever, and which are mealy mealy, something finer about the edges, as many other tips of them are. The flowers stand at the top of a firing and call Stalk, larger than any of the others, being of a dark blue color, resembling the bluish of a Spanish, whose fancy Spanish cannot manifest to part a bluish, as the English can, for which reason it is called the Spanish blish.

XX. 18. *Auricula Ursi Flore rubra major.* Scarlet or Light Red Auricula, or Bears Ear. The Leaves of this Kind are very like the Leaves of the first purple kind; but that they are not so thick, of a little purper green kind, but little or nothing finer about the edges. The flowers are of a bright, but pale reddish color, not half so deep as the time, with white Eyes or circles in their bottomes, in other things it differs not from others.

XXI. 19. *Auricula Ursi Flore Refae.* The Rose colored Auricula or Bears Ear. The Leaf of this is almost as large as any of the former, and a little mealy. The flowers are of a light red, or Dismask, or Province Rose color very near, with a white Eye at bottom.

XXII. 20. *Auricula Ursi Imperialis.* The Imperial Auricula or Bears Ear. It might be reckoned with the Purpurs, but is rather a dark earth
Salmon's Herbal. Lib. 1.

Red, it has small Leaves and a short Stalk, but bears many fair Flowers close together, of a dark a red or purple color, but with equal ease, it may be called black, with fair Snow white Eyes.

XXVII. 21. Auricula Ursi Flore Sanguinei. The Emperor. It is like the last, only a little bigger in all its parts, but of as dead or black a red color, with fair white Eyes. This has lately ruffled from Seed.

XXV. 22. Auricula Ursi Flore rubro fine Ceci- noc, The red or Scarlet Auricula. This is of diverst sorts, it has large Leaves, a strong upright Stalk, bearing a great Trust of fine Scarlet Flowers, with Salmon white Eyes.

XXV. 23. Auricula Ursi Flore Sanguinei. The blood red colored Auricula. It is of two sorts, 1. Flore Sanguineo florum, which is of a deep crimson velvet color. 2. Hote Sanguineo diluc- to, or fair bright Crimson. It has Leaves of a middle size more green than mealy, and Flowers of a bright crimson color, longer than the deep blood red following.

XXVI. 24. Auricula Ursi Flore Sanguinei. The crimson, or deep blood red Auricula. It has a yellowngh green leave, something small and long, with a few diots on the edge. The Leaves are of a deep Blood color with a yellow Eye, and but a few upon a Stalk.

XXVII. 25. Auricula Ursi Flore Cornu color Aureo. The various Gold colored Auricula. Of this Gold and blith colored Auricula, there are various sorts, some pale, some deeper, more or less beautifal as much as others, and with such a wonderful variety of colors, not easily to be expreaced, which arise almost every Year from the Seed. There are divers other sorts of Red inclining to Scarlet, Crimson, Carnation, Rose colors, and both these, some redder, some yellower than others, some with large flowers, and many on a stalk, with white or pale yellow Eyes, for many of which new invented Names have been imploed, not worth our Remembering here.

XXVIII. 26. Auricula Ursi varicolor primus, five color reboundente. The Prime or Chief varie- gated blith Auricula or Bears Ear. Its Leaves are as large, and as busy and mealy as the third or Greater yellow or Straw colored Auricula, at Set. 31, following, from which arises up a Stalk about 4 or 5 Inches high, bearing from 6 to 12 or more fair blossoms, something larger than the Smaller yellow Auricula, being the ground of the Flower of a dark or dun yellow color, shadowed over a little, with a flowre of light purple, which makes a kind of blith color, the edges of the blower being ruff, with a little deeper flowre of that purple color, the bottom of the Flowers being wholly yellow, without any Eye or Circle, and is of very great beauty, making an admirable variable colored Auricula.

III. Yellows, Buff, and Tawney.

XXIX. 27. Auricula Ursi maxima lutea Flore Elagasti. The greatest hir yellow Auricula or Bears Ear with Eyes. It has many fair and large thick Leaves, ruffing mostly or burying upon the ground, being larger than any other kind, except the Spanish Blufh, at Sett. 19, or going, and the next yellow following, smooth about the edge, and without any indingal at all. The Stalk is large, round, and not higher than in some others of the former, but bearing many more Flowers theron than in any other kind, many times to the number of thirtieth, ruffing so round and edge together, that of the same fashion with others, but that the latter are much shorter and rounder, yet with a much in the style of those, of a fair yellow color, neither very wide nor deep, with a white Eye on the bottom, about the middle of every Blower, which gives it the greater grace. The Seed is of a bluish brown color like unto others, but contained in greater round Heads than any other, with a small pointick sticking in the middle. It is most green and thicker than any other, with long Strick Fakes but greater than any of the former.

XXX. 28. Auricula Ursi major Flore foliata. The greater yellow Auricula, or Bears Ear. Its Leaves are longer, and more bounteous than the last or any of these kinds. The Flowers are not so many, but longer and not so thick then the former, but of a deeper yellow color, without any eye, or Circle in them.

XXXI. 29. Auricula Ursi major Flore pallida. The great Straw colored Auricula, or Bears Ear. It has about as mealy as on the other, nothing so large. The Flowers are of a fair yellow color, with an Eye or white Circle at their bottoms. These three last have no flowre or shadows of any other color in any part of the edge, as some others which yellow have.

XXXII. 30. Auricula Ursi minor Flore pallante. The lesser straw colored Auricula. The Leaves of this are a little shorter, or rather of a pale green, little mealy visially. The Flowers are of yellow, than the last, and it bears almost upon a Stalk, as the first great yellow.

XXXIII. 31. Auricula Ursi minor Flore lutea. The lesser yellow Auricula, or Bears Ear. Its flowers are nothing so large, as either of the three former yellow kinds, but rather of the highest first kind. They have a little longer, and thicker and longer than it, having under the green a small flowre of mealy, and something frays about the edges. The flowers are of a pale yellow color, with a smal white Eye or bottom in them. The Seed and Roots are like the other kinds.

XXXIV. 32. Auricula Ursi Flore flavo. The deep yellow Auricula, or Bears Ear. It has something larger Leaves than the last, of a yellowish green color, without any mealyings on them, or indenting about the edges, but smooth and white. The Flowers are not longer, but longer, and are laid open fully at the former, but of as deep a yellow color, or deep Cowellip color, without any Circle in the bottom. Neither of these two last have any flowre of other color than yellow in them, saving the white in the Eye.

XXXV. 33. Auricula Ursi minor Flore flava. The tawny Auricula, or Bears Ear. It has a greater flowre of mealyings in its Leaves, than is to be seen in the second kind, at Set. 4, or going, and frays or indenting at the ends like this, the Flowers are many, of the same fashion with these, but smaller, each of which is of a deep yellow, or rather. Some color taken up it is blanched, as the bodies of the above named are before they are blanched, having an Eye or white Circle at bottom, which is yellowish in the middle below the Circle.

XXXI. 34. Auricula Ursi flore flavo. The yellow Auricula, or Bears Ear. It has a greater flowre of mealyings in its Leaves, than is to be seen in the second kind, at Set. 4, or going, and frays or indenting at the ends like this, the Flowers are many, of the same fashion with these, but smaller, each of which is of a deep yellow, or rather. Some color taken up it is blanched, as the bodies of the above named are before they are blanched, having an Eye or white Circle at bottom, which is yellowish in the middle below the Circle.

XXXII. 35. Auricula Ursi Flore crispa. The Hair colored Auricula. Its Leaves are more mealy than those at Set. 29, or going, and somewhat longer and larger, frays also about the edges in the middle of the Leaves. The Flowers are in a small fashion, of a fine light brown yellow color, by some called Hair color, and sometimes brown. The edges of the flowers have a slight or

shadow
Chap. 580. **Engl. Herbs.**

**Cherry.**

Red as of a light purple or bluish about them, but more on the outside than on the inside. Of this Species there are diverse sorts.

XXXVII. 55. _Auricula Ursi verficera late._

The yellow variable Bees Ear, or _Limoniaco._ Its Leaves are green and something like to the Deep yellow, at Sct. 34. sometimes, but sometimes of a fleshier green, more shining and smaller, first also about the edges towards the ends, as many of those before are. The Flowers are of a fair yellow color, much laid open, when they are full blown, that they seem almost flat, doubt about the edges only, with purple, being yellow in the bottom, than in any other part.

XXXVIII. 56. _Auricula Ursi verficera late._

The Yellow, _Flowers._ The Variable yellow green Auricula, or Bears Ear. Its Leaves are green, much like to those last described, and in like manner about the edges: but in it it differs, that its Leaves do not turn or fold themselves a little backward. The Flower most of the yellowish green color, more closed than the former, having purplish edges, especially after they have stood blown some time, and live little or none at the last opening, on one or five or circles at all time.

XXXIX. 57. _Auricula Ursi Flora late._

The Noble yellow _Flowered Auricula._ It bears the large flower and biggest _Trufs._ of the deep yellow color bearing white Eyes. Of this Species there are some whose _Flowers_ are of a Buff color, some yellower and some daintier than others, which are in good Esteem. There is also one, which on a short Stalk bears four or five double Flowers, with three rows of Leaves in each Flowers.

XL. 58. _Auricula Ursi verficera late._

The variable yellow Auricula. Its Ground is yellow, but it is so diversified or varied with other colors, impossible to be expressed in Words, and they are so many that some Authors have said, they are numberless.

XLII. 59. _Auricula Ursi Flora late._

The_Leaf Coat Auricula, or Bears Ear. It is of so many Kinds, the greater and lesser, and deeper and paler, one than other. They have all large meaty Leaves, yet not so much as in the Greatest yellow, but it has not in it such a great variety of Leaves produced from them, they come so near to it. Of this sort is the Showny colored.

XLIII. 60. _Auricula Ursi Flora Limoniaco._

The Limoniaco _Flowered Auricula, or Bears Ear._ It is of a delicate pale yellow color, and of a middle size, both for Leaf and _Flower._ Of this other sort of plain yellow, there are a very great number, impossible to be distinguished.

IV. Whites.

XLIV. 61. _Auricula Ursi major Flora alb._

The great white _Auricula, or Bears Ear._ Its _Root_ is like the Purple _Kind, or all over of the color; the Leaves on the contrary are not much differing. It has many fair subtilt green Leaves some what paler than the Leaves of any of the Kinds of _Auricula,_ and a little faint about the ends, as many others are. From among these Leaves rise up Stalks four or five Inches high, bearing at the top many Flowers, like unto the Small yellow Auricula, at Sct. 51. sometimes, of a pale subtilt color, tending to yellow at the first opening of the Flowers, which after 2 or 3 days change to a fair white color, and so continue all the while at Flowers.

XLV. 62. _Auricula Ursi minor Flora alb._

The little white _Auricula, or Bears Ear._ It has smaller _Leaves_, of a little darker green color. The _Stalk_ and _Flowers_ are likewise fatter than the former, and have no flow of yellowness at all, in either bud, or _Flower_, but is pure white, not differing in the things from the last.

XLVI. 63. _Auricula Ursi Flora nive._

The Snow white _Auricula, or Bears Ear._ The _Flowers_ are of a pure white color, but smaller than those in Sct. 44. above otherwise in all other things they are much alike.

XLVII. 64. _Auricula Ursi Flora albida vel Paide._

The whitish _Auricula, or White mixt with a pale blush. Of these there are various Kinds according to the differing mixture of the red with the white, the white most predominating.

XLVIII. 65. _Auricula Ursi Flora albida._

Lac Virginicum, & Lac Virginica dilla, The Milk white _Auricula, called also Virgins Milk._ This is accounted the best among the Whites. It has large nearly Leaves, a tall strong _Stalk_, with a great _Trufs_ of white Flowers, with Snow white _Eyes_, which placed among the Purples set off, and adds to their glory. There are many perfectly white, and many _Auricula_ white, but not many of better esteem than the Yellows.

XLIX. 66. _Auricula Ursi Flora multiplica._

Lacei, the double Milk white _Auricula, or Bears Ear._ The Leaves are like the former, the _Stalk_ bears but one _Flower_ on its top, but it is very double, and like the Common double Primrose.

LXI. The Places. That goodly Plants grow Naturally on Mountains, especially on the Alps in divers places, for which reason some call them Primula veris Alpina; some of them have been found also on the Pyrenean Mountains: but that Kind with the Barge Leaf, has been found on the Mountains in Spain, and on the Pyreneans next to Spain. From which places they have been transfered to us, into our Gardens, and into almost all the Gardens of Europe, where they thrive admirably well.

L. The Times. They all Flower from the beginning of April to the beginning of May, and the Seed is ripe in the end of June or beginning of July. And sometimes they will Flower again in the end of August, or beginning of September, if the _Stalk_ prove temperate, more or less rainy; but those Flowers which come then, are neither to fair, nor to many on one _Stalk_, as those which come in the Spring.

**Directions for Planting them.**

LI. The best Sort of _Auricula_ are set in Pots, which they well deliver; the Pots are to be filled almost half full with fitted Neats Dung, the rest with good Sandy Earth, well mixed with fitted Dung. About the end of August fill the Plants therein, and not too deep, for the Roots will be apt enough to run downwards. Place their Pots in the Sun all the Winter, and with Clives defend them from over much wet, but Haole them not, they will do better in the open Air. In the Spring, when they set to Flower, remove them into a place more shady, and after the Flowers are past (except those you leave for Seed) you may dispose them in some shady place out of the way, to make room for Pots with Gillflowers.

LII. But if you Plant them in the Earth at large, and not in Pots, let it be in some place a little shaded from the scorching heat of the Sun, the Soil being fit, made very Rich, it stith, with Sand and flour of well rooted Neats or Cows Dung;
and in this let the Roots be Set, a Foot or two (for they spread wide, and will not thrive if they want room). The best way of Planting them, is to open a little Hole, leaving or raking a little Hill in the middle thereof, then to let the Root there on, and spread the Fibres round about it, Lillly, to cover them with Earth, and so to Water them. After the middle of August, or the latter part of September, take them up, and then imbed or enrich the Soil where they grow, with sifted Neats or Cows Dung, and having lifted or parted the Roots, and cut off the Fibres which are too long, set them in the same place again. By this means you will not fail to have them thrive, and bear more of Flowers. But if you let them stand too long unremoved, or in poor or ill Ground, you must expect a crop of Flowers accordingly.

LII. The raising variety of them from Seed, is a Secret, with which few are well acquainted, and it is to be performed with something more than common diligence, by the following method. When the Flowers are past and the Stalks begin to grow yellow, you may observe in the top of the little round Seed Vefsel, a small hole, and then you may be sure, that the Seed is almost ripe, and which if you do not carefully look to, will all of it fall before you are aware. So soon therefore, as you perceive it to be ready, cut down the Stalks, and keep the tops upright, for if you turn them downwards all the bolt Seads will fall out. Then bind them up in Bundles or Handfuls, and place them upright, to the Gifs of some South Window, where (by the warmth of the Sun) they will harden, and be much the better.

LIV. About the end of August, or beginning of September, prepare some square Box or Boxes, according to the force of Seeds: let them be 9 or 10 Inches deep, and of what breadth you please, with some holes in the bottom to let out the Water, which fill three parts full with fine Sandy fitted Earth, one half whereof let be well rotted Neats Dung, which well mingled together, and laid smooth with your Trowel, lay thereon a Fingers thickness of fine fitted Willow Earth, or for want thereof, of dried Cow Dung wherein small, mixed with a little good Earth and fitted, and love your Seeds thereon, mix with Wood Ashes, which by their color will direct you to sow them the most suitably; for them not too thin, for all will not come up; and if they do, they may easily be removed to another place.

L.V. The Seeds being thus laid, cover them half a Finger thick with the same Earth, you put next under them, which press down lightly, and let them remain in the Sun and Air, till they begin to come up, which will be about April next, and then they must be removed into the Shade, and often gently Watered. As soon as they are grown to any considerable height, take some of them up where they are too thick, and set them prefently in some Bed prepared for that purpose, eight Inches alonder, where they may remain, till they come to bear Flowers. And those you leave in the Box, may be Transplanted in the end of August, after the same manner, and so the Box will be ready again to sow more Seads in. Some of them will bear the Spring following, others about August the Year after they were sowed; and the rest, the Spring next following, provided the Earth you let them in be rich and good, otherwise you will fail of your expectation.

LVI. Some think that the best time to sow the Seed in, is, in the beginning of October, others at the end of February: but having tried all those Seasons, it has been found that the end of August or beginning of September, are the best times for that purpose; for the Seeds are so small, that if they be kept any time out of Ground, they will die and become unprofitable. You are also to observe, that you lose the Seed of the choicest and best Flowers, for from thence must come all your Expectations. Such Flowers as you dislike, call their Seed away, it is not worth living, by this means saving the bolt Seed, bowing it into a time, and that also in prepared Earth, and then finally removing them, into their delineated places, you may reasonably expect not only a great Variety of admirable Plants, but even all that you can de- fine to result from the same.

L VII. The Qualities, Specification, Preparations, and Virtues of Beets, are, the same in all res- pects with those of Primrose and Lysippia, which if you please, you may see at large, in Chap. 59. Sect. 8, ad 18. and Chap. 157. Sect. 10. ad 32. as also, in Chap. 279. Sect. 21. ad 27. foregoing, to which places we refer you, it being needless to repeat the same things over and over again.

PRIME, 
PRIVYT, 
PRUNELLA, 
PRICK-FISTS, 
PUPPING-GRASS, 
PURPLE-VELVET-FLOWER, 

CHAP. DLXXXI.

OF PURPLE--WORT.

OR,

PURPLE--GRASS.

I. T H E Name. This Plant has no Greek Name that I know of: but it is called in Latin, Quadrifolium purpureum, Gramum purpureum, Lotus Quadrifolius, and in English, Purple-wort, or Purple-Graze.

II. The Kinds. Authors make it a Species of the Trefolii, as Caffier Iobisme in his Primus, who calls it Quadrifolium purpureum album, as Linnaeus, and Purpula call it Quadrifolium plenum purpureum, or purpureum, which is our Lentis Graze, or ore Purple-Graze, and is a Sanguinar Plant, see General.

The Descriptions.

II. It has a long Brinny Stalk, furnished with many fibres and hooks, both or protrastances, as it were Springing from them: from this Root rises several creeping Branches, which wind themselves on the Ground, bearing at their end a few Leaves like to those of Trefolii, it has for the most part four Leaves (where the Name Quadrifolium) yet some- times but three, and sometimes five, and sometimes seven, (to which epigram, &c. Al regarding Sep- tember, &c.) these Leaves are of a flat green color, with a shade of dark purple

914 Salmon's Herbal. Lib. I.
VIII. The Qualities. Purple Grass is temperate in respect to heat or cold, and dry in the first Degree Attrigent, Stomachick, Cardiack, Antipeptic and Aegispharmac.

IX. The Specification. It is generally given (through the Kingdom) for the cure of the Purple Fever, or the Purples (as it is commonly called) in Children, as also in older People.

X. The Preparations. You may have therefrom, 1. A Liquid Juice. 2. An Essence. 3. A Decoction in Wine or Water.

The Virtues.

XI. The Liquid Juice. Given to a Spoonful more or less, it prevails against all sorts of Burning Fevers, more especially against that called the Purple Fever. Drop into the Eyes it repels or drops a Flux of Rheum into them, and cures Redspots or inflammation, and Blood shot.

XII. The Essence. Drink inwardly to 3, or 4, or more Spoonfuls, it is good against the bitings of Vipers, or of any other poisonous Serpent, washing the place bitten with the Same. It SpicaUy also cures Green Wounds, they being daily once or twice a day wash'd therewith, and Clysterwise, it is good against Fluxes of the Bowels, Strengthens the Guts, and prevents against a Tetauson, or continual provocation or desire to go to Stool, and is profitable to stop the Whites in Women.

XIII. The Decoction in Wine or Water. It has been given with good success against the Purple Fever, commonly called the Purples in Children, and also in older People, and has indeed all the Virtues of the Liquid Juice and Essence, but much weaker, and therefore ought to be given in a larger Dose, as from a quarter of a Pint to half a Pint.

CHAP. DLXXXII.

Of PURSIANE Garden and Wild.

I. THE Names. It is called in Arabic, Babel anchas, and Bachele anthasias; in Greek, by Dioscorides, Avedon, Andarchaen; and by Theophrastus, Athis; and in Latin, Portulaca; and in English, Purslane.

II. The Kinds. There are two principal Species of this Plant, viz. 1. Portulaca terrena, vel terricola, The Land Purslane, of which in this Chapter. 2. Portulaca Hydric, Sea or Water Purslane, of which in the next Chapter.

III. The Varieties of the Land Kinds. These are, 1. Portulaca Hortensis, The Garden Purslane, which is, 1. Portulaca Hortensis varia communis, Our common Green Purpovane. 2. Portulaca Hortenso aurea, Golden Leaved Purslane. 11. Portulaca Sylvisiris, Wild Purslane, which is, 3. Portulaca agrestis major, Portulaca Sylviiiris major, Portulaca minor, Cenarzry or Gefvera, Portulaca Angustifolia Bambini, & Cepalina, Cepa Corda, for Cures upon Dioscorides lays that Cepa is no other than Portulaca Sylvisiris, The greater Wild Purslane. 4. Portulaca agrestis minor, Portulaca Sylvisiris minor, Portulaca exigua Cenarzry, Portulaca arvensi Bambini, The smaller or least Wild Purslane.

6 A 2
Salmon's Herbal

The Descriptions.

IV. The first, or Our common green Garden Kind. Its Root is small and perisheth every Year; from which Roots springing up many thick round, shining red Stalks, fall of Juices, lying upon the Ground, for some part, or on which are set several long, thick, pale green Leaves, sometimes alone by themselves, and sometimes many small ones together with them, among which grow small yellow blossoms, which stand in little green Husks, containing black Seed.

V. Gerard decribes it thus. Its Root has many Strings, and the Stalks of this Great Purslane are round, thick, somewhere red, fall of Juices, finally, glittering, and parted into certain Branches trailing upon the Ground. The Leaves are on each long, something broad, thick, flat, glib, somewhere green, and whitish underneath. The Flowers are small, of a faint yellow, and grow out at the bottoms of the Leaves. After they are past, there Spring up in each Flowers place, a Husk of a green color, of the biggest of almost half a Barley Corn, in which it contained small black Seed.

VI. The second, or Golden Leaved Purslane. This in its Roots, Stalks, Leaves, Flowers, and Seed, as also in its manner and form of growing, is escallion like the former, lasting, that the Leaves are of a shining yellowish, or yellowish red Golden color, and possibly larger than the Green Kind before described, that the whole Plant seems to be the larger, and the Stalks to grow something the more upright.

VII. The third, or Greater Wild Purslane. The Root is small and threadily, perforating at the first approach of Winter, from which rise up juicy reddish

Purslane Garden.

Purslane Wild.

VIII. The fourth, or Lesser, or Smallest Wild Purslane. It has a Root of a considerable thickness, running under the upper Surface of the Earth, from which a great number of greater and lesser Stalks, and other smaller Foliage proceed, running not only deep into the Earth, but almost every other way. This Small Purslane is like also to the other, but much smaller than it, having always a Leave set together, of a pale yellowish green color, on the thick round Stalks and Branches, which stand a little more upright, and bend down to the Ground again. The Flowers are like the former, and so is the black Seed, but the Husks open themselves before the Seed is ripe, and stand upon smaller and longer foot Stalks. This has little or no Taste, but what is flatulent and watery.

IX. The Fives. The first and second grow only in Gardens in mild places of England, by reason the Root perisheth every Year, but it must be sown every Spring in April. The Gardeners sow it many places in a Row between the Beds, or in rich Beds of fair Earth, and moss, where it may have plenty of Nourishment, or in those Beds of Dung, which Gardeners have for their purposes.

IX. The Fives. The first and second grow only in Gardens in mild places of England, by reason the Root perisheth every Year, but it must be sown every Spring in April. The Gardeners sow it many places in a Row between the Beds, or in rich Beds of fair Earth, and moss, where it may have plenty of Nourishment, or in those Beds of Dung, which Gardeners have for their purposes.

cambria, Melons and Pompions, whence, after those have been taken away, they many times low their Parched Seed: where it is much watered, the warmth of the Sun, and the Water together, make it grow great and large, and continues it in that State, if it be Sometimes cut, till Winter. The Melon grows many times in our Gardens, without any previous help of ours. And in most of our Plantations, in New England, New York, New Jersey, Maryland, Pennsylvania, Virginia, South Carolina, and South Carolina, where they lie rod. It will spontaneously come up, and cover much Acres of Ground, even in one Spring, and in those places where never any has grown from the begin-
ing of the World, to that time, and this it does in almost all our Follow Plantations, thro' the whole Continent of Florida, which considering it does to universally do it, and that in such vast quantities, as sometimes almost to cover a Plan-
tation, it is a Remark worthy for taking notice of.

The four, Carumiers in Horto Medicis, says, that he found it growing about Lyspach, and I have been informed by some, that they found it growing Wild, in some of the Northern Countys of England.

X. The Times. They may be all Sown in March or April, and they spring up in May, and are white and green in May and June, they are fit for Salleting in July, and to continue all Aug-
gust, and sometimes to the end of September, if the Seaon is favourable and warm, even till the colds nip them, and cause them to perish.

XI. The Qualities. All these sorts of Parchance are cold in the third degree; and the two Garden Kinds mild in the second Degree; but the Wild Kind and only in the first Degree. Alliferive, Costive, Diuretic, Diaphoretic, Excretive, Re-
irative, Repercutive, Nephritic, Hyperbic, and Galacogonietic.

XII. The Specification. Parchane is good against Burning Fecers, hot and choleric Fluxes of the Bowels, Catarrh, want of Sleep, Gonorhhea in Men, and Whites in Women, as also the over-
flowing of the Counties. It cools the Blood, gives ease to the Strangury, and takes away the heat and inflammation of the Urine. Abates Lath, extinguishes the Seed, stops Vomiting, as also defluxions of hot, dull, and swelling Humors into the Eyes.

XIII. The Preparations. You may have there-
from, 1. A Sallet. 2. A Liquid Juice. 3. An
Infusiate Juice. 4. An Essence. 5. A Syrup. 6. An Oil or Ointment. 7. A Cataplasme. 8. A
Distilled Water. 9. A Powder of the Seed. 10. A
Colyrium.

The Virtues.

XIV. The Sallet. It is made of the green Leaves and very young Stalks, with Salt, Sugar, Vine-
gar and Oil. It is good to cool and attempe-
trate the Blood and Lymphs, is grateful to hot and inflammation, and is profitable for such as have the belly's heat.

The Wild Parchane is used on both sides of the Seas, and in our Plantations in Florida, as familiarly in Sallets and Meats, as the first Garden Kinds, and with all the same good effects, living that it is not altogether to cool, and therefore the more fit to stop some sorts of Fluxes.

XV. The Liquid Juice. It is good against the burning Feces of Agues and Cholesterol Fluxes of the Blood, the Head, and other parts. It is good for those that have the Headache, and has the same effects as the Sallet, and causeth the Head to cool, and takes away the pains of the Head proceed-
ing from Heat, and causeth Sleep and Rest, and is of good use for such as are in a Delirium or Frenzy.

It is prevalent against protrusions Lath, extinguis-
hes, and oft diminishes the Head, and being over much used, it abolishes the Natural power of Procreation. It is good to dry Vomiting, and sweetens with a little white Sugar, is good against an old and dry Cough, and tobe, and thornykees of Breath. It cures vehemence Thirtf, and health Ulcers of the Lungs.

It is good also against Inflammations and Ulcers of the Secret parts in Man or Woman, and gallings of those parts and all with Hone, it heals excor-
ations, and even Ulcers of the Body, and take away, and obliterates a Tenderness, tho' of some Weeks standing. Dose from 2 to 4 Spoonfuls or more, Morning and Night.

XVI. The Infusiate Juice. Camerarius says, that the thickened Juice, Made up into Pills with Powder of Gum Tragacanth, and Gum Arabick, and taken (from a Dram to two Drums, Morning and Evening) prevails much, in making such as make a bloody Urine, or piles Blood.

XVII. The Essence. It has all the Virtues of the Liquid and Infusiate Juices, excepting, that it does not so powerfully support Lath, and extinguishes the Seed. But it more powerfully heals excori-
ations of the Bowels, Acnes, Lungs, and other external parts. Outwardly applied it gives eases to the Gout, and thinnes the hardness or the Nerves. It is good for Women Cold and pain-
ed Breasts, and other Tumors caused by heat and Inflammation. It is good against the biteings of Serpents or other poisonous Creatures, and to draw forth the Poison, being bathed upon the part. Applied to the Navel of Children which bite forth, it helps them, it is good also for four Months and fore Years, which are much swollen, and to fatten loose Teeth, and take away their pain, when they seem to be on edge as it were, after the eating of fewer things. Dose from 2 to 4 Spoonfuls.

XVIII. The Syrup. If made with Honey of the Juices, it is not only prevalent against Coughs, Colds, Holi-thin's, but is also prevalent against a Phthisis, and Uteration of the Lungs, and has all the other Virtues of the Juice and Essence, and is given from to 2 or 4 Spoonfuls, Morning and Night.

XIX. The Oil or Ointment. They cool inflamma-
tions, heat galling in the Groin and Secret parts, give ease in the Head, Cough, and other parts proceeding from heat, and all hectic Falts; Wrets, Pimples, and other like hot and fiery Eruptions in the Skin. They are also good against Burns and Scaldings, and Women's hand, tumified and inflamed Breasts, as also the Rangings and bitings of Homers, Waps, Bees, Serpents, and other venomous Creatures.

XX. The Cataplasme of the Green Herb. It is prevalent against Anthony's Fire, Goat Scatices, strained Nerves if Inflamed, Pimples, Tumors, Ringworms, Shingles, and other hot breaking out of the Skin, Made with Vinegar, a little Linseed Oil, and Powder of Nut Galls, and applied, it takes away pains and creeks, in the Neck, and other parts, and officules and heals simple Contusions in the Muscular parts.

XXI. The Distilled Water from the whole Plant. It has all the Virtues of the Juice, Essence, and Syrup, but nothing near so effectual, and therefore may be given in a double or triple Dose, or as a Vehicle to Convey other Preparations in, be-
ing seasoned with double Refined Sugar. It pre-
vails against Anthony's Fire, beautifies the Face and Skin, and allays the Inflammations of the Eyes.
Salmon's Herbal. Lib. 1.

XXII. The Powder of the Seed, or Seed bruised: It is said to be more effectual than the Herb, even for all the purpocks afore named, it is of singular good use to cool the heart and sharpen the Urine, to suppress Lulph, and Nocturnal Pollutions, and even to extinguish the Seed, and abate the inclination to Venery. Given to Children which have Worms, it is said to kill and expel them. The Decoction of the Seed being bruised, in Wine, performs likewise the same things. And the Seed of the Wild Purslane, is more recommended for killing of Worms, than the Seed of the other. Dose from 2 Drams to 2 Drains in any proper Vehicle.

XXIII. The Distillation. Take a Cleared Juice of Purslane 2 Ounces, of the Distilled Water 3 Ounces, of common Spirit of Wine or Brandy 4 Ounces, and let it settle for 12 Days, then decant the purest part, and keep it for Life. It cools Inflammations of the EYES, dries up hot and, falt Rheums, heals Sores and Ulcers in them, and cures most Difficulties happening to them, removing Milis, Clouds, and Films, and very much clearing the Sight.

CHAP. DLXXXIII.

Of PURSLANE Sea and Water.

I. THE Names. It is called by the Arabians Melocha; in Greek, *Amses* and in Latin, Holium, and Portulaca Marina. The Water Purslane is called in Greek, *Andropeus* and in Latin, Portulaca Aquatica.

II. The Kinds. There are severall Species of the Sea Purslane to be found in Authors, but omitting those which grow not in England, or some of our Foreign Plantations, we shall only treat of these two following, viz. 1. *Holium, Holium, Portulaca marina mollis*, Our Sea Purslane. It is called *Holium*, because of its fistith Taffe, which is as much as if you should call it Salt meat. But Salme calls it *Amses, Amses* without the Affixaire, and says that its Name is derived from its effects, or operation, which is to prevent Hunger; for Eys Holium, the People in Candia tell us, that on that Day they eat thereof, they shall not be Hungry, but be free from desiring Food. 2. *Holium tridentatum, Holium angustifolium procumbens*, *Holium minor, Portulaca Marina minus minor*, The lesser Sea Purslane, or Sea Purslane left white than the former. 3. *Andropeus* *Andropeus* Portulaca Aquatica, *Affine aquatica minor folio oblongo*, *Portulaca vel Andropeus aquatica, Water Purslane.*

The Descriptions.

III. The leaf, or Our Sea Purslane. It has a Root which is something woody, with several long Strings bound thereto, and sheds with the Leaves on the Branches all the Winter. It has several hairy and graffy Stalks, somewhat Woody, about a Foot or more long, lying for the most part upon the Earth, bearing thereon many small, thick, fat and long Leaves, of a whitish green color, yet without order, at some Joints more, at some less, Branching forth here and there, and bearing at the tops many long Sprigs, orJhish Stalks, set round about

with greenish purple Flowers, which turn into Whitish, but thin Seeds, like unto those of Sea Arnia.

IV. The second, or Lesser Sea Purslane. Its Root is woody and permanent, so enduring all Winter like

Purslane Sea.

Purslane Sea Common.
Chap. 583. English Herbs.

The former. This Sea Purslane has very slender, weak, and somewhat hairy white Stalks, about 2 Feet long, scarce able to stand upright, but for the most part do fall down, and so upon the Grounds, the Leaves which grow on them, being set so much in the same manner, viz. without order, something narrower and sometimes longer, but not altogether so hairy entire. The Flowers are much like the Hoof kind before described, but of a more greenish color, growing at the tops of the Stalks, and afterwards yield such like Seed as they, but somewhat left.

V. Gerard describes the second kind after this manner. Its Leaves are like the former, but not altogether so white, yet they are somewhat larger and narrower, not much unlike to the Leaves of the Olive Tree. The slender Branches are not above a Cubit or Cubit and half long, and commonly lie spread upon the Ground. And the Flowers are of a deep overworn Herb color, after which follow Seed, like those of the first but smaller. Ramsy plures a radicis candida (Dist Matthioli in Dioclesian) lentos et claripilos, jalsus Olivi pinguiotberos, alli- cantibusque, falso Tapere, Somn suedet eacnuntur in Catullum fanumtares.

VI. The third, or Water Purslane. Its Root consists of fibres but a parcel of few leaves or Branches, Its manner of growing is something like the Chickweeds, especially the Water Chickweeds. It is but a small Plant, but has many trailing Square Branches, which take Root almost everywhere, as they spread, but not so thick as with Leaves.

Chap. 584. English Herbs.

The former. This Sea Purslane has very slender, weak, and somewhat hairy white Stalks, about 2 Feet long, scarce able to stand upright, but for the most part do fall down, and so upon the Grounds, the Leaves which grow on them, being set so much in the same manner, viz. without order, something narrower and sometimes longer, but not altogether so hairy entire. The Flowers are much like the Hoof kind before described, but of a more greenish color, growing at the tops of the Stalks, and afterwards yield such like Seed as they, but somewhat left.

V. Gerard describes the second kind after this manner. Its Leaves are like the former, but not altogether so white, yet they are somewhat larger and narrower, not much unlike to the Leaves of the Olive Tree. VI. The third, or Water Purslane. Its Root consists of fibres but a parcel of few leaves or Branches, Its manner of growing is something like the Chickweeds, especially the Water Chickweeds. It is but a small Plant, but has many trailing Square Branches, which take Root almost everywhere, as they spread, but not so thick as with Leaves.

as the Chickweeds are. Its Leaves are something long, narrow, and round pointed, of a pale yellowish green color, two always growing as at a Joint, the Flowers are small and white, set together in long Clusters, on small few Stalks, with very small round Seed following them, in little round Seed Vessels.

VII. The Places. The two first grow in Salt Marshes, and by the Sea side, in many parts of the World. The first grows in the Salt Marshes and by the Sea Coast in many parts of England, as &c. In the Marshes by the Sea side going over the King’s Ferry unto the Isle of Sheppey, going to Shoreland House, and by the Dutch sides of this same Marsh: it grows also plentifully in the Isle of Thanet, as you go from Margate to Sandwich, and in many other places along the Coast. The second grows upon the Sea Coasts of Spain, and other hot Countries: Clafius says it grows about Lisbon in Portugal. With us it only grows in Gardens. Dedanous says, it grows in the Maritime places of Flanders, Holland, and Zealand, and other like Sandy places. The Water Purslane grows in for near Water, and Watery Ditches and Grounds in many parts of England.

VIII. The Times. They Flower in July and August, and the Seed is ripe in August or September; not long after the time of Flowering.

IX. The Qualities. These Plants are temperate in respect to heat or cold, and mild in the first Degree: Astringent, Astringent, Anodyne, Galactogenetick and Spermagenetick.

X. The Specification. Sea Purslane expels or diffuses Wind, gives ease in the Collick, strengthens the Bowels, and is profitable against Cramps and Convulsions.

XI. The Preparations. You may have from the Sea Purslane, 1. A Sallet. 2. The Leave Pickled. 3. The Juice or Essence. 4. A Decotion in Wine. 5. A Powder of the Root.

The Virtues.

XII. The Sallet. Parkinson says, it is used to be eaten as other Sallet Herbs, for that it much pleases the Palate, having a little astringent relish withal. The Leaves Disinfodorous says, are boiled, and then eaten as a boiled Sallet: Folia Disinfodorous at, deconquantur chlorum gratia.

XIII. The Pickle. Folia autem in Belgio veluti Cappares Sale sub Maria condimentur, &c. The Leaves are preferred with Salt, or Pickles, in Holland and other parts of the Low Countries, as Caper am, to be larded up at Mens Tables, and eaten in their Head, having a pleasant and grateful taste.

XIV. The Juice or Essence. They expel Wind in the Stomach and Belly, give ease in the Collick, almost upon the Spot, loosen the Belly stuff, and then afterwards Bind, Stop Fluxes and strengthen the Bowels. They are good against Ruptures, prevail against Cramps and inward Convulsions; cause plenty of Milk in Nurse’s Breasts; and very much expels Seed, and Viper. Dose 1, 2, 3, or 4 Spoonfuls, Morning and Night, in a Glass of Generous Wine.

XV. The Decotion in Wine. It has all the Virtues of the Juice and Essence, but as it is weaker do it ought to be given in a double or triple Dose.

XVI. The Powder of the Root. Given to a Dram in Mead or Honied Water, it is good against Ruptures, Convulsions, and contents of the Guns, as Disinfodorous says: but we find the Leaves to have the same effects.

CHAP. DLXXXIV.

Of RADISH Garden.

I. The Name. It is called in Greek, Ράφανον; in Latin, Raphanus, of Raphanus Hortensis: and in English, Radish and Garden Radish, or Reddish. Gerard says, that Marcellus Empiricus calls the Seed of Radish, Bacanum, which is also found in A. Myrtillus, lib. 1. comp. 275. but Cornelian Radish, Carana.

II. The Kinds. Of Radishes, there are three General Species, viz. 1. Raphanus sativus. Radish Hortensis, Garden Radish. 2. Raphanus raphanistrum, Wild Radish. 3. Raphanus Radicatus, Horti Radish: of all which in order.

III. The Garden Kinds. They are various, as,

The Description.

IV. The First, or Our common Garden Radish. Its Root is long, white within, and of a reddish purple color on the out side towards the top of it, and of a sharp biting Taste; yet some are less sharp, and biting and of a more pleasant Taste. It has long Leaves unevenly gilled on both sides: the Stalks rise up to the height of three or four Feet, bearing many purplish Flowers at top, made of four Leaves above, which turn into thick short Pads, in which are contained round Seed, larger than Turnep or Cole-wort Seed; and of a pale reddish color.

V. Gerard describes it thus: Its Root is grodi, long and white, both within and without, and of a sharp Taste. It seeds forth great and large Leaves, green, rough, cut into both sides with deep gapers, as unlike the Garden Turnep, but greater.

The Stalk is round and parted into many Branches, out of which spring many Flowers of a light purple color, made of four little Leaves, and when they be past, there come in their places, sharp pointed Pods, pust or blown up towards the Stalk, full of a fine gassy Substances, wherein is contained the Seed, of a light brown color, somewhat greater than the Seeds of Turneps or Cole-worts.

VI. The second, or Small Garden Radish. Its Root is small, long, white both within and without, except a small part of it, towards its top, which is of a reddish color. Its Leaves are exactly like the former, saving that they are smaller and more brittle in Handling. The Stalk is about a Yard high,

Radish Garden Great.

having some Branches from the middle upwards like the other, on the tops of which grow the Flowers, very like them also. The Seed is smaller and not so sharp in Taste.

VII. The third, or Round Radish. Its Root is almost Orbicular, and firm, nothing watery like the Common Radish, but more pleasant in Taste, and wholesome, not so apt to rise in the Stomach, as the others are, or as the Garden Radishes do. Its Leaves are like the Garden Turneps, from among which spring up a round and smooth Stalk, divided it self towards the top into two or three Branches, on which grow small purplish Flowers.
Radish Pear-fashion'd.

Feet high, of a bright reddish color. The Leaves are deeply cut, or jagged on the edges, like those of the Turnep, and somewhat rough within. The Flowers consist of four Leaves, one of a light Carnation, or light color. And the Seed is contained in small branched Coils like the former.

IX. Parkinson says, That this Pear-fashion'd Radish, has a Root which is blackish on the outside, and white within, great and round at the Head, but ending shorter than a Radish, and longer than a Turnep, so that it is almost Pear-fashion'd, of a firmer and harder Substant the than our Common Radish, but no less sharp and biting, and somewhat pungent withal. The Leaves are somewhat smaller and with deeper gashes. The Flowers and Seed are also like the others but smaller. It has been observed also, that some of this Seed, being sown again, have produced Roots, colored some have been black, but the most parts have been white. This has been brought to us from Flanders and Holland, in which Places it is accounted a rare Winter Root or Sallet, and is there sometimes sold by the Pound.

X. There is Raphanum perennis minor, a little sort of black Radish, (like in Leaf and Seed to the former, but its Flower is of a lighter purple color: ) whole Root is longer and smaller, and

sometimes changes color to be white, as the other does: It is thought that both these Species have arisen from one Kind.

XI. The Places. All these Kinds of Radishes are generally sown in Gardens, where they require a loofe Ground, which has been long Manured, and it somewhat Fat. They prosper well in Sunny Ground also, where they are not to Subject to Worms as in other Grounds.

XII. The Times. These Kinds of Radishes are left to be sown after the middle of June, viz. in June or July, for being sown betimes in the Spring, they yield not their Roots to kindly nor promptly, for that they then quickly run up to Stalk and Seed. They are very profitable against Stomach and gravel.

XIII. The Qualities. Radishes are hot and dry in the third Degree, Aperitive, Alumferve, Carminative, Colmericin, Digestive, Diuretic, Incisive, Capsaicin, Pectoral, Nephritic, Emmenagogic, and Lithuretic.

XV. The Specification. The Root is mostly used, after that the Seed, and in the last place the Leaves. They are peculiar for the Cure of Strangury, or pain, heat and fluxgation of Urine, by reason of Tartarus Slime, or any other Matter impasted in the Urinary, Ureters and Bladder, are peculiar for provoking of Urine, as also of the Counties in Women, and to expel Sand, Gravel, and the Stone from the Urinary parts. To cure the Cough, Asthma, Phthisis, and other Difficulties of the Lungs. Also the Scoury, Drophi, Gout, obstructions of Liver and Spleen, and Quaran Aegus, the of long standing.

The Virtues.

The Virtues.

XVII. The Sallet of the Roots and tender Tops. They are eaten raw, either with Salt and Bread and Butter, or with Meat: They strengthen the Stomach and cale Digestion, and are very Digestive: but are apt with home to rife in the Stomach, yet are great Enemies to Scoury, Drophi, Jaundice, and Gout in cold Confinations.

XVIII. The Liquid Juice of the Roots or Leaves, (but that of the Roots is best) It powerfully opens obstructions of the Stomach, Lungs, Liver, Spleen, Reins, and Worm: refills the Scoury, Drophi, and Gout, is good against Althama's, Coughs, Colds, Hoarsness, Wheezing, and shortness of Breath: refills the purgation of the Blood, and Hypochondriack Melancholy: gives elixir to the Stomach and Spleen; and expels Sand, Gravel, Stones and Tartarous Slime out of the Urinary parts,
Salmon's Herbal. Lib. I.

CHAP. DLXXXV.

OF RADISH WILD.

I. T H E NAM3. It is called in Greek, Πάνσανον; in Latin, Armoracia Raphana Sylvestris; and in English, Wild Radish.

II. The Kinds. Of the Wild Kinds there are two Sorts, viz. I. Tabernemontani, Raphanus sylvestris, which is called also, Armoracia Lutea; Raphanus aquatilis, and Raphanus Palustris; the Field Wild Radish. II. Raphanus sylvestris; Raphanus Aquatilis vel Palustris, Water Radish; and this twofold, viz. a. Raphanus Aquatilis; Raphanus Palustris prunum, Raphanus Sylvestris; b. Raphanus Aquatilis, Raphanus Palustris; the common Water Radish. 1. Raphanus Aquatilis; 2. Raphanus Palustris; 3. Raphanus Sylvestris, the other or second Water Radish of Bauhinus.

The Descriptions:

III. The fifth, or Field Wild Radish. It has a Root which is about a Vingera thick, white both without and within, and of a sharp and biting Taste. It has a shorter narrower Leaf than the Common Radish, and were deeply cut or jagged, almost like

Radish Wild.

parts, and provokes the Terms in Woman where they are Stop. Use it from to, or a Spoonful in White Port, or the Distilled water hereof, Morning and Night: and so taken it kills Worms.

XIX. The Efficacy of the same. It has all the Virtues of the Liquid Juice, and may be given in the same manner, from to Spoonful to 3, according to Age, &c. It comforts a cold and raw Stomach, eases Appetite and a good Digestion, expels Wind, and is good against the Colick, &c. Given to 4 or 5 Spoonfuls, 2 or 3 Hours before the coming of the Fit of a Quaran Ague, it caulis in some Vomiting, in others Sweating, and so thereby alters the course of the Ague and cures it.

XX. The Decoction or Infusion. They procure Urine powerfully, expelling Sand, Gravel, and Tartar out of the Reins and Bladder. The Root may be filed thin, and laid to Infuse all Night in Rheum Wine, or in White Port, or Labour Wine, and drank in the Morning Fasting, and so to be continued for some Days.

XXI. The Sprain of the Juice. It is made by diffusing double Refined Sugar, or Clarified Honey in the Juice, in Balance, and some added to Vinegar. It is good against Allmack's, Coughs, Colds, Phthisis, and all other Diffeases of the Lungs. It is good against an old Cough, and makes thin, thick and gouty Phlegm, caufing it to be easily expelleed: it is of good use in pains of the Reins, Bladder and Stone, provokes Urine much, and it carries off the Jaundice, and has all the Virtues of the Juice, Essence, Decoction and Infusion afo foregoing.

XXII. The Seed. It may be given to a Drear, or two, bruised or made up into a Pectoral with Clarified Honey or Oxymel. It Kills Worms in Children being drank, and provokes Urine. It is fad to cause Vomiting sometimes, especially in weak Stomachs.

XXIII. The Cataplasme of the Root. Being bruised and laid to the place grievous with the Gout Scatia, or other like pains, or to the hard and painful Swellings, it wonderfully gives eafe to them and helps them. If the Cataplasme is made with a mixture of Orphis Meat and Wine Vinegar, and applied to the Belly, it kills Worms therein. And to make, if it is applied to other places, it takes away all black and blew Spots, and other blemishes of the Skin.

XXIV. The Distilled Water from Root and Herb. It has all the Virtues of Jayce, Essence, Decoction, Infusion, and Syrup, but in a much lower Degree, and therefore ought to be given in a much larger Dose. Used as a Cologne, it is a great beauteur of the Skin, more especially if Paid of Cypripedium be Infused therein.

XXV. The Spirit from Root, Seed, &c. It is made altogether as you make Spirit of Scurvy-Craft, Grease, &c. It is a potent Remedy against the Scurvy, Colick, weakeens of the Stomach, and Indigested in a cold habit of Body: and has indeed all the Virtues of Juice, Essence, Infusion, and Syrup, and may be given from 15 to 20, or 24 Drops, in Ale, Beer, Wine, or other proper Vehicle, Morning, Noon and Night, and in some cafes, four or five times a Day.
like the Leaves of Rocket, but much greater. The Stalks are slender and rough, about 3 feet high, directed towards the top into many Branches. The Flowers are small and white. And the Seed (so which is contained the Seed) is long, slender, and joined.

IV. The fourth, or Water Radish. Its Root is very long, and of near aingers thicknesse, which runs far up and down, here and there through the Mud, spreading forth a great many Fibres, and in many places, as also severall Leaves under Water. It rises up in the Water with slender weak and bending Stalks, yielding to and fro, on which grow at every Joint, a long and somewhat broad Leaf, very deeply inclosed, or cut on on the edges unto the middle Rib. At the top of the Stalk, comes forth a small Tuft of yellowish Flowers, compounding of four Leaves apiece. After which follow small and almost round Puds, with round Seed in them.

V. Gerard describes this Water Radish thus. In Root it is lying the long and plump, with small Fibres or Threads like the bowels of a Spur, hot and burning in Taffie, more than any of the Garden Radishes. It has long and broad Leaves deeply indented. It is not to be missed in the middle Rib. The Stalk is long and weak, and leaves this style and that way, being not able to stand upright, without a prop, refisitible, that you shall never find it, nor know where it is very young, but bearing down upon the Mud or Mire where it grows. The Flowers grow at the top, made of four small yellow Leaves.

VI. The third, or Second Water Radish, (which is also the Raphum Aquaticum Tabernamentum in Gerard.) It has a long tough white Root, a Fingers thicknesse or more, running and spreading it self much, not deep into the Ground, but under the upper Crust thereof, having at certain distances among every square, small bunches of Fibres or Strings proceeding from it, which have long Leaves springing from them. This grows more upright than the last, for that it seldom grows in Ponds or Ditches of Water, as the other does, but on the edge, or near Watery Ditches, or other standing Waters. Its main Stalk or Stalks grow to be sometimes three Feet or more high, on which grow many long Leaves, much torn, or cut in, on both edges. At the top of the Stalk grows large Tufts of whitish or purplish Flowers, which being past away, leave in their places, short Puds containing the Seed, which is small, and not round at the former.

VII. The Places. The fist grows upon the Borders of Banks, and Ditches cauf, and in the Borders of Fields. The second never grows but in Water, or Brooks, or by Ditches and Broading Waters, and by Rivers fides, or where Store of Water is continually. The third grows near the Water fide, and sometimes in small watery Ditches, where there may be some little Water, and almost dry.

VIII. The Times. They all Flower in June and July, and the Seed is ripe in August, in or about a Month, as the former.

IX. The Qualities. Specification, Preparations, and Virtues, are the same with those of the Garden Radish foregoing, (except being used as they are for Salter,) but this they may be used instead of Helianthus, to warm a cold Stomach, and to help both to provoke Urine, and to expel Wind: For which purpose the Seed is more effectual than the Herb, and the Root of more force than the Seed.

CHAP. DLXXXVI.

OF RADISH Horfe.

I. T H E Name. It was unknown unto the Greeks, and therefore has no proper Greek Name: but it may well enough be called "Irmother" in Latine, Hipporephanus, Raphanus Radicans Latellis, Raphanus major, in English, Horfe Radish.

II. The Kinds. It is the third Generick Species of Radisher, and Planta singulare sui Generis, a singular Herb of its own Kind. This cannot be the Raphanus Syphyroides Dofeatis, because the Root of that is small, and the Leaves of this are not. But Tragus will have it to be the Armortacea Plant. It is the Raphanus major, & Radicula magna Dodemini, Armortacea, which Raphanus major Brunnellii, Tragi, & Gefani, Thalphi mag- num Thalphi uterum Dofeatis (L.) \\

The Descriptions.

III. Its Root is great and long, white and rugged, shooting up divers Heads of Leaves, which may be buried or divided for Increase, but it does not creep within the Ground, nor run above Ground, but for the most part runs deep into the Earth. The first Leaves which rise up before Winter, are about a Foot and half long, thin, and much cut in or turn about the edges into many parts, of a dark green color, with a great Rib in the middle, but after these have been up a while, others follow, which are greater, rougher, broader and longer, whole, and not divided as the first, but of something roundly dented about the edges. The Stalk when it bears Flowers (which it does but seldom) is great, rising up with some few feporter Leaves thereon, till it is 3 or 4 Feet highly spreading at the top into many small Branches of whitish Flowers, made of 4 Leaves apiece; after which come small Pods like those of the Lesser Sheepards Purse, but smaller with any Seed in them.

IV. Gerard describes it thus. The Root is long and thick, white of color, in Taft sharp, and very much biting the Tongue like to Mulford. It brings forth great Leaves, long, broad, sharp pointed, and sharp about the edges, of a deepl Green color, the leaves of the great Garden Dock, called of some Fanciers, or Moffs Khurbah, but longer and roughe. The Stalk is funder and brittie, bearing at the top small white Flowers: which being poll, there follow small Pods, in which is contained the Seed.

V. The Places. Gerard says, he has found it growing Wild in several places, as at Nunyards, in the place called the Mile-lace: as also at Magdelen near London, in the Field next to a Farm House leading to Kings-land, where it flour-ished for a long time afterwards. But for the most part it is planted and grows in Gardens, and delights in moil and shady Places.

6 B 2

6. VI. The
Salmon's Herbal. Lib. I.

VI. The Times. Gerard says that it flowers for the most part in April or May, and the Seed is ripe in August, but that it is rare or seldom to be found; and that Ferret Fleursanion has wrote, that it brings forth no Seed at all. Parkinson says, that it Flowers but seldom, but when it does, it is in July.

VII. The Qualities. It is, (sic. the Root) hot and dry in the third Degree. Aperitive, Digestive, Alterative, Attractive, Carminative, Comminative, Diuretic, Cephalic, Neurotic, Stomachic, Pethural, Hepatic, Splenetic, Nephrick, Hydropick, Parkick, and Alexipharmick.

VIII. The Specification. It is prevalent against the Strangury, and Stoppage of Urine by Stone, Gravel, Sand, or Tannous Humors lodged in the Urinary parts: it is good against Affhtus's, Coughs, Plethysms and other Defilements of the Lungs, open Obstructions of Liver, Spleen and Worm, and provokes the Terms in Women. It cures the Scoury, Dropsy, Gout, and Quaartan Agues, kills Worms in Children: and outwardly applied eases pains of the Gout, Sciatic, Liver, Spleen, and Reins, being applied upon the parts afflicted.

The Virtues.

X. The Juice. It is made of the Root scraped very thin, and eaten with Salt and Vinegar, either alone with Meat, or mixed with other Saltering. The same Particles cannot away with it, yet it is grateful to many Stomachs, and by strengthening the Vifcera, it causes a good Appetite and Digestion, prevents breeding of Wind, and eases Gripings in the Bowels, being a Speciel Enemy to the Scoury.

XI. The Liquid Juice of the Root. Being given in Drink, it is held to be very effectual for the cure of the Scoury; and to given, it kills also Worms in Children; A Cataplasm of the Root being also laid upon the Belly.

XII. The Essence of the Root. It has all the Virtues of the Juice, besides which, it gives eases in the Strangury, and eases pains in the Reins, Liver and Bladder; is profitable against the Stone, provokes Urine, and expels Sand, Gravel, and Tannous Matter from the Urinary parts. It is a good Remedy in Strong Bodies against Affhtus's, Coughs, Cold, Plethysms, and other like Defilements. It provokes the Terms in Women; and being given some Hours before the coming of the fit of a Quaartan Ague, it alters its Course, and many times cures it. Given also to a Woman in Childbed, it brings away the After-Birth, and causes dignus Cleaning. Dose from one Spoonful to two, or more in Wine, or some other proper Vehicle.

XIII. The Infusion in Wine. It has all the Virtues of the Juice and Essence, but must be given in a larger quantity, as from 2 to 4 or 6 Spoonfuls, Morning, Noon, and Night. It is good against the Colic, Strangury, pain, heat, and difficulty of making Water.

XIV. The Lochoth. It is made of the Juice with the addition of Vinegar and Honey, and then boiling them to a due Consistency. It has all the Virtues of Juice, Essence, and Infusion, but is peculiar good against Affhtus's, Coughs, Cold, Plethysms, Hoarsness, Wheezing, shortness of Breath, want of Appetite, &c.

XV. The Distilled Water from the Root, as also from the Herb. It is profitable for all the purposes aforesaid, being dulcified with fine white Sugar, and taken inwardly from a quarter of a Pint to half a Pint, Morning and Night. The Water Drops into the Eyes, is laid to clear the Sight: and if two parts of it be mixed with one part of the Juice or Essence, and the Face or Skin he washed therewith, and suffere to dry, it will (if used for some considerable time) clear the same from Spots, Tannings, Sunburnings, Pimples, Scurf, Morpbe, and other Deformities thereof.

XVI. The Spirit of Herbs Radify Roots. It is made altogether as the Spirits of Coffeas, Scorpy-Grafs, &c. And taken in the same manner as they are taken. It cures the Scoury absolutely in a cold habit of Body: causes a good Appetite and Digestion, warms, comforts, and strengthens the Stomach; invigorates and deparures the Blood and Lombe, and causes a due Circulation of the same through all the Veins, and every part of the Body. It is profitable against Rheumaticks, and all deformities of the Vifcera. Dose 20 or 30 Drops or more in Ale, Beer, or Wine, 3, 3, or 4 times a Day.

CHAP. DLXXXVII.

OF RAG-WORT. OR

JAMES — WORT.

I. T H E Names. It was unknown to the Greeks: the Latins call it Jacobus, and Herba Jacobi, Vos Jacobi C Jacobus; in English, Rag-wort, and James-wort: thought by some to be a Species of Crambe.

II. The Kinds. Authors make near a dozen Kinds of this Plant; but the five following are the most usual with us, viz.: 1. Jacobus vulgaris major; Jacobus senecio Lobellis; Vos vel Herba Jacobi Majora vel Jacoba communis; Our Common Rag-wort. 2. Jacobus vulgaris minor, Vos Jacobi minor; Our Lesser Rag-wort. 3. Jacobus marina, Cineraria vulgaris, Cineraria Dolomica, Arctochema Marina Alpini, Our common Sea Rag-wort. 4. Jacoba marina altera, hou minor, Cineraria Lobeli; Cineraria altera, The lesser Sea Rag-wort. 5. Jacoba marina latifolia Budhini; Cineraria latifolia Budhini, Broad-Leave Sea Rag-wort.

The
Chap. 587. English Herbs.

The Descriptions.

III. The first, or Our common Ragwort. Its Root is made of many little, some greater, others lesser, by which it is firmly fastened into the Ground, and abides many Years. This Greater common Rag-wort, has many large and long dark green winged Leaves lying on the Ground, very much rent and torn on the sides into many pieces even to the middle Rib. From among which rise up sometimes but one, and sometimes two or three square or crested blackish or brownish Stalks, three or four Feet high, sometimes Branched, bearing divers such like Leaves upon them up to the tops, at several distances, where it branches it self forth, each Branch bearing yellow Flowers, consisting of divers Leaves, set as a Pale or Border, with a dark yellow Thrum in the middle, which do while a great while; but in the end growing full ripe, are turned into Down, and with a small blackish gray Seed, carried away with the Wind.

IV. The second, or Our lesser Rag-wort. This in its Roots, Stalks, Leaves, Flowers, form and manner of growing is very like the precedent, so that many who do not well view it, do over-pass it, as judging it the same with the former, but the chiefest differences are these, it usually rises in Stalks not so high, nor is the Plant in the whole so great, the Leaves are not so finely jagged, nor of so flat a green color, but rather somewhat yellowish, soft and woolly, and the Flowers are commoner paller, yet in many of them are much alike.

V. The third, or Our common Sea Rag-wort. Its Root is long and more woody than the others, with several small Fibres adjoining to it, it has hard crofted Stalks about two Feet high, all hoary or white, on which grow hoary white Flowers, much much jagged, or cut into many parts, yet each part of them broader than any of our Wild Rag-worts, and somewhat stiff, but yet soft in handling. The tops of the Stalks are furnished with divers Flowers, whose Cups or Hacks are hoary at the root of the Plant is, but the Flower it self is of a pale yellow color, with a brownish Thrum in the middle, which turn into Down, and with the Seed is carried away with the Wind.

VI. The fourth, or Lesser Sea Rag-wort. Its Root is some thing great and Woody like the other. It grows lesser and lower than the former, yet the Leaves are longer, and much divided, or cut into many other jagged Leaves, each being rounder pointed than in the former, of a greenish or Ash green color above, and very white underneath. The Flowers are many which grow at the tops of the hard woody hoary white Stalks, which are sometimes three or four Feet high, and Branched. These Flowers are smaller, and of a dun or dark yellow than the other, and the middle Thrum also fferreer, which while in Flower two whole Months at least, before they fall away, and then at last, they turn into Down, as the others do.

VII. The fifth, or Broad Leaved Sea Rag-wort. Its Root is long, and thicker than any of the former, with some few Fibres running to it, from whence springing up round Stalks, about a Foot and half high, very hoary and woolly, spread out into divers Branches, the lower Leaves whereof are somewhat round and jagged as a Cole-wort, each part being as it were waved about the edges, and each Leaf being about four Inches broad, and (together with its foot Stalk) about a Foot long, of a dark green color on the upper side, and of a hoary white underneath, and soft in handling. The Flowers grow at the tops of the Branches upon longer and slenderer foot Stalks, whose Cups or Hacks are hoary, and the Flowers themselves greater, and taller, than in the former parts, the middle Thrum being of a Gold yellow color, which after they are ripe, are turned into Down, and with the Seed blowen away with the Wind.

VIII. The Places. The two first grow Wild in Fallowes and untilted Grounds in many places of this Kingdom, and oftentimes both together in one Field, more especially in Fields or Grounds which are standing moist, and chiefly near the Borders of Fields. The third grows on our own Coasts, not far from the Sea, in the Isle of Shee,
The Virtues.

XIII. The Liquid Juice or Efficacy. By gargling, and washing the Throat and Mouth therewith, they cleanse and heal Sores and Ulcers therein. And are good against Swellings, Hardness and Apoplexy in those parts; and therefore are said to be profitably against the Quinsy and Struma, or Kings Evil. Drink in a Glass of Wine about 2 or 4 Spoonsfulls at a time, they are profitably against Cataracts, and Defluxions of Rheum into the Eyes, Noses, Mouth, Throat, and other parts. They are singular good to heal Green Wounds, and cleanse old Ulcers, and filthy running Sores; as well in the Privy parts, as in other parts of the Body: and inwardly taken they cure inward Wounds and Ulcers in the Stomach, Lungs, Bladders and Womb. And outwardly injected into hollow Ulcers and Fistula’s, they cleanse, and induce their healing.

XIV. The Decoction in Wine or Water. It has all the Virtues of the Juice and Efficacy, and may be used in the same manner as to those intentions; but when given inwardly, it is to be given in a much larger Dose, as to 4 or 6 Ounces, adding to every Dose about half an Ounce of Common Spirit of Wine.

XV. The Ointment. After it is made of the Juice, or Green Herb, according to the usual manner, you ought to add to every pound thereof 3 Ounces or something more, of pure fine Powder of Tobacco Leaves, that heals Green Wounds, and cleanses and heals filthy running Sores, old Ulcers and Fistula’s, not suffering them to spread farther. It gives ease also in pains which happen both in the Muscular and Nervous parts.

XVI. The Balsam. It has all the Virtues of the Ointment, and being mixed with an eighth part of White Precipitate, it is more admirablely cleanses old painful running Sores and Ulcers, more especially those of the Kings Evil, which diffuse it powerfully, and cures the Ulcers thereof after an admirable manner. It is good against pains of the Nervous parts, and gives ease in the Goit and Scarcity, being applied thereto.

XVII. The Confusion. It is made of the bruised Herb boiled with Hogs Lard and Beef Suet mixt in equal quantities, adding thereto a little Frankincense and Myrrh. It eases pains in any part, chiefly in ulcers; and is good against Simple Contusions; and cleanses old purulent running Sores.

CHAP. DLXXXVIII.

Of Rampion.

I. THE Name. We know no Greek Name for this Plant, but it is called in Latine, Rampion, and Rapum: It is called by Geofl- ner, Dodonaeus and others, Rapum Sylyphre, tho’ it is not at all like Rampion or the turnip, but is in the edibility of the Root: in English, Rampion.

II. The Kinds. Authors give us many Species of this, these following are most usual with us, viz. 1. Rapunculus officinalis vulgaris, Rapannum purpureum, Rapunculus minutus Matthiolus, Camararij, Donedi, alburnum, Rapannum vulgaris, Tragia Per Loofus Anticenus, Our common Garden Rampion. 2. Rapunculus Spicatus Alpestris, Rapunculus Sylyphre Tragi, Rapum Sylyphre major, & Rapunculus Alpestrum Dodones, Rapannum major Alpestris Confoe Flora Lathy, Rapunculus Sylyphre Alpestris fera longa Claudia, Rapunculus Sylyphre Spicatus, Thalia, Rapunculus Nemorosus primus, Toberamontanus, Rampion major Gerardi, Great Rampion, or Long Foxtail Rampion. 3. Rapunculus Nemorosus Toberamontanus, Gerardi, & Parthenonius, Rapunculus Complanatus Nerij felicius Thalia, Our Wood Rampion. 4. Rapunculus Nemorosus, Vore magno major, Rapannum fera, Virea Vore magno Columba, Wood Rampion with great Flowers. 5. Rapunculus Cornulatus Montaneus, Gerardi, Our Mountain horded Rampion. 6. Rapunculus Sylyphre Flora ex purpuris Sarcandae. Eberemontani, Complanatus major, & Complanatus Gerardi, Our Wild Heath Rampion. 7. Rapunculus Cretae Bubensis, Pyramidae altae, Petreomarz, Candy Rampion.

The Descriptions.

III. The First, or Our common Garden Rampion. Its Root is small and white, and gives Milk being broken, at all the Root of the Plant does, foaming out two or three Branches, almost of an equal bigness, which is sweet in Tastes, and therefore much used to be eaten. It is usually Nerif up to Gardiners and is accounted a lesser Kind than many of the others which grow Wild, and lying upon the Ground with several small and long round pointed pale green Leaves, before it sends up its Stalk, which spread out with divers such Leaves therin, but smaller to the top, where break forth several small pale purplish Flowers, ending in five points, like unto the Throat-worts, but much smaller, being such like Heads, with small brownish Seed therein.

IV. The Second, or Great Rampion, or Long Foxtail Rampion. Its Root is white, greater than the
Chap. 588. English Herbs.

927

Rampion Mountain Horned.

VII. The fifth, or Our Mountain Horned Ram-
pion, Its Root grows after an unusual manner, for forth or lowermost is a Root like to that of a
Rampion, but slenderer, and from the top of that, comes forth as it were another Root or two, (as it
were Root upon Root,) being much smaller than the
lower Root, especially where they are united
under Root, and all these have small fibres or
Strings proceeding from them. The Leaves which
first grow up are smooth, and almost like those
of a Rampion, yet rounder, and made somewhat
after the form of a Violet Leaf, but nothing so big.
At the bottom of the Stalk came forth five or
eight long narrow Leaves, denting about the edges
and sharp pointed and upon the top, as if they were
grown also three or four narrow sharp pointed Leaves,
not much unlike those at bottom of the Stalk, but
narrower and rounder. The Flowers are of a purple
color, and grown at the top in an almost flat
Leaves, and shaped almost like a Chymical Vessel, which we
call a Retort, being big, large, or fanciful
out of their bottoms, and so becoming smaller
towards their tips. But afterwards they are
transformed into five parts or slender Strings, with Thorns
in the middle: which decaying, they are succeeded
by little Caps, ending in five little points, in which
is contained a small little Seed.

VIII. The sixth, or Our Wild Heath Rampion.
Its Root is small with some Fibres adjoining to it.
Its Ground Leaves are small and roundish, almost
like unto a Violet, but rounder and denting about
the edges, from among which rise up many slender
Roots, about two Feet high, which have very few
Leaves thereon, or none at all, each Stalk or
Branch being at its top one Flower only, of a per-
fell blue or white color at any of the former, and
almost as large.

IX. The seventh, or Candy Rampion. Its Root
is green and white, parted into many Branches,
yielding Milk even at the Leaves and Roots also do,
and abider many Years, altho the Leaves and Stalks
perish every Year, fresh springing up before Winter
again, but with as it requires to be a little defended
in Winter time as before. The Hair Leaves
which springing up from the Seed of this Cretick or
Candy Rampion, are round, like unto Violet Leaves,
little or nothing denting about the edges, which jo
abide the first Year, but those which rise afterwards
with the Stalks, are much different from them,
being much cut in, and deeper into several parts,
set on both sides of the middle Rib, the end being
longer, all of them denting, of a dark taste, or color
on the upper side, and oftentimes reddish under-
neath. From among which rise up several Crooked
Stalks two or three feet high, bearing such like
Leaves on them as before, but sometimes from
the middle to the tops, furnished abundantly with many
small reddish purple Flowers, and sometimes with
white Flowers, growing one above another in a long
Spire, very like unto the Spotted Rampion. But
somewhat longer, and more divided or denting in
the corners, and each part turning it self a little
back again. After which come very small brownish
Seed in Heads, both of them to the other
Rampions. This Pena in his Mota Balbus, and
Honores Bellus in his first Epitile to Claris, calls
Persamara dae Ladacis petrae Cretica.

X. The Violets. The fifth is always North up in
Gardens, and sometimes the second, both of which
are also found growing Wild in England, the Roots
being eaten in Sallets, and also eaten boiled. The
second grows with us only in Gardens, but is to be
a little defended in the Winter with us.
The third grows in Woods in many places of
England. The fourth grows also Wild in Fields and
and in Woods. The fifth Gerard says, that he received Seeds and Roots thereof from Mr. Goadyer, who found it growing plentifully Wild in the enclosed Chaffy Hill Grounds by Neyland Durban near Petersfield in Hampshire, and that being Plant ed in Gardens, its Flowers become much longer and taller. The Fresh grows Wild also in many places in this Kingdom.

XII. The Qualities. The Roots of the Ramps are only used, and are temperate in respect to heat or cold, dryness or moisture, are Adherent, Commined, Stomatiek, Astringent, and Kellygenetick, or Ecreas of Milk in Nutritive Berulis.

XIII. The Description. The Roots encrease appetite, cause good digestion, are Adherent, and Commined, clearing the Skin from Stomateries, and retiring in Contumptions.

The Virtues.

XV. The Sallet. The Roots of all the Ramps, if they be of any greatnes, are used for Sallets, either Cold, with Salt, Vinegar, Oil, and Pepper, being cut and blest thin. Or being boiled, or stewed in Butter, or Oil, and so eaten with Salt, Vinegar and Pepper; either way, or any way, they are familiar to the Stomach, stir up the Appetite, and cause Digestion, and so cause Milk in Nutritive Berulis. And by reason of their Temperate and Astringent, or Nutritive Qualities, they encrease Blood and Heat, and so retire in Contumptions.

XVI. The Distillation. It may be made in Wine, Milk, or Water. It is said to be good against Infumations of the Mouth, Throat and Almonds, and other diseases happening to those parts, in like manner, as the Throat-Burrts are.

XVII. The Cataplasm. The Roots been small and mixed with Meal or Flower of Lupins or rather of Orment, cleanses the Skin, from Scurf, Warts, Pimpls, Spots, Marks, and other like Disgracings or Discolorings.

XVIII. The Distilled Water of Roots and the whole Plant. It has all the Virtues of the Cataplasm, and makes the Face and Skin, very fine, beautiful and clear. Drunk constantly by Nutritus, either alone, or mixt with Milk or Whey, and a little sweetened with double Refined Sugar, it encreas Milk in their Breasts, and is good against a Pining Contumption, as also for Ulcers of the Lungs.
Chap. 590. English Herbs.

The description of Rape - seed.

A ND

COLE - RAPE.

I. The Name. We know no Greek Name for it; but it is called in Latin, Rapa, a Proper Name, and in English, Rape and Colerape. The Wild Rape, or Colerape, yields the Rape Seed, and is only known for Profit sake.

The Description.

III. The first, or Garden Rape. Col. It has one single long Root, garnished with many Thready Strings, from which rise up a great thick Stalk, bigger than a Great Cucumber, or Great Turnip, at the top whereof, at the root thereof, great broad Leaves like to those of Cabbage-Cole. The Flowers grow at the top of the Riper Stalks, compact of four small yellow Leaves, which being full, the Seed follows, enclosed in small long Cole, like the Seed of Mustard.

6 C  IV. Pan:
IV. Parkinson describes this Rape Cole thus, It has a Root which is somewhat long, and very bulky with Threads. From the Head of this Root, proceeds another white Head, or Headed Stalk above the Ground, as large as a reasonable Turnep, but a little longer; and from the top thereof proceeds or springs out divers great Leaves like unto Coleworts), for which reason it is accounted one of the Kinds of Coleworts: from among these Leaves, rises divers Stalks, which bear yellow Flowers, consisting of four Leaves apiece; and Seed in small long pods, almost as small at Mustard Seed.

V. The second, or Garden Cole Rape. It has a long fibrous Root like unto the former. The Tuberous Stalk is very great and long, thrashing forth in some places here and there some foot Stalks, on which do grow smooth Leaves, slightly indented about the edges: on the top of the long Turnep Stalk grow Leaves, Stalks, and Flowers like the former. This differs from the first chiefly in the length of the fiddle Stalk, for which reason it is called by some Cauld Rape longum, or Long Cole Rape.

VI. The third, or Wild Rape, or Wild Cole wort, (which yields the Rape Seed, of which they make Rape Oil.) Its Root is white, hard, and somewhat Woody. From this Root spring up many long greyish round Leaves, much gilded in, or tore on the edges. From among these Leaves rise up the Stalks, bearing such like Leaves, but smaller, and at their tops yellowish Flowers, each consisting of four Leaves, which are succeeded by small rough Pods, with small round Seed in them.

VII. Gerard thus describes this Kind. This Wild Rape, or Cole-wort has long broad Leaves,
Of **RASP--BERRY** Plant:

O R.

**HINDE--BERRY.**

1. **T H P. Names.** It is called in Greek, Άνθενος; in Latin, Rubus Linn. in English, Rasp-Berry, and Hinde-Berry.

II. The Kinds. We shall describe five several Varieties, viz. 1. Rubus Linnæi vulgaris vel Hortensis, Our common Garden Rasp-Berry. 2. Rubus Montanus Oederatus, The sweet Mountain Raspberries. 3. Rubus Tricoccus, Our common Field Dew-Berry. 4. Rubus Saxatillis Alpinus, The Stony, Rock Rasp-Berry. 5. Chamamasorus Anglica, Our Knot-Berry.

The Descriptions.

III. The first, or Our common Rasp-Berry, its Root creeps under Ground very far, and shoots up again in many places, much increasing thereby. It is of two sorts, viz. one bearing red Berries, the other white; but otherwise they differ not in their form or manner of growing, either as to the

Rasp-Berry Bush.

whole Bush, or as to the Leaf, Flower or Berry, but only in the color of the Fruit, and a little in the Taffle thereof, the white Rasp-Berry being a little more plesant than the red. The Rasp-Berry Bush has tender whitish Stems, with reddish small Pricks like...
Salmon's Herbal. Lib. I.

Rasp-Berry Garden.

Standing three or five upon a Stalk, something like unto Raisin, but greater, and of a proper green color. The Flowers are small, made of five whitsip round Leaves, with a daff as it were of bluish catt over them, many standing together, yet every one upon its own Stalk, in the tops of the Branches. After which come up small Berries, something bigger than the Common small red Straw-Berry, with a kind of downiness catt over them, of a pleasant acid Taffe, having a kind of peculiar flavor of their own.

IV. The second, or Sweet Mountain Rasp-Berry. Its Root creeps and spreadeth much under Ground, as the other does. It has several long Stalks rising up from the Root, without any Thorns on them, but for thick with soft Hairs, having on them broad and large Leaves without order, growing upon long hairy foot Stalks, divided into five parts, almost to the middie rib, and sometimes but into three, each part little dented about the edges, of a very sweet Smell, but falling in Winter. The Flowers are something large like the Eglantine of a diluted purplish Violet color, with several yellow Threads in the middle, standing at the tops of the Branches: after which come the Fruit, very like to the former, and reddish, having much the Rasp-Berry Taffe.

V. The third, or Our common Field Dew-Berry. Its Root creeps under Ground more than the last, and has flender much Branches like that, but more often lying down, then rising up, with a few Thorns or Prickles thence. The Leaves are usually but three set together, more separate on the Branches, yet almost as large, and standing on long foot Stalks. The Flowers are white and small. The Berries usually consist but of three parts or Bunchings out, each having but one Seed in it, and all maturing but one Berry, yet sometimes they may have a set of three Grapes like the Bunchings out, being of a sweet and pleasant Taffe.
